ABBREVIATIONS

The titles of subjects, which are printed first in bold type, have been abbreviated within each article to the initial letter or letters.

ac., acre(s).	lb., pound(s).
agric., agricultural.	l. b., left bank.
ambas., ambassador(s).	long., longitude.
Amer., American.	m., mile(s).
anct., ancient.	manuf., manufacture.
ann., annual.	M.E., Middle English.
arron., arrondissement.	min., minute(s).
A.-S., Anglo-Saxon.	Mod. E., Modern English.
A.V., Authorised Version.	m.p.h., miles per hour.
b., born.	mrkt tn., market town.
Biog. Dic., Biographical Dictionary.	MS., MSS., manuscript(s).
bor., borough.	mt, mts, mount, mountain(s).
bp., birthplace.	N., north; northern.
Brit., British.	N.T., New Testament.
c., about.	O.E., Old English.
C., Centigrade.	O.F., Old French.
cap., capital.	O.T., Old Testament.
cent., century (7th cent.).	oz, ounce(s).
chem., chemistry.	par., parish.
co., county.	parl., parliamentary.
com., commune.	pop., population.
cub. ft., cubic feet.	prin., principal.
d., died.	prof., professor.
Dan., Danish.	prov., province; provincial.
dept., department.	pub., published; publication.
dimin., diminutive.	q.v., Lat. <i>quod vide</i> , which see.
dist., district.	R., riv., river.
div., division.	R.A.F., Royal Air Force.
E., east; eastern.	r. b., right bank.
eccles., ecclesiastical.	rep., republic.
ed., edition; edited.	Rep. of Ireland, Eire.
educ., educated.	R.N., Royal Navy.
e.g., example.	Rom., Roman.
Ency. Brit., <i>Encyclopaedia Britannica</i> .	r.p.m., revolutions per minute.
Eng., English.	R.V., Revised Version.
estab., established; establishment.	S., south; southern.
fl., flourished.	sec., second(s).
Flem., Flemish.	sev., several.
fort. tn., fortified town.	Sp., Spanish.
Fr., French.	sp. gr., specific gravity.
ft., feet.	sq. m., square miles.
Ger., German.	temp., temperature.
Gk., Greek.	ter., territory.
gov., government.	tn., town.
Heb., Hebrew.	trans., translated; translation.
hist., history.	trib., tributary.
horticult., horticultural.	U.K., United Kingdom.
h.p., horse-power.	U.N., United Nations.
H.Q., headquarters.	univ., university.
hr(s), hour(s).	U.N.O., United Nations Organisation
in., inch(es).	urb., urban.
inhab., (inhabitant(s)).	U.S.A., United States of America.
is., island(s).	vil., village.
It., Italian.	vol., volume.
Jap., Japanese.	W., west; western.
jour., journal.	Wm., William.
Lat., Latin.	yd(s), yard(s).
lat., latitude.	

APPENDIX I Alphabetical Arrangement	page 779
APPENDIX II Index of longer articles	782

T

Tar, dark-brown or blackish, viscous liquid obtained as a by-product in the destructive distillation of coal, shale, peat, lignite, or wood, or by the cracking of petroleum hydrocarbons in the presence of hydrogen and carbon monoxide (carburetted-water-gas T.). The prin. kind of T. is coal T. (q.v.). About 9-17 gallons are obtained from a ton of coal, the quantity depending on the source of coal and the type of retort used, e.g. coke oven, continuous vertical retort, horizontal retort, etc. The chief products obtained from coal T. are pitch and creosote oil (85-90 per cent), naphthalene, T. acids (phenol, cresols, and xylenols), and anthracene. From the first 2 main products road T., black varnishes, agric. insecticides, and liquid fuels are made, while the lesser products provide the raw materials for a wide range of important drugs, dyes, explosives, perfumes, and bactericides. Wood T. is mainly obtained from deciduous hard woods; these give a dense charcoal, whereas the pyrolysis of pine, etc., gives a light, softer charcoal, together with turpentine and resins. Wood T. is condensed with the watery distillate termed pyroligneous acid which contains acetic acid, methyl-alcohol, and acetone. The wood T. separated from the pyroligneous acid is generally distilled in batch pot stills to yield a residue of wood-pitch (or Stockholm pitch as it is often termed, although the term should only be used for the T. or pitch derived from pinewood) and a wood creosote distillate. The creosote (q.v.) finds a use in the preservation of rope, etc.; the pitch is still used for caulking ships. Stockholm T. is also used medicinally in the preparation of ointments for skin diseases. Chemically, wood T. is entirely different from coal T. and affords no important by-products, although the presence of butyric acid, maltol, and acetyl acetate in it has been demonstrated.

See COAL; CREOSOTE; PITCH.

Tar Heel State, see NORTH CAROLINA.

Tara, vil. of co. Meath, Rep. of Ireland, on the Boyne, 6 m. S. of An Uaimh. The Hill of T. (567 ft) was in anc. times the religious, political, and cultural cap. of Ireland; upon its summit are the coronation stone of the anc. kings, and a statue of St Patrick. It was a royal residence until 560 and national assemblies were held, and in 980 the Dances were overthrown here. Important excavations began, 1952. See S. P. O'Riordain, *Tara*, 1954.

Tara Fern, *Pteridium aquilinum* v. *esculentum*, a variety of Common Bracken, native to the S. hemisphere. Its root stock is eaten by pigs, and when roasted is a favourite food of the aborigines.

Taranaki, dist. in the SW. of the N. Is., New Zealand, with an area of 3732 sq. m. and a pop. of 94,073. Formerly forest-clad, most of the ground has now been cleared and is utilised for stock-raising,

sheep-rearing, and dairy-farming, meat, wool, butter, and cheese being produced. New Plymouth is the cap. and port. It was in the T. dist. in 1860 that war broke out with the Maoris (see NEW ZEALAND, *History*).

Tarantella, Neapolitan dance for 2 people, in 6-8 time, with a gradually increasing speed. It was supposed to be a cure for tarantism (q.v.).

Tarantism, or **Tarantulum**, epidemic dancing mania which spread over Europe in the 13th and 14th cents. and persisted into the 17th cent. The symptoms originated with a great dread of the bite of the tarantula, which was popularly supposed to cause a form of chorea (q.v.), and the cure for it was believed to be dancing.

Taranto: 1. Or **Ionio**, prov. of Italy, in E. Apulia (q.v.). It is the NW. portion of the 'heel' of Italy. There is a long coastal plain on the Gulf of T. (q.v.), and a plateau in the N. The prin. tns include T., Manduria, and Massafra (qq.v.). Area 960 sq. m.; pop. 443,000.

2. (anc. **Tarentum**, q.v.) It, seaport, cap. of the prov. of T., on the Gulf of T., 49 m. SSE. of Bari (q.v.). It was taken by the Normans in 1063, and became a feudal principality subject to the Kingdom of Naples (q.v.). In the harbour on 11 Nov. 1940 the Brit. Fleet Air Arm crippled 3 It. battleships and 2 cruisers (see NAVAL OPERATIONS IN SECOND WORLD WAR). The port was taken, from the sea, by Brit. forces on 9 Sept. 1943. T. has an archiepiscopal cathedral (11th-18th cents.), and an anc. castle. It is one of Italy's 4 naval bases, and has oil-refining and oyster and mussel fishing industries. Pop. (com.) 174,200.

Taranto, Gulf of, inlet of the Ionian Sea (q.v.), separating the 'toe' and 'heel' of Italy. It is bordered by Calabria, Basilicata, and Apulia (qq.v.). The prin. tn on the gulf is T. (q.v.). It is about 60 m. across.

Tarantula, name for various large, formidable-looking spiders, European and Amer., but correctly applied to a few relatively small species of the genus *Lycosa*, found near Taranto in Italy. It is no more poisonous than other spiders of similar size. It burrows in the ground and catches its prey by pouncing on it and not by means of a web. See SPIDER.

Tarapacá, prov. of N. Chile, with Peru to the N. and Bolivia to the E. The Atacama desert dist. nearest the coast has deposits of guano, sulphate of soda, and salt (of which the prin. deposit is the Salar Grande), and copper, silver, and nickel in the mts; gold has also been found. A narrow strip, 3 m. in breadth and 250 m. long, to the eastward contains large deposits of nitrate of soda, whilst eastward again stretches the Pampa of Tamangal to the Andes, the agric. portion of the prov. Alpacas and sheep

are reared. The cap. is the port of Iquique, the other main port being Arica. Area 21,340 sq. m.; pop. 102,789.

Tarare (anct Taratrum), Fr. tn in the dept of Rhône, on the Turdine. It manufs. muslin, velvet, silk, and plush. Pop. 10,100.

TARANTULA

Tarascon, Fr. tn in the dept of Bouches-du-Rhône, on the Rhône, 50 m. NNW. of Marseilles. There is a splendid castle (15th cent.), a notable church, and a 17th-cent. tn hall. It has a trade in olive-oil and fruit. Pop. 7800.

Tarasus, St (d. 806), patriarch of Constantinople who became patriarch in 784. The second council of Nicaea was held under his initiative. He is much venerated in the Orthodox Church, which observes his feast on 25 Feb.

Tarasp, or Vulpera-Tarasp, vil. of Switzerland, in the canton of Grisons, Lower Engadine, 28 m. NE. of St Moritz. It is frequented for its mineral baths.

Tarawa, see GILBERT AND ELLICE ISLANDS.

Tarawera Mt, peak of New Zealand, situated in the Hot Lakes dist. of the N. Is., 90 m. NNW. of Napier. On 10 June 1886 an eruption destroyed the famous pink-and-white terraces of Rotomahana.

Taraxacum, a genus of stemless, herbaceous perennials, family Compositae; there are many species, of which *T. officinale* is the Dandelion (q.v.), and *T. bicorne*, Turkistan, is grown as a source of rubber in Russia.

Tarazona (Rom. Turiaso), Sp. tn, in the prov. of Zaragoza, on the Quiebes. It has medieval walls and a Gothic cathedral. Mt. Moncayo (q.v.) is near by. Pop. 10,000.

Tarbagatai, mt range in Russian and Chinese Turkestan, extending over 200 m. Its highest point is Muz-tau (11,920 ft), and the best pass is Say-assu, which leads to Chuguchak.

Tarbert, fishing vil. of Argyll, Scotland, 38 m. NNE. of Campbelltown. The vil. lies on an isthmus between E. Loch T.

(inlet of Loch Fyne, 1 m. long) and W. Loch T. (inlet of the Sound of Gigha, 10 m. long). The anct castle was erected by Robert Bruce, and there is a good harbour. Pop. 2000.

Tarbes (Rom. Turba), Fr. tn, cap. of the dept of Hautes-Pyrénées, on the Adour. It was the cap. of Bigorre (q.v.), and in the 16th and 17th cents. was a Huguenot (q.v.) stronghold. In 1814 Wellington defeated the French here. T. is the seat of a bishopric, and has a 12th-cent. cathedral. There is a school of artillery, armament works, and manufs. of shoes, furniture, and pottery. It is noted for its horses. Th. Gautier, Barère, and Foch (qq.v.) were b. here. Pop. 44,850.

Tarbolton, tn and par. of Ayrshire, Scotland, on Fall Water, 6 m. ENE. of Ayr. Pop. (tn) 2200; (par.) 6129.

Tarbush, see FEZ.

Tardieu, André Pierre Gabriel Amedée (1870-1945), Fr. politician, b. Paris. He became a diplomat, but then took up journalism and became foreign editor of the *Temps* and editor of the *Revue des deux mondes*. He became a deputy in 1914. At the peace conference, 1919-20, he was a colleague of Clemenceau, with whom he later founded the *Echo national*, and strenuously opposed any revision of the Versailles Treaty. T. was Premier for 3 periods, and from 1936 was a strong critic of the politics of the Third Republic.

Tardieu, Jacques Nicolas (1718-95), an engraver, son of Nicolas Henri T. (1674-1749). He received his artistic tuition from his father, became a member of the Fr. Academy, and was one of the group of engravers who worked after Watteau and his school.

Tardigrada, Bear Animalcules, or Sloth Animalcules, order of Arachnida. They are microscopic animals living amongst damp moss. There are 4 pairs of short, stumpy legs, each ending in a pair of claws; the body is covered by a thin cuticle.

Tardiveau, René, see BOYLESVE.

Tare. The Hairy T. is *Vicia hirsuta*, the Slender T., *Vicia tenuissima*, both leguminous trailing anns. native to Britain. The T.s of the parable (Matt. xiii) are probably darnel.

Taree, tn on Manning R., 235 m. N. of Sydney. T. is the centre of a thriving dairying and maize-growing dist. Pop. 7610.

Tarentum (Gk Taras; modern Taranto, q.v.), Gk colony in Italy, on the W. coast of the peninsula of Calabria. Its greatness dates from 708 bc, when the original inhab. were expelled by a body of Lacedaemonian Partheniae under the guidance of Phalanthus. It remained autonomous, though with varying fortune, until 272 bc, when it was captured by the Romans. It revolted during the second Punic war, but was retaken in 209 bc, and was subsequently an ally and (in 123) a colony of Rome. It was taken by the Saracens in 830.

Target, or Targe: 1. A round shield (q.v.).

2. From its similarity to the above, the object at which archers and, later, riflemen aim at was also called a T. In archery a T. is a circular frame of straw, painted with concentric rings of 4½ in. width; there are 5 rings, counting respectively 1, 3, 5, 7, or 9 points. For some time 'match' T.s of rectangular shape were solely used by soldiers; the 'bull' counted 4 points, the inner ring 3, and either a 'maggie' (a shot in the second of the T.'s 2 rings) or an outer 2 points. 'Service' T.s which are now used in the Brit. Army consist of a brown head and shoulders shown against a dark canvas ground, etc.

Targovishte (formerly Eski-Dzhumaya), tn of Bulgaria, in Kolarovgrad prov., on the Vrana, 17 m. W. of Kolarovgrad (q.v.). It has textile, furniture, and pottery manufs. Pop. 11,000.

Targoviste, see TIRGOVISTE.

Targa Mures, see TIRGU MURES.

Tarifa (Rom. Julia Transducta), Sp. tn in the prov. of Cadiz, on the Strait of Gibraltar (q.v.). It has harbours on both the Mediterranean and the Atlantic, and the isthmus on which it stands is joined by a causeway to the Isla de las Palombas and the Punta de Marroqui (lat. 35° 59' 50" N.), the most southerly point in Spain. The tn is very Moorish in appearance, and has anchovy and tunny fisheries. Pop. 17,000.

Tariff Reform, see PROTECTIONIST LEGISLATION.

Tariffs. Tariff comes from the Arabic *tarif* (notification) via the It. *tarifa* (arithmetic, ratebook), and means (a list of) duties or customs to be paid on imports (usually) or exports; or the law imposing them. T. are imposed for protection or revenue purposes. Although the U.K. abolished protective T. in the 19th cent. a number of T. were retained for purely revenue purposes (on tea, coffee, wine, spirits, etc.), excise duties being imposed as necessary to offset any protective effect. T. may be levied on weight or value, percentage duties on value being known as *ad valorem* duties.

The article on customs duties (q.v.) discusses early Eng. T. and cites the consolidating enactments of 1787, 1853, and 1876. Together with Free Trade (q.v.), it gives an outline of U.K. T. since the Free Trade era. The latter article discusses developments since the 1830's and refers to the General Agreement on Tariffs and Trade (G.A.T.T.) (q.v.) of 1947.

In the U.S.A. the first Congress, in 1789, enacted a tariff which served to provide both revenue and protection simultaneously—an unusual and difficult feat. After the 1812-15 war with Great Britain, T. were raised to stem the flood of Brit. goods, with further measures of protection up to early in the 1830's, whence a tendency towards lower T. prevailed generally up to the Civil war of 1861-5. After the war the Republicans passed a number of high-duty T. up to and including the Fordney-McCumber tariff of 1922 and the Hawley-Smoot tariff of 1930, interrupted from time to time by lower T., such as the Wilson-

Underwood tariff of 1913, promoted by the Democrats. The 1930 Act has been weakened through amendment in 1934 by the Reciprocal Trade Agreements Act empowering the president to reduce duties by 50 per cent. By 1939 agreements had been made with 21 countries. Further powers were given later, and further reductions negotiated at Geneva in 1947 under G.A.T.T. and again at Annecy in 1949 and Torquay in 1961.

Tarija: 1. Dept of Bolivia, with Paraguay on the E. and Argentina to the S. The Camblaya R. flows through the dept and forms its N. and NW. border. The E. dists. are part of the Gran Chaco. Wheat, maize, wine, and tobacco are produced, cattle are reared, and there are extensive forests. T. includes proven oil-bearing lands. Area 9570 sq. m.; pop. 136,000.

2. Cap. of the above, on the T. R., 180 m. SE. of Sucre. The T. valley yields prehistoric animal remains. There is a cathedral, a univ., and an airport. Rubber, asphalt, and quinine are produced. Pop. 17,000.

Tarik, see GIBRALTAR.

Tarika, see SUPHEM.

Tarim, important riv. of Sinkiang, China, formed by the junction of the Yarkand-Daria and the Khotan-Daria. The T. is a sluggish stream, shallow and tortuous, and after flowing by the side of the desert of Takla-makan, and through the oases of Yarkand, Kashgar, Aksu, etc., it dies away in the marsh of Lop Nor, after a course of 1000 m. The area of its basin is 354,000 sq. m., of which over half consists of arid deserts, including those of Takla-makan, or Gobi, and Kumtagh. The region has been explored by Sven Hedin and Sir Aurel Stein, who discovered the anc. civilisation of the T. basin.

Tarim Desert, see TAKLA-MAKAN.

Tarin, see SISKIN.

Tarkington, (Newton) Booth (1869-1946), Amer. dramatist, novelist, and essayist, b. Indianapolis, Indiana. Educ. at Purdue and Princeton Univs., he was a member of the Indiana House of Representatives in 1902-3, but then gave up politics to devote himself to writing. He was successful with his first book, *The Gentleman from Indiana*, 1899, the model for further realistic novels of Middle W. life. He won the Pulitzer Prize for novels twice (a record) with *The Magnificent Ambersons*, 1918, the chronicle of the decline of an Indiana family, and *Alice Adams*, 1921, the story of a girl whose love affair with a man of higher social standing is ended when he meets her mediocre family. Among others were *The Two Van Kessels*, 1902, *The Conquest of Canaan*, 1905, and *The Plutocrat*, 1927. In another vein were his stories of young people, *Penrod*, 1914, its sequels, and *Seventeen*, 1916, which won a new success for him. Standing apart in his work is the romance *Monsieur Beaucaire*, 1900. T. dramatized it, and the play had much success in the U.S.A., and as the libretto of a popular opera in England. His many other plays include *Clarence*, 1919, and comedies (with H. L. Wilson and J. Street). His

reminiscences, *The World Does More*, appeared in 1928. In 1942 he was awarded the Roosevelt Distinguished Service Medal, and in 1945 the Howells Medal of the Amer. Academy of Arts and Letters. He held honorary degrees of Princeton, de Pauw, and Columbia. See life by A. D. Dickinson, 1926.

Tarlac, or **Tarlag**: 1. Prov. of Luzon Is., Philippines. The chief products are coconuts, rice, and sugar. Area 1175 sq. m.; pop. 327,018.

2. Cap. of the above, 65 m. NNW. of Manila. Pop. 64,587.

Tarlatan, gauze-like muslin used for ladies' dresses, etc., originally produced in India. It occurs in white and colours, and is often printed.

Tarleton, Richard (d. 1588), comedian, distinguished for his performance of the clowns of the old Eng. drama. One of his last performances was in *The Famous Victories of Henry V.*; this was in 1538 at the 'Bull' in Bishopsgate Street. T. is known to have written at least one play, *The Seven Deadly Sins*, which, though never printed, and now lost, was much admired. There is a portrait of T. in his clown's dress, with his pipe and tabor, in the Harl. MS. 3885; and a similar one on the title-page of a pamphlet called *Tarleton's Jests*, 4to, 1611.

Tarn: 1. Dept. of S. France, formed of part of the anct prov. of Languedoc. It is watered by the T. and its trib. the Agout. In the E. and SE. are the high plateaux of the Sidobre, in the W. there is a fertile plain, and in the rest of the dept there are small, wooded hills. Cereals, vines, and vegetables are produced, and livestock is raised. Coal, iron, and zinc are mined, and there are metallurgical, textile, leather, glass, and paper industries. The prin. tns are Albi (the cap.) and Castres (qq.v.). Area 2231 sq. m.; pop. 308,200.

2. Riv. of France, rising in the Cévennes and flowing into the Garonne. The chief tns on its banks are Albi and Montauban. Length 225 m.

Tarn-et-Garonne, dept. of S. France, formed from parts of the anct provs. of Guyenne, Gascony, and Languedoc. It is an alluvial plain formed by the confluence of the rivs. Garonne, Tarn, and Aveyron. There are some hills, generally wooded. Cereals, fruit-trees, vines, and truffles are produced, and sheep are raised. There is little industrial development. The prin. tns are Montauban (the cap.) and Castelsarrasin (qq.v.). Area 1440 sq. m.; pop. 172,400.

Tarnopol, see TERNOPOL'.

Tarnowskie Góry, tn of Poland, in Katowice prov., 15 m. NNW. of Katowice (q.v.). It was transferred from Germany to Poland in 1921. There are coal and iron mines. Pop. 16,000.

Taro, see COCCO.

Tarots, see CARDS, PLAYING.

Tarpaulin, large sheet of the coarsest kind of linen or hempen cloth, saturated with tar to render it waterproof. It is used for covering loaded wagons, the hatchways of ships, etc., as a temporary protection from wet. See WATERPROOF.

Tarpeia, daughter of Spurius Tarpeius, the governor of the Rom. citadel on the Saturnian hill, afterwards called the Capitoline. During the Sabine war she was tempted by the gold bracelets which the Sabines wore to betray the Capitol to them. But on entering, the Sabines crushed her to death beneath their shields. The Tarpeian rock, a part of the Capitoline, was used as the place of execution for traitors.

Tarpon (*Megalops atlanticus*), giant herring-like fish plentiful in warm Amer. seas and off W. African coasts. It grows to a length of 7 ft or more, and to a weight of over 300 lb., the scales, which are tough like thin horn and are made into ornaments, sometimes being as much as 5 in. in diameter.

Tarquini (formerly Corneto), It. tn, in Lazio (q.v.), 20 m. SW. of Viterbo (q.v.). It stands near the mouth of the Marta, and in the late Middle Ages was a busy port. Near by is the site of the anct city of Tarquinii, one of the cities of the Etruscan Confederation (see ETRURIA), where a great number of antiquities have been discovered; an Etruscan necropolis, with tombs dating from the 6th to the 2nd cents. BC, still exists. T. has manufs. of pottery and matches. Pop. (tn) 6400; (com.) 8100.

Tarquini, see TARQUINIA.

Tarquinius, name of a family in early Rom. hist., to which the fifth and seventh kings of Rome belonged: *Lucius Tarquinius Priscus* (616-579 BC), fifth King of Rome, defeated the Latins and Sabines, and, according to one tradition, the Etruscans. He is reputed to have modified the constitution and to have begun the building of the sewers and the Circus Maximus. He was murdered after a reign of 38 years. *Lucius Tarquinius Superbus* (534-510 BC), the seventh and last King of Rome. His cruelty and tyranny obtained for him the surname of 'Superbus.' But, though a tyrant at home, he raised Rome to great influence and power among the surrounding nations. He defeated the Volscians and took Gaius. Owing to his son Sextus's rape of Lucretia, the wife of his cousin, T. Collatinus, T. Superbus and his family were exiled in 510 BC. The people of Tarquinii and Veii took up his cause and marched against Rome, but they were unsuccessful. T. next obtained the help of Lars Porcena, King of Clusium, who marched against Rome, but was induced to make peace with the Romans. Thereupon T. took refuge with his son-in-law, Octavius Mamilius, who induced the Lat. states to declare war against Rome, but they were defeated at the battle of Lake Regillus. T. then fled to Aristobolus at Cumae, where he died. It should be noted that the story of the Tarquins contains many inconsistencies, and may therefore be treated in great part as legend.

Tarrasina, see TERRACINA.

Tarraco, see TARRAGONA.

Tarragon (*Artemisia dracunculus*), aromatic perennial plant, the green or dried leaves of which are used for flavouring vinegar.

Tarragona: 1. Sp. prov., in Catalonia (q.v.), with a coast-line on the Mediterranean. It is mountainous, and has a temperate coastal plain containing the mouth of the Ebro (q.v.). There is much forest, and the valleys are fertile. Wine, fruit, olive-oil, silk, hemp, and cereals are produced. Copper, lead, silver, limestone, and marble are found. Area 2506 sq. m.; pop. 361,400.

2. (anc. *Tarraco*) Sp. city, cap. of the prov. of T., on the Mediterranean coast at the mouth of the Francolí. Already anc., in Rom. times it became the cap. of Hither Spain, *Hispania Tarraconensis* (see SPAIN, History). The Visigoths sacked it in 467, and the Moors in 714. Alfonso I (q.v.) of Aragón took it from the Moors in 1120. In 1811 it was sacked by the French, and later in the cent. the town was replanned. The older part of T. stands on a high rock and has remarkable walls, portions of which date back to about the 6th cent. BC. The Romanesque and Gothic archiepiscopal cathedral stands on the site of a temple of Jupiter. In the town and in its vicinity are numerous Rom. remains, including an amphitheatre and an aqueduct; in some cases the remains of Rom. buildings have been incorporated into more modern structures. The port of T. has a coasting trade in the produce of the Ebro valley. Chartreuse liqueur is made, and T. wine is well known. Pop. 39,700.

Tarrasa, Sp. town in the prov. of Barcelona. It is an important industrial centre, with cotton and woollen mills, and has a trade in agric. produce, oil, and wine. Pop. 46,000.

Tarrytown, vil. of New York in Westchester co., on the Hudson R. 25 m. N. of New York City. It is famed as the 'Sleepy Hollow' of Washington Irving's story; he lies buried here, and his home is near by. T. is the seat of Marymount College for Women. It manufs. clothing and wood products, and automobile assembling is also carried out. Pop. 8851.

Tarshish, in biblical geography, a far-distant locality, rich in silver, iron, tin, and lead (Ezek. xxvii. 12). The largest ships of those days were called 'ships of Tarshish' (Ezek. xxvii. 25). It is commonly identified with the anc. Tartessus, situated in the S. of Spain, which in the 8th and 7th cents. BC was under Phoenician hegemony (see ANDALUCIA). Less probable is the identification of T. with Tarsus (q.v.).

Tarsier (*Tarsius tarsius*), small primate intermediate between lemurs and monkeys, a native of the E. Indies. They are about the size of a small rat, have very large eyes, very long ankle bones, sucker-like disks on the fingers and toes. The T. lives in trees, is nocturnal in habit, and feeds mainly on insects. Its skull closely resembles the ape type.

Tarsipes Rostratus, the Noolbenger or Honey-mouse, a tiny marsupial, native of W. Australia. It is arboreal in habit, and feeds on insects and honey, the latter being extracted from flowers by the long extensible tongue.

Tarsus, city of Cilicia in Asia Minor, near the R. Cydnus, about 20 m. WSW. of Adana. It was the bp. of St Paul.

Tartaglia, Niccolo (c. 1500-57), It. scientist and mathematician, b. Brescia. He was mainly interested in the scientific and mathematical problems of gunnery and the art of warfare, particularly in projectiles. In 1521 he was a teacher of mathematics in Verona, and discovered a method of solving certain cubic equations, for which Cardan (q.v.) unjustly got the credit. His chief works are *Nova Scientia*, 1537, on the theory and practice of gunnery, and *Trattato generale di Numero e Misura*, 1556, 1560, dealing with arithmetic, algebra as far as quadratic equations, geometry, and mensuration. He pub. the first It. trans. of Euclid and the earliest version of some of the prin. works of Archimedes, 1543.

Tartan (from Fr. *tiretaine*, a linsey-woolsey cloth). The word has come to mean the distinctive woollen cloth in which coloured threads are woven into both weft and warp at intervals to give a checkered or cross-striped effect, some patterns being so closely associated with certain highland Scottish families or clans as to be regarded as their exclusive property. In this modern sense T.s probably date from the upsurge of nationalism which eventually led to the Scottish rebellion of 1745, after the failure of which they were proscribed for 35 years. The rescinding of the proscription led to a new enthusiasm for T.s, but speaking generally new sets of designs were adopted by the qualifying families which did not correspond to those appearing in earlier family portraits. In recent years many scraps of older T.s have been carefully collected by scholars, and some of these are being again called into use. The use of T.s of different patterns or sets as a clan or family distinction is a feature of the great Scottish social system of clan-ship in which the essential link is a theory of kinship between the chief and the people of the clan, though in large clans subdivisions into chieftains and septa have arisen for historical reasons.

The theory that distinctive clan or family T.s date from a period earlier than the 17th cent. cannot be supported by evidence. The use of checkered and striped cloths by primitive peoples is natural: the wool of the black sheep woven in a pattern of stripes or squares into the wool of the white sheep is the simplest form of decorative weaving, and it is this effect that is known as 'shepherd's plaid.' In the later Middle Ages cheap striped woollen cloth, which had been imported from N. Africa and was the usual wear of Carmelite monks, was forbidden by the Pope because by that time it brought ridicule on the order. This cloth has remained a part of the general wear of the Arab peoples. Striped materials have often formed a part of European fashion, but it is only in Scotland that the systematic weaving of checkered cloths has taken on a special significance, and from surviving pieces it can be seen that the earliest T.s were

often very elaborate in the arrangement of their colours. They were also, since only vegetable dyes were used, quite different in colour from modern T.s, though not necessarily less bright. Some families and clans have more than one T., a separate design being used, for instance, as a 'hunting' T. At the end of the 18th cent. certain 'loyal' regiments having Scottish associations were ordered to adopt their own regimental T.s from which kilts or trews (q.v.) and plaids were made. See also HIGHLAND DRESS.

Tartar Emetic, or **Potassium Antimonyl Tartrate** ($C_4H_4O_6K(SbO) + 4H_2O$), prepared by boiling potassium hydrogen tartrate with antimonious oxide and water. It is readily soluble in water, and is used in dyeing as a mordant and in medicine as an emetic. In the form of intravenous injections it is highly effective in the treatment of a number of tropical diseases due to animal parasites such as filariasis (q.v.) and schistosomiasis (q.v.).

Tartaric Acid, or **Dihydroxysuccinic Acid** ($C_4H_4O_6$), commonly occurring vegetable acid, contained in grapes and other fruits. During the later stages of the fermentation of grape-juice, impure potassium hydrogen tartrate or argol is deposited. From this salt the commercial acid is prepared. The crude argol is partially purified by recrystallisation from hot water, and it is then boiled in solution with chalk. Calcium tartrate is deposited, and the T. A. is set free from this by treating with dilute sulphuric acid. The acid forms large transparent crystals, is readily soluble in water and alcohol, but insoluble in ether (melting point 167° C.). Like other dicarboxylic acids, it forms both hydrogen and normal salts. The acid salt is known as 'cream of tartar' and the potassium sodium salt as 'Rochelle salt.' T. A. is used in the preparation of effervescing drinks and in baking powders. There are 4 optical isomers of the acid, viz. dextro-tartaric, laeo-tartaric, meso-tartaric (inactive), and racemic acid (inactive).

Tartars, see **TATARS**.

Tartarus: 1. Son of Aether and Gaea, and, by his mother, father of the giants Typhoeus and Echidna.

2. In Homer, a place of punishment reserved for the rebel Titans, as far below Hades as heaven is above the earth. Later poets use the name as synonymous with Hades.

Tartini, Giuseppe (1692-1770). It. composer and violinist, b. Pirano. Having clandestinely married the niece of the Archbishop of Padua, he had to flee to Assisi but eventually returned to Padua. In 1728 he started a violin school of European fame. His compositions for violin comprise about 150 sonatas, 50 trios, and about 140 concertos. T. made sev. improvements in the technique and construction of the bow.

Tartu (Russian Yur'yev 1030-1224 and 1893-1913, Derpt before 1893; German Dorpat), tn and chief cultural centre of the Estonian Rep., 100 m. SE. of Tallinn. It has varied industries. There is a univ. founded 1632 by Gustavus Adolphus of

Sweden, closed in 1710, and re-opened in 1802 by Alexander I; the language of instruction was German till 1895, Russian till 1918, and has been Estonian since), a univ. library (1802, largest in the Baltic reps.), a botanical garden (1803), and an observatory (1809). Pop. (1956) 70,400. T. was founded by the Russians in 1030 on the site of the Estonian village of Tarpatu, and belonged variously to the Livonian Order, Moscow, Poland, and Sweden; it was Russian from 1704, and occupied by the Germans in 1918 and 1941-4. The peace treaties were signed here by Soviet Russia with Estonia and Finland in 1920. It was the cap. of T. Oblast within the Estonian Rep. 1952-3 (abolished).

Tarudant, the cap. of the prov. of Sus, Morocco, about 125 m. SW. of Morocco, and between the R. Sus and the Atlas Mts. It is an important caravan centre. The chief minerals are copper, iron, and silver, while copper goods are manufactured, and dyeing and tanning carried on. Pop. 8793.

Tarvisium, see **TREVISIO**.

Tascher de la Pagerie, Joséphine, see **JOSÉPHINE, MARIE ROSE**.

Tashauz: 1. Oblast (prov.) of the Turkmen S.S.R. of the Soviet Union. The N. section is drained by arms of the Amu-Darya; S. is mainly desert. Cotton is grown in irrigated areas. Pop. 265,000.

2. Cap. of the above on a trib. of the Amu-Darya, 40 m. NW. of Khiva. Pop. 70,000.

Tashi, or **Tesho**, **Lama**, see under **LAMA-ISM**.

Tashkent: 1. Oblast (prov.) of the Uzbek S.S.R., with the Kazakh S.S.R. to the N., the Kirghiz S.S.R. to the NE., and the Tadzhik S.S.R. to the E. and S. Cotton and fruit are extensively cultivated, and the oblast contains sev. important industrial centres, including Angren (coal), Begovat (steel), and Chirohik. Pop. 1,350,000.

2. Cap. of the Uzbek S.S.R., the largest city and the cultural and economic centre of Central Asia, on a trib. of the Syr-Darya, 160 m. N. of Samarkand. T. was taken by the Chinese in AD 659. It is divided into 2, the native oriental and the modern Russian, and is well built, with large public edifices. It contains many mosques and old houses built of sun-baked bricks. The streets are lined with the shops of carpet weavers, metal workers, and potters. In the newer quarter of the tn there are flour mills, leather, food, and fruit-preserving factories, and textile mills, surrounded by broad streets and modern flats and bungalows. A univ. was estab. in 1919. The trade of the city is important; the chief manufs., besides those mentioned, include nitrogenous fertilisers, cotton and silk, and textile machinery. It is an important centre of coal production, notably from the mines at Angren. Non-ferrous metals are mined at Kara Mazar and Amalyk near by. It is connected with the main Russian railways at Chkalov and with Novosibirsk and Alma Ata by the Turksib line. It is also

served by air lines to Moscow and elsewhere. Pop. 600,000.

Tashkurghan, the chief place in the dist. of Khulm, Afghan Turkestan, 4 m. S. of the ruined tn of Khulm. It is an important trading centre. Pop. 50,000.

Tashmetum, see NABU.

Tasman, Abel Janszoon (1603-59), Dutch navigator and explorer, b. Lutjegast. After journeys in China and India, he was sent by the Dutch East India Company to investigate the extent of Australia. He discovered Van Diemen's Land, later renamed Tasmania, in 1642, and also New Zealand, the Fiji and Friendly Is., and the Gulf of Carpentaria. His jour. appeared in an Eng. ed. in 1898.

Tasman Glacier, in the S. regions of the S. Is. of New Zealand, discovered in 1862 by Julius von Haast. It has a total area of just over 20 sq. m.

Tasman Sea, name given to the Pacific waters which lie between New Zealand and Australia and Tasmania.

Tasmania, one of the 6 states of the Commonwealth of Australia, an is. separated from Victoria by the Bass Strait, which is about 140 m. wide. It lies between the parallels of 40° 40' and 43° 38' S. lat., and 144° 30' and 148° 30' E. long. A little smaller than Scotland, it is the smallest of all the Australian states as well as the most temperate and pleasant. The N. coast forms a concave curve flanked by the is. groups of Furneaux (E.) and the Hunter and King Is. (W.). The N. and W. coasts are not greatly indented, but have some good harbours. The E. coast is much more indented, whilst the S. and SE. coasts are formed of a series of curiously shaped peninsulas. Area, including dependent is., 26,215 sq. m.; pop. 340,000.

Physical Features. It is conjectured that T. was once part of the mainland, the is. in the strait being, it is supposed, part of a mt range that connected the 2 lands. T. is a beautiful, well-watered is., rich in harbours and inlets, crossed by high mt chains, full of crags, glens, and ravines of bold appearance, the basaltic cliffs of some being sev. hundred ft in height. On the coast there are good anchorages, and many excellent harbours.

The prin. is. belonging to T. are over 50 in number: the Furneaux group, at the E. end of Bass Strait, and off the NE. corner of T., including Flinders Is., with an area of 800 sq. m.; Cape Barren Is., 170 sq. m., and Clarke Is., 30 sq. m.; besides these are Chappell Is. and Kent's Group, aggregating about 40 sq. m. On these is. live a number of so-called half-castes, descended from the offspring of sealers and native women. Strictly, however, they are of mixed and almost untraceable ancestry.

T. has 2 mt chains, separated by the central dist., through which is the communication between the N. and S. of the is. That to the E., or the dividing range, has an average height of 3750 ft, and runs nearly N. and S., parallel with the E. coast. Among the peaks are Row Tor, or Mt Arthur, 3895 ft; Mt Barrow, 4664 ft; Mt Victoria, 3964 ft; Ben Nevis, 3910 ft; and Ben Lomond 5160 ft. The

W. chain is an elevated table-land, averaging 3000 ft in height, in the centre of the is., which contains all the large lakes and from which branch many ranges in all directions except eastward. From this table-land spring the peaks, Table Mt, 3582 ft; Barr Bluff, 5114 ft; Mt Field West, 4721 ft; Cradle Mt, 5060 ft; and a number of others over 4000 ft. In the S. is Mt Wellington (4166 ft), at the foot of which is Hobart.

English Electric Co. Ltd.

HYDRO-ELECTRIC POWER

One of the three 21,000-h.p. double-runner twin-jet impulse turbines and generators in Tarraleah power station, Tasmania

The is. is well watered, and abounds in rivs., rivulets, and creeks, many of them rising from the lakes of the table-land, the average fall to the sea being estimated at 93 ft per m. The prin. rivs. are the Derwent, about 130 m. long (on the estuary of which is Hobart, with a deep and sheltered harbour accommodating the largest vessels afloat), which issues from Lake St. Clair, receiving in its course the R.s Nive, Dee, and Jordan from the N., and the Florentine and Russell from the S.; the Huon, about 100 m. in length, issuing from Lake Edgar; along the riv.'s shores the great apple orchards of the state are situated, and it receives the Cracroft and Picton from the S., and the Weld and Russell from the N., and falls into D'Entrecasteaux Channel; the Coal R., rising in the E. chain of mts, and running S. into Pittwater. The mouths of these 3 rivs. are in the SE. of T. To the SW. and W. are the Davey R., the Spring, the Gordon, with tribs. the Wedge, Denison, Serpentine, and Franklin R.s, falling into Macquarie Harbour; King R., with its tribs. the Queen and Eden, also falling into Macquarie Harbour; the Pieman R., consisting of the R.s Mackintosh, Murchison, Huskisson, and Donaldson; and the Arthur R.—these 2 last falling into the S. Ocean. On the N., flowing into Bass Strait, are the Montagu, the Duck, the Inglis, the Morsey, and the Tamar (the last-named being

navigable up to Launceston by inter-state steamers, or 40 m. from its mouth). The R. Gordon and King R. on the W. coast are of remarkable beauty. To the NE. are the Piper, Little Forester, and Trent, rising in the W. slopes of Mt Victoria and debouching into Ringarooma Bay. Flowing to the E. are the Anson, emptying into Anson Bay, the George, into George's Bay, Scamander, and Swan.

The W. coast of T. is bold, rocky, and inhospitable, but there are sev. accessible ports. The chief harbours are: on the W. coast, Port Davey (formerly much frequented by whaling vessels), Pieman R., and Macquarie Harbour; on the N. coast, Stanley, at Circular Head, Emu Bay, and Port Frederick, at the mouth of the Mersey; on the E. coast, George's Bay, Oyster Bay, Prosser Bay, Spring Bay, and Fortescue Bay. The S. and SE. of the is. is studded with safe bays and harbours, the prin. being Port Arthur, Storm Bay, Norfolk Bay, Frederick Henry Bay, D'Entrecasteaux Channel, Port Esperance, and Southport.

There are numerous extensive freshwater lakes on the elevated table-lands, the largest being the Great Lake, in the co. of Westmorland (3822 ft above sea-level), covering an area of upwards of 40 sq. m.; Lake Sorell, in the co. of Somerset, about 20 sq. m.; Lake St Clair; Arthur Lake; and Lake Echo. These lakes form the head-waters of the prin. streams flowing S., W., and N.

In physical characteristics the surface of T. is uneven, being a succession of hills and valleys of varying height and depth, and peaks and glens, and it presents a pleasing variety of scenery, with snow-capped mts, glassy lakes, wild shores, green valleys, and extensive sheeplands, studded with neat homesteads, and subdivided into fields and highly cultivated gardens and orchards. T. is very popular as a holiday resort.

Climate and Rainfall. In climate and rainfall T. is suggestive of England, though warmer and sunnier. Hot winds are almost unknown, and the summer heat is tempered by sea breezes and mt air. The average temp. of Hobart in the hottest month is 61.1° F. The winter is cold enough to produce thin ice in the lowlands and snow in the mts and plateaux. The average temp. in the coldest month is 46.5° F. The mean temp. for the year is 53.9° F. The average rainfall of T. is about 29.6 in., but there is much variation in different dists., rainfall in the W. sometimes reaching to 170 in. per year.

Geology. The great mt range that traverses nearly the whole of the central part of T. is of trap, or greenstone, formation, and its upheaval has burst through the more recent rocks of sandstone, clay-slate, and limestone that once overlaid it. The rocks on the E. and SW. coasts are respectively granite and quartz, associated with vast quantities of micaceous rocks. In the NE. portion of the is., granite and metamorphic rocks exist in large masses, and in still larger quantities all over the SW. corner. Mt Wellington consists mainly of massive

greenstone. Volcanic action in parts of the is. is strongly marked, and igneous and volcanic rocks are prevalent.

Flora. Mt slopes are covered with big timber: eucalyptus, King William pines, with girths up to 30 ft, Huon pines, white flowering myrtles rising to 150 ft, blackwood, and acacia (100 ft); shrubs include oleander, tea-tree, green fuchsias, and crimson waratah.

Fauna. The fauna in general is that of Australia, but there are sev. species peculiar to the is.—the T. devil (*Sarcophilus ursinus*) and the tiger (or striped) wolf, which, on account of the damage it wrought to sheep, is now extinct. Among other larger indigenous animals are the native hyaena (*Thylacinus cynocephalus*), wombat (*Phascolomys ursinus*), platypus, and, among smaller, the bandicoot and native cat. The majority of these are nocturnal in their habits. Among reptiles are snakes (tiger, copperhead, and whip), lizards, and iguanas. Among land birds are cockatoos, jays, whitehaws, eagles (*Aquila audax*), sparrowhawks, owls, moreporks, paroquets, diamond birds, blue wrens, firetails, and many others. Among those of the lakes and sea-coast are black swans, snipe, herons, bitterns, petrels, cormorants or shags, etc. The sheltered bays abound in fish: trumpeter, perch, rock-cod, flathead, whiting, colonial salmon. The prin. fresh-water fish are the eel, blackfish, and trout.

Production, Manufactures, etc. The vegetation of T. is practically identical with that of Australia; the eucalyptus is the most predominant feature. Of the 16,778,000 ac. comprised in the state, over 10,000,000 ac., mostly mt land, are inalienated, of this area some 2,072,000 ac. being leased. The chief farm crops are wheat, oats, peas, turnips, potatoes, hay, and apples. Cereals of all kinds and root crops thrive in most parts of the is., the soil of decomposed basalt situated in the NW. and NE. being especially fertile. Hops grow well in the S. and the Tasmanian fruits—particularly apples—are well known. Apple production exceeds 5,000,000 bushels. Potatoes and mixed farming are accountable for much of the prosperity of the state. Wool production has reached an ann. value of over \$6 m.; butter production was over 10,214 tons in 1955-6 and cheese over 292 tons. The chief minerals are copper, tin, silver, lead, zinc, gold, coal, and osmiridium. The total value of mineral output in 1955 was over \$8,950,000. A rich copper-mining industry exists at Queenstown on the W. coast, that part of the is. being the chief source of minerals. Forestry is a great feature of T. The chief timber is the hardwood variety (eucalyptus), and the chief export timbers are the stringy-bark and blackwood, the former being used for bridges, railway sleepers, etc., and the latter for furniture and cabinet work. Other woods are Huon, celery-top, and King William—all species of pine. Industries include woollen mills, jam and fruit-preserving factories, butter and cheese factories, tanneries, bricks and pottery, saw-mills, joinery and furniture,

engineering, railway works, flour mills, boot and shoe factories, printing, and paper-pulp making. In 1955-6 exports were valued at £A80,003,308, the prin. items being butter and cheese, fruit, preserves, copper, peas, potatoes, wool and woollen manufs., zinc, timber, and hides and skins. Imports were valued at £A72,829,000. The 2 important export industries are metal extraction and fruit preserving. Cheap electric power is a strong factor in the prosperous industrial hist. of the state, the Great Lake being a chief source. The chief tns and centres are linked up with the railway system, which comprises 800 m. of track (614 being state-owned). Chief tns: Hobart (cap. city) (pop. 58,300; with suburbs, 97,440), Launceston (with suburbs, 50,690), Devonport (12,200), Burnie (11,200), Deloraine, Latrobe, Lilydale, Scottsdale, Oatlands, Ross, New Norfolk, Geevestown, Sorrell. There is a univ. of T., estab. in 1890. Most of the primary teaching is at state schools. Secondary education is about equally divided between state high schools and the older endowed schools. There are also sev. technical schools. There are a supreme court, courts of petty sessions, and general sessions.

History and Government. T. was originally called Van Diemen's Land and was discovered by Tasman on 24 Nov. 1642. In 1777 it was visited by Cook, who thought it formed part of the mainland. Lt. Wm Bligh planted Eng. fruit trees at Adventure Bay on 17 Aug. 1788, on the outward voyage of the *Bounty* to Pitcairn Is. It was proved an is. by circumnavigation by Bass and Flinders in 1798. Other notable explorers who visited the is. were Du Fresnoe (1772), Furneaux (1775), D'Entrecasteaux (1792-3), and Hayes (1794). The earliest settlement, mostly of convicts, was estab. under Lt. Bowen at Risdon, on the R. Derwent, by Governor King of New S. Wales, in 1803. In 1804 another expedition reached Port Dalrymple (Tamar Is.) and formed a settlement at George Town. The is. was used as a penal settlement, and increasing numbers of convicts were sent there after transportation to Australia had ended. The system ceased in 1853. In 1825 the is., which had previously formed part of New S. Wales, was proclaimed a separate colony, and in 1856 the name of Van Diemen's Land was changed to T. and responsible gov. granted. In 1901 T. united with the states of the mainland in establishing the Commonwealth of Australia. Parliament is bicameral: the House of Assembly (30 members), which is elected by adult suffrage by proportional representation by single-member votes in 6-member constituencies, and the Legislative Council (19 members), with limited adult suffrage. The queen is directly represented by the governor, who presides over the Executive Council. T. elects 5 members of the Commonwealth Lower House and 6 of the Upper House.

Aborigines. These numbered in 1803 about 2000, but the pure aboriginal is now wholly extinct. The Brit. treatment of

them was cruel, the prin. offenders being bush-rangers and the lower type of convict stockmen; and for the first 30 years after the settlement a constant war was waged between native and settler. Finally, about 1840, some attempts were made to preserve them on reservations on Flinders Is. in Bass Strait. But their mortality rate was so high that by 1847, when they were removed to Oyster Bay, near Hobart, fewer than 50 remained. Wm Lanne, the last full-blood male, died in Hobart Hospital in 1869.

See H. L. Roth, *The Aborigines of Tasmania* (2nd ed.), 1914; J. B. Walker, *Early Tasmania*, 1914; G. Wittram, *Western Tasmania*, 1914; R. W. Giblin, *The Early History of Tasmania*, 1928-39; State Development Board, *Tasmania: its People and Possibilities*, 1929; G. L. Wood, *The Tasmanian Environment* (2nd ed.), 1930; C. Barrett, *Isle of Mountains*, 1948; *Tasmanian Almanack* (ann. pub.).

Tass (Russian abbreviation for Telegraphic Agency of the Soviet Union), official Soviet Russian news agency attached to the U.S.S.R. Council of Ministers. It was estab. in 1925. T. is the only agency in the U.S.S.R. for both internal and foreign news, and in its work it is subordinated to the Propaganda Dept of the Central Committee of the Communist Party of the Soviet Union (q.v.).

Tassie, James (1735-99), gem-engraver and modeller, b. Pollokshaws. With Henry Quin, T. invented the 'white enamel composition' which he used for his medallion portraits and reproduction of gems. The *Descriptive Catalogue*, 1791, of Raspe enumerates 16,000 pieces from his hands, but before his death this had reached 20,000. His nephew, William Tassie (1777-1860), was also an engraver and modeller.

Tassigny, Jean de Latre de, see LATRE. *Tasso*, Bernardo (1493-1569), b. Venice; a poet of high contemporary standing, now remembered as the father of Torquato T. (q.v.). Technically skilful, his poetry was marred by exaggeration and bombast, imitating Petrarch and Ariosto. Educ. at Padua, he became secretary to Prince Sanseverino of Salerno. His works, mostly published posthumously, include *Amadigi*, 1560, *Floridante*, 1587, and *Rime* (ed. Serassi), 1749.

Tasso, Torquato (1544-95), It. poet, son of Bernardo T., b. Sorrento. In 1560 he was sent to Padua to study law, but, influenced by the literary environments of his early years at Rome and Venice, he devoted himself to literature and philosophy. In 1562 he produced *Rinaldo*, a romantic poem dedicated to Cardinal Luigi d'Este, who later became his patron. In 1572 he entered the service of Duke Alfonso at Ferrara. For the court theatre he wrote his pastoral play *Amita*, 1573. It was in 1570 that he first manifested signs of mental derangement, but he escaped from his first confinement to Ferrara, wandered through the chief cities of Italy and, in 1579, again returned to the court of the Duke of Ferrara; but the duke received him coldly and T., wounded by some real or fancied insult, buried

denunciations at the whole ducal household, with the result that he was confined from 1578 to 1586 by the duke as insane. During his confinement he produced much admirable verse, a number of philosophical dialogues, and an *Apologia for La Gerusalemme Liberata*, which had been pub. without his consent and with many errors. The grotesque contrast between his fate and the rising fame of his masterpiece had roused public interest in him, and consequently he was released in 1586 on the intervention of Prince Vincenzo Gonzaga. *La Gerusalemme Liberata* had been completed in 1575 and submitted to sev. critics, and on his release T. went to Mantua as the protégé of Prince Gonzaga, and here he rewrote his great epic in accordance with his critics' suggestions. The result, *La Gerusalemme Conquistata*, 1592, was a pedantic effusion, in which he expurgated the fine passages of paganism and chivalry of the original ed. on which his fame ultimately rested, e.g. those relating to the characters Erminia, Clorinda, and Armida, and which made the *Gerusalemme Liberata* for long the most popular work in It. literature.

Broken in health, he resumed his old restless wanderings, spending, however, much of these later years between Naples and Rome, helped and protected by many friends and patrons. In 1595 he was summoned by the Pope to be crowned poet laureate, but he died on his arrival in Rome at the convent of Sant' Onofrio, without receiving the honour. T.'s poetry was an attempt to reconcile classic form (e.g. the Virgilian epic in *Rinaldo*) with a deeper note of personal sentiment. His *Gerusalemme*, an idealisation of the first crusade, is a typical literary product of his age, its unquestioning acceptance of classic forms in marked conflict with newly revived theological interests. His other works include a comedy, *Gli Intrighi d' Amore*; a tragedy, *Torrismondo*; *Discorsi*, elucidating his attitude to his own poetry; and religious poems. His *Opere* were ed. by Rosini in 33 vols., 1821-32. The earliest complete ed. of the *Gerusalemme* is that of Bonna, 1581; A. Solerti's, 1895-9, is also reliable. See W. Boulting, *Tasso and his Times*, 1907; C. Previtera, *La poesia e l'arte di T. Tasso*, 1936; E. Donadoni, *T. Tasso saggio critico*, 1946; G. Getto, *Interpretazione del Tasso*, 1951.

Tassoni, Alessandro (1565-1635), It. poet, b. Modena. He was employed in sev. diplomatic missions (1599-1608), and was later in the service of the Duke of Savoy. His prin. works are *La Secchia Rapita*, 1622, (Eng. trans. 'The Rape of the Bucket', 1715, 1918), a burlesque epic, *Considerazioni sopra il Petrarca*, 1609, and *Pensieri Diversi*, 1612. See life by G. Bertoni, 1935.

Taste, in physiology, sensation caused by the application of certain substances in solution to organs known as taste buds situated on the tongue, and to a lesser degree on the soft palate, the uvula, and adjacent structures. Four T.'s are usually identified—sweet, bitter, acid, and saline. All the other delicately differentiated

sensations usually referred to the sense of T. are really smell sensations.

Tata, Yamsatji Nasarwanji (1839-1904), Parsi merchant and philanthropist, b. Nosari in Baroda. He introduced a silk industry after Jap. methods into Mysore, and endowed a research institute at Bangalore. His son Sir Dorabji Yamsatji T. (1859-1932) discovered iron ore in Orissa, estab. an iron and steel works at Jamshedpur, and developed hydro-electric power in the W. Ghats. He made large charitable donations.

Tata, see TATABANYA.

Tatabánya, tn of N. Hungary, cap. of the co. of Komárom, 30 m. W. of Budapest (q.v.). It is an important modern lignite-mining centre. During the anti-Russian upheavals of Oct.-Nov. 1956 the colliers of T. went on strike. At the neighbouring spa of Tata there is a fine Esterházy (q.v.) mansion. Pop. 47,000.

Tatanagar, the site of the steelworks at Jamshedpur (q.v.).

Tatar Autonomous Republic, formed in 1920, lies in the E. of European Russia, occupying a lowland area traversed by the middle Volga and lower Kama. There are extensive oil deposits (see VOLGA-URALS OIL AREA) and large oil (since 1940's), engineering, chemical, woodworking, and fur industries. Grain, sunflowers, and potatoes are grown, and horticulture (apples) and dairy farming practised. The prin. tns are Kazan' (cap.), Chistopol', Bugul'ma. For its early hist. see VOLGA BULGARIANS. Area 26,100 sq. m.; pop. (1956) 2,800,000, mostly Tatars and Russians (since 16th cent.).

Tatars (often, but wrongly, written as Tartars), peoples of mixed ethnic, linguistic, and cultural origin, nowadays speaking Turki languages, professing the Islamic religion with Shamanist influences, and dispersed over the steppes of E. European Russia, Central Asia, and Siberia. The meaning of the term T. is unknown. The word T. appears in the Orkhon inscriptions (q.v.) of the 8th cent. AD, and in later Chinese and Arabic sources, and refers to peoples speaking Mongolian languages and inhabiting the border regions of China, the ter. of present Mongolia and some neighbouring dists. It was later applied to Mongols of Genghis Khan, and particularly to Turki peoples, such as Bulgars, Qipchaks, Turkomans, and others, who preceded and followed the Mongolian invasion of Europe. From the 14th cent. the name Tatars was applied in W. European languages to a vast ter. (corresponding partly to S. Russia and Central Asia) inhabited by T. **Tatars**, see TATARS.

Tate, Frank (1863-1939), Australian educationalist, b. Castlemeane, Victoria; educ. the Model School, Melbourne, and the Melbourne Univ. After teaching in Victorian schools and lecturing at the training college, T. was appointed prin. of the teachers' training college, 1899, and in 1902 became first director of education in Victoria. Later he went overseas to study educational problems in Europe and the U.S.A. He was largely responsible for the Education Act, 1910, and

became chairman of the committee of public education appointed under the Act. T. strove to improve training and remuneration of teachers, to encourage the community's interest in education, and to introduce better methods of instruction. The increased number of students and the improvement in education, particularly secondary education, indicate his contribution to the Australian educational system.

Tate, Sir Henry (1819-99), merchant and art patron, *b.* Chorley, Lancs. He was a sugar merchant, and patented machinery for making sugar cubes. His firm of Henry Tate & Sons later became Tate & Lyle. He was instrumental in founding the Tate Gallery (q.v.) in 1897, and was created baronet in 1898.

Tate, John Orley Allen (1899-), Amer. poet and critic, *b.* Winchester, Kentucky. Educ. at Vanderbilt Univ., he was on the Eng. staff at the Univ. of North Carolina and at Columbia; then from 1939 to 1942 was Fellow in Creative Writing at Princeton, from 1944 to 1950 Fellow in American Letters of the Library of Congress, and in 1951 became Prof. of Eng. at the Univ. of Minnesota. In 1936 he pub. *Reactionary Essays in Poetry and Ideas*, and in 1941 *Reason in Madness*, which marked him as one of the leading critics of his time. Later essays are *On the Limits of Poetry*, 1948, *The Hovering Fly*, 1949, and *The Forlorn Demon*, 1952. His poetry, which shows the influence of Donne and T. S. Eliot, includes *The Winter Sea*, 1945, and *Poems 1922-1947*, 1948. He also pub. *Stonewall Jackson—The Good Soldier*, 1928, and *Jefferson Davis—His Rise and Fall*, 1929, and a novel, *The Fulmers*, 1938.

Tate, Nahum (1652-1715), poet, *b.* Dublin, son of a clergyman named Faithful Teate. Educ. at Trinity College there, he settled in London in 1672, and in 1677 pub. *Poems on Several Occasions*. He also wrote some indifferent plays, including an adaptation of Shakespeare's *King Lear* which was defended by Dr Johnson and held the stage till well into the 19th cent. In 1682 he wrote, with Dryden's assistance, a second part to that poet's famous satire *Absalom and Achitophel*. In 1692 he was appointed Poet Laureate in succession to Shadwell, as a result of which Pope pilloried him in the *Dunciad*; and in 1702 he was made Historiographer Royal. His chief original poem was *Panacea or a Poem on Tea*, 1700, but he is remembered mainly for the metrical version of the Psalms in which he collaborated with Nicholas Brady (q.v.); pub. in 1696, it gradually superseded the earlier rendering of Sternhold and Hopkins.

Tate Gallery, The, at Millbank, London, S.W.1., contains the national collection of Brit. painting from the 16th cent. to the present day, of modern foreign painting from approximately 1800, and of modern sculpture. The T. G. has unique collections of the work of Turner and Blake, also one of the best collections of the Pre-Raphaelites and the Fr. Impressionists. Sir Henry Tate (q.v.) financed the build-

ing of the gallery on the site of Jeremy Bentham's 'Model' Penitentiary, and it was opened by King Edward VII as Prince of Wales in 1897. This housed the Tate gift of 65 Brit. paintings, the collection purchased under the terms of the Chantry Bequest (q.v.), the Vernon Collection, bequeathed in 1847, and the Watts gift. Sir Henry Tate made possible the addition in 1899, of 8 further galleries, and in 1910, through the generosity of Sir Joseph Duveen senior, the wing to house the Turner bequest of 1856, which had been in the possession of the National Gallery, was opened, while his son, Lord Duveen, gave an immense sculpture hall, opened in 1937. The nucleus of the collection of modern foreign art was estab. by the bequest of Sir Hugh Lane (q.v.) in 1915, and the endowment by Samuel Courtauld (q.v.) in 1923. The T. G.'s collections have been greatly enriched by many other bequests and gifts, and an effort has been made since the war, in spite of limitations of finance and space, to clarify and extend its 2 separate functions as the National Gallery of Modern Art and National Gallery of British Art (see official report on the Gallery's Function, 1946, and the trustees' report, 1954). During the Second World War the gallery was severely damaged, but repairs were carried out; the T. G. was partly reopened in 1948 and by 1949 all repairs had been completed. A series of important exhibitions have been held since 1946, including those of the works of Blake, Van Gogh, Chagall, Rouault, Matisse, Hogarth, Gainsborough, Richard Wilson, Alexander Cozens, Monet, Kandinsky, and living artists, e.g. Graham Sutherland (1953) and Sir Matthew Smith (1954).

Tati Concession, gold-mining dist., owned by the Tati Company Ltd., of the British Bechuanaland Protectorate, with an area of 2500 sq. m., which was originally conceded by Lobengula in 1887. It is excellent ranching country. The chief tn is Francis Town.

Tatian (c. 150), Christian apologist, Syrian *b.* in Mesopotamia and Gk-educ., converted to Christianity at Rome and became a disciple of Justin Martyr. He wrote a number of works of which *The Discourse to the Greeks* survives (Migne, *Patrologia Graeca* vi; Otto, *Corpus Apologetarum*, 1867-72). More important, however, was the *Diatessaron*, a harmony of the Four Gospels, written in Greek or in Syriac, of which a Gk fragment was found at Dura-Europos, while an 11th-cent. Arabic version from the Syriac (J. H. Hill ed., 1910), and a Lat. version from the Greek of about 546, numerous anc. quotations, etc., enable us to reconstruct it to some extent. See T. Zahn, *Tatian's Diatessaron*, 1881; G. Bardy, 'Tatien', in *Dictionnaire de Théologie Catholique* (Vacant-Mangenot), Vol. XV, 1946.

Tatius, Achilles, see under **ACHILLES**

TATIUS.

'Tatler', jour. pub. twice weekly in London between April 1707 and Jan. 1711. Sir Richard Steele (q.v.) first pub. this jour., writing for it 'The Lucubrations of

Isaac Bickerstaff.' Addison (q.v.), who discovered the identity of the author at the eighteenth ed., became a contributor thereafter.

'**Tatler and Bystander**,' weekly illustrated jour. pub. in London, estab. in 1840 and incorporating the *Tatler*, 1801, and *Bystander*, 1803. It deals mainly with contemporary events in the social, sporting, and theatrical world.

Tatra Mountains, see under CARPATHIANS.

Tatsienlu, see KANGTING.

Tatta, tn of E. Pakistan, some 60 m. SE. of Karachi on the R. Indus. T. was a great city of the turbulent rulers of Sind until 1740, when with the collapse of the Mogul Empire new Sindh rulers founded new cities, notably Hyderabad. T. is now a small place, but there are impressive remains of its former greatness, including a notable mosque.

Tattersall's, name of the firm estab. in 1766 by Richard Tattersall for the purpose of selling horses by public auction. It transferred from Hyde Park Corner to Knightsbridge Green in 1865. At the present moment T. offices are in Hay Hill, Berkeley Square, W.1, while the Knightsbridge offices are being rebuilt. To-day large bloodstock auctions are held at Park Paddocks, Newmarket, and at Glasgow Paddocks, Doncaster, at fixed times annually.

Tattersall's Committee is in no way related to the above; it is an authority set up to settle all questions relating to bets, wagers, or gaming transactions on horse-racing. It has the power to report defaulters to the Jockey Club. The Jockey Club take no cognisance of any disputes or claims with respect to bets, but if any defaulter is reported to them by T., the defaulter is warned off by the Jockey Club until the report is withdrawn.

Tattershall, small tn of Lincs, England, 8 m. S. of Horncastle. Its first charter was granted in 1201; its famous castle, built in 1440 by Ralph, Lord Cromwell, is one of the finest and earliest examples of E. Anglian brick-work in England. It was restored and bequeathed to the National Trust in 1926 by Lord Curzon. The par. church, formerly a collegiate church, was begun by Ralph, Lord Cromwell, and completed by William of Waynflete. Pop. 600.

Tatting, see CROCHET.

Tattoo (Dutch *tap toe*, literally 'tap shut,' meaning the time of closing public-houses) is the signal, by drum-beat or bugle, for soldiers to return to their quarters at night, just before 'lights out.' The word is also applied to a kind of military pageant consisting of spectacular evolutions with musical accompaniment, performed at night by artificial light. Best known of these is the annual search-light tattoo at Aldershot in June.

Tattooing, custom of marking the skin with incisions which are filled with a colouring matter to produce an indelible stain. T. was practised by Palaeolithic man, and figurines from the SE. European Neolithic cultures have been found which

are covered all over with spiral decorations. Among the Thracians it was a sign of rank. Caesar mentions the painted bodies of the Britons, and the Picts may have received their name from their practice of painting or T. The custom must have been widespread in prehistoric times. In later periods it was used mostly for identifying convicts and slaves. In the Brit. Army, until 1876, the letters B.C. = bad conduct, and D. = deserter, were still tattooed on soldiers. Now in civilised communities it survives only among certain sections of the pop., mostly sailors, as ornament, but it can be used to disguise birth-marks, or even to remove them, a neutral-coloured pigment being injected to obliterate any discoloration of the skin. Its origin lies in the desire to heighten personal attractions or else to make the individual look more terrifying in war. Among primitive peoples it is often part of the initiation ceremonies at the time of puberty. Some peoples tattoo only on the face, others on the back, chest, arms, and thighs also. In Polynesia it has been brought to a fine art. It is done with a sharp bone with the end cut into teeth, which is dipped in a solution of charcoal or cinnabar to produce black or red markings respectively. The tattoo lines follow and accent the features.

Tauber, Richard (1892-1948), Austrian-born Brit. singer and composer, b. Linz. He studied music at Frankfurt-am-Main and Freiburg, and trained as a conductor for about 2 years. In 1913 he made his first appearance as a singer in opera, in Mozart's *Magic Flute*, but later turned to operetta. He appeared in *The Land of Smiles* in London in 1931. He became a Brit. subject in 1940. See life by Diana Napier Tauber, 1949.

Taucha, Ger. tn in the dist. of Leipzig, 6 m. NNE. of Leipzig (q.v.). It was an important tn in the Middle Ages, and has engineering and chemical industries. Pop. 17,000.

Tauchnitz, Christian Bernhard Freiherr von (1816-95), Ger. publisher, nephew of Karl Christoph Traugott T. (q.v.), b. Schleinitz. He founded in 1837 a printing and publishing house in Leipzig, which became more famous than that belonging to the senior branch of the family. He began his library of Brit. and Amer. authors in 1841. This library at one time numbered over 5000 vols. In 1868 he began the collection of Ger. authors, and in 1886 the Student's Tauchnitz eds. appeared. He was ennobled in 1860, and made a Saxon life-peer in 1877.

Tauchnitz, Karl Christoph Traugott (1761-1836), Ger. printer and publisher, b. near Grimma, Saxony; he estab. a printing business in Leipzig in 1796 and a publishing house in 1798. His special pubs. were stereotyped eds. of the Gk and Rom. classics, but he also printed Bibles and dictionaries. His son, *Karl Christian Philipp T.* (1798-1884), carried on the business, and left money for philanthropic purposes.

Tauler, Johann (c. 1300-61), Dominican friar and mystic, b. Strasburg. He came

under the pietistic influence of Master Eckhard of Cologne, and showed the devotional fervour of the 'Rhine mystics' at its purest and most perfect. His *Sermons*, full of mystical devotion and practical piety, were printed at Leipzig in 1498. There is a modern ed. by E. Hugueny and L. A. Corier (Paris), 1928-35. See G. Bouter, *Das Predigerkloster in Basel*, 1233-49, 1935.

Taunton: 1. Municipal bor., markt tn, co. and assize tn of Somerset, England, 30 m. N.E. of Exeter, 45 m. S.W. of Bristol. It is situated in the heart of the fertile valley of T. Deane, and is sheltered on the N. and S. by the Quantock and Blackdown Hills. St Mary Magdalene par. church is a statly Perpendicular 15th-cent. building, noted for its double aisles and monuments and for its fine tower. Other buildings of note are a 12th-13th-cent. lazear house or leper hospital; Priory Barn, sole relic of an important 12th-cent. Augustinian priory; and Gray's Almshouses (1635). T. castle is a Norman and Edwardian building and stands on the site of a Saxon fort. It contains the Great Hall in which Judge Jeffreys held his 'Bloody Assize.' Part of the municipal buildings originally housed the 16th-cent. grammar school, now known as King's College. T. is an agric. centre. Manufs. include shirts, collars, and other textiles; leather goods; gloves; aeronautical instruments; agric., mining, and other machinery; and older. It is the seat of a suffragan bishop. T. existed in Saxon times, and had a mrkt before the Conquest, receiving its first charter in the reign of Stephen, though its last charter of incorporation was not granted until 1877. During the Civil war T. was held for Parliament, and later in the same cent. it witnessed the proclamation of Monmouth as king, and the brutalities of Judge Jeffreys and Kirke's 'lambes' (it was from the signboard of the White Hart Inn, now a shop, that Col. Kirke hanged Monmouth's rebels). The bor. is part of a co. constituency which returns 1 member to Parliament. Pop. 34,660.

2. City of Massachusetts, U.S.A., in Bristol co., of which it is the co. seat. It manufs. cotton goods, machinery, textiles, stoves, machine parts, oilcloth, pottery, and plastics. It is about 30 m. from Boston. Pop. 40,109.

Taunus, range of hills in the *Land of Hessen* (q.v.), German, lying between the Rhine, Main, Lahn (qq.v.), and Wetter. The slopes are well forested, are known for their vineyards in the S., and have mineral deposits. There are many spas, including Wiesbaden and Naheim (qq.v.). See NIEDERWALD.

Taunus Mountains, range of hills in the *Land of Hessen* (q.v.) in Germany, lying between the Rs. Rhine, Main, and Lahn (qq.v.). The chief summits are the Grosser Feldberg (2890 ft) and the Kleiner Feldberg (2715 ft.). They are well wooded, and the lower slopes are particularly fertile; the vineyards produce such famous wines as Rudesheimer and Hochheimer. In the N. of the region there are mineral deposits; and there are

well-known spas, including Homburg, Wiesbaden, and Naheim (qq.v.).

Taupo, lake of N. Is., New Zealand, situated in the centre of the Is. The chief riv. flowing out of it is the Waikato, while near its shores are volcanoes. It is a famous trout-fishing centre. Pop. 2842.

Tauranga, tn and harbour of North Is., New Zealand, on the Bay of Plenty. Pop. 9574.

Tauria, medieval name of the Crimea. It is locally used to denote also the adjacent part of the mainland bordered in the N. by the lower Dnieper, a steppe lowland, rich agric. region belonging to Kherson and Zaporozh'ye Oblasts. See also ASKANIA-NOVA.

Taurica Chersonesus, **Tauric Chersonese**, or **Tauric Peninsula**, see CRIMEA.

Taurine (C₂H₅NSO₃), amino ethyl sulphonic acid, a crystalline substance produced in the decomposition of bile.

Tauromenium, see TAORMINA.

Taurunum, see ZEMUN.

Taurus, range of mts in the S. of Asiatic Turkey extending from the R. Euphrates to the Aegean Sea. Portions of the range are known by different names, as Aladagh, Bulgar-Dagh—the height ranging from 800 to over 10,000 ft. In the Anti-Taurus, a N. spur of the T. proper, is Mt Argaeus, the loftiest peak in Asia Minor.

Taurus, or the Bull, second sign of the zodiac (q.v.), which the sun enters on 21 April, contains the 2 well-known clusters, the Pleiades and the Hyades, the former being embedded in nebulous matter. The well-known Crab nebula is also in this constellation, and the bright star Aldebaran (q.v.). Amongst other interesting objects in T. are the stars ε and λ, the former a spectroscopic binary with a period of 138 days and the latter an eclipsing binary like Algol, the period being 3.9 days. Ross studied the Hyades cluster and showed that the motion of its stars was convergent. The average distance from the earth of the stars in this cluster is 120 light-years.

Taus, see DOMAZLICE.

Tautog, or **Black Fish** (*Tautoga onitis*), food fish which occurs off the Atlantic coast of N. America. It averages from 12 to 14 lb. and is much valued in Amer. fish markets.

Tautology (Gk *tauto*, the same, *legein*, to say) is the employing of superfluous words that are in the same grammatical relation, and thus differs from pleonasm (q.v.). Needless iteration is seen in phrases such as 'free, gratis, and for nothing,' 'the shortest and nearest way.' Sometimes, however, what appears to be tautology expresses different shades of meaning, as in Pope's lines:

'Oh happiness! our being's end and aim!
Good, pleasure, ease, content, what-e'er thy name.'

See also FIGURE OF SPEECH.

Tautomerism, or **Dynamic Isomerism**, in chem., the phenomenon exhibited by various substances that appear to have 2 different constitutions. Thus ethyl

acetoacetate in some of its reactions appears to have the constitution $\text{CH}_3\text{CO}\cdot\text{CH}=\text{C}(\text{COOC}_2\text{H}_5)_2$, while in others its behaviour corresponds to the formula

It has been shown that substances exhibiting T. are usually equilibrium mixtures of the 2 tautomeric forms. Both forms of ethyl acetoacetate have been isolated by Knorr.

Tavel, see RHÔNE WINES.

Tavern (Lat. *taberna*, booth, hut, from same root as *table*), house where wines and other excisable liquors are sold and where accommodation is given to travellers or parties. T.s existed in England as early as, if not before, the 13th cent. By an Act of 1284 they were ordered to be closed at curfew. In Edward III's reign 3 only were allowed in London: in 'Chepe', 'Walbrook', and Lombard Street. By Edward VI (1552-3) 40 were allowed in London, 8 in York, 6 in Bristol, 4 each in Cambridge, Canterbury, Chester, Exeter, Gloucester, Hull, Newcastle-on-Tyne, and Norwich; and 3 each in Colchester, Hereford, Ipswich, Lincoln, Oxford, Salisbury, Shrewsbury, Southampton, Westminster, Winchester, and Worcester. Among famous T.s (ancient and modern) are the Chequers Inn, Canterbury (q.v.); the 'Bear and Billet', Chester; the Bull Inn, later called the George Inn (pulled down in 1808), York; the 16th-cent. Maid's Head Hotel, Norwich; the 'Great White Horse', the 'Coach and Horses', and many others, Ipswich (q.v.); the Lion Hotel and the now vanished Talbot Hotel, Shrewsbury; the Old George Hotel mentioned by Pepys, Salisbury; the 'Saracen's Head', Lincoln; the Mermaid Tavern (q.v.), which formerly stood in Cheapside; the Tabard Inn, Southwark, from which Chaucer started his pilgrims; and 'Ye Olde Cheshire Cheese' (or 'Chop House') in Fleet Street, London. For the law of T.s see INNS AND INNKEEPERS; LICENCES AND LICENSING LAW.

Taverner, John (c. 1495-1545), composer, b. Tattershall or Boston, Lincs. In 1528 he vacated a benefice in the collegiate church of Tattershall to become choirmaster at Cardinal College, Oxford (later Christ Church). He was imprisoned for heresy in 1528 and left Oxford about 1530. The rest of his life was spent at Boston, where he d. His works include 8 masses, of which *The Western Wynde* is the best known, though the *Missa sine nomine* is probably finer. He also wrote motets, services, etc. See E. H. Fellowes, *Tudor Church Music: Appendix*, 1948.

Tavernier, Jean Baptiste, Baron d'Aubonne (1605-89), Fr. traveller, b. Paris of Protestant parents, and began his career as a traveller in 1631, when he went to Turkey and Persia. During succeeding years he travelled much in the E., visiting Persia, Syria, and India. Finally he travelled through Batavia, and returned via the Cape. He pub. his famous *Six Voyages* in 1676. See study by Foret, 1886.

Tavilah, see QISEM.

Tavistock, mkt tn and urb. dist. of Devon, England, 15 m. N. of Plymouth, on the R. Tavy. It forms one of the gateways to Dartmoor. It is connected with the Tamar by canal. Known as the 'Gothic Town of the West,' it has sev. fine buildings, chief amongst which are the par. church of St. Eustachius (14th-cent.) and the guildhall. There are also the remains of an abbey, founded in the 10th cent., which was granted to the Russell family at the time of the Dissolution by Henry VIII. Part of this now constitutes a public library. T. is an agric. centre. An annual 'Goose Fair' is held under royal charter granted by Henry I in 1105. T. forms part of a co. constituency. Pop. 6173.

Tavoliere, see FOGGIA.

Tavoy, seaport and cap. of T. dist., Tenasserim, Lower Burma, 30 m. from the mouth of the Tavy R. It is in a rice-producing region, and tin and wolfram are mined. Pop. (tn) 37,700; (dist.) 212,000. Area of dist. 5308 sq. m.

Tavy, riv. of Devon, England, rising on Dartmoor and flowing into the Tamar.

Taw, riv. of Devon, England, rising on Dartmoor and flowing into Bideford Bay. Length 50 m.

Tawe, riv. of Wales rising in the Black Mt. in SW. Breconshire. It flows through Glamorgan and enters the Bristol Channel at Swansea. Length 36 m.

Tawney, Richard Henry (1880—), historian, b. Calcutta, and educ. at Rugby and at Balliol College, Oxford, where he was a fellow from 1918 until 1921. He was prof. of economic hist. at London Univ., 1931-49. T. has been closely connected with the Workers' Education Association, being a member of its executive from 1905 until 1947, and its president from 1928 until 1944. His pub., *Religion and the Rise of Capitalism*, 1926, estab. him as the spokesman of a new school of thought on the growth of modern capitalist society. Other pub. include *The Agrarian Problem in the Sixteenth Century*, 1912, and *Land and Labour in China*, 1931, and *Beatrice Webb*, 1945.

Tax Reserve Certificates, see INCOME TAX.

Taxation, the method of raising the revenue required for public services through compulsory levies.

General Principles of Taxation. There have been 3 schools of thought on the purpose of T. The first was that T. should be designed solely to raise the revenue required by the expenditure authorised in the Budget. The second was that T. should also be used to promote social justice and equality. In Britain, Lloyd George was the first to use T. as an instrument of social reform. The two wars, with the necessity for raising higher revenue and need for 'equality of sacrifice' by the whole pop., left no other choice but to design T. in conformity with the prevailing ideas of social equality. The Second World War especially brought a redistribution of incomes, and through income tax and surtax extinguished very high incomes considered as antisocial. With the increase of public expenditure

(and the consequent need for permanent high T.) the third school emerged. This is that T. should be used as an instrument of general economic policy in order to contribute to general stability (in addition to the traditional means of monetary policy) or to achieve specific aims. Examples are maintenance of high rates of income tax at periods when inflation is threatened and levy of higher rates of purchase tax on goods which would be particularly suitable for exports.

Economists are still discussing the 4 canons set out by Adam Smith on the standards by which the quality of a tax should be judged. These are: (1) equality—the subjects of the State should contribute to the support of the State as nearly as possible according to their ability; (2) certainty, not arbitrariness; (3) convenience of payment; (4) economy of collection.

Classification of Taxation. Taxes can be classified according to a number of different principles, e.g. the tax base (land tax, income tax, etc.), the regularity of levy (income tax to be paid annually, special contribution from capital only once). The distinction between direct and indirect taxes (e.g. between income tax and purchase tax) relates in practice rather to the method of collection than to incidence.

A central problem of the theory of T. is that of *incidence*. If the gov. collects a tax on cigarettes from the manufacturer, the amount of the tax can, to an extent depending on the 'elasticity' of demand, be passed on to the consumer. This *shifting* of the tax may take place from the original payer to someone else either once (e.g. the rates from the landlord to the tenant of a dwelling), or through a whole chain of economic relationships (from the tobacco manufacturer to the wholesaler to the retailer to the consumer). The *incidence* of the tax is on that group which cannot shift it farther. Taxes which are levied on large classes of the pop., e.g. income tax, cannot be shifted.

A further problem is the economic effect of T. Too high profits and income tax may act as a discouragement to enterprise. Too high rates of income tax on wages or a sudden steep rise after a certain amount of income may act as a discouragement to the worker, who does not feel it worth while to work overtime if he has to pay to the State a large part of his additional earnings. The 1955 Royal Commission on T. arrived at the opinion that high tax on the salaries and incomes of professional and business men did not have much effect on their normal activities, although it might affect their willingness to undertake additional work. It admitted, however, that it was too soon to reach a conclusion. The fact that high T. has been accompanied by economic expansion and enterprise in the post-war world is no evidence that it does not deter effort. The post-war generation grew up with certain *habits* of work. There is no certainty that these habits will not change under the impact of high T. At some point the new generation will prefer leisure to highly taxed income which

produces only a few shillings out of each additional pound earned. And the tendency for young people to emigrate suggests that lower T. in other countries exerts a powerful attraction.

Licence revenue obtained as the result of an ann. tax on the right to use a certain commodity (e.g. a wireless receiving set) may be classed as a direct tax, whereas a tax on enjoyment or consumption may be classed as indirect if the impact and incidence fall on different parties. Taxes such as the Brit. entertainment tax imposed in 1916 or the purchase tax on certain articles imposed in 1940 fall in this second class, but there is no distinction in kind between a periodical tax on the continued enjoyment of a commodity while it remains in use and a tax on its enjoyment in the form of a once-for-all tax paid at the time of its purchase. Modern economists therefore make a truer distinction between (1) income and capital taxes on the one hand, and (2) outlay taxes on the other. T. in the first category includes: (1) taxes on net incomes which are progressive as they allow liability to be adjusted in accordance with ability to pay; (2) taxes on profits; and (3) capital taxes, strictly a levy on capital, but estate and succession duties are also included under this head. The second category—outlay taxes—includes taxes on commodities. An outlay tax is a tax on consumption assessed either on the value of the commodity or in the form of a licence. When assessed on the value of the goods the tax is either *ad valorem*, i.e. related to the selling price, or specific, i.e. reckoned in accordance with quantity. Outlay taxes in the U.K. are generally specific in character. The 'property tax' or tax on the ownership of real estate, although allied to income tax, is strictly an outlay tax, and similarly, when assessed on the occupier or tenant in the form of rates, the tax is analogous to the licence for the use of a commodity.

Post-war T. in Britain as a proportion of the national income was higher than in any other W. industrial country. Public expenditure (central and local gov. and national insurance funds) reached 40 per cent of the national product after the war. It fell to some 33 per cent in the middle 1950's mainly because the national product increased.

Taxation of Costs, see COSTS.

Taxation of Land Values, see LAND TAXES.

Taxicab, see CAB; HACKNEY CARRIAGE.

Taxidermy, art of preparing the skins of vertebrate animals so as to give them the

appearance of life and preserve their characteristics as nearly as possible. The art began to be practised in the 16th cent., and the Sloane collection, which formed the nucleus of the natural hist. collection at the Brit. Museum, was made in the early 18th cent. Skinning must be done with great care, as if the skin is flayed off there is great difficulty in restoring its proper proportions. A bird is opened under the wing. If opened on the breast, the bowels may be cut into, and a white breast spoiled. After the body is removed measurements are taken. While the skin is inside-out it is painted with a preservative soap. In making a skin, the head is filled with tow before being turned through the neck, and with this material a false body is then constructed by wrapping the tow round a piece of wire. This is put into the skin, and while drying any irregularity is corrected. 'Setting up' may be done by wiring and filling in with fine wood wool. Another method is to retain the skeleton and, after freeing it from flesh and washing it with carbolic acid, to work over it with tow or clay to produce a shape like that of the body. With larger birds and most mammals an alternative method is to prepare a mould of plaster by arranging the hardened carcase in a suitable attitude. When the mould is dry paper casts are made by pressing a series of layers of paper into the mould, so that when the model is properly mounted and prepared the skin can be drawn over it. After setting up, the specimen is painted over with a solution of 50 grains of bichloride of mercury in a pint of methylated spirit as a protection against the ravages of insects. With the exception of grasses, mosses, and dried leaves, real natural objects should be excluded from the 'mounting,' as they are almost certain to harbour insects. The highest art of the taxidermist falls with fishes, for shrinking and shrivelling of the skin cannot be avoided. A more satisfactory method is to take a cast as soon as possible after capture, and make an exact model in plaster. See J. Rowley, *Taxidermy and Museum Exhibition*, 1925; J. W. Moyer, *Practical Taxidermy, a Working Guide*, 1953; R. Wagstaff and J. H. Fidler, *The Preservation of Natural History Specimens*, Vol. 1, *Invertebrates*, 1955.

Taximeter, instrument for use in a hired vehicle, as a motor cab, for automatically showing the fare due. Grüner of Magdeburg invented the modern T. in 1895. The name 'taxi' for a motor cab is derived from this apparatus. The T. records the fare by a combination of time and distance. It is operated from the gear-box of the vehicle by a flexible cable, and comprises in its essentials a clock-winder, a gear-box, and, attached to the latter, a meter which registers the time and distance. The meter is set in operation by moving a 'flag' bearing the words 'For Hire' from the vertical position (in some meters the 'flag' arm is replaced by a lever, the movement of which sets the meter in operation).

Taxing Master, see **COSTS**.

Taxodium, genus of deciduous coniferous trees. *T. distichum*, the deciduous cypress, is a tall tree often grown in Britain, bearing cones about the size of a walnut; the trunk is usually very thick and the base is often swollen, while knees or hollow protuberances rise from the roots when the tree grows in swampy soil. The timber is of considerable value. Other species include *T. heterophyllum*, the Chinese water pine, and *T. mucronatum*.

Taxonomy, the study or science of classification; the classification of plants and animals into taxa, or groups or categories embodied in the International Codes of Botanical and Zoological Nomenclature. See **CLASSIFICATION**, **PLANT**.

Taxus, see **YEW**.

Tay, riv. and firth of Scotland. It rises on the borders of Argyllshire in the Grampians, and flows first of all in a N.E. direction and then at the confluence of the Tummel in a S.E. direction. It flows through Perthshire and its estuary forms the div. between the cos. of Angus and Fife. Its chief tribs. are the Tummel, the Braan, the Almond, and the Earn. The Earn joins it at its estuary. The total length of the riv., including the firth, is 115 m. It is crossed at Dundee (q.v.) by the famous T. Bridge. Part of the first bridge, opened in 1878, was blown, together with a train passing over it, into the riv. in 1879. The present T. Bridge was completed in 1887. The chief port is Dundee, but the riv. is navigable as far as the tn of Perth. The total area of the T. basin is nearly 2500 sq. m. It is famous as Scotland's most important salmon riv., and is the longest in Scotland.

Tay, Loch, lake (15 m. long and 1 m. wide) of Perthshire, Scotland, one of sev. found in the course of the R. Tay, and not very far from its source before it joins the Tummel. There is good fishing in the loch.

Tayabas, see **QUEZON**.

Taylor, Alan John Percival (1906-), historian, b. Ashton-on-Ribble, and educ. at Bootham School and Oriel College, Oxford. As fellow and tutor in modern hist. at Magdalen College, T. became known for his authoritative studies of Ger. and Austrian 19-cent. constitutional hist. He is known to a wide public through his broadcast and television appearances. His pubs. include *The Habsburg Monarchy, 1815-1918*, 1941, *The Course of German History, 1945*, *The Struggle for Mastery in Europe, 1954*, and *Bismarck*, 1955.

Taylor, Ann, see **TAYLOR, JANE**.

Taylor, Bayard (1825-78), Amer. author, b. Kennett Square, Pennsylvania. He was apprenticed to a printer, but spent much of his life in travel, visiting, among other countries, Mexico, Egypt, India, China, Japan, and Scandinavia, and writing about them in *Views Afoot*, 1846, and *El Dorado*, 1850. He pub. sev. novels, of which the best is *Hannah Thurston*, 1863, and some poems and plays, but his reputation rests mainly on his trans. of Goethe's *Faust*, 1871, one of the best attempts of its kind. See study by R. C. Beatty, 1936.

Taylor, Brook (1685-1731), mathematician, b. Edmonton, Middx., entered St. John's College, Cambridge, in 1701. He became a fellow of the Royal Society in 1712, and its secretary in 1714. In 1716 he went to Paris and had an enthusiastic reception from the Fr. savants. He returned to England in 1717, and resumed his studies, but was forced by declining health to resign his secretaryship in 1718. His *Methodus Incrementorum* and a *Treatise on Linear Perspective* were pub. in 1715. The former contains the proof of his well-known theorem by which any function of a single variable can be expanded in powers of it. See FUNCTION.

Taylor, Sir Henry (1800-86), dramatist, b. Bishop Middleham, Durham. In 1824 he became a clerk in the Colonial Office, where he remained for 48 years. He devoted his leisure to writing, and in 1828 produced a tragedy, *Isaac Commens*, which was a failure. This was followed by *Philip van Artevelde*, 1834, which was a great success. In recognition of his official labours, T. was in 1869 created K.C.M.G. His *Autobiography*, privately printed in 1877, was pub. in 1885. See study by J. B. Bilderbeck, 1887.

Taylor, Jane (1783-1824), and **Taylor, Ann** (1782-1860), poetesses, b. London, daughters of an engraver. In 1804 the 2 sisters collaborated in *Original Poems for Infant Minds*, which went through 50 eds. *Rhymes for the Nursery* followed in 1806, and in 1810 *Hymns for Infant Minds*, which went through 100 eds. Among Ann's most famous pieces are 'My Mother' and 'Meddlesome Matty,' while Jane is best remembered as the author of 'Twinkle, Twinkle, Little Star.' See H. C. Knight, *Life and Letters of Jane Taylor*, 1880.

Taylor, Jeremy (1613-67), divine, b. Cambridge and educ. at Gonville and Caius College, Cambridge, and Univ. College, Oxford. He took holy orders in 1634. His sermons attracted the attention of Laud, who interested himself in T., and sent him to Oxford, where he was elected to a fellowship at All Souls in 1636. He became chaplain to Laud and shortly afterwards was appointed one of the king's chaplains. In 1643 he was made rector of Overstone, and 2 years later was taken prisoner by the Parliamentary forces at Cardigan Castle. He settled at Golden Grove, Carmarthenshire, and wrote his well-known works, *The Liberty of Prophecy*, 1646 (a noble and comprehensive plea for toleration), *The Rule and Exercises of Holy Living*, 1650, and *The Rule and Exercises of Holy Dying*, 1651. His more formal treatises include *An Apology for Authorised and Set Forms of Liturgy*, 1646, *The Worthy Communicant*, 1660, *The Rite of Confirmation*, 1663, and *Ductor Dubitantium, or the Rule of Conscience*, 1660, the subtlest of his works, and intended as a handbook of Christian ethics. After the Restoration he was appointed Bishop of Down and Connor and made vice-chancellor of Dublin Univ., and was also made 'administrator' of the diocese of Down; but his desire for an

Eng. bishopric was never gratified, though his claims for such preferment were uncontested. T. was also appointed a member of the Irish Privy Council. His tenure of the Irish bishopric was apparently unhappy: T.'s strict episcopalianism and extremely High Church views made him unpopular among his clergy and his Irish Protestant congregations. T. was one of the most literary of churchmen, and his books are still regarded as among the masterpieces of theological literature. His prose style had a nobility and passion which invites comparison with that of Bossuet. He was a brilliant scholar of the late Renaissance period, but his writing is distinguished not only by its logic, but by its imagination, purity, and complete sincerity. His works were first collected by Bishop Reginald Heber in 1822, and these were revised by C. P. Eden, 1847-52. The *Poems and Verse Translations* were ed. by A. B. Grosart, 1870. See lives by T. S. Hughes, 1831; E. Gosse, 1904; W. J. Brown, 1925.

Taylor, John (1580-1653), commonly called the 'Water-Poet,' b. Gloucester. He became a waterman and achieved notoriety by a number of eccentric journeys, notably the voyage from London to Queenborough in a paper boat, described in *The Praise of Hempseed*, 1620, and the journey from London to Edinburgh on foot told of in his *Penniless Pilgrimage*, 1618. His *Works* were reprinted by the Spenser Society (1808-78). See R. Southey, *Observations on Uneducated Poets*, 1831.

Taylor, Rachel Annand (1876-), poetess, b. Aberdeen, daughter of J. W. Annand. Educ. at Aberdeen Univ., she married Alexander C. Taylor in 1901. Her first pub. vol., *Poems*, 1904, was followed by *Rose and Vinc*, 1908, *The House of Fiarmetta*, 1909, a sonnet sequence, and its sequel *The End of Fiarmetta*, 1923. Her prose works include *Leonardo the Florentine*, 1927, *Renaissance France*, 1930, and *Dunbar and his Period*, 1931.

Taylor, Rowland (d. 1555), Protestant martyr, b. Rothbury, Northumberland. He became chaplain to Cranmer in 1540, and incumbent of Hadleigh, Suffolk, in 1544, becoming archdeacon of Exeter in 1552. He was one of the first to suffer martyrdom in Mary's reign, and was celebrated as the ideal of a Protestant par. priest.

Taylor, Tom (1817-80), dramatist, b. Sunderland. Educ. at Glasgow and Cambridge, he was prof. of Eng. Literature in London Univ. from 1845 to 1847. From 1854 to 1871 he was secretary to the Local Gov. Board. He was the author of about 100 dramatic pieces, original and adapted, including *Still Waters Run Deep*, 1855, *Our American Cousin*, 1858, and *Lady Clancarty*, 1871. He was also a large contributor to *Punch*, which he ed. from 1874 till his death.

Taylor, Zachary (1784-1850), twelfth President of the U.S.A., b. Orange co., Virginia. He entered the Army in 1808, and distinguished himself in sev. engagements against the Indians. After the

annexation of Texas he resisted the Mexican invasion, winning the battles of Palo Alto and Resaca de la Palma and seizing Matamoros and Monterey, and later gained the memorable victory over Santa Anna at Buena Vista in 1847. On his return he was elected President (1848) as a Whig, just at the time when the struggle over the extension of slavery had begun, but he *d.* during the compromise of 1850. Though a Southerner and slave owner, he declared in favour of the admission of California as a state where slavery would be forbidden.

Taylor, city of Williamson co., Texas, U.S.A., 35 m. NE. of Austin. The chief products are cotton and dairy produce. Pop. 9100.

Taylor Institution, Oxford, for the study and teaching of medieval and modern languages in the univ. It was planned 1839-45 and was designed by Cockerell, being provided for in the will of Sir Robert Taylor (1714-88). The building was inspired by Cockerell's study of the temple of Apollo at Bassae; there have been many additions to it since 1890, and it has received further endowments. There are lecture-rooms and one of the finest language libraries in England.

Taylor's Theorem, see FUNCTION.

Taymyr, peninsula in N. Siberia, between the Kara Sea and the Laptev Sea. Cape Chelyuskin (77° 43' N.) is the northernmost point in Asia. Together with the adjacent mainland and islands T. peninsula forms the *T. National District* of the Krasnoyarsk Kray, estab. 1930. Area 316,700 sq. m., pop. (1956) 34,000, mostly Russians, also Yakuts and Samoyeds. Nickel, copper, uranium, and coal are mined; other activities include fishing, reindeer raising, and fur trapping. The cap. is Dudinka. It is an area of labour camps and rapid economic development. See also *NORIL'SK*.

Tay-ninh, cap. of prov. of the same name, 55 m. NW. of Saigon, Cochinchina. Rice is the prin. product, but there are also rubber plantations. T. is the H.Q. of the Cao-dai religion (q.v.), and is noted for its architecturally remarkable Cao-daist cathedral and statuary.

Tayport, or **Ferry-Port-on-Craig**, burgh in the co. of Fife, Scotland, on the shore of the frith of Tay, 3½ m. ESE. of Dundee. It has foundries, engine works, and timber yards, and linen and jute are manufactured. Pop. 3400.

Tayshet, tn in the Irkutsk Oblast of S. Siberia, important junction on the Trans-Siberian Railway (branch T.-Lena), 360 m. NW. of Irkutsk. Pop. (1919) 17,000. It is the admin. centre of forced-labour camps along the T.-Lena railway, where extensive riots took place in 1954.

Tbilisi, see *TIFLIS*.

Tohad, see *CHAD, LAKE*.

Tohaikovsky, Peter Ilyich (1840-93), Russian composer, b. Kamsko-Votinsk, was taught music early at home, but in 1850 entered the School of Jurisprudence in St Petersburg, and in 1859 became a clerk in the Ministry of Justice. He had studied music as an amateur with Zarembo and A. Rubinstein, but in 1862

decided to take it up professionally and entered the Conservatory. In 1865 N. Rubinstein appointed him prof. at the Moscow Conservatory. He met Balakirev in 1868 and accepted his advice, but did not join his circle or subscribe to its exclusive nationalist attitude: technically his music remained cosmopolitan, although it often has a distinctly Russian flavour because his individuality is Russian. His early operas, the first 2 symphonies, and the piano Concerto in B flat minor had won him recognition by 1875, and the following year a wealthy widow, Nadezhda von Meck, offered him financial support on condition that they should never meet. In 1877 he married Antonina Miliukov, who had sent him a declaration of love, out of compassion and without returning her feelings, with disastrous results. He had a serious breakdown and left her for ever within a month of the wedding. After some months in Switzerland and Italy he resigned his post and settled in a country house. In 1888 he made his first international tour, in 1892 he visited the U.S.A., and in 1893 England. After a performance of the 'Pathetic' Symphony in St Petersburg he drank a glass of unboiled water and *d.* there of cholera. Of his 11 operas *Eugene Onegin*, 1879, and *The Queen of Spades*, 1890, both based on Pushkin, have remained in the world repertory, and so have the ballets *Swan Lake*, 1877, *The Sleeping Beauty*, 1890, and *The Nutcracker*, 1892. Three of the 6 symphonies and the first of the 2 piano concertos are also permanent favourites, but there is much else that remains characteristic and valuable, such as the symphonic poems *Romeo and Juliet*, *Francesca da Rimini*, and *Hamlet*, the *Capriccio italiano* and *1812 Overture*, the violin Concerto and the Trio for violin, cello, and piano. The church music and secular choral works are rather tied up to their Russian words, but many of over a hundred songs remain attractive, and there is much that deserves to be remembered among as many piano pieces. See M. Tchaikovsky, *Life and Letters of P. I. Tchaikovsky* (Eng. trans.), 1906; E. Evans, *Master Musicians*, 1935; G. Abraham (ed.), *Tchaikovsky: a Symposium*, 1946.

Tczew (Ger. Dirschau), tn of Poland, in Gdańsk prov., on the Vistula (q.v.), 20 m. SSE. of Gdańsk (q.v.). It has a trade in timber and cereals, and manufs. bricks, agric. machinery, and beer. Pop. 23,000.

Te Anau, lake in Otago, S. Is., New Zealand, largest of the lakes in the S. Alps. It has a maximum length and breadth of 40 m.

Te Deum Laudamus, well-known non-metrical Lat. hymn, found in the Rom. breviary at the end of Matins, and also used by the Rom. Catholic Church on occasions of rejoicing. There has been much discussion on its origin, and modern scholars have shown that it consists largely of borrowings from older sources. Its present form is probably due to Niceta, Bishop of Remesiana (d. c. 414). There are 20-30 Eng. versions including one by Dryden. An Eng. form is also used in the Anglican Communion at Matins.

Tea, beverage used since a remote period in China, but unknown in England until 1657. Though it at once attracted great interest, it was obtainable only by wealthy people until about 1750. At first it was infused and kept in barrels, being drawn like beer, and warmed for use. In 1660 a tax of 1s. 6d. was imposed per gallon of liquid tea, but in 1680 a tax of 5s. per lb. was substituted. Since 1852, when the tax was 2s. 2½d. per lb., it has been down to 4d. in 1890, and was 5d. just before the First World War. In 1929 the duty of 4d. on foreign and of 3½d. on empire T. was repealed. The duty was reimposed in April 1932, the rates for foreign and empire teas being 4d. and 2d. respectively. These have since been altered from time to time. Consumption in Britain in 1956 was 10·1 lb. per head of the pop.; of this about two-thirds is Indian T. The first shipment of Indian T. was made from Assam in 1839. T. is derived from *Camellia sinensis*, which is indigenous to Assam and China. The young leaves and shoots (the 'flush') are picked from the bushes by women. After gathering they are taken to the factory, spread thinly over wire or bamboo trays, and placed on wire or hessian racks to wither, after which they can be rolled without breaking. The length of time required for withering depends on climatic conditions, the shortest time being about 12 hrs. and the average 24 hrs. During the wet seasons, and in specially humid areas, the leaves are withered by artificial heat. The next process, that of rolling, is done entirely by machine so far as general commercial production is concerned. It causes the juice to be exuded, and it imparts to the leaf the twist characteristic of its manufactured state. The leaf is then spread out thinly in the fermenting room, where the air is kept moist, and there in a few hrs it changes from green to copper colour. It is then 'fired' by being spread on trays which pass through a hot-air chamber.

After being sorted or classified, a process carried on in modern factories by machinery, the T. is then packed for export.

In making T. the water should be fresh and freshly boiled, and after pouring over the T. should be allowed to stand for 3-5 min., when the T. should be poured off the leaves. More than half the T. exported from T.-producing countries is consumed in Great Britain and N. Ireland. In relation to imports the next largest consumers—outside the producing countries—are the U.S.A., Australia, and Canada. After the outbreak of the First World War internal troubles and national poverty greatly changed the ability of Russia to purchase this beverage, but in theory, at all events, Russia remains one of the great T.-drinking nations. During recent years T. has gained increased popularity in the U.S.A. Until the beginning of the Second World War, London was the chief T. market of the world, and the prices at the London sale-rooms estab. values in every country, with the possible exception of China. This results from the fact that Chinese T. is marketed in a different way from the T. of other lands, the purchases being usually made in China on behalf of importers instead of the T. being exported to London and elsewhere for sale by auction. But even in the case of China, prices were largely influenced by results in the London sale-rooms. The Eng. T. trade was, however, temporarily disrupted by the impact of war. Before the war China was the largest T. producer in the world, but although reliable information is no longer available, production is thought to have declined by a third since that time. Even before the war, India, Ceylon, and Indonesia had gradually supplanted China as the world's chief source of T., and they now contribute more than three-quarters of the total production. In 1955 world production was at the record level of 672,000 metric tons—50 per cent above pre-war. The largest proportionate increases in production have occurred in E. Africa, and some 20,000 metric tons now come from this area each year. In other countries production in thousands of metric tons was: India and Pakistan 324·8, Ceylon 172·4, Japan 70·0, and Indonesia 43·4. To regulate exports of T. from the major producing areas the International Tea Agreement was signed in April 1933 and renewed in 1938 and 1950. It expired in 1955, and unfortunately negotiations for its renewal have been hampered by fundamental economic disagreements. So far this has not had any serious repercussions on the T. trade. T. trade has always interested the Brit. merchant and investor, and many of the best tea gardens of the E., particularly in India and Ceylon, are controlled by Brit. companies. Much also of the continental T. trade is Brit. For maté or Paraguay T., *see* MATÉ.

See O. Lancaster, *The Story of Tea* (new ed.), 1947; R. D. Morrison, *Tea—Its Production and Marketing* (revised), 1948; *Tea: a Progressive Industry, 1950—*all pub. by the Tea Centre.

Tea Rose, *see* ROSE.

Tea Seed Oil is commercially produced in China from *Thea sasanqua*, cultivated for its seed. Tea plants *Thea sinensis* and *Thea japonica* are cultivated for their leaves at the expense of the seed, and yield less than 10 per cent of the commercial T. S. O. The seed kernel of *Thea sasanqua* contains 56–60 per cent of oil, which is yellow to brown and may have a very biting, unpleasant taste. It refines to a pale yellow oil with very little taste and odour, resembles olive oil in both chemical and physical characteristics, and is used mainly as a salad and frying oil. Only low-grade oil is used for soap making. Component fatty acids of the oil are: saturated—6–12 per cent; unsaturated—oleic, 74–87 per cent, and linoleic, 2–15 per cent. The cake remaining after extraction of the oil has astringent properties and cannot be used as cattle food; it has limited use as an insecticide.

Teaching, *see* EDUCATION.

Teak, Asiatic timber tree growing in various countries, though the wood is provided chiefly by the true teak, *Tectona grandis*, a species of the family Verbenaceae. It reaches a great height and bears panicles of small white flowers. The wood is deep yellow to dark brown or almost black in colour, that of the mixed deciduous forests of Burma being the darkest and that of Siam the lightest. It grows also in India, Ceylon, Malaya, and Java. The T.s of India include the 'Deccan', which is probably the darkest Indian T. and most ornamental, the colour being deep brown with handsome figuring. T. is the most valuable timber in Burma, yielding a large part of the country's revenue. Before the Second World War, for many years the Brit. forest returns showed that 450,000 tons of T. were produced annually ('ton' in this context has no reference to weight; it means a cub. ton of 50 cub. ft.). There are such large quantities of this timber in Burma that, provided the forests are properly managed, the extraction of 450,000 tons a year is not wasting any of the capital value of the forest; it is merely removing the natural increment. As far as freedom from movement is concerned, T. is superior to all other woods. Its primary use is in shipbuilding, where the essential oil contained in it has the desirable quality of non-corrosion of the metal fittings, the metal decks on which it lies, and the bolts that stay it down. T. is of great value for railway carriages, and outdoor use. The *Cutty Sark*, famous tea clipper of the 1860's, was built of Burmese T. and was still afloat in 1914. T. is also much used for cabinet-making. *See* D. J. Atkinson, 'Forests and Forestry in Burma,' in *Journal of the Royal Society of Arts*, 2 July 1948. *See* FORESTRY; TIMBER.

Teal (*Anas crecca*), kind of small freshwater duck. The male, in general colour, is dusky grey; tail-feathers ashy grey; crown of head deep cinnamon or chestnut; the eye is surrounded by a black band, glossed with green or purple, which unites on the nape; wing markings black and white; bill black and resembling that of

the widgeon. The female is mottled brown. Total length 14–15 in.

Teallach, An ('The Forge,' after the smoke-like mists around its peaks), range of 14 Torridon sandstone mts in W. Ross-shire, Scotland, extending N. and S. for 3 m. on the S. side of Little Loch Broom. The highest top is Bidean a' Ghlas Thuill (3483 ft.).

Tear Gas, lachrymatory irritant, usually consisting of a mixture of chloro-acetone, ethyl-bromo-acetate, benzyl iodide, iodo, and benzyl bromide. It causes an immediate stinging pain in the eyes and tears, but does not injure the eyes unless liquid or solid gas enters them, when the effects are serious. It was used first as a military weapon by the Germans during the First World War. It is used for civil purposes, i.e. by police for the dispersal of rioters, though its military use was prohibited by the Geneva Protocol (1925).

Tearle, Sir Godfrey (1884–1953), actor, son of a famous Shakespearean actor, Osmond Tearle, played his first dramatic part at the age of 9. A handsome man of fine presence, he possessed a magnificent voice and played many parts, having a considerable range of talent. He was certainly one of the best Othellos of his period, and had he possessed a more forceful personality might have become the leader of his profession. He was knighted in 1951.

Tears, secretion of the lachrymal gland. *See also* EYE.

Teasdale, Sara (1884–1933), Amer. poetess, b. St. Louis, Missouri. After extensive travel in Europe and the Near E. she settled in Chicago, where she met Vachel Lindsay, whose suicide in 1931 was a great shock to her. In 1914 she married Ernest P. Filsinger; they were divorced in 1929. As a poetess she excelled in lyric verse, her earliest influence being Christina Rossetti, with whom she has been compared. Vols. of her poetry include *Sonnets to Duse*, 1907, *Helen of Troy*, 1911, *Rivers to the Sea*, 1915, *Love Songs*, 1917, which was awarded the Columbia University Prize, *Flame and Shadow*, 1920, *Dark of the Moon*, 1926, and *Strange Victory*, 1933. Her *Collected Poems* were pub. in 1937.

Teasel, or **Teazel**, *see* DIPSACUS.

Teate, *see* CHIETI.

Tebessa (anc. *Theveste*), tn in Algiers, in the dept. of Constantine, famous for its Rom. ruins. It is the place where St Crispin suffered martyrdom and, situated at the junction of the roads to Carthage, Cirta, Lambessa, and Tacapa (modern Gabes), soon became a place of the first importance, not only from a military but also from a commercial point of view. T. is assumed to have been founded about AD 71, just after the Jewish war. It was probably one of the first tns to adopt Christianity after its introduction into Carthage, AD 150, and many famous bishops ruled over the Church there. Its period of greatest splendour was the commencement of the 2nd cent., and from that time there began the construction of its finest monuments. Later it was razed by the Vandals and disappeared from hist.

until its restoration by the Byzantine armies, Solomon being its second founder. The modern tn, which is contained within the walls of the Byzantine citadel, is 11 m. from the Tunisian frontier and N. of the mts of Bon Rouman. One of the most interesting of its Rom. ruins is that of the great basilica, originally a temple of Minerva. There is also an enormous circus and a triumphal arch. Near T. are some important phosphate quarries. In the Tunisian campaign of the Second World War, in Rommel's assault of Feb. 1943 at the Kasserine Pass, T. figured as an important road junction guarding a gap through the last lines of hills to the Algerian plains, but the allied heavy artillery and bombers checked his thrust some 20 m. from T.

Tebeth (Esther II. 16), tenth month of the Jewish calendar (or fourth month from Tishri, q.v.), corresponding to Dec.-Jan.

Technical Education, a term used to describe courses of instruction, in a variety of institutions, in subjects directly applicable to the purposes of agriculture, industry, trade, or commercial life. A distinction is sometimes made between T. E. and commercial education (q.v.). In its limited sense T. E. is provided for 3 categories of personnel. Technologists, who make a scientific study of the practical or industrial arts, have a univ. degree or some comparable qualification, are usually eligible for membership of one of the professional institutions, and are expected, in their careers, to accept a high degree of responsibility and initiate advances in their own field. Technicians, whilst specialists by virtue of their theoretical and practical training, usually require a good knowledge of the mathematics and science related to their speciality. They work under the general direction of technologists, and in the factory would occupy such positions as assistant designers, or junior managerial positions, for example, in industrial workshops. Craftsmen represent the skilled labour of manufacturing industry, and account for a high proportion of its manpower. Each category has its appropriate qualifying examinations—degrees, technical diplomas, and certificates. In the U.K. these awards are made by a variety of bodies—univs., technical colleges, the Ministry of Education through its National Certificates, the City and Guilds of the London Institute, Regional Examining Unions, and other professional and trade organisations. Commercial education includes subjects such as accountancy, book-keeping, costing, shorthand, typing, and so on (see COMMERCIAL EDUCATION).

Since T. E. in the U.K. developed piecemeal, courses are offered in a great variety of institutions. Apart from the univs. there are over 500 technical or commercial establs. in England and Wales. These include Polytechnics, Technical Colleges, Technical Institutes, Colleges of Technology, Art, and Commerce, Colleges of Commerce, Colleges of Further Education, the seven National Colleges of technology—Horology, Foundry, Rubber Technology, Heating and Ventilating,

Leather, Food Technology, Aeronautics, and the Royal College of Art. Nearly three-quarters of the students attend evening courses; most of the rest are released by their employers to attend courses under the day-release scheme; a few are in full-time attendance. Industry co-operates in T. E. through 'sandwich' courses—substantial periods of full-time study are alternated with periods of industrial training. This kind of arrangement is appropriate at various levels.

Within the secondary-school system in England and Wales there are a number of technical schools (see EDUCATION) which provide a general secondary education with an increasing technical bias in the later years of the course. It is probable that these schools will send on an increasing number of their pupils to further technological training. It is likely that the 5 per cent of the age group who attended them in 1955 will be raised in an attempt to meet the national demand for technically trained personnel. This demand has been emphasised in a series of Gov. Reports since the Second World War (e.g. the Barlow Report 1944, the Percy Report 1945, and Technical Education Report 1956), and the number of technically trained personnel in the U.K. compared unfavourably with other countries, particularly the U.S.A. and U.S.S.R. See P.F.R. Venables, *Technical Education*, 1955.

Technicolor, leading colour process employed in modern cinematography. The first T. films were made about 1926: a special lens and filters were used to obtain a 2-colour image, which was based upon the principles known as the additive process. This was later abandoned when the 2-colour subtractive process was introduced, which was followed by the 3-colour subtractive process, the system now employed. The T. 3-colour camera photographs the 3 primary aspects of a scene (red, green, and blue) upon 3 separate film strips, simultaneously, at normal speed, without fringe or parallax, in balance, and in proper register with each other. These separate strips are developed to negatives of equal contrast and are always considered and handled as a group. From these colour-separation negatives, printing is carried out by projection through the celluloid upon a specially prepared stock, which is then developed and processed to produce positive relief images in hardened gelatin. These 3 reliefs are then used as printing matrices which absorb dye. The dye is then transferred by imbibition printing to another film strip, which, when it has received all 3 transfers, becomes the completed print ready for projection. This process is designed to reproduce whatever is placed in front of the camera, not only as to colour, but also as to light and shade.

The T. process reproduces a full scale of contrasts and effects of light and shade, and consequently the designer of settings has to bear in mind the cameraman's problem of achieving the necessary light-levels with a minimum number of sources

of illumination. T. adds few complications to sound recording, but the 'whistle' from the arcs caused by high-frequency ripples in the electric current coming from the commutators of direct-current generators must be eliminated. This is done by the combination of an alternating-current filter at the generator and additional choke-coils at the individual arc units. Modern film production, Amer. and Brit., has proved that, used imaginatively, colour heightens dramatic effect. Some experts believe that colour will eventually supersede black-and-white photography altogether in film-making.

Technology (Gk *techné*, art or craft), body of knowledge relating to arts and crafts. It includes the hist. of the development of productive arts, the scientific principles underlying them, and descriptive accounts of processes employed in them.

Technology, Imperial College of Science and, see IMPERIAL COLLEGE.

Teck, Ger. family whose name was taken from a castle of Württemberg. Francis, a prince of Württemberg, who became Duke of T., married Mary Adelaide, daughter of the Duke of Cambridge, and settled in Britain. He died on 20 Jan. 1900, and his wife on 27 Oct. 1897. Their issue was a daughter, Mary, who married King George V. and 3 sons: Adolphus, Duke of T. (1868-1927), eldest brother of Queen Mary, who married a daughter of the first Duke of Westminster and was created Marquess of Cambridge in 1917; Francis, who died in 1910; and Alexander, created Earl of Athlone in 1917. In the latter year the family name was changed to Cambridge, when that of Guelph was changed to Windsor (q.v.).

Tedder, Arthur William, first Baron of Glenguin (1890—), Marshal of the R.A.F., educ. at Whitgift School and Magdalene College, Cambridge. He entered the colonial service in 1914. Commissioned in 1914 in the Dorset Regiment, he went to France in 1914 and was seconded to the Royal Flying Corps in 1916. He was given a permanent commission in the R.A.F. in 1919. He held sev. important posts and became air officer, commanding-in-chief Middle East, 1941-3. He became air commander-in-chief, Mediterranean air command, in 1943. T., appointed deputy supreme commander under Gen. Eisenhower for the Anglo-Amer. expeditionary force, was the first Brit. airman to assume so important a military post. He was a specialist in strategy, moulding to his own shape the current ideas on air co-operation with armies. He relinquished the post of chief of the air staff at the end of 1949 at his own request in order to facilitate the advancement of younger officers. T. was promoted marshal of the R.A.F. in 1945. He was knighted in 1942 and created a peer in 1946.

Teddington, tn of Middx, England, on the N. bank of the Thames, since 1937 part of the bor. of Twickenham. The manor of T. belonged to the abbey of Westminster until the Dissolution. The

National Physical Laboratory and the Chemical Research Laboratory are in T. It is the highest tidal point on the riv., and its famous lock (built 1811) is the largest (650 by 25 ft) on the Thames. T. is the point where the discharge is gauged, and is the frontier of the respective jurisdictions of the Port of London Authority and the Thames Conservancy Board.

Tees, riv. of England, rising in Cross Fell, Cumberland, and flowing SE. and then NE. for 70 m., forming the boundary between Yorks and Durham and entering the estuary called T. Mouth to join the N. Sea. It is navigable to Stockton-on-Tees. The riv. valley, known as Teesdale, includes Mickle Fell (2591 ft), the highest point in Yorks, and the great waterfall of High Force; among the fells near the riv.'s mouth are found alpine flowers.

Teeth, calcareous structures occupying the alveolar processes of the upper and lower jaw, and serving to tear, cut, or grind food.

In man there are 32 permanent T., 16 in each jaw. They are divided as follows: 2 incisors, 1 canine, 2 premolars or bicusps, and 3 molars in each lateral half of each jaw. The incisors have chisel-shaped crowns, and are therefore adapted for dividing food by cutting. In the upper jaw they are socketed in the pre-maxillary bone. The canine T. are conical in shape, and are therefore adapted for piercing. In carnivorous animals they are developed as sharply pointed T., which serve to tear the prey. The canines are borne behind the junction of the maxillary and pre-maxillary bones. The premolars have somewhat flattened crowns and bear 2 cusps, 1 external and 1 internal. The first premolar has sometimes 2 roots, though, like the canines and incisors, it usually has a single root. The molars, the largest and firmest T., are placed behind the bicusps. Those of the upper jaw have 3 or 4 cusps, while the lower-jaw molars have 4 or 5. The upper molars have usually 3 roots each, and the lower molars 2 roots each. The last and smallest molar is known as the 'wisdom tooth.' The arrangement of the T. of any mammalian species is best summed up in a dental formula. Thus the formula for man, $\frac{2.1.2.3}{2.1.2.3}$, indicates that there are 2 incisors, 1 canine, 2 premolars, and 3 molars in each lateral half of the upper and of the lower jaw. In man the structure of all the T. is essentially the same. The outer layer is composed of enamel, a hard substance consisting principally of calcium phosphate and smaller amounts of calcium carbonate, magnesium phosphate, and calcium fluoride. The next layer is composed of dentine, which contains the same mineral substances as the enamel with the addition of organic matter. Dentine is hard, though not so hard as enamel; it forms the greater part of the bulk of the tooth, and is furnished with a series of fine channels by which communication is estab. between its substance, the enamel, and the dental pulp. The dental pulp is contained in a cavity

within the dentine. It consists of blood-vessels and nervous matter. The root of the tooth is devoid of enamel, but possesses a coating of 'dental cement', a bony layer which is adjacent to the periosteum of the alveolar cavity. The permanent T. in man are preceded by temporary or 'milk' T. These are fewer in number, smaller in size, and whiter in colour than the permanent T., and they are also somewhat different in shape, the roots of the molars, in particular, being more divergent than corresponding structures in permanent T. The process of their development is usually over by the end of the second year. The permanent T. develop from the fifth year to the twentieth year.

Dental caries is a common disease affecting the human race. The cause of the disease is the presence of bacteria in the mouth which bring about fermentative changes in starchy or carbohydrate food by which lactic acid is produced. The acid disintegrates the enamel coating, after which other bacteria cause putrefactive changes in the organic matter of the dentine, leading to a breaking down of the tooth structure, inflammation of the pulp, and the consequent distressing pain known as toothache. The baneful effects upon general health resulting from defective T. can be successfully obviated only by recourse to the methods of dental surgery. Pyorrhoëa (q.v.) also has markedly ill effects on general health. T. should be cleaned before retiring, on rising, and after every meal, by brushing up and down, and to and fro.

Dentistry. This is the dept of medical science which treats of the care of the mouth, particularly of the T. The work that falls to the dentist is mainly comprised under the heads of dental surgery, mechanical dentistry, and dental prophylaxis, or the general prevention of T. diseases. Dental surgery includes all measures for the treatment of unsound T. and the correction of deformities and irregularities of the T.; mechanical dentistry deals with the manuf. and adjustment of artificial substitutes for T. The dental surgeon and the surgeon work in collaboration in the treatment of fractured jaws and in the field of plastic surgical treatment of deformities of the face due to disease or injury. Considerable advances have been made in mechanical dentistry, and strong, light plastic materials and acrylic resins have superseded the older materials in the making of dentures. The art of dentistry has been practised from very early times. In the 19th cent. much progress in dental science is particularly associated with the names of Blake, Fox, and Bell in England; Fonzi, Cuvier, and Bertin in France; and many able scientists and practitioners in America. In 1878 the profession was regularised in England by an Act which estab. a register, the conditions for registration being put in the hands of the General Medical Council. The position was further regularised by the Act of 1921, according to which all persons practising dentistry had to be registered,

the penalty for an unregistered person practising being a fine not exceeding £100. The term dental surgeon is strictly reserved to those who possess the qualification of L.D.S. or are otherwise professionally qualified. Under the Dental Act, 1958, a General Dental Council was set up which will in future assume all the functions previously exercised by the General Medical Council in relation to dentistry. The licensing corporations are the Royal Colleges of Surgeons in England, Scotland, and Ireland, and the Royal Faculty of Physicians and Surgeons of Glasgow. See also NATIONAL DENTAL SERVICE. See J. B. Parfitt and W. E. Herbert, *Operative Dental Surgery* (7th ed.), 1955.

Teges, tn of Arcadia in anct Greece. Named after its reputed founder, Tegates, son of Lycaon. In its earliest days it was closely associated with Sparta, but after 371 BC became independent. The tn was famous for its temple of Pallas Athene (394 BC). Considerable excavations have been made on its site.

Tegernsee, Alpine lake in the Land of Bavaria (q.v.), 27 m. S. by E. of Munich (q.v.). It is a popular tourist resort and sporting centre. Length 4 m.; width 1 m. The vil. of T. on the E. shore of the lake has a castle (once a Benedictine abbey) belonging to the Duke of Bavaria. Pop. 4500.

Tegnér, Esaias (1782-1846), Swedish poet, b. By, Värmland. He studied at Lund Univ., and in 1802 became lecturer in philosophy there. In 1811 he pub. a patriotic ode, *Svea*, which was crowned by the Academy, of which he became a member in 1818. He pub. in 1820 *Nattvardsbarnen* ('The First Communion'), in 1822 *Axel*, and in 1825 *Frithiof's Saga*, a paraphrase of an Icelandic saga. He was also a critic of considerable ability. In 1812 he had been ordained, and in 1824 he was made Bishop of Vexjö. T. is regarded as one of Sweden's greatest poets. Although bred in the classical tradition, he was much influenced by the Romanticism of Schiller. T.'s finest passages, whether inspired by love, patriotism, politics, or philosophy, display great originality of thought, and a blending of the new Romantic style with the Scandinavian saga heritage. Among his best poems, besides those mentioned, are *Song to the Sun*, 1817, *The Candidate for Confirmation*, 1820, and *Degree Day at Lund*, 1820. See M. Gravier, *Tegnér et la France*, 1942; F. Böök, *E. Tegnér* (2 vols.), 1946-7.

Tegucigalpa, cap. of the rep. of Honduras (q.v.), situated on the R. Choluteca at the base of the old volcano E. Picacho. It is a well-built tn much modernised since 1900, containing a cathedral, central univ., military and aviation schools, law courts, national museum, national printing works, tobacco and other factories. It is united by a bridge to Comayagüela on the opposite bank of the riv. Gold and silver mining is carried on in the vicinity. Its airport is at Toncontin, 2½ m. S., and the city is a fine road centre, but has no railway. Pop. 55,700.

Tehran, or **Teheran**, city and cap. of Persia. It stands 3850 ft above sea-level, about 60 m. S. of the Caspian Sea. The climate is hot during the summer, but mild during the rest of the year, with a mean daily maximum of 98° F. in July and 44° F. in Jan. The relative humidity in Jan. is 76 and in July 47. Under Shah Reza Pahlavi (1925-41) T. was to some extent rebuilt and extended on W. lines; since the Second World War it has increased in size. It is a commercial centre, and has match, tobacco, textile, cement, soap, glass, and munitions manufs. The univ. was founded in 1935, and there are a national library and a number of museums. T. became cap. of Persia, in place of Isfahan, in the 18th cent. Pop. (city and suburbs) 1,500,000.

Tehri-Garhwal, see GARHWAL.

Tehuacán, tn of Mexico, in the state of Puebla and 65 m. SE. of Puebla city, at an altitude of 5400 ft. It is noted for its mineral springs; but it is also now a modern city with manufs. of agric. products, textiles, and chemicals, flourmilling, and tanning. It has a railway junction and airfield. Pop. 17,000.

Tehuantepec, tn of Mexico, in Oaxaca state, 12 m. up the R. T. from Salina Cruz on the Pacific coast. It gives its name to the isthmus inhab. by the Zapotecs. There are tropical agriculture and mineral resources. Pop. 7000.

Tehuantepec Winds, or **Papyagayos**, strong cold winds due to the same influence as the 'nortes' or 'northerners' of the regions round the Gulf of Mexico. They are cold, dry winds from the continent, allied to the mistral or bora of the Mediterranean. They are strong on the Mexican W. coast, but weaker on the Pacific, in Nicaragua and Guatemala, where they are known as T. W. from their direction.

Teifi, or **Teivy**, riv. of Wales, rising in Llyn Teifi, NE. Cardiganshire. It forms the boundary between Cardiganshire, and Carmathenshire and Pembrokeshire, and after flowing 53 m. enters Cardigan Bay.

Teign, riv. of Devon, England, rising in Dartmoor, near Chagford; after flowing for 30 m. it enters the Eng. Channel at Teignmouth. Its estuary is nearly 1 m. across.

Teignmouth, **John Shore**, first Baron (1751-1834), statesman. He entered the service of the East India Company as a cadet at the age of 18. He rose rapidly, and was finally made a member of the Supreme Council. In 1793 he succeeded Cornwallis as governor-general of India. He retired from this office in 1797 and received his peerage on his return to England.

Teignmouth, seaport, urb. dist., and holiday resort of Devon, England, at the mouth of the R. Teign, with a sea-wall 2 m. long. T. is built partly on a tongue of land between the Teign and the sea, and partly on rising wooded ground enclosing the valley which rises to the high moors below Haytor. Pipe-clay and china clay are shipped here for the continental potteries, and fishing is

carried on. The commercial netting of salmon is practised in the Teign. The par. of Shaldon on the S. bank of the riv. is in the urb. dist. Pop. 11,000.

Tello, St, disciple of Dyring and founder and first abbot-bishop of Llandaff. He restored many of Dyring's foundations after the plague of 547. He died c. 680 and his feast is on 6 Feb. See S. Baring-Gould and J. Fisher, *Lives of the British Saints*, 1908.

Tithes. The T. of a Scottish par., like the tithes (q.v.) of Eng. law, are that proportion of rents or goods which goes to the maintenance of the clergy. The clergy, however, have now no right to T. beyond a suitable provision or stipend. Generally speaking, T., like tithes, are a burden on land, and most lands, except glebe lands and lands in respect of which the T. have been redeemed, are liable to such burden. According to canon law one-tenth of that which one acquires by one's own industry (personal T.) is due by divine right to the Christian clergy; but Scots law requires evidence of 40 years' possession of personal T. to make good a legal right to them. Predial T. are said to be either parsonage or vicarage; the former being T. of corn due to the parson or other titular of the benefice; the latter being payable to the vicar out of cattle, fowl, eggs, etc. Parsonage T., having always been an inherent burden upon all lands not specially exempt, cannot be lost by prescription; but the right to vicarage T., having always rested upon usage, can be lost 'non utendo' (non-user). After the Reformation the whole of the T. were transferred to the Crown, or to private individuals called titulars, to whom they were granted by the Crown, or to feuars or renters from the Church, or to the original founding patrons, or to colleges or pious institutions. In the reign of Charles I it was provided by arbitral decrees (subsequently confirmed by statute) that T. (up till then payable in kind) should be liable to be valued and the landowner entitled to purchase or redeem them at a certain valuation. This obviated the inconvenience of the titular or patron of T. coming on the land at his leisure and claiming the physical separation of his tenth part after harvest (though there was an alternative method of payment by 'rental-holls'). Landowners liable to T. may also sue titulars for a valuation or for a sale of their T. T. not so valued or redeemed are still 'drawn in kind.' Predial T. are still paid in kind. The court of session (q.v.) has now taken over the whole of the jurisdiction of the old court of T.

Teth, riv. of Scotland, rising 16 m. ENE. of Inveraray, and flowing through Perthshire to join the Forth 2 m. from Stirling. Length 33 m.

Teixeira de Rascoais (1878-1952), Portuguese poet and essayist, b. Gafão, his real name being Joaquim Pereira Teixeira de Vasconcelos. His early work was lyrical in character, but later, particularly in his prose writings, he concentrated more on a metaphysical discussion of the problem of good and evil

and the progress of humanity. His pubs. include *Jesus e Pan*, 1903, *Regresso ao Paraiso*, 1912, *Santo Paulo*, 1934, and *Santo Agostinho*, 1945.

Tejo, see TAGUS.

Tejuco, see DIAMANTINA.

Tel el Amarna, see Tell el Amarna.

Telemón, brother of Peleus, who with him slew Phocus their half-brother. T. fled from Aegius to Salamis, where he married the daughter of the king and ultimately succeeded to the throne. He was one of the Calydonian hunters and an Argonaut (q.v.). He also helped Hercules to take Troy. T. was the father of Ajax by Eriboea.

Telavi, tn in E. Georgia, 58 m. NE. of Tiflis, the centre of a famous wine-producing area (see KAKHETIA). It has the ruins of an ant. fortress and palace, and is surrounded by sev. monasteries and churches of the 6th-16th cents., formerly much frequented by pilgrims. T. was founded in 893, and was cap. of Kakhetia since the 17th cent. Pop. (1939) 13,000.

Tel-Aviv, tn of Israel, 48 m. from Jerusalem, provisional cap. of Israel from 1948 to 1950. Although the largest tn, as far as the number of inhab. is concerned, its area before the Second World War was smaller than that of Jerusalem or Haifa. During the war and under the Israeli Gov. the municipal boundaries were extended, so that the area is now some 10,000 ac., 4 times as great as in 1939. For this area the pop. goal is 500,000. In 1950 it was proposed to join Jaffa to T.-A. in the near future by Act of the Knesset (Parliament). The scope of its municipal, social, and educational services and free medical aid to the poor, etc., was outstanding in Israel in 1950. T.-A. had estab. itself by 1930 as the prin. economic centre of the country. Two large textile factories were erected in 1924; this marked the beginning of steady industrial expansion in T.-A. It became famous for its sugar and chemical and pharmaceutical industries. The largest number of banks are situated here, as well as most commercial firms, newspaper offices, etc. T.-A. is also a cultural centre. All the Heb. daily newspapers are pub. in T.-A., as well as numerous periodicals. It contains the 2 best-known Jewish theatres. Other municipal buildings include a museum and an art gallery. Its main exports before 1939 were oranges. T.-A. presents, in its European modernity of style and life, a striking contrast to the Oriental character of Jaffa. The Palestine Electric Corporation has built a power-house at T.-A., and the transmission lines have been extended beyond the tn boundaries to colonies N., S., and E., and thus provide energy for lighting, industry, water supply, and irrigation.

T.-A. was founded in 1909 by a group of residents of Jaffa who decided to build for themselves a modern garden-suburb on the N. outskirts of Jaffa, and in 1910 this received its present name which means 'The Hill of Spring.' By 1914 the pop. of T.-A. was 1500, or one-fifth of the total Jewish pop. of Palestine. In addition to

the constant migration of Jews from Jaffa to T.-A., the waves of Jewish immigration into Palestine, largely absorbed by T.-A., contributed to a rapid and constant increase of its pop. By May 1921 it was given the status of an independent township gov., and after the disturbances of 1929 the last official links binding T.-A. subordinately to Jaffa were removed. No other place in Palestine has seen so rapid a development. The original quiet streets, with the first 60 small villas, soon developed into broad and busy streets, lined with large modern concrete buildings. By the outbreak of the disturbances of 1936 T.-A. had become the largest tn of Palestine, and its industrial and commercial centre. As a result of the disturbances the business community could not use the port facilities of Jaffa, and this led to the building of the T.-A. Lighter Port, which made a substantial contribution to its economic expansion. The municipality of T.-A. in 1950, with gov. approval, planned to expand this into a large permanent port. The Bar-Glan univ. was founded here in 1955. Pop. (with Jaffa) 400,000.

Telecommunications, science of communication by electrical means. See RADIO-COMMUNICATION; TELEGRAPHY; TELEPHONY; TELEVISION.

Telecontrol, Electric, the starting, stopping, and regulation of machines and operation of switchgear from a distance, sometimes of many miles, by electric current signals in a telecommunication system. The operation of a section of an interconnected network, including generating stations and distributing substations, is controlled at a central control room.

Telegonus, son of Ulysses by Circe. He was sent by her to find Ulysses. He landed in Ithaca, but was attacked by his father and Telemachus, who imagined him a pirate. He slew Ulysses not knowing who he was. He conveyed the body to Circe for burial, and later married Penelope.

Telegony, see HEREDITY.

Telegraphy, system for conveying information between 2 points. The first serviceable telegraphic device, invented by Chappe (France) in 1792, was a form of semaphore. In 1816 Ronald (England) produced his pith-ball telegraph, where an electric current to line caused 2 pith balls to diverge, and their movement exposed a character. In 1819 Oersted discovered that an electric current deflected a neighbouring magnetic needle, the direction of movement depending on the direction of current flow. Cooke and Wheatstone, applying this principle, produced the first practical electric telegraph system in 1837. Their first system was a 5-needle telegraph requiring 5 lines. This was followed by the double-needle and then the single-needle system. Fig. 1 shows the system in its simplest form. When a message is to be transmitted from A to B, the key is depressed as shown and line current flows through the recorder at B to earth and deflects the recorder needle.

Karl Steinheil (1836) devised an acoustic telegraph with 2 gongs of different notes. Line current deflected 1 of 2 needles depending on the current direction. Attachments to these needles struck the gongs, and thus gave a code of audible

FIG. 1. PRINCIPLE OF COOKE AND WHEATSTONE ELECTRIC TELEGRAPH

signals. Alternatively, the needles were equipped with ink-holders in contact with a moving tape and recorded dots in 2 parallel lines to give the message according to a dot code. In 1837 Morse produced his electro-magnetic telegraph. The Morse code consists of 2 distinct signals in

FIG. 2. THE MORSE CODE

groups to define the various characters. One signal is a 'dot' and the other a 'dash,' the dash being 3 times the duration of the dot. There are intervals between the letters and a longer interval between words (Fig. 2). In the elementary Morse system the recorder at each end (Fig. 1) is replaced by a sounder (Fig. 3).

It consists of a U-shaped electromagnet M and a soft iron bar A attached to a brass bar B. The brass bar is pivoted; its free end is normally kept up by a spring S. When the signal current flows through the electro-magnet the iron bar A is attracted, the brass bar is pulled down and the screw C strikes the frame. When the current ceases, the spring pulls the bar up again and its end strikes the screw D.

FIG. 3. MORSE SOUNDER

The receiving operator hears the 2 taps; if the interval between them is short the signal is a dot; if long, a dash. Later a number of systems were produced where the dots and dashes were ink recorded on a paper tape. Galvanometers are included at each direct-sounder station to enable the operator to verify that the key operation is actually causing current to flow to line.

The direct-sounder system can be used only over short lines. On longer lines the sounder is replaced by a relay which requires a much smaller operating current.

FIG. 4. DOUBLE-CURRENT WORKING

The relay contacts complete a local circuit to operate the sounder.

The single-current working so far described involves signal distortion and requires a slow signalling speed to prevent interference. In double-current working the interval between the signal (mark) currents is filled by currents (space) flowing in the reverse direction. The effect is to accelerate the discharge of the line (Fig. 4). This method is used extensively on long submarine cables. The cable code is similar to the Morse code, except that the dots and dashes are distinguished by direction of current flow.

They appear as punched holes in a paper tape, and the 2 signals are readily distinguished by their relative positions on the tape. This method permits a greater signalling speed.

FIG. 5. POLARISED RELAY

Double-current working requires a receiving relay of the polarised type, operating in one direction to the mark, and in the reverse direction to the space currents. Fig. 5 shows a modern type

broken by non-magnetic spacers. The pole pieces are 2 permalloy screws. The armature contacts play between 2 contact screws. The relay is polarised by a permanent magnet, the poles of which are in contact with the yoke at the point where the pole pieces pass through it. The coil is wound on a bobbin which is slipped over the armature, but does not touch it. The permanent magnet produces 2 poles in each half of the yoke, at the pole pieces and at the spacers. The coil magnetises the armature. The paths of the polarising and operating magnetic fields are shown by the solid and dotted lines respectively. These fields aid and oppose each other at the respective pole piece and spacer gaps. With the direction of the fields shown, the armature operates to the right (mark position); reversal of the coil current would cause the armature top to move left (space position).

In simplex working (Fig. 6), as here described, operation is only possible in one direction at a time. To increase the traffic-carrying capacity of circuits, duplex working is used. This permits the simultaneous transmission of signals in both directions on the 1 line. Two simplex circuits, 1 in each direction, may be combined to give duplex facilities (2-way simplex). Differential duplex is often used on inland networks.

The Bridge duplex, used on submarine cables, is based on the principle of the Wheatstone Bridge, and depends for its action upon the balance of potentials across a relay connected in the diagonal of the bridge. The line-signal conditions give potential balance and unbalance conditions to operate the relay.

An extension of the duplex principle gives quadruplex working, a duplex system in which simultaneous transmission of 2 messages in each direction is possible over a single circuit. One message is given by the direction of current flow and the other by the actual current value.

High-speed Automatic Systems. In automatic systems (Creed, Wheatstone,

FIG. 6. SIMPLEX WORKING

used by the Brit. Post Office. The yoke, armature, and pole pieces are made of permalloy. The yoke is in 2 pieces, clamped together over the end of the armature, the magnetic circuit between the armature and the pole pieces being

Baudot) now in general use, the signals are transmitted by mechanical means. The Brit. Post Office now use the start-stop teleprinter system.

The Wheatstone automatic system (1867) is still in use to-day on submarine

cables, because of its speed superiority over teleprinter working. It is a development of the Morse system, and can work at some 300 words a minute. Three instruments are required: (1) a perforator for punching holes representing the Morse code in a paper tape; (2) a transmitter which sends out mark and space currents to line in accordance with the punched holes; (3) a receiver for recording the signals. The system may be worked simplex or duplex. The message is prepared on a paper tape, perforated according to the signals of the Morse code, the disposition of the punched holes about central guiding holes in the tape giving the dot or dash. The perforated strip is run through an automatic transmitter, which results in corresponding currents (mark or space) being transmitted to line. The receiver consists of a polarised relay with a tongue carrying an inked wheel which writes on a moving strip of paper; the message is translated by operators. In modern forms a reperforator is used to produce a perforated tape at the receiving end precisely similar to that at the transmitting end. This tape may be used to retransmit the message by passing it through an automatic transmitter connected to another circuit; or, by passing it through a suitably designed printing instrument, the message is recorded in Rom. characters.

The Creed keyboard perforator eliminates the perforation of the punched holes as a separate operation. The mechanism incorporates a keyboard similar to a typewriter, and operation of the keys causes a tape to be perforated in accordance with the Morse code. Sixty words a minute can be obtained with the keyboard perforator.

The Baudot system (1874) is a multiplex printing system worked double current. It uses a 5-unit code in which each character is made up of a combination of 5 currents, each current being positive or negative. A multiplex system is a multiple-way arrangement of sending 2 or more messages over the same line by the allocation of the exclusive use of the line in rapid succession. A number of operators are given the exclusive use of the line for a time sufficient to transmit 1 character (time-division multiplex).

Signals are transmitted and received by means of segmented distributors with contacting brushes rotated in synchronism at each end of the line. The distributors enable up to 6 operators to use the line during 1 revolution of the brushes around the distributors. Assuming 6 operators, the distributor periphery is divided into 6 sections, each serving 1 operator. Each section is further subdivided into 6 segments. The rotating brushes make contact with the corresponding segments in the respective sections at the same time. Each successive segment at each end is thus in circuit with the line for the short time the brushes rest on them and, during this time, information may be passed between the 2 segments.

Start-Stop Teleprinter Working. Modern inland telegraphic communication is now carried out by teleprinters. The teleprinter consists of (1) the transmitter, and (2) the receiver, which are mounted upon the 1 base and are driven by a small electric motor. The transmitter consists of (a) a keyboard, and (b) a transmitting unit, controlled by the keyboard, which transmits signals in the form of electrical impulses. The receiver part consists of (a) an electro-magnet, operated by the line signals, and (b) a mechanism which causes the character corresponding to the signals to be printed on a moving paper tape.

Modern teleprinter working uses the Murray 5-unit signal code. Here the signal time for each character is the same. Five electrical impulses of equal duration are transmitted for each character. Various formations of these impulses make up the different characters. In double-current working, space signals are positive battery and the mark negative battery. The maximum number of different characters that can be obtained is 32, and since it is necessary to transmit numerals and other characters as well as the alphabet, the machine is arranged to use the same combinations for figures as for letters. Start and stop pulses accompany every character combination. The motors run continuously, but when no signals are passing the transmitting and receiving mechanisms are at rest. When a key is depressed, both mechanisms make 1 revolution, during which time the start pulse, character combination, and stop pulse are sent. At the receiving end the start pulse sets the receiving mechanism in motion for 1 revolution. The character combination is received while the mechanism is in motion and finally the stop pulse is received. The start and stop signals obviate maintaining continuously correct phase relationship between the teleprinters at each end of the line such as is required in multiplex systems. The time for 1 revolution is approximately $\frac{1}{3}$ sec., and the system is capable of working at approximately 60 words a minute.

Where the traffic is too heavy for direct keyboard operation, automatic tape transmission may be used. The operator prepares the message, to the 5-unit code, on perforated tape. This is fed through an automatic tape transmitter which transmits the signals to line.

Repeaters. With d.c. signalling, the speed at which long circuits, having large values of capacitance and resistance, can be worked is limited. A repeater inserted in the line permits a greater speed, as the repeater effectively breaks the line up into a number of shorter links. The simple type consists of a relay receiving and retransmitting the signal to the receiving station. A regenerative repeater is one which accepts distorted signals and retransmits them free from distortion. This type has application in repeating Wheatstone signals to enable long submarine cable circuits to be extended via land lines.

Telegraph Signalling. Direct-current signals are subject to distortion. On

inland networks the modern method is to signal by a.c. in the voice-frequency range. Such signals can be passed over standard telephone trunk lines, amplified with thermionic valve amplifiers. Alternating-current signals retain their shape in transmission with sufficient accuracy almost without distance limit. The Brit. Post Office use a multi-channel voice-frequency signalling method for inland networks. In this system 18 channels are obtained on 1 line. Each channel has its own signalling frequency, which is transmitted within a narrow frequency band. The signalling bands are contained within the normal frequency band of a 4-wire telephone circuit.

Facsimile, or picture T., transmitting still pictures, or printed matter, over an electrical circuit, is now finding increasing application, particularly for press work. A typical technique incorporates a sender, which is arranged to scan the picture in a regular manner by means of a light-spot. The variations in tone of the picture are interpreted into variations in amplitude of a.c. passed to line to a receiver. Here a light from a constant source is arranged to fall on a piece of photographic material and scan this at exactly the same rate as the sender light-spot. The variation of incoming current from the line operates a light-valve, which controls the intensity of the light falling on the photographic material to reproduce the original picture. For T. systems see POST OFFICE; for submarine cables see CABLES; SIGNALING, MILITARY. See W. T. Perkins, *Telecommunications* (3rd ed.), 1948.

Tel-el-Kebir, or Tell-el-Kebir, vil. in N.E. Egypt, on the Freshwater Canal. It owes its fame to the fact that it was the scene of Wolseley's great victory over Arabi Pasha, 13 Sept. 1882. See WOLSELEY, G. J. W., VISCOUNT.

Telemachus, son of Ulysses and Penelope, a child when his father set out for Troy. After about 20 years he set sail in search of news of him. He visited Pylos and Sparta, and returned to Ithaca in time to help his father in the famous fight with the suitors.

Telemann, Georg Philipp (1681-1767), Ger. composer, b. Magdeburg. He studied languages and law at Leipzig Univ. and was mainly self-taught in music, but in 1704 secured the appointment of organist at the New Church there and founded a students' music society, the Collegium Musicum. After various appointments at Sorau, Eisenach, Frankfurt, and Bayreuth, he became music director of the Johanneum at Hamburg in 1721 and organist at the 5 prin. churches. He travelled a good deal, and sev. times visited Berlin and in 1737 Paris. T. was one of the masters of the late Baroque period. He demon-

strated that 'rococo' music could retain a purity and an unworldliness, while possessing a rich and complex form. His works include sev. operas and oratorios, chamber music, and church music. See life by E. Valentin, 1931; also H. Hörner, *Telemanns Hamburger Passionen* 1931; K. Schäfer, *Telemanns Klaviermusik*, 1931.

Telemark, fylke of Norway, on the S. coast. It is a mountainous region, with vast reserves of timber. Skien, bp. of Ibsen (his *Peer Gynt* has its setting in T.), is the cap. Industries include timber, paper, and chemicals. T. contains some of Norway's wildest and most picturesque scenery. Of particular interest is Rjukanfoss (415 ft), one of Europe's finest waterfalls, providing power for chemical works, etc. Pop. 136,000.

Telemeter, see RANGE-FINDER.

Telemetering, measurement of physical quantities, pressure, temperature, speed, currents, voltage, etc., on meters placed at a distance from where the phenomena occur that are measured, e.g. the operating characteristics of boiler plant, turbines, generators, and transformers in a power station indicated on meters in the control room.

Teleology, see KANT; HEGEL.

Teleostii, or **Teleostean**s, the largest group of bony-fishes (q.v.) consisting of about 25,000 living species. The scales and outer headbones are not faced with a shiny armouring of ganoin such as is found in most other Actinopterygii, 'ray-finned fishes,' the tail is typically symmetrical (homocercal), and each half of the lower jaw is formed only of 3 bones. The more primitive orders are the herring and salmon-like fishes (Isospondyli), the pikes and mud-minnows (Haplomi), the carps, characins, and catfishes (Ostariophysi), and the eels (Apodes). These are soft-rayed fishes with the swim-bladder opening into the foregut through a tube (pneumatic duct) and typically with abdominal pelvic fins. The Inlomi (lancet-fishes, lizard-fishes, Bombay duck, etc.), also soft-rayed fishes and mainly with abdominal fins, differ from the herrings and salmon group in that in the upper jaw the anterior jaw bones (premaxillae) exclude the posterior jaw bones (the maxillae) from the gape. The Syngnathii (gar-fishes, flying-fishes, etc.), the Microcyprini (toothed-carps), and the Anacanthini (cod-like fishes) are soft-rayed fishes with a closed swim-bladder. But while the pelvic fins are abdominal in position in the first 2 orders, in the cod-fishes these fins are placed below or in front of the pectoral fins. The pipe-fishes, sea-horses, snipe-fishes, etc. (order Solenichthyes), have the mouth at the end of a long, tube-like snout, the swim-bladder is closed and the pelvic fins are abdominal. A spinous dorsal fin may be present.

The other main orders of teleosts consist of spiny-finned fishes and their allies. The great group of spiny-finned fishes is the Percomorphi consisting of sev. thousand species. Spines are formed in the dorsal and anal fins, and the pelvic fins generally consist of a spine and 5 branched rays.

Included in this order are the perches, sea basses, cichlids, breams, red-mullets, drums, butterfly-fishes, wrasses, parrot-fishes, surgeon-fishes, mackerels and tunnies, gobies, blennies, dragonets, etc. The flat-fishes (Heterosomata) are clearly related to the Percomorphi, as is the order Plectognathi (trigger-fishes, file-fishes, globe-fishes, porcupine-fishes, sun-fishes, etc.). The angler-fishes (Pediculati) have a spinous dorsal fin of a few flexible rays, the first of which is set on top of the snout and is used as a line and bait. The deep-sea angler-fishes have a luminous bait. See also BONY-FISHES.

Telepathy, name given by F. W. H. Myers to the transference of knowledge from one mind to another without the use of any normal sensory channel of communication. The reality of this power was proved in the early days of the

From time to time performances of alleged T. are shown on the variety stage. It would be rash to assert that none of these performers has T. powers, or that they never use them on the stage. On the other hand, most of these performances depend on the use of codes or other means known to conjurers. In all cases the conditions of a stage performance are altogether unfavourable for critical determination of whether genuine T. has been used. See Prof. J. B. Rhine, *The Reach of the Mind*, 1948; R. Heywood and S. G. Soal, *Telepathy and Allied Phenomena*, 1948.

Telephony, system of reproducing sounds at a distance. Credit for the production of the first practical telephone is due to Alexander Graham Bell (q.v.). In Bell's original electro-magnetic telephone, the receiver and transmitter both con-

FIG. 1. MODERN INSET TRANSMITTER

FIG. 2. MODERN INSET RECEIVER

Society for Psychical Research, but it was generally supposed to be restricted to a few exceptional individuals. The more recent work of Prof. Rhine at Duke Univ. has shown that it is much more widespread than was at first supposed, and that the paranormal acquisition of knowledge is not restricted to what is in another person's mind, since a fact not known to any other person may also be known without the use of any normal sense channel. T. is thus only one example of a more general paranormal power of obtaining knowledge often now referred to as extra-sensory perception (or the *psi* capacity). Experimental work in extra-sensory perception is commonly done by a method of guessing the order of a pack of 25 cards containing 5 each of 5 symbols, and performing a statistical analysis of the results to discover whether more have been guessed right than can be accounted for by chance. Explanations of T. by unknown radiations acting on an unknown sense organ are now generally rejected. It seems necessary to make a more radical reorientation of the theory of the way in which knowledge is obtained.

sisted of an electro-magnet with a pivoted armature connected to the centre of a flexible diaphragm. The 2 instruments were connected together with a battery in circuit. The current in the electro-magnet windings produced a magnetic flux dependent on the reluctance of the air-gap between the end of the electro-magnet and the armature. Sound-waves created by speech vibrated the diaphragm, varying the reluctance. The fluctuations in the induced e.m.f. results in fluctuating current in the circuit, and thus in fluctuating excitation of the receiver electro-magnet. In the modern transmitter (Fig. 1) two carbon electrodes, connected to a d.c. source, are immersed in a chamber filled with carbon granules. The rear electrode is fixed and the front electrode attached to the centre of a light cone-shaped duralumin diaphragm clamped round its periphery. Vibration of the diaphragm due to speech moves the front electrode, thus varying the resistance of the granules (normally about 60 ohms) and hence the current.

The modern receiver (Fig. 2) is based on the Bell receiver.

In early telephone systems (Fig. 3) local batteries supply current to each transmitter, the transformers preventing the battery current from flowing in the external line. The a.c. components of the fluctuating current in the transformer primary (P) induce an alternating e.m.f.

FIG. 3. LOCAL BATTERY TELEPHONE CIRCUIT

into the secondary (S) circuit, which includes both receivers and the line.

MANUAL TELEPHONE EXCHANGE SYSTEMS.

Magneto System. The speech current is supplied by local batteries and the signalling by currents generated by the subscriber operating a small electric generator incorporated in the telephone instrument.

automatic, being controlled by the removal or replacement of the receiver.

Central Battery (C.B.) System. A central battery at the exchange supplies current for both speech and signalling; the signalling is automatic (Fig. 4). The load on the exchange is divided equally among the operators, and each attends to a certain number of subscribers. The line jacks and calling lamps of each group of subscribers appear in the home section of the switchboard in front of the respective operators. The operators answer the subscribers at the home section. As each subscriber must have access to any other subscriber on the exchange, all the subscribers' lines are multiplexed round the multiple section of the switchboard, so that they appear a number of times. Each appearance of all the lines in the multiple is arranged to be within arm's reach of each operator. The size of an exchange is controlled by the size of the multiple appearance accessible to each operator, and for this reason exchanges are limited to 10,000 subscribers. An operator ascertains that the required line is free or not by tapping the end of the calling plug on the required subscriber's multiple jack. If the subscriber is engaged the operator hears a click in her telephone; if free no click is given.

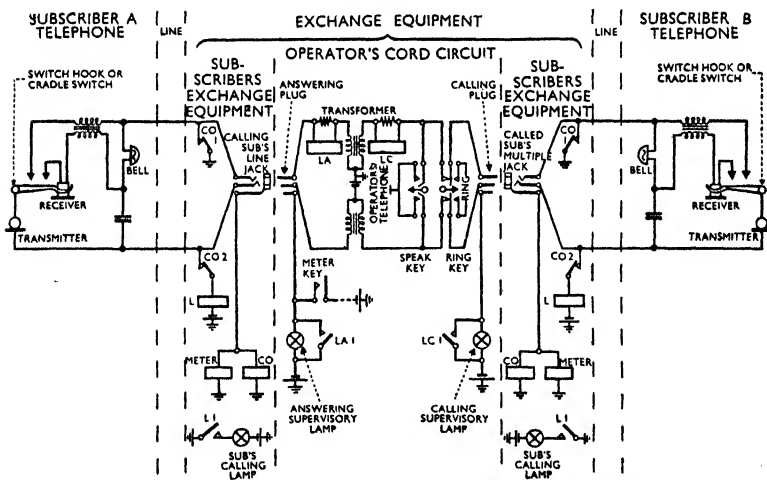

FIG. 4. CENTRAL BATTERY MANUAL EXCHANGE SYSTEM

The signalling currents operate electro-magnetic indicators on the operator's switchboard.

Central Battery Signalling (C.B.S.) System. The speech current is supplied by local batteries, but the signalling current for all the subscribers on the exchange is supplied by a central battery at the exchange. The signalling is

AUTOMATIC TELEPHONE EXCHANGES. In automatic working machine equipment at the exchange completes the call without the aid of an operator. The subscriber controls the exchange equipment by the operation of a dial which is part of the telephone instrument, although a certain number of operators are still required to assist the subscriber in case of difficulty,

trunk calls, etc. All automatic systems are based on the central battery system. In 1912 the first public automatic exchange in Great Britain was opened at Epsom. This exchange was based on the Strowger step-by-step principle.

In recent years the development of automatic systems has proceeded at a rapid rate, and there are now 5 prin. systems in use: (1) step-by-step (Strowger) system; (2) panel system; (3) crossbar system; (4) rotary system; and (5) relay system. Of these the step-by-step system is most widely used and is the present standard system of the Brit. Post Office.

Step-by-step (Strowger) System. The exchange equipment consists of: (1) line switches; (2) group selectors; and (3) final selectors. The operation is controlled by the subscriber's dial, which interrupts the current from the exchange at regular intervals, depending on the digit dialled. These electrical impulses operate the group and final selectors which seek out the called line and connect the calling line to it. The selector switch used in step-by-step systems is a 2-motion type in that it is actuated first vertically and then horizontally. The switch consists of 3 main units: (1) relays; (2) contact bank; and (3) switching mechanism, including wipers, shaft, and controlling magnets. Fig. 6 shows a typical telephone relay. The magnetic

group. The shaft raises the wipers to the horizontal level and then rotates the wipers over the level to the desired contact. The lower (line) bank contains 200 contacts arranged in 10 horizontal levels, each having 10 sets of 2 contacts each. In some cases the selector has 200, instead of 100, circuits wired to the bank, and there are 3 banks, 1 private and 2 line.

FIG. 6. MODERN TELEPHONE RELAY

The corresponding bank contacts of a group of Strowger switches are multiplied together to provide the same basic arrangement found in manual multiple switchboards. The subscriber's line is thus accessible from a number of switches.

The basic 2-motion switch mechanism consists of an electro-magnetic device that is capable of raising, rotating, and releasing a wiper-carrying shaft. The Strowger 2-motion selector consists of a central shaft carrying flexible spring wipers at the lower end. These springs make contact with the required bank contact by wiping over the level to which the shaft is raised—hence the name 'wipers.' Two notched ratchets, the vertical and rotary ratchets, are attached to the shaft. Two electro-magnets, the vertical and rotary magnets, by attracting their respective armatures, control the motion of the wiper-carrying shaft. When the vertical magnet is impulsed a pawl engages with the vertical ratchet, and the shaft (and wipers) is stepped vertically to the bank level corresponding to the digit dialled. When the rotary magnet is impulsed a pawl engages with the rotary ratchet and the wipers are rotated horizontally over the level to the desired contact. To release the selector the rotary action is continued until the wipers disengage from the bank. In this position the shaft falls, and when clear of the bank it is turned back to its normal position by a spring.

Line Switch. The line-switch mechanism is self-actuated and is independent of dialled impulses. The wipers move round a bank of contacts in 1 direction only, and for this reason the switch is

FIG. 5. DIAL

A, numbered dial; B, numbered and lettered dial. (One-third actual size.)

circuit consists of the coil core, the heel-piece, and the armature, all of good magnetic material. When a current flows in the coil the armature pivots on the knife-edge, and is attracted to the core face. The spring assembly is actuated by the armature and is arranged, by the making or breaking of the contacts, to provide the desired electrical circuit conditions.

The 2-motion switch bank consists of 2 banks (private and line) mounted at the bottom of the mechanism. The top (private) bank consists of 100 contacts arranged in 10 horizontal rows of 10 contacts each, arranged in a semi-cylindrical form so that a pair of wiper springs on the selector shaft may make connection with any contact in the 100

called a unselector. It searches for a subsequent switch wired to its contact bank. This subscriber's unselector automatically connects the calling line, wired to its wipers, to an idle 2-motion selector wired to its bank, when a call is initiated and before the subscriber commences to dial.

Exchange Trunking. A feature of the step-by-step system is the straight-forward decimal selection. The number of selector stages required depends on the number of subscribers on the exchange. Fig. 7 shows the trunking of a 100-line exchange. As all the subscribers on the exchange can appear on the bank of a

similar arrangements of the group and final selectors shown in Fig. 8 are provided, and a rank of 1st group selectors added so that the 1st group selectors in Fig. 8 now become 2nd group selectors, the capacity of the exchange is 10,000 lines. The size of automatic exchanges is usually limited to 10,000 lines. Extension of this selector-switch stage principle permits calls to be routed from exchange to exchange, and the ultimate objective of telephone administrations is to permit any subscriber, national or international, to be called by a system of long-distance dialling.

Basic Working. When the receiver is removed the subscriber's unselector

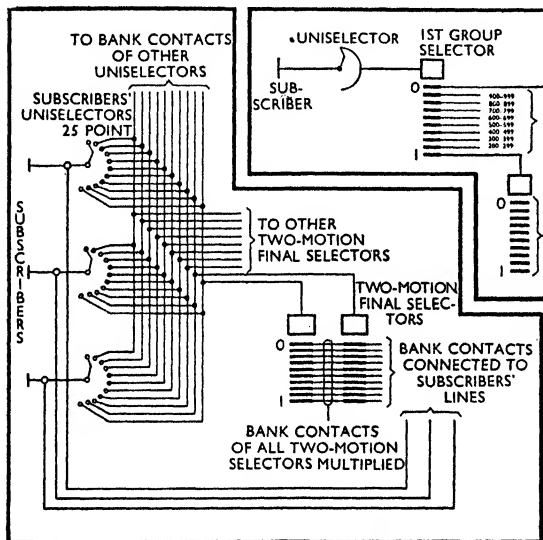

FIG. 8. TRUNKING DIAGRAM—1000-LINE EXCHANGE

FIG. 7. TRUNKING DIAGRAM—100-LINE EXCHANGE

2-motion switch only 1 selector stage, the final selector, is required. A number of selectors are multiplied together, the actual number depending on the traffic. The first (tons) dialled digit steps the final selector vertically, and the second (units) digit steps it rotary to the called line. The capacity of the exchange may be extended by additional switching stages known as group selectors, and Fig. 8 shows the trunking of a 1000-line exchange, which is regarded as consisting of 10 100-line groups. Access to a group is obtained by the additional switching stage, and 3 digits are dialled by the subscriber. The additional stage (1st group selector) steps vertically to the first (hundreds) dialled digit, and then hunts automatically over the level to find a free final selector in the particular hundreds group. The final selector responds vertically to the second (tens) dialled digit and rotary to the (units) digit. If 10

searches for and connects a 1st group selector to the calling subscriber's line. A dial tone is now transmitted to the subscriber, informing him that he may now dial. The dialled digits route the call through the sev. switching stages, and the wipers of the final selector are set on contacts to which the called line is connected. If the line is engaged, a busy tone is returned to the calling subscriber. If the line is free, the bell is rung by ringing current applied to the required subscriber's line from the final selector. At the same time a ring tone is transmitted to the calling subscriber to inform him that the required number is being rung. When the call is answered ring and ring tone are ceased, the call is automatically metered against the caller, and a speaking circuit is completed by the exchange equipment. The connection is held under the control of the calling party.

Multi-exchange Areas. In an area where the total number of subscribers does not exceed 10,000 and these are served by a number of exchanges, the traffic can be routed to the various exchanges from the 1st group selector levels.

Step-by-step System. Director Working. The director method of working is used for the large cities in Great Britain, in a number of areas in the U.S.A., and in other countries. In such areas 'tandem' working is adopted. Each exchange must be obtained by dialling a fixed code to permit a common directory to be used throughout the area. This involves the use of equipment which will automatically change the dialled code digits into other digits appropriate to the particular routings (translation). Each exchange must have a dialling code containing the same number of digits. Each code consists of 3 digits. In director areas subscribers dial a total of 7 digits, 3 code and 4 numerical. The 3 code digits for any exchange are the first 3 letters of the exchange name, and the dial used is of the type shown in Fig. 5(b), having letters as well as figures. The directory is so printed that the first 3 letters of the exchange name stand out in heavy type capitals (CENTRAL 2345). Director equipment is provided at each exchange in a director area, and the equipment is used to direct the call to the required exchange. The director receives all the digits dialled by the subscriber, translates the 3 code digits into 2-6 digits as necessary to route the call to the required exchange, and transmits these digits followed by the 4 non-translated numerical digits. Director equipment is required only during the setting up of a call; it releases after the numerical digits have been sent and becomes available for other calls.

The Panel Automatic Telephone System. The panel system is a development of the Western Electric Company Ltd. (Bell Laboratories), U.S.A., and is primarily for use in large areas. It is fitted in many areas in the U.S.A., including New York. The system differs from the Strowger in the basic design of its switch and bank, and in the fact that the switching functions are established largely by motor-driven units. The use of a motor drive requires indirect control of the switching equipment by register senders. The motor-driven switch mechanism carries contacting brushes vertically upward to establish a connection with the desired vertical bank contact field. The elevating members are under the control of electromagnetically operated clutches whose action is controlled by relays.

When the caller removes his receiver a line-finder motor-driven contacting brush is set in operation, and moves upwards into a bank of contacts to find the calling line. At the same time auxiliary equipment selects a sender and connects it temporarily to the calling line. The subscriber now receives the dial tone and dials. The dialled impulses are received by the sender and are trans. into pulses which control the operation of various selector mechanisms (called dist., office,

incoming, and final selectors) to establish a circuit through to the called line. A sender is in operation only for the setting up of the call, and then releases for use on other calls. A group of senders is common to the whole exchange. The selector frames are so arranged that as many as 500 sets of terminals can be made available to each selector.

The register sender is thus a device for translating the digits dialled by the subscriber into information to control selection through the switching stages. The device is necessary, as the panel system is not a direct-action decimal selection system under the control of the dial. The code routing digits are trans. to facilitate flexible tandem routing through the network.

The Crossbar Automatic Telephone System. The Bell Laboratories developed the crossbar system to supersede the panel system. The crossbar system is similar to the panel system in that it makes use of a sender. It consists wholly of relay type crossbar switches and multi-contact relays. Connections between the subscriber's lines are accomplished by the operation, controlled by senders and markers, of the crossbar units. The system has a sender-marker method of control which permits apparatus, common to all the subscribers, to be used to set up the call to the required subscriber, then released prior to the speech period.

The crossbar switch consists of (1) 20 separate vertical circuit paths; (2) 10 separate horizontal circuit paths; and (3) a mechanical means for connecting any one of the 20 vertical paths to any one of the 10 horizontal paths by the operation of electro-magnets.

FIG. 9. PRINCIPLE OF THE CROSSBAR SWITCH

Fig. 9 shows the schematic arrangement of the switch, and 10 simultaneous connections can be established on each horizontal path. The number of lines that can be connected to the same 10 trunks may be increased by adding other switches wired to different groups of 20 lines and connecting the horizontal contacts in multiple to other switches. The assembly of switches is called a link frame.

The Rotary Automatic Telephone System. This is used in some European and S. Amer. countries, and in some centres in the U.S.A. The switches are unselector type. The operating mechanism consists of a motor-driven shaft to which the

wipers of the sev. switches in a group are geared. The driving mechanism is placed in operation by means of an electromagnetic clutch which brings a flexible gear into temporary contact with the shaft driving gear. The register in the rotary system operates in much the same manner as the sender in the panel system. Power-driven rotary line-finder switches locate the calling line and extend it temporarily to the register. The register receives all the dialled impulses from the calling subscriber, stores and translates them, and then transmits pulses to control the operation of the subsequent power-driven numerical selecting switches to find the required subscriber's line. The selectors have a bank capacity of 200 or 300 circuits, arranged in 10 levels of 20 or 30 circuits each. They have 1 set of wipers for each level, and an auxiliary shaft to select 1 of the 10 sets of wipers.

Automatic Trunk and Toll Working. The usual present method of trunk and toll working on automatic networks is for an outgoing controlling operator to dial the required subscriber over the network, and record particulars of the call on a ticket which is then used for costing purposes. Increasing use is being made of automatic ticketing of calls to permit direct trunk subscriber-to-subscriber dialling. This facility requires equipment to identify the calling line and an automatic ticketing machine which may produce a printed ticket, or a punched tape, recording all particulars of the call, including the charge.

Other telephone administrations, particularly in Europe, have adopted a repeat metering process whereby the normal subscriber's meter is automatically operated a number of times for each call. The number of operations depends on the distance and duration of the call, and is automatically determined by equipment. One meter operation is regarded as the unit charge for a local call.

LINE PLANT. Telephone lines may be overhead or underground. Overhead lines are bare copper wire, supported by porcelain or glass insulators mounted on poles. In general, modern practice is to lay underground cables (q.v.) which are of the paper-insulated or co-axial type.

Line plant is expensive, and often a system of carrier working is adopted to increase the circuit-carrying capacity of a single line. Carrier working permits a better utilisation of the frequency band which a line is capable of transmitting. A line may transmit a frequency band which is many times that required for commercial speech, and it is possible to form a number of speech circuits on the one line by shifting the speech frequencies of each subscriber to another band (modulation, q.v.) and demodulating at the receiving end. Up to 24 channels per line may be obtained on ordinary underground cable circuits. The separation of the various carrier channels at each end of the line is performed by electric wavefilters.

Recent development in thermionic-valve (see VALVES) amplifier design has

made it possible to use wide-band transmission systems, where hundreds of carrier channels may be carried on one line. Wide-band systems require co-axial cables. The outer conductor is a copper tube, the inner conductor is a bare copper wire kept in the centre of the tube by insulating spacers. The 2 conductors so formed constitute the pair of a circuit, and 2 such tubes are required to form a 4-wire circuit. At the high frequencies used in wide-band systems the cable becomes a waveguide (q.v.). In submarine co-axial cables the insulation is solid, usually paraggutta, on account of the great pressures.

STATISTICS. The U.S.A. is by far the greatest telephone user in the world, having over half the total world telephones.

Teleprinters, see TELEGRAPHY.

Telescope. The first T. was probably made by the Dutchman Lippershey in 1608, although Galileo in 1609 constructed the first of his famous T.s and commenced astronomical observations at the beginning of the year 1610. Roger Bacon, who lived during the 13th cent., is often credited with the invention of the T.; while this statement is probably erroneous, it is remarkable to notice that the germ of the function of a T. is contained in his writings. The apparent size of an object depends solely on the angle it subtends at the eye; thus a sixpence may appear as large as or larger than the sun if it is held at such a distance that it subtends an angle at the eye as great as or greater than does the sun. The function of a T. is, then, to increase the angle subtended by an object at the eye, and as a result 2 things are judged to occur: (1) the object seems magnified; (2) the object seems to be brought nearer. The effect is, of course, a subjective one, for if we view a man 1 m. away through a T. and find that he appears to be 6 times as tall as when viewed by the naked eye, we estimate his distance as 4 m.

Magnifying Power. The magnifying power of a T. is defined as the ratio of the angle subtended at the eye by the image viewed through the T. to the angle subtended at the naked eye by the object. Field-glasses commonly have a magnifying power of 8, while some of the finest astronomical T.s have magnifying powers of the order of 1000. The principle of the simple astronomical T. can be seen by referring to Fig. 1. It consists of a convex lens (C) of long focal length, called the objective, and a convex lens of short focal length, called the eyepiece. In order to show quite plainly how it works, a parallel beam is shown entering the objective in a direction inclined to the axis of the T.; such a beam would, for instance, fall on the T. from the edge of the

sun when the axis of the T. was pointing at the centre of the sun. The objective forms a real, inverted image at P, below F, its prin. focus, and the eyepiece is moved so that F is at a slightly smaller distance from it than the focal length of the eyepiece, the focus of which is f , in order to form a virtual image at X, 25 cm. away from the eye, i.e. at the east distance of distinct vision. With-

bination consisting of a convex lens of crown glass placed in contact with a weaker concave lens of flint glass that partially corrected the dispersion produced by the convex lens, the combination behaving as a weaker convex lens. Since that time, the study of achromatic combinations has made so much progress that the Yerkes T., the largest refracting T. in the world (40 in.), is constructed on

FIG. 1. PRINCIPLE OF SIMPLE ASTRONOMICAL TELESCOPE

out the instrument the angle subtended at the eye by the radius of the sun would

be \widehat{SCO} , but with the instrument, the angle subtended by the radius of the

image of the sun is increased to \widehat{CEX} , hence the sun appears to be greatly enlarged. The objective and eyepiece are mounted in a tube whose walls are blackened on the inside to prevent confusion arising from light reflected by the walls of the tube. The instrument described above has 2 serious defects, viz. the image suffers from *spherical aberration*

the essential principles of the simple astronomical or refracting T. Various forms of eyepieces are used instead of the single convex lens in order to obtain greater magnification without the defects of aberration.

Galileo's T. is the prototype of modern opera-glasses. The astronomical T. produces an inverted image; this is immaterial for astronomical observations, but it renders the instrument useless for terrestrial work. The simple pattern of the Galilean T. is shown in Fig. 2. The objective (O) is a convex lens of comparatively long focal length, and the eye-

FIG. 2. PRINCIPLE OF GALILEAN TELESCOPE

(q.v.) and *chromatic aberration* (q.v.). Spherical aberration arises from the fact that a point object does not give rise to a point image when a single lens is used. The defect can be remedied by using stops and by using a compound lens. Chromatic aberration is due to the fact that the focal length of a simple lens is different for each of the coloured components of white light. The image produced is tinged with colours at its edges. The attempts to remedy this defect were completely unsuccessful until 1758, when Dollond discovered an achromatic com-

piece (E) is a concave lens of short focal length. The rays from the objective fall on E, and the final image formed by this concave lens is at XY, a virtual and erect image. The eye has, of course, been enlarged in the diagram for convenience. This instrument requires correction for spherical and chromatic aberration in a similar way to the simple astronomical T.

Reflecting Telescopes. Newton despaired of making a refracting T. free from chromatic aberration, and he designed the first reflecting T. on the lines shown in Fig. 3. M is a concave mirror of large

radius of curvature; its prin. focus is at F . Light from a distant star is reflected at M and the reflected beam converges towards I , a point vertically below F . A plane mirror m inclined at 45° to the axis of the instrument intercepts this beam and the real image is formed at f . This image is viewed by the eyepiece and the final image seen by the observer is a virtual one at I' .

FIG. 3.
PRINCIPLE OF NEWTON'S
REFLECTING TELESCOPE

All subsequent reflecting T.s were modifications of Newton's, a famous one being that of Herschel, the great Brit. astronomer of the 18th cent. The 100-in. T. of the Mt Wilson Observatory, the second largest instrument to-day, is a reflecting T. The mirror, instead of being truly spherical, is 'parabolised' in order to avoid the aberration of a spherical mirror, and it is silvered on its front surface by a process of chemical deposition. In this way the silver can be renewed whenever desired. The mirrors of reflecting T.s are usually aluminised instead of silvered, and better results are obtained. A still larger T. with a mirror of diameter 200 in. is now in operation at Mt Palomar, California.

Brightness of Objects. In no case can objects such as the moon or sun appear brighter through a T. than they do when viewed by the naked eye, and if the losses of light by reflection or refraction are taken into account, the apparent brightness of such objects is actually diminished when viewed through a T. But this statement does not apply to the case of stars, whose apparent size is so small that diffraction effects are produced (see below). Under the best conditions the apparent brightness of stars viewed through a T. varies directly as the square of the diameter of the objective, and with the largest modern T.s stars appear about 100,000 times as bright when viewed through the instrument. As the brightness of the sky is not increased, it is possible to view stars in daylight.

Resolving Power. A star seen through a T. appears as a central bright disk of

light which is surrounded by alternate dark and bright diffraction rings. Two stars can be recognised as distinct stars, provided that the centre of the bright disk of one falls on the first dark ring of the other. If the stars are closer than this they cannot be distinguished as separate stars; if farther apart they are the more easily distinguished. The limit mentioned is known as the limit of resolution. It can be shown that the angle subtended at the centre of the objective by 2 stars that can just be resolved is 1.22λ

$\frac{D}{\lambda}$, where λ is the wavelength of the light and D is the diameter of the objective. Hence the greater the D is, the greater the resolving power of the T.; in point of fact, the above fraction is adopted as the quantitative measurement of the resolving power of a T. The Yerkes T. can resolve 2 stars that subtend an angle of only $\frac{1}{2}$ sec. of arc at the centre of its objective. Michelson (q.v.) invented a form of interferometer (q.v.) attachment to the Mt Wilson T. that increased the resolving power of the instrument sev. times and made it possible to measure directly the angular diameters of some of the larger stars.

In astrophysical research a spectrometer attachment replaces the ordinary eyepiece, while permanent records are obtained by means of a spectrograph attachment, whereby the spectra are photographed. Cameras are fitted to T.s in all observatories, as it is possible to obtain prolonged exposures of any part of the heavens by means of a clockwork arrangement that keeps the instrument directed to a given area of the sky. Photographic records taken in this way reveal much more information than may be obtained by ordinary visual observation. See also RADIO ASTRONOMY.

Teletich, see ACROSTIC.

Television is the transmission and visible reproduction of pictures or scenes by line or radiocommunication (q.v.).

History. The earliest practical demonstration of T. was given by J. L. Baird (q.v.) before the Royal Institution in 1926. In 1928 the Brit. Broadcasting Corporation experimented with the transmission of still pictures, using the 'fultograph,' and in the same year Baird transmitted a low-definition picture by radio to the U.S.A. In 1929 Baird commenced an experimental low-definition service from the Crystal Palace, and in Aug. 1932 the B.B.C. conducted tests in conjunction with the Baird Company, using a 30-line system radiated from the Brookman's Park station. The postmaster-general appointed a Television Advisory Committee in 1934 to determine which system should be followed for a public service. They recommended the abandoning of low-definition T., and accordingly, in Sept. 1935, the B.B.C. transmissions ceased. The first high-

definition T. service in the world began in Nov. 1936 with the opening of the B.B.C.'s station at Alexandra Palace, *see* TELEVISION, B.B.C.; INDEPENDENT TELEVISION AUTHORITY.

Scanning. The subject-matter to be 'televised' is scanned electrically, the

FIG. 1. SIMPLE CAMERA TUBE

resulting signals being transmitted for subsequent reconstitution at the receiver into an image. The scanning process takes place: (1) at the transmitter, where the image is broken down, and (2) at the receiver, where the cycle follows that at the transmitter and is synchronised with it by means of synchronising signals transmitted with the picture.

Scanning for Transmission. The scene to be transmitted is projected by a lens arrangement in the T. camera on a flat

intensity falling upon it, so that the surface carries an electrical 'picture' of the image focused upon it. An electron-gun assembly, similar to that of a cathode-ray tube

FIG. 2. 'RASTER' FORMATION, SHOWING INTERLACE

Typical fly-back lines are shown dotted.

(q.v.), projects a stream of electrons towards the mosaic. This stream is deflected by time-bases (q.v.), so that it scans the whole surface of the plate. As

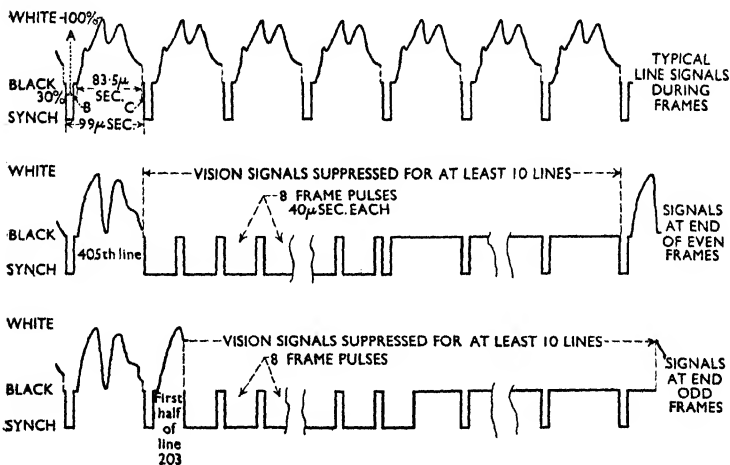

FIG. 3. B.B.C. TELEVISION TRANSMITTED WAVE FORM

A, 10 μ sec.; B, 5 μ sec.; C, 0.5 μ sec.

rectangular plate suspended within the tube (Fig. 1). The surface of this plate is a mosaic of photo-electric silver-caesium cells, each of which is microscopic in size and separated by an insulating film from a metal back plate. When the image is projected on this mosaic each cell takes up an electric charge proportional to the light

the beam passes over each cell it is discharged, transmitting to the back plate an impulse equivalent to the charge on the cell. In this way the output from the camera tube is an electrically varying current which represents, line by line and frame by frame, the make-up of light and shade in the picture.

Scanning at the Receiver. This is carried out by the moving electron beam in the cathode-ray tube, which is deflected in synchronism with that in the camera tube. Two time-bases are used, a horizontal ('line time-base') and one causing vertical deflection ('the frame time-base'). These operate in the same manner as those in an oscillograph (q.v.). The frequency of the line time-base for the Brit. T. system is 10,125 c/s, which means that 405 oscillations are completed each $\frac{1}{50}$ sec. While this is taking place the frame time-base applies its deflecting voltage at right angles to the horizontal lines drawn on the tube by the line time-base. The frequency of the frame time-base is 50 c/s, so that during one complete oscillation the line time-base completes only $202\frac{1}{2}$ lines. At the centre of the 203rd line the downward motion of the beam ceases and the frame time-base cycle starts again, so that a further $202\frac{1}{2}$ lines are completed, but interlaced with the first $202\frac{1}{2}$. This gives a completed picture of 405 lines in $\frac{1}{50}$ sec. (Fig. 2). The full frame is made up of two interlaced halves. This reduces the flicker of the repeating frames. The completed rectangle so reproduced on the face of the cathode-ray tube is called the *Raster*.

The B.B.C. Television Wave Form. Both line and frame synchronising signals are essential to ensure that the receiver time-bases are in step with those of the camera tube. The actual picture signal accompanying these must be capable of transmitting all the details of light and shade present in the camera, and in practice frequencies up to 3 Mc/s must be transmitted to give approximately equal definition in the horizontal and vertical directions. Positive modulation is used such that peak 'white' in the picture is represented by 100 per cent modulation of the carrier, 'black' by 30 per cent \pm 3 per cent, with the intermediate shades in between. Between zero and 30 per cent is used for transmitting the synchronising signals (often called synch pulses), which, being 'black' than black, do not appear on the *Raster*. Fig. 3 shows in graphical form, how these signals are disposed, relative to each other, in the final wave form.

The line pulses are of 10 μ s (microsec.) duration, separated from the picture wave form itself by a blank period of 5 μ s in front and 0.5 μ s behind. Frame pulses are 40 μ s long, so that the frame and half-frame synchronising signals are made up of 8 such pulses separated by 10 μ s intervals. To accommodate the frame and half-frame signals described, at least 10 lines of the *Raster* are suppressed at each half-frame, so that a 405-line picture possesses 385 active lines of picture material, i.e. lines 1-4 are occupied by 8 frame pulses, the following 6-10 lines being 'black', separated simply by the usual line pulses, and then the picture lines begin. At 202½ lines the frame pulses are repeated, interlace is effected, and the remainder of the *Raster* is built up to give the completed picture. The ratio of height to width is 3:4.

Film Scanners. Increasing use of cinematograph film is being made in compiling T. programmes. Modern film scanners have been developed especially for T. transmission in which the film moves through the 'gate' at a constant speed, and scanning is accomplished by means of a 'flying spot' scanner. The latter, in its simplest form, produces a *Raster* on the screen of a special cathode-ray tube operated to give a very bright image. Nothing except the lines of the *Raster* appear on the tube screen, but these are focused on the film in the gate behind which a photo-cell picks up the light passing through the film as the flying spot on the scanning tube builds up the *Raster*.

Other Television Systems. Great Britain was the first country to inaugurate a public high-definition service; others with projected and existing T. stations include the U.S.A., where many are on daily schedules. The Amer. wave form differs from the Brit. in sev. respects: Negative modulation is used to transmit an interlaced picture of 525 lines and 30 frames. The accompanying sound is broadcast, using frequency modulation (see MODULATION). The Netherlands Philips Company operate an experimental system at Eindhoven similar to the Amer. but of 625 lines and 25 frames, while the French favour 819 lines and 25 frames. Sev.

Photograph taken from the screen of a picture monitor at the B.B.C. studios.

attempts are being made to reach an agreed standard for Europe, so that programmes can be exchanged internationally. To do this it is essential that the number of lines and frames be the same even if the direction of modulation is

different, as the latter can be converted for relay purposes.

Receiving Aerials. Because the wavelength for any T. station is short a resonant aerial becomes possible, and this usually consists of a half-wave aerial made of light alloy or steel tube, and fed at the centre with low-impedance co-axial or balanced cable. Greater gain is obtained if a reflector element be added, and quite complicated arrays are used in areas of weak signal strength (see BEAM WIRELESS). These aerials are mounted either vertically or horizontally to conform with the polarisation of the transmitting aerials. Tubing is used for the elements, since an aerial made of wire would be too sharply resonant, with resulting loss of bandwidth, and therefore poor picture definition.

Receivers. Receivers (see RECEIVERS, RADIO) used for broadcast reception are tuned radio frequency (T.R.F.) or 'superhet' (superheterodyne); the latter is more common. T. receivers exist in both varieties, and the tendency is also to favour the superhet. Their main characteristics are that they should have sufficient sensitivity; the band-width accepted should be wide enough to reproduce all the picture detail; the time-bases should lock easily and not respond to impulsive interference; both vision and sound channels should also discriminate against such interference; and, finally, the picture should be sharply focused and bright, with correct grading of half-tones.

The T.R.F. receiver accepts the vision and sound signals at their carrier frequencies and amplifies them directly. Separate channels are used for sound and vision, following a common R.F. amplifier (see VALVES), and each has its separate detector. After detection the receiver operation becomes identical with that of the superhet. More stages of amplification are necessary than in a broadcast set.

In a superhet receiver the first valve is an R.F. amplifier accepting both sound and vision channels. Next follow one or two mixer valves, but only one oscillator is used. This oscillator beats with the sound and vision carriers to give 2 intermediate frequencies (I.F.), which are then fed to separate I.F. amplifier valves. The vision I.F. containing 1, or both sidebands, may have 2 or 3 subharmonic valves, while the sound is sufficiently amplified by 1 or 2. The vision (or 'video') signal is detected, amplified, and passed to the electrode of the cathode-ray tube which controls the intensity of the beam, and hence the light and shade of the picture. At the same time, the processes of 'synchronisation' and 'd.c. restoration' are performed. The synchronisation removes the synchronising signals from the video signal existing after detection discriminating between line and frame signals, and passing them to their respective time-bases. The d.c. restorer sets the 'black level' of the tube at zero potential, and by fixing it ensures that the video signals above 'black' in the picture are positive. In addition to the normal voltages common to other valves in the

receiver, a source of 'extra high tension' is necessary, which may be between 5 and 10 kV in a domestic receiver. Most present-day receivers employ 'line fly-back' making use of the fact that, on the horizontal return stroke of the beam, a very rapid change of current takes place in the winding of the line transformer which, possessing appreciable inductance, opposes this change so that a h.v. pulse appears across it. This pulse can be rectified, voltage doubled or trebled, smoothed and used for the final anode of the cathode-ray tube. Another system employs a separate R.F. oscillator having a sinusoidal wave form, which after amplification is passed through a peak rectifier, and thus the necessary E.H.T. is obtained.

A, loudspeaker; B, cathode-ray tube; C, deflection-coil assembly; D, focus coil; E, one of four main control knobs; F, E.H.T. rectifier; G, line-output transformer; H, time-base pre-set controls.

Big Screen Receivers and Projection Television. Before 1939 2 Brit. manufacturers demonstrated big-screen pictures successfully. The more remarkable was that produced by the Scophony Company, using high-precision mechanical scanning to give a bright picture which was projected on a cinema screen. The mechanical scanner, however, was very expensive and required skilled operation.

Projection T. is the system whereby pictures are thrown by optical means from the face of a small cathode-ray tube on to a much larger screen. Early attempts used projection lenses, but they lacked sufficient brilliance. A more recent development makes use of a Schmidt mirror lens arrangement. The light-path is 'folded' (Fig. 4) so that the whole

assembly becomes compact enough for inclusion in a domestic receiver cabinet. The picture is produced at AB on the tube face C, which is $2\frac{1}{2}$ in. in diameter; it is reflected by spherical mirror D to the plane mirror E through which the tube projects. Interposed between E and the second plane mirror G is a weak lens or 'corrector plate' which counteracts the spherical aberration introduced by D. The picture JK is reproduced by back projection on the screen H; 25 kV at 100 μ A are used for the final anode of the tube, whose screen is aluminium backed to give an intense black-and-white picture. Fig. 3 shows the optical unit from which the tube neck projects surrounded by (but not shown in the diagram) the focus and deflection coils. The picture possesses good brilliance, excellent tone gradation, and is almost independent of ambient light in front of the screen.

FIG. 4. DIAGRAM OF THE MULLARD TELEVISION PROJECTION SYSTEM, USING THE SCHMIDT PRINCIPLE

The folding of the optical path reduces cabinet dimensions. The correction lens between the two 45° mirrors corrects the spherical aberrations.

Mullard Electronic Products Ltd.

Colour Television. J. L. Baird was an early pioneer in this direction, and one of the first techniques developed employed a system whereby the normal frame frequency was increased by a factor of 3, each successive frame containing the material for one primary colour. The receiver used revolving colour disks in front of the viewing screen, synchronised with the correct frame colours at the camera. A similar system replaced the colour disks by 3 superimposed projected pictures corresponding to the 3 primary colours. In 1949 the Radio Corporation of America produced a 6 Mc/s compatible high-definition colour 'T' system which, it is claimed, requires no wider frequency band than for a monochrome picture, and enables standard monochrome receivers to accept the same signal without modification.

Its main use is on closed-wire circuits, e.g. in a teaching hospital where a camera over the operating table can transmit images in full colour to a number of receivers located at a remote point where students can follow in close-up detail the operation being performed.

Reception, 1949; M. Gorham, *Television*, 1949; British Broadcasting Corporation, *The B.B.C. Television Service: a Technical Description*, 1950; J. Swift, *Adventure in Vision*, 1950; Jan Bussell, *The Art of Television*, 1952; F. J. Camm, *Television Principles and Practice*, 1955; A. Swinson, *Writing for Television*, 1955; H. Bettinger, *Television Techniques*, 1957. See also BROADCASTING.

Television, B.B.C. The B.B.C. began the first public service of high-definition television in the world from the Alexandra Palace, London, on 2 Nov. 1936. By the outbreak of the Second World War, when this television broadcasting service had to cease for reasons of national emergency, there were approximately 20,000 receiving sets in Britain. The B.B.C. television service reopened in June 1946.

The second charter granted to the B.B.C. in 1937 entrusted the B.B.C. with

television broadcasting, in accordance with the recommendations of Lord Selsdon's Television Committee of 1934 which was endorsed by the Report of Lord Ullswater's Committee of 1935. The licence, which the B.B.C. is required under its charter to acquire from the postmaster-general, does not permit the B.B.C. to derive any revenue from advertising in programmes. Commercial advertisements and sponsored programmes are debarred.

In December 1957 eighteen transmitting stations capable of reaching some 98 per cent of the pop. were in operation—a higher proportion of national coverage than has been achieved in any other country—and over 7,000,000 receiving sets were in use.

The transmitters in operation at the end of 1957 were:

Transmitter	Area Served
Crystal Palace	London and the Home Cos.
Sutton Coldfield	Midland Cos.
Holme Moss	N. of England
Kirk o'Shotts	Central Scotland
Wenvoe	S. Wales and part of W. of England

Television

<i>Transmitter</i>	<i>Area Served</i>
Divis	Major part of N. Ireland
Meldrum	N.E. Scotland
Pontop Pike	N.E. England
North Hessary Tor	Devon and Cornwall
Rowridge	S. England (Dorset, Hampshire, W. Sussex)
Norwich	E. Anglia
Londonderry	NW. parts of N. Ireland
Rosemarkie	Moray Firth
Blaen-plwyf	West Wales
Sandale	Westmorland, Cumberland, and SW. Scotland
Douglas (I.O.M.)	Isle of Man
Les Platons	Channel Is.
Truleigh Hill (temporary)	Brighton, Hove

B.B.C.

B.B.C. CRYSTAL PALACE TELEVISION TRANSMITTING STATION

Transmitting mast under construction.

By 1957 regional studio facilities were available in Manchester, Birmingham, Bristol, Glasgow, and Cardiff. Mobile television units were serving in Scotland, Wales and the Midlands, N. and W. regions of England. Film-making resources were available in N. Ireland.

The B.B.C. applied to the gov. in July 1955 for the allocation of frequencies in

Television

Band III in order to provide a second television service, which it deems essential to the fulfilment of the requirements of the charter, that is, to provide a complete service to 'disseminate information, education and entertainment.' The postmaster-general announced in Feb. 1956 that the gov. had decided to defer consideration of any additional television programme for 2 years.

On its single programme, the B.B.C. transmits some 55 hrs a week. The maximum permitted by the postmaster-general, the authority prescribing hours of broadcasting in Britain, is 50 basic hours with extensions for specific purposes. This service aims at providing as far as possible the balance prescribed in the charter, and caters both for the majority and for minorities. Of the total of 15,335 staff employed by the B.B.C., some 4137 were engaged exclusively on work for the Television Service (figures at Mar. 1958).

In its television services the B.B.C. broadcasts in a year more than 4000 items. In 1956-7 B.B.C. television broadcasting was approximately 2794 hrs. The cost per hour was calculated at some £3,256. Programmes and engineering absorbed 47 and 38 per cent respectively of the total expenditure for the year 1956-7—£9,096,000. Television news, which was first presented as a 20-min. illustrated news bulletin in 1954, now appears in sev. nightly eds. Drama, music, and light entertainment programmes account for approximately 33 per cent of the output, while sport and outside broadcasts covering important occasions and interesting events make up another quarter of the programme output. Programmes for women and children, religious programmes, and many discussion programmes on current affairs are also provided. At the request of the School Broadcasting Council, the B.B.C. began a service of programmes for schools on television in the autumn of 1957. (School broadcasts in sound are now received by some 29,000 schools.)

The B.B.C., with the co-operation of broadcasting organisations on the Continent, has successfully developed television programme exchanges with some 9 countries, with the participation of up to 14 networks. In Sept. 1955 the first part of a permanent 2-way television link between England and France was completed. This section consists of co-axial cables joining London with the coast at St Margaret's Bay, in Kent. The next section, which is expected to be ready before 1959, will be a permanent 2-way radio link across the Channel. A temporary 2-way radio link across the Channel, installed and operated by the B.B.C. and Radiodiffusion-Télévision Française, is in operation. The Eurovision exchanges developed after the highly successful Coronation television broadcasts of 1953, when B.B.C. television programmes were relayed by 12 television transmitters in France, the Netherlands, W. Germany, and Berlin. It was estimated that the audiences for the

Coronation television broadcasts amounted to some 20,000,000 in the U.K. alone.

Colour Television. The B.B.C. has done considerable research into colour television. Experimental test transmissions from Alexandra Palace were begun in Oct. 1955. Two further series of test transmissions were carried out in 1956 and 1957. A fourth series began in Oct. 1957. The B.B.C. is not committed to a compatible system, that is, one in which the colour signals may be received as a black-and-white picture on monochrome

son of an Eskdale shepherd, and apprenticed to a local stone-mason when 14 years old. He went to Edinburgh in 1780, and to London and Portsmouth in 1784. T. built the Severn bridges at Montford and Buildwas, 1793-6; the Ellesmere Canal, 1796-1801; the Caledonian Canal, 1801-23, and in the same period over 1000 m. of road and 1200 bridges throughout Scotland. His greatest achievement was the improvement of the London-Holyhead road with the building of the Menai suspension bridge.

receivers, nor is it committed to the non-compatible, that is, those which can be received only on a colour receiver. The first B.B.C. tests were made on a Brit. version of the National Television System Committee system, which is compatible. The decision as to the system to be used will be a matter for the postmaster-general, advised by the Television Advisory Committee. In April 1956 the B.B.C. demonstrated its work on colour television to a study group formed by the C.C.I.R. (the International Consultative Committee on Radio Communications) and in Jan. 1957 two demonstrations were given at the Palace of Westminster for the benefit of Members of both Houses of Parliament. *See also* BROADCASTING; INDEPENDENT TELEVISION AUTHORITY.

Telford, Thomas (1757-1834), civil engineer, b. Wester Kirk, Dumfriesshire,

He also did much harbour work in Scotland; he built St Katherine Dock, London; the Gotha Canal, Sweden; and designed the Warsaw frontier road for Tsar Alexander. A man of talent, wholly self-educated, T. often gave his services gratuitously. He was one of the founders of The Institution of Civil Engineers (1818), and was its first president. He is buried in Westminster Abbey. His autobiography was pub. in 1838. *See* L. T. C. Rolt, *Thomas Telford*, 1958.

Tell, William, national hero of Switzerland. The story in the form which first appears in a chronicle written between 1467 and 1476 would appear to be largely legendary, but sev. Swiss critics suggest that T. did really live, and that he may have played some part in the rising of the Inner Cantons against the tyranny of

the Hapsburgs at the beginning of the 14th cent., though his importance has been greatly exaggerated in the legends that remain, and his real character has been obscured by a confusion with old folk-themes. The prin. source of the life and deeds of T. is the *Chronicon Helveticum* of Aegidius Tschudi (1505-72), which is even more embellished. From this Schiller took his drama *Wilhelm Tell*, 1804. The story centres on the struggle for independence of the cantons of Uri, Schwyz, and Unterwalden, and is as follows: T. having refused to do homage to the ducal hat which Gessler, the Austrian governor, set up for the purpose in the market-place of Altdorf, was taken prisoner, and on being brought before the landgrave was promised his liberty if he could shoot an apple in two, placed on his son's head, at the distance of 80 paces. He accomplished the task, but confessed on compulsion that the other arrow in his hand was meant for Gessler's heart had he killed his son, whereupon he was again seized and taken on the lake bound for Küssnacht Castle. But a storm having arisen, T. was asked to steer the ship, and while doing so effected his escape. He sprang ashore, pushing the boat back from the shore by his spring, an incident which has given its name to a place, the Telleprung. He afterwards killed the landgrave, and his actions became symbolic of the courage of the Inner Cantons in their struggle against the Hapsburgs. See F. Schiller, *Wilhelm Tell* (trans. by A. Latham, Temple Classics). See also P. Lang, *Die Schweizer Tellspele*, 1924; F. Gropengießer, *Wilhelm Tell in der Schweiz, Geschichtsschreibung*, 1940; K. Meyer, *Der Ursprung der Eidgenossenschaft*, 1941; R. Labhart, *Wilhelm Tell als Patriot und Revolutionär*, 1947.

Tell, see ALGERIA; TUNIS.

Tell Basta, see BUBASTIS.

Tell el Amarna, modern name of anct site on E. bank of Nile about 180 m. S. of Cairo. The ruins are those of Akhetaton, the capital of Akhnaton (q.v.), who built it c. 1360 BC to replace Thebes when he abandoned the worship of Amen for Aton. After his death the city was destroyed and has since been uninhabited. In 1887 peasants found there a group of clay tablets consisting of letters mostly in cuneiform from Asiatic potentates and Egyptian vassals in Palestine and Syria to Akhnaton and his predecessors, which are of great historical importance. Most are now in Berlin and the British Museum. Excavations by Petrie (1892) disclosed inlaid coloured pavements and important evidence for the early manufacture of glass, etc. In the hills E. of the city were cut tombs for Akhnaton's courtiers, containing scenes typical of the art of the period, and beautiful hymns to the Aton.

Tell-el-Kebir, see TEL-EL-KEBIR.

Tell el-Mugayyar, see UR.

Tellers of the Exchequer, see TALLY.

Tellez, Balthazar, see GALLAS.

Téllez, Gabriel, see TIRSO DE MOLINA.

Tellurium (symbol Te, atomic weight 127.6, atomic number, 52), rare element of the sulphur group. It occurs in the free

state in nature, but is chiefly obtained in combination with other elements, as in tellurite (TeO₂) and tetradytmite (Bi₂Te₃). It is a bluish-white solid with a metallic lustre (melting-point 452° C.; sp. gr. 6.26). T. forms tellurides with hydrogen and the metals, corresponding to the sulphides. Two oxides, the dioxide and trioxide, are known, which give rise respectively to the 2 acids, tellurous acid and telluric acid.

Tellus, see GAEA.

Telpher, see under MONORAIL.

Telugu, Dravidian language spoken in the central and E. portions of S. India. It may be said that Telingana ('Teluguland') stretches roughly N. from Madras to the borders of Orissa and NW. to Bellary, where T. meets the Kanarese. Of all the Dravidian languages, T. is spoken by the largest number of people, about 22,000,000. It is strongly admixed with Sanskrit.

Tembuland, div. of Cape Prov., S. Africa, one of the Transkeian Terts (q.v.), situated near the coast to the SW. of Griqualand E. Area 3339 sq. m. Umata is the cap. The name is derived from a Kaffir tribe, who claim to be descendants of Tembu.

Teme, riv. of Great Britain. It rises in Wales, and flows through Shropshire and Worcestershire, to join the Severn near Worcester. It is 60 m. in length.

Temenos (Gk, from *temnein*, to cut), in Gk architecture, a sacred enclosure adjoining or surrounding a temple.

Temesvar, see TIMISOARA.

Temir Tau, tn and iron and steel milling centro in Karaganda oblast (prov.) of Kazakh S.S.R. of the Soviet Union. Pop. 60,000.

Temora, tn in New S. Wales, Australia, 301 m. SW of Sydney. Once a prosperous goldfield, T. is now the centre of wheat-growing and sheep-raising dists. Pop. 4620.

Tempe, valley of N. Thessaly, famous for its beautiful scenery, to which there are many references in anct literature. It was the traditional scene of Apollo's purification after the slaying of Python, and of Daphne's metamorphosis.

Tempera, or **Fresco Secco**, see under FRESCO PAINTING; MURAL DECORATION.

Temperament, in music, is connected with the intonation of the notes in a scale, on the one hand, and the tuning of instruments, on the other. In vocal and to a great extent in instrumental music the intervals of a scale are flexible, even if we disregard the ever-present danger of singing and playing out of tune. A singer or string player with a keen ear, especially if unaccompanied by a tempered instrument, such as the piano, will instinctively or consciously make a slight difference between A flat and G sharp, which on the piano or the organ are played by one and the same mechanism. The tuning of keyboard instruments had thus always to be slightly adjusted, and until equal T. came into universal use for their tuning, some notes, and therefore some keys, were more noticeably out of tune than others. Thus B flat on a harpsichord was purer than A sharp, and F sharp purer

than G flat, with the result that the extreme sharp and flat keys were considerably out of tune and therefore rarely used. Equal T., on the other hand, adjusted all the intervals so that there was exactly the same difference in the ratio of vibrations between all of them, with the result that the black-key notes remained the same whether sharp or flat, at the cost of very slightly distorting many of the intervals within the scale. Bach, by writing 48 preludes and fugues in all the major and minor keys in his *Well-tempered Clavier*, proved that the distortion is too small to disturb even a musician with so fine an ear as his and that keyboard instruments could henceforth be regarded as capable of dealing satisfactorily enough with any key.

Temperance. The recognition of the social, moral, and physical evils which may be directly or indirectly traced to the excessive consumption of alcohol is of comparatively recent origin. The attitude of civilised mankind on the subject has undergone change within the last cent. The more critical attitude adopted has been accompanied by widespread constructive endeavour towards the abatement of intemperance. It can now be generally assumed that moderate drinking has steadily increased, while no evidence exists to prove any general increase in the numbers of those who totally abstain. Heavy drinking is to be found in many sections of the community. Alcohol is no longer the escape mainly from poverty, unemployment, and illness. Excessive use of alcohol is now due to many other causes, e.g. mal-adjustment to normal life. Many who suffer from mental abnormality seek relief in alcohol, and people of a nervous disposition may indulge because of the feeling of well-being that alcohol imparts. Above all, a great number of alcoholics have reached that state by imperceptible advances from controlled social drinking.

In Great Britain in 1948, the expenditure on beer was £577m., in 1956 it was £547m. The expenditure on wine, spirits, cider, etc., in 1948 was £249m, but in 1956 it was £348m. Wines have greatly increased in popularity, as have also the non-alcoholic fruit juices. During the 19th cent. various computations gave intemperance as the chief cause of the major social evils, some authorities placing the proportion as high as 75 per cent. Careful examination made since 1948 has revealed that in cases of secondary poverty drink is the main agent, direct and indirect, of destitution. Some are poor because they drink, but others drink because they are poor.

The prin. existing means adopted since the origination of the T. movement in 1826 may be conveniently classified into: (1) prohibition and local option; (2) the Scandinavian company system, which places the control of the sale of liquor in the municipality, the profits to be utilised for public purposes; (3) state monopoly of municipal control; (4) the institution of counter attractions; (5) high licence; (6) taxation of liquor.

Prohibition (q.v.) was tried in the U.S.A. and other countries, and involved the suppression of the buying and selling of liquor within the ters. concerned. Eng. T. organisations never favour prohibition except as a long-term policy and as the result of the enlightened judgment of the community, but are for the most part strongly in favour of local option (q.v.). Under the Scandinavian company system, called the Gothenburg system, the liquor traffic was controlled by companies to whom the municipal authorities transferred all liquor licences (see LOCAL OPTION). In Sweden in 1919 the Bratt system replaced the Gothenburg system, by a charter of the Stockholm City Council and control rested in the hands of a central trade organisation subject to a royal board of control. In Oct. 1955 Sweden abolished the rationing system for the sale of strong drink. Many measures have now been adopted to combat alcoholism there. A special propaganda campaign has been started. Advertisements for liquor will be forbidden. Greater care is to be taken of alcoholics. More research work is to be undertaken. Bigger subsidies will be given to T. societies, and generally better facilities for T. education will be provided. Finland, like the U.S.A., had an absolute prohibition law adopted in 1919. An advisory national plebiscite was held in Jan. 1932, a great majority voting in favour of abolition of prohibition. The Parliament thereupon set about passing a law permitting the sale of all liquors, but under a state-controlled monopoly. The system of state monopoly was adopted in tsarist Russia. In 1924 the Soviet Gov. revoked the Imperial Edict which forbade the sale of intoxicants and controlled the sale of such by State monopoly. In 1949 the gov. reduced the price of vodka by more than 50 per cent. In 1954 the Moscow Minister of Health considered steps to educate public opinion in this matter, and so encouraged social ostracism towards alcoholics.

The increasing concern for the welfare of childhood and youth is reflected in legislation in many countries. In England this concern has been accentuated by the grave increase in juvenile delinquency, with which is associated the mounting figures for the convictions for drunkenness of people under 20 years of age. The increase in drunkenness in males between the ages of 17 and 20 between 1946 and 1949 was 25 per cent, but in the years 1949-54 it was 167 per cent. In 1956 the Occasional Licences and Young Person's Bill became law, making provision that in places which had obtained an occasional licence the same restrictions concerning sale and consumption of liquor to young people that apply in public-houses should also apply in these places. A similar Bill, entitled *The Children and Young Person's (Registered Clubs) Bill*, has been framed. This Bill would provide that no person under 14 would be allowed to be in the bar of a registered club during permitted hours, and no person under 18 would be allowed to serve or be served with intoxicants in

any bar on the premises of a registered club. The alarming increase in road accidents has awakened deep thought in many countries. During 1955 1 person in every 700 in Britain was killed or seriously injured in road accidents. The extent to which these are due to strong drink is difficult to determine in this country at the moment. But where blood and other tests are applied to those responsible for accidents, revealing data have been provided. One authority in America states that 35 per cent of all Amer. highway accidents were caused by drivers under the influence of alcohol; a Swedish authority states that a comparable figure for Sweden is 37 per cent. The Brit. Gov. awaits a report by the Research Council on the relationship between road casualties and strong drink, with the intention of taking appropriate legislative action. Alcoholism is receiving great attention in many countries. The World Health Organisation (q.v.) has a special committee dealing with this subject. In France in 1955, 4106 people died from acute alcoholism, and another 12,076 from cirrhosis of the liver. The W.H.O. stated that in England there were 350,000 suffering from alcoholism and 86,000 from chronic alcoholism; the number increases. Much excellent research work on this has been done by medical experts and psychologists. Commandable service has been rendered by the members of Alcoholics Anonymous in helping to rehabilitate the erstwhile alcoholic. Both the gov. and Church are showing a deepening interest and concern in this tragic aspect of the drink problem.

For a time the most promising solution of the drink problem was considered to be in the direction of the municipal control of the drink traffic, but experiments along these lines have not been wholly successful, particularly when they have been divorced from any democratic control by local option. Opponents of public ownership contend that the mere transfer of the vested interest from private to public ownership does not necessarily improve sobriety. They maintain that it simply confers a civic dignity upon the trade in intoxicants. Prominent supporters of T. include Father Mathew, Cardinal Manning, Archbishops Frederick and Wm Temple, Lord Snowden, and Lady Astor (q.v.). There is a permanent T. Council of the Christian Churches at Parliament Mansions, Westminster. See also PROHIBITION. See H. LEVY, *Drink, an economic and social study*, 1951; U.N. World Health Organisation, *Alcohol and Alcoholism*, 1955; C. Rea, *Alcoholism, its psychology and cure*, 1956.

Temperature: 1. In physics, the degree of hotness of a body, the condition determining the power of a body to transfer or receive heat from another body. A body *A* is said to be at a higher T. than a body *B* if heat flows from *A* to *B* when the two bodies are placed in contact. Any property of a body which depends on T., e.g. its length, or electrical resistance, can be used to define a Scale of T. It is

necessary first to assign temps. to 2 'fixed points,' e.g. the melting point of ice and the boiling point of water under specified conditions. The particular property considered, e.g. length of a column of mercury in a glass capillary, is measured at these 2 fixed points and a relation is assumed to exist between the change in the property (length) and the change of T. In the simplest case the relation assumed is a linear one, i.e. change of length is proportional to change of T. The Centigrade (q.v.) Scale takes the Ice Point to be 0° C., and the Steam Point to be 100° C. If L_0 is the length of the mercury column at 0° C., and L_{100} that at 100° C., the temp. T° C. corresponding to a length L_T is given by

$$T = (L_T - L_0)100 / (L_{100} - L_0)^\circ \text{C.}$$

The Fahrenheit (q.v.) Scale defines 32° F. and 212° F. as the Ice and Steam Points. Scales of T. defined in terms of the properties of various thermometric substances are not exactly the same. Kelvin (q.v.) defined an Absolute Scale of T. (see THERMODYNAMICS) and showed that it was the same as the Perfect Gas Scale. This can be closely approximated to in practice, and other scales can be corrected by comparison for more precise measurements. See THERMOMETER and THERMOMETRY; GAS AND GASES; PYROMETER; METROLOGY.

2. **Body Temperature.** The T. of the body varies with the different forms of life. In man it lies between 98.4° and 99.5° F. in a state of health, and between these limits there are slight variations due to the amount of exercise, ingestion of food, the T. of the surrounding atmosphere, etc. In the cold-blooded animals the T.s have a wider range and are much lower than in the human family. Thus the T. of the frog may vary from 63° to 48° F., according to circumstances, and that of the python, about 76° F., may be higher when the female is coiled around her eggs. It is not always easy to draw a hard-and-fast line between the cold-blooded and warm-blooded animals; hibernating animals like the dormouse, hedgehog, and others resemble cold-blooded animals during their winter sleep. Some of the mammals which are born in a state of immaturity (naked and blind like rabbits and rats) bear a resemblance to cold-blooded animals. There are small fluctuations in T. in human beings during the day; it reaches its maximum during the afternoon and evening, from about 4 p.m. to 9 p.m., and a minimum in the morning hours, from about 1 a.m. to 7 a.m. The source of animal heat is due to the oxidation within the tissues of the body, and different foods have different values as heat producers. The almost uniform T. of the body is maintained by a process of adjustment, superfluous heat being eliminated by different means, the lungs and skin playing a major part in this process. There is a heat-regulating centre in the brain.

3. **Air Temperature** varies appreciably with time, but, in any one place, the mean T. over an interval of, say, 10 min.

changes only slowly and can be measured approximately by a thermometer which has a short time-lag, shielded from radiation in a Stevenson screen or whirled through the air (see further METEOROLOGY). A detailed record of this 'mean' T. throughout the day can be obtained by using a thermograph (q.v.), but a rough idea may also be obtained by using maximum and minimum thermometers in addition to reading an ordinary thermometer at fixed times. T's in the upper air are measured by instruments attached to aircraft, or supported by kites or kite balloons or, more frequently nowadays, by radio-sonde (q.v.). Since the air near the surface is warmed or cooled by contact with the earth's surface, the daily maximum usually occurs in the early afternoon when the heat loss from the surface by radiation, conduction, and convection just balances the heat received from the sun and the sky. The daily minimum T. usually occurs about dawn when the sun's radiation begins to warm the earth's surface again.

The figures generally accepted for extremes of temp. near the surface are as follows: world highest, Azizia (Libya), 58° C. (136° F.), Sept. 1922; world lowest, -67.8° C. (-90° F.), Verkhoyansk, Siberia, Feb. 1892. British ls., highest 38° C. (100.5° F.), Tonbridge, July 1868; lowest -28.8° C. (-20° F.), Grantown-on-Spey, Scotland, 1955. The actual surface temp. is often considerably higher than the air temp. at 4 ft.

Tempering, heat-treatment process for relieving certain stresses that may occur in hardened steels, and for recovering to specific limits the hardness and ductility essential to hardened steels. A hardened steel that has not been tempered or stress relieved can be brittle and susceptible to cracking. The process consists of reheating the hardened steel to a specific temp. and quenching in oil and water or by cooling in air. The oldest method of determining T. temp. is one of observing the surface oxide colour tints that occur whilst the steel is being reheated. These tints indicate with some measure of accuracy the temps. reached. When the appropriate colour change appears the steel is cooled in air, oil, or water. This method is not capable of close control of temp., and is not now often used.

The methods used for heating steels to T. temps. are: (1) By the use of hot cast-iron plates, upon which the parts to be tempered are placed. As soon as the required T. colour appears the parts are removed from the heat. (2) The parts to be tempered are placed in a box or tray of clean dry sand and heated upon a fire hearth or forge. (3) Baths containing oil, lead, or salt are heated and maintained at exact temps. The parts to be tempered are placed in a suitable basket or cradle and suspended in, or passed through the hot liquid. (4) Lastly, there are various types of electrically heated and air-controlled furnaces in which the parts to be tempered are heated. The trend in modern methods of T. is to use liquid baths for reheating, and towards the use

of pyrometer and thermo-electric control for accurate measuring of T. temps.

Temperley, Harold William Vazelle (1879-1939), historian, b. Cambridge, and educ. at Sherborne School and at King's College and Peterhouse, Cambridge. He became a fellow of Peterhouse in 1904. T. frequently visited the Balkans between 1905 and 1909, notably during the Young Turk revolution. In the First World War he served in the Dardanelles campaign. In 1920-4 he ed. the *History of the Peace Conference of Paris*. T. was recognised as one of the leading modern historians by his work on the *Foreign Policy of Canning*, 1925. He collaborated in the production of the *Cambridge Modern History*. With G. F. Gooch (q.v.) he was given the task of editing the Brit. documents relating to the origin of the First World War, which were produced in 11 vols. (1926-38) as *British Documents on the Origins of the War*. From 1930 he was prof. of modern hist. in the univ. of Cambridge. In 1938 he succeeded Lord Birdwood as master of Peterhouse. T. was considered an authority on Brit. foreign policy after 1815.

Tempest, Dame Marie (1866-1942), actress, b. London, her real name being Mary Susan Etherington. She was educ. at the Convent des Ursulines, Thildonck, Belgium, and studied music in Paris and at the Royal Academy of Music under Manuel Garcia. In 1885 she acted in Suppé's *Boccaccio*. From 1895 to 1900 she was the leading attraction at Daly's and drew great audiences to such musical comedies as *The Geisha*, *San Toy*, *A Greek Slave*, and *An Artist's Model*. She then abandoned the musical stage. Her change to 'straight' acting proved immediately triumphant. She began with historical and romantic comedy, appearing as Nell Gwynne and Peg Woffington, following these with Becky Sharp and Polly Eccles. Her technique was artificial, yet an ideal medium for the expression of caprice and waywardness in light comedies. Her chief parts in this type were in *The Marriage of Kitty* and in Arnold Bennett's *The Honey-moon*. She had a series of successes in Somerset Maugham's epigrammatic comedies. As an actress of the mannered style she had no equal during all her later years, and her vivacity was perhaps her outstanding natural gift. D.B.E. 1937.

Tempio Faustinia, tn in Sardinia (q.v.), 32 m. N.E. of Sassari (q.v.). It is the centre of the cork industry. Pop. 15,800.

Templars, or Knights Templars, military order founded in 1118 by 9 Fr. knights, led by Hugh de Payns. They received their rule in 1128 from St Bernard. Their original vow was simply to maintain free passage for the pilgrims who should visit the Holy Land. The name that they first took was the Poor Soldiers (*Pauperes Commilitones*) of the Holy City, and they professed to have no source of subsistence but the alms of the faithful. Pope Honorius II confirmed their rule and assigned a white mantle as their badge. Pope Eugenius III added a red cross on the left breast to the mantle. The anct banner of the T., *Beauseant* (O.F., a black and white horse). was party per pale

argent and sable, and *Beauseant* was the famous war-cry of the order. Their motto was *Non nobis, Domine, non nobis, sed Nomini Tuo da gloriam*; and their seal showed 2 knights riding 1 horse. The constitution of the Knights Templars was simple. At the head was the grand master, who was elected by the general body of the knights. Under him was his seneschal or lieutenant; other high officers were the marshal, the treasurer, etc. The sev. countries in Asia and Europe in which the order had possessions were denominated provs., and each of them was presided over by a resident chief, called a grand prior, grand preceptor, or prov. master. Under the prov. masters were the priors, otherwise called balliffs or masters, who each had charge of 1 of the dists. into which the prov. was divided; and finally, under the priors were the preceptors, each of whom presided over a single house or estab., hence called a preceptory. For more than 170 years the Soldiers of the Temple formed the most renowned portion of the Christian troops, and almost every encounter with the enemy bore witness to their prowess and daring. By 1300 the order had 15,000 members, and its property included 9000 castles and manors. The destroyer of the T. was Philippe le Bel of France. He compelled the Pope to summon the grand master, Jacques de Molay (q.v.), to Europe. In 1307, whilst Molay was at Paris, 2 individuals of notoriously evil character made certain revelations accusing the T. of heresy, idolatry, unbelief, and a number of foul practices. As a result, the order was suppressed at the council of Vienne in 1312, many of its members executed, and its property confiscated. It continued, however, in Portugal, where it took the new name of the Order of Christ. The name survives in the Temple, London, and the Temple, Paris, etc., and a number of their churches, built in the round style peculiar to the order, still exist. The London Temple Church survived the Second World War with severe damage.

See M. Lobet, *Histoire mystérieuse et tragique des Templiers*, 1943.

Temple, Frederick (1821–1902), prelate, educ. at Blundell's School, Tiverton, and Balliol College, Oxford, where he met and formed a friendship with Jowett, Matthew Arnold, and Clough. T. was ordained deacon in 1846 and priest in 1847. In 1857 he became headmaster of Rugby, where he continued the work of Arnold, though he laid more stress than the latter on the place of orthodox religion in school life. His friendship with Gladstone, whose Liberal views he shared, led to his being appointed in 1869 to the see of Exeter, where he won for himself great popularity by his sincerity and humanity. He was appointed Bishop of London in 1885, and in 1896 Archbishop of Canterbury. Among the ideals which T. had much at heart was the cause of temperance. He worked hard to prevent the influence of the Oxford movement from resulting in a split within the fabric of Anglicanism. See lives by W. F. Aitken, 1903, and E. G. Sandford (ed.), 1906.

Temple, Henry John, see PALMERSTON. **Temple, Shirley Jane** (1929–), Amer. child actress, b. Santa Monica, California. She made her screen début in 1932 in *Red Haired Alibi*. She was a leading figure in the *Baby Burlesque* series. Her appearance in *Stand Up and Cheer*, 1934, resulted in a highly successful career; she is probably the best-known child star ever to appear in films. Her pictures include *Baby Takes a Bow*, *Bright Eyes*, *Little Miss Marker*, *Now and Forever*, *The Little Colonel*, *Our Little Girl*, *Curly Top*, *The Littlest Rebel*, *Captain January*, *Poor Little Rich Girl*, *Dimples*, *Slowaway*, *Wee Willie Winkle*, *Heidi*, *Rebecca of Sunnybrook Farm*, *Just Around the Corner*, *The Little Princess*, *Susannah of the Mounties*, and *The Blue Bird*. With the passing of childhood her popularity faded, although she did make a number of later films.

Temple, Sir William, Bart. (1628–99), statesman and man of letters, b. London. Educ. at Emmanuel College, Cambridge, he travelled in his youth, and in 1655 married Dorothy Osborne (q.v.). In 1666 he was created baronet, and appointed envoy at Brussels. He was largely responsible for carrying through the triple alliance formed against Spain in 1668 between England, Holland, and Sweden. He was later ambas. at The Hague, but

SIR WILLIAM TEMPLE

was recalled in 1670. Four years after he returned to The Hague to arrange a marriage between Princess Mary of England and Wm of Orange. He was offered a secretaryship of state in 1677 and 1679 but declined. When he removed to Moor Park he engaged Swift as his secretary, and was assisted by him in the composition of his *Memoirs*. His *Miscellanæ* were pub. in 1680 and two more series in 1692 and 1701. T.'s essays and reflections are exquisitely polished and graceful, perhaps owing something of their style to Swift's pen. His originality lies in his economic

theories, and his ideas on labour and trade were of particular importance. See lives by T. P. Courtenay, 1836; F. I. Herriot, 1893; M. L. R. Beavan, 1908; C. Marburg, 1929. See also R. J. Allen, *Swift's Earliest Political Tract and Sir William Temple's Essays*, 1932.

Temple, William (1881-1944), prelate, b. the Palace, Exeter, son of Frederick T. (q.v.), and educ. at Rugby and Balliol College, Oxford. T. was fellow and lecturer in philosophy at Queen's College, Oxford, 1904-10. He was ordained priest in 1909, and was chaplain to the Archbishop of Canterbury, 1910-21. T. was headmaster of Repton School, 1910-14, rector of St James's, Piccadilly, 1914-18, and canon of Westminster 1919-21. He was Bishop of Manchester, 1921-9, and was appointed Archbishop of York and a privy councillor in 1929. T. became Archbishop of Canterbury in 1942. As a writer, T.'s fame will rest chiefly on his essays in philosophy and on his application of that philosophy to social and economic problems. The two vols. of his *Readings in the Gospel of St John*, 1939, show his deep devotion. His Gifford Lectures, delivered at Glasgow Univ. while he was Archbishop of York and collected under the title *Nature, Man, and God*, 1934, are an outstanding contribution to theology. Among his more important pubs. may be mentioned *The Kingdom of God*, 1912, *Plato and Christianity*, 1916, *Mens Creatrix*, 1917, *Faith and Modern Thought*, 1921, *Christus Veritas*, 1924, *Christianity and the State*, 1928. His other works include *Christian Politics and Kindred Subjects*, 1927, *Christianity and the Social Order*, 1932, *Citizen and Churchman*, 1941, and *The Resources and Influence of English Literature* (being the first ann. lectures delivered before the National Book Council, of which he was a vice-president, 1943). The motif of T.'s life was the faith and discipline of the Anglican Church. He led the Life and Liberty Movement which resulted in the Enabling Act, 1919, and the setting up of the Church Assembly (q.v.). To T. the unity of the Church was an urgent and practical necessity, not merely a pious hope or an intellectually necessary end to the Christian interpretation of history. But he made his greatest impact on the public mind by his pronouncements on Christian social theory, having, indeed, started life as a Christian Socialist. Many of his pronouncements were the cause of controversy; but his zeal and energy did much to stimulate active Anglican and Christian life, while his political opponents recognised his sincerity, humility, and deep sense of social justice. See life by F. A. Iremonger, 1948.

Temple, Eng. carldom, held from 18th cent. by the Grenville family together with the dukedom of Buckingham and Chandos. The first earl was Richard Grenville (1711-79), eldest son of Richard Grenville (1678-1728) and Hester T., afterwards Countess T.; succeeded to his mother's peerage in 1752 and took the name of Grenville-T., M.P. (1734). **George Nugent Temple-Grenville** (1753-1813), second son of

George Grenville and nephew of the 1st Earl T., succeeded his uncle as 2nd Earl T. in 1779. He was created Marquess of Buckingham in 1784 and was a lord-lieutenant of Ireland. His son, **Richard Temple Nugent Brydges Chandos Grenville** (1776-1839), became 1st Duke of Buckingham and Chandos and Earl T. of Stowe (1822). His son, **Richard Plantagenet Temple Nugent Brydges Chandos Grenville** (1797-1861) was 2nd Duke of Buckingham and Chandos (q.v.). His successor, Richard, the 3rd Duke (1823-99) was colonial secretary, 1866-8. On his death the dukedom became extinct. His titles of Earl T. and Viscount Cobham passed to relatives. The 6th Earl T. of Stowe (succeeded 1940) was b. in 1909.

Temple, city of Bell co., Texas, U.S.A., situated in a cotton-growing dist. 35 m. SSW. of Waco. It was founded in 1881, and chartered as a city in 1884. Pop. 25,500.

Temple, London, see INNS OF COURT.

Temple, structure designed for the worship of a deity or deities. The first *templum* of the Romans was simply the space of earth and sky marked off by an augur for divination. The anc. Egyptians built enormous T.s by degrees over a long period; anc. India is noted for cave T.s hewn out of the solid rock; but the most celebrated T.s of antiquity were those of the Greeks. In the Far E. and in SE. Asia the T. is known as *pagoda*, while the anc. Mexican T. was known as *teocalli*. In France Protestant churches are known as T.s as also are some Jewish synagogues and Masonic halls.

See ARCHITECTURE I, II, III; ATHENS; AZTECS, THE; BUDDHA AND BUDDHISM; INDIAN ARCHITECTURE; JAPANESE ARCHITECTURE; MAYA; OLYMPIA; PARTHENON; THEREES; UR; ZIMBABWE.

The Jewish Temple. The sacred edifice of the anc. Hebrews, erected at Jerusalem on Mt Moriah, one of the hills of Mt Zion. **Solomon's Temple**. The idea of building the T. was suggested to the mind of David, but it was Solomon, his son and successor, who commenced the work in the fourth year of his reign. The building of the T. required 7 years. The T., whose building was directed by Phoenician craftsmen, was of imposing character. It is described in detail in the Bible (1 Kings vi, vii; 2 Chron. iii-v) and by Josephus (*Ant.* viii, iii). The rock-altar (see below) is the only remains still preserved. The site of the T. lies to-day within the sacred enclosure of the Muslims known as the Haram esh-Sherif ('The Noble Sanctuary'). The most striking natural feature of the Haram is the anc. rock-altar (a great outcropping of rock), known as es-Sakhra ('sacred rock'), and covered by the Kubbet es-Sakhra ('Dome of the Rock'). One can still trace on this rock the channels which conducted the blood to an opening which in turn conducted it to a sacred cave underneath. **The Second Temple**, built on the same site, by Zerubbabel, was completed in 518 BC, 70 years after the first T. was destroyed. It was probably without ornaments, and was as nothing in the eyes of those who

had seen the T. in its former glory. *The Herodian Temple* (described by Josephus, *Ant.* xv, xi, and *Wars* v, v, and in the Babylonian Talmud, *Qodashim, Middoth*) was begun in 20-19 bc, and was finished in ad 64, 6 years before it was finally destroyed. According to Tacitus, it was 'a temple of immense wealth.' The 'Western' or 'Wailing Wall' (q.v.) belongs to the remains of the enclosure-walls of the Herodian T.

Temple Bar, formerly a gateway marking the boundary between the cities of London and Westminster. A barrier existed here in medieval times after the city of London extended beyond the old wall. It was removed in 1669, and in 1670-2 a new archway was erected to

years later he was a Lieutenant-gen. Subsequently in that war he commanded the 1st and 56th divs, and the 6th armoured div. After the War he was serving as G.O.C. Eastern Command when the need arose for a 'strong man' in Malaya, where a communist terror campaign was disrupting the life of the country. He was sent as High Commissioner, with broad military powers, and soon his vigorous and original measures brought much needed relief. The situation has so improved that terrorist incidents are now negligible. In 1955 T. succeeded F.-M. Sir John Harding (q.v.) as C.I.G.S. He was promoted F.-M. in 1956. In Feb. 1958 Gen. F. W. Festing succeeded T. as C.I.G.S.

A RECONSTRUCTION OF HEROD'S TEMPLE

E.N.A.

Wren's designs. Soon after there began the practice (discontinued in 1772) of exhibiting the heads of executed criminals. It was removed in 1878 and later re-erected at Theobald's Park, near Cheshunt, Herts, and the site is marked by the Temple Bar Memorial. In former times the sovereign sought permission of the lord mayor at T. B. before entering the city of London, and the act continues to be symbolically performed.

Templemore, mkt tn of co. Tipperary, Rep. of Ireland, 34 m. N. of Clonmel, at the foot of Devil's Bit Mt (1577 ft). Loughmoe Castle and Barna Castle are nearby. Pop. 2000.

Templer, Sir Gerald Walter Robert (1898-), soldier, educ. at Wellington and Royal Military College. He joined the Royal Irish Fusiliers (of which regiment he later became Colonel) in 1916, and served in France and Belgium. Between the wars he served in Persia, Iraq, and Palestine as well as at home, and was a lieutenant-colonel at the outbreak of the Second World War, in France. Two

Templewood, Samuel John Gurney Hoare, 1st Viscount T. of Chelsea (1880-), statesman and diplomat, educ. at Harrow and at New College, Oxford. From 1910 until 1944 he was Conservative M.P. for Chelsea. He was secretary of state for air from 1922 to 1924, and from Nov. 1924 to 1929, and secretary of state for India from 1931 to 1935. He then became foreign secretary, but resigned, owing to the violent criticism evoked by the Hoare-Laval pact. Later, he held successively the posts of home secretary and secretary for air, and from 1940 to 1944 was ambas. in Spain. His *Ambassador on Special Mission*, 1946, is an account of his efforts to maintain the neutrality of Franco Spain. In 1944 he was created a viscount. T. is deeply interested in penal reform. Other pubs. include *The Shadow of the Gallows*, 1951, and *Nine Troubled Years*, 1954.

Tempo (It. 'time'), musical pace. The speed of any musical composition, determined, not by the note-values used by the composer, which are relative, but by

the directions set above the stave at the opening of a piece or section (e.g. *allegro*, *andante*, *adagio*, etc.). These words cannot fix the exact pace required by the composer; this can be done only by means of metronome marks (e.g. $\text{♩} = 96$, i.e. 96 crotchets to the minute, etc.).

'Tempo, II,' Italian daily newspaper, estab. in Rome by Renato Angiolillo in 1944. It soon became one of the leading Italian dailies representing right-wing opinion, and has now a circulation of 175,000.

Temporal Power, see PAPACY.

Temporary Rank, see RANK.

Temse (previously Temsche; Fr. Tamise), tn in the prov. of E. Flanders, Belgium, on the R. Scheldt, 10 m. SW. of Antwerp. It has shipyards for barges and trawlers. Chief manufs. are lace, baskets, ropes, and cotton goods. There is some good baroque architecture. Pop. 14,300.

Temuchin, see GENGHIS KHAN.

Temuco, city of Chile, cap. of the prov. of Cautin, 430 m. S. of Santiago and 106 m. NE. of Valdivia. Cereals, timber, and apples are the main products. It is the H.Q. of the S. Amer. Missionary Society. T. is a cathedral city at the gateway to the Chilean Lake Dist. The Araucanian Indians still use it as their chief mkt. It is rapidly becoming modernised, and is an important rail centre; it also has a military airport. Pop. 38,000.

Ten, Council of, secret committee of the Venetian Senate, estab. in 1310 and vested with such a measure of executive authority as was deemed effective to cope with extraordinary crises. Its institution marked the final overthrow of the democratic constitution, in favour of a system of close oligarchies of hereditary aristocrats. After the defeat of Tiepolo's revolution (1310) against the growing exclusion of so many Venetians from any share in the gov., the aristocratic element deemed it advisable that the Great Council, then composed almost entirely of the nobility, should elect 10 of its members, the Doge, his council, and the Supreme Court another 10, and that from these the Great Council should make a final selection of 10 to act as a committee of public safety. Eventually the C. of T., though theoretically outside the constitution, became the most powerful organ of gov. It was not finally abolished until 1797, the date of the fall of the rep.

ten Brink, Bernhard, see BRINK.

ten Brink, Jan, see BRINK, JAN TEN.

Ten Commandments, see DECALOGUE.

Ten Thousand, Expedition of the. In anct Gk hist. the 'Ten Thousand' were an army originally composed partly of large levies of native troops in the Persian satrapies of Asia Minor, but mainly of Gk mercenaries collected by Cyrus, younger son of King Darius II of Persia, who hoped to win the crown from his elder brother Artaxerxes II. At the battle of Cunaxa (401 BC) the Greeks routed their opponents, but Cyrus was killed. The native levies at once dispersed, and the Gk mercenaries found themselves marooned in Mesopotamia. Their officers were killed by a trick of the

enemy. The Greeks chose new officers, among them Xenophon (q.v.), the historian of the expedition, and fought their way N. into the Armenian mts. Ultimately they reached the Euxine at Trapezus (Trebizond). A graphic account of the remarkable wanderings of the Ten Thousand is contained in the *Anabasis* of Xenophon.

Tenacity, see ELASTICITY; STRENGTH OF MATERIALS.

Tenant, see LANDLORD AND TENANT.

Tenants in Common, see COMMON, TENANCY IN.

Tenasserim: 1. Tn of Lower Burma on the T. R.

2. Div. of Lower Burma, consisting of a narrow strip of land lying to the E. of the Bay of Bengal. There is a heavy rainfall, and where cultivation is possible, rice is grown. Some tin is mined. Cap. Moulmein. Area 35,886 sq. m.; pop. 2,111,000.

Tenby, Gwilym Lloyd George, first Viscount (1894-), Brit. politician, educ. at Eastbourne College and Jesus College, Cambridge. He served in the First World War, and entered Parliament as a Liberal in 1922. He was minister of food, 1941-2, and minister of fuel and power, 1942-5. In 1951 he was returned as a Liberal and Conservative M.P. and joined the Conservative gov. as minister of food, 1951-4. From 1954 until 1957, when he was created a viscount, he was Home Secretary and minister for Welsh Affairs.

Tenby, municipal bor. and seaside resort of Pembrokeshire, Wales, 9 m. E. of Pembroke. It is situated on a narrow promontory jutting out into Carmarthen Bay. T. has a long hist., and by the late 15th cent. was a prosperous little port. Part of the castle and most of the town walls still exist. Pop. 4500.

Tench (*Tinca tinca*), European freshwater fish with exceedingly small scales, abundant secretion of mucus, and the presence of a short barbel at each angle of the mouth. It is rich olive green in colour, shading into light grey on the belly. It spawns in early summer, the greenish ova numbering about 250,000. Like the carp, to whose family it belongs, it feeds on both animal and vegetable substances. It attains a length of about 18 in. and a weight of 4 lb.

Tende, Col de, Alpine pass, leading from Limone, in the It. prov. of Cuneo (q.v.), to Tende, which (since 1947) is in the Fr. dept. of Alpes-Maritimes (q.v.). It has a road tunnel 3360 yds long.

Tender, in law, offer of money in payment of a debt. To be valid it must be: (1) Unconditional; but a T. will not be invalid merely because it is made under protest. (2) Of the whole debt; though if the creditor's claim is made up of separate items the debtor may validly make a T. of payment of any one item provided he makes it clear in respect of which item it is made. (3) In the current coin of the realm. Bank of England notes of £1 and 10s. are legal T. in Great Britain and N. Ireland to any amount; those of £5 in England and Wales only. Change cannot be demanded except from the Bank

of England. Gold (dated 1838 onwards), if of or over the least current weight, is legal T. to any amount. Silver (dated 1816 onwards) is legal T. up to 40s., nickel brass 3d. up to 2s., and bronze (introduced 1860 to replace copper) up to 12d. A valid T. does not extinguish the debt, but it exposes the creditor in his action against the debtor as the litigious oppressor, and a plea of T., if sustained by the debtor, will assuredly result in the plaintiff having to pay the costs of the action. But the defendant, if he pleads T., must pay the amount into court. The other effects of T. are that it stops the further accrual of interest, and extinguishes any right of lien (q.v.) the creditor may have. T. in commerce is a written offer of terms for executing a specific piece of work or for supplying a certain consignment of merchandise. For T. of amends in libel see DEFAMATION.

Tendon, see under MUSCLE.

Tendon of Achilles, tendon attaching the muscles of the calf of the leg to the heel-bone. It is capable of resisting a great tensional strain, and yet is sometimes ruptured by the contraction of the muscles in sudden extension of the foot. Aet. surgeons regarded wounds in this tendon as fatal, probably because of the legend of Achilles. It was so called from the hero Achilles, whose mother dipped him when an infant into the Styx, so that he became invulnerable except in the heel by which she held him.

Tendrill, in botany, a thread-like growth by which some plants climb. T.s may be modified terminal shoots, as in vines, leaves as in peas, leaf-stalks as in clematis, or branch stems as in white bryony; they are sensitive to contact and react by twining round supports, climbing and giving leaves and flowers more light.

Tenebrae (Lat. *Tenebrae*, darkness), name popularly given to the solemn recitation of the canonical hours of Matins and Lauds during the last 3 days of Holy Week, and so timed as to finish as it is growing dark. Distinctive features are the extinction of a candle at the end of each psalm, and the making of a slight noise at the end of Lauds, typifying the earthquake felt on the death of Christ (Matt. xxvii. 51).

Tenedos, Turkish is. in the Aegean Sea, near the entrance of the Dardanelles. Area 16 sq. m.

Tenerife, or Teneriffe, largest of the Canary Is., in the prov. of Santa Cruz de Tenerife (q.v.). It is divided in two by a mt chain. The volcanic Pico de Teide rises to 12,180 ft. The flora is very varied, and the is. is known for early fruits and vegetables, and for bananas. It is a popular tourist and health resort. The cap. is Santa Cruz de Tenerife. Area 780 sq. m.; pop. 280,000.

Tengri Khan, see KHAN-TENGRI.

Tengri-Nor, or Neimo, lake of Tibet. It is 80 m. N. of Lhasa and has an area of 950 sq. m. Altitude 15,400 ft.

Teng-yüeh, or Momein, tn of Yunnan, China, 135 ENE. of Bham (Burma). Pop. 6000.

Teniers, David, the Elder (1582-1649), Flem. painter, b. Antwerp. He studied painting under Rubens and Adam Elsheimer at Rome. His subjects were mainly religious; as a painter of Flem. life he was eclipsed by his son and pupil, T. the younger (q.v.).

Teniers, David, the Younger (1610-90), Flem. painter, b. Antwerp, the son of David T., the Elder, from whom he received his prin. instruction. He was a master in the Antwerp Guild (1632-3). He was appointed court painter to Archduke Leopold and keeper of his pictures. His work was a development of his father's style influenced also by Brouwer (q.v.), and was extremely popular. He was happiest in his portrayals of small figures in landscape or rustic interiors. His best picture, 'Meeting of the Civic Guards,' is at Leningrad, while his 'Village Fête' and many other works are in the National Gallery, London.

Tenison, Thomas (1636-1715), prelate, b. Cottenham, Cambs, and educ. at the Grammar School, Norwich, and at Corpus Christi College, Cambridge. He was made minister of St Andrew's, Cambridge, and rector of Holywell in Hants; and in 1680 was presented to the living of St Martin-in-the-Fields, London. In 1689 he was made archdeacon of London, in 1691 he became Bishop of Lincoln, and in 1694 Archbishop of Canterbury. In St Martin-in-the-Fields he endowed a free school and founded a library. T. was strongly Whig and Protestant in sympathy. As such he secured favour under William III, and was never popular with Anne, or with his High Church Convocation. He worked zealously to improve the quality of parochial Anglicanism, and was a supporter of missionary endeavour. See life by E. Carpenter, 1949.

Tennant, Emma, see OXFORD AND ASQUITH.

Tennant, Kylie (1912-), Australian novelist, b. Manly, New S. Wales. Educ. at Sydney Univ., she married Lewis C. Rodd in 1932. Her first novel, *Triburon*, 1935, and *The Battlers*, 1941, both won the Prior Memorial Prize, and the latter was also awarded the gold medal of the Australian Literary Society. Others of her novels are *Forcœur*, 1930, *Ride On, Stranger*, 1943, *Time Enough Later*, 1943, *Lost Haven*, 1946, and *The Joyful Condemned*, 1953. In these she depicts with irony and gusto the life of the Australian poor. She also wrote a number of plays, and *Australia, her Story*, 1953. See also AUSTRALIAN LITERATURE.

Tennant, Smithson, see DIAMOND.

Tennessee, central S. state of the U.S.A., having an area of 42,246 sq. m. It is known as the Volunteer State. Its boundaries on the N. are Kentucky and Virginia; on the E. N. Carolina; on the S. Georgia, Alabama, and Mississippi; and the Mississippi R. on the W. separates it from Arkansas and Missouri. Along the E. boundaries rise the Unaka and Great Smoky Mts, with peaks over 6000 ft high, whilst between these highlands and the Cumberland Plateau, the mean elevation of which is 1800 ft, is the

valley of E. T. (watered by the upper reaches of the 652-m.-long T. R. (q.v.), scene of the T. Valley Authority project, and its tribes.), part of the Great valley of the Alleghenies. The Cumberland R., affluent of the Ohio, waters a fertile valley W. of the Cumberland Mts in the N. of the state. There are wide level tracts in the W. between the Mississippi and the lower T. The state enjoys a pleasant climate, the average ann. fall of snow being 8 in. and of rain 52 in. The mean extremes of temp. are 38° F. in the winter and 78° in the summer. Almost half is still woodland, and lumbering and timbering bring in a large revenue; national forest lands cover some 564,471 ac. Cultivated lands are dispersed over the rest, there being 18,534,380 ac. of farmland in 1950. The best crop is maize (63,500,000 bushels in 1947), though conditions favour the growth of wheat, oats, potatoes, and peanuts. Tobacco and cotton are the chief cash crops. Hay, sweet potatoes, sorghum, and fruits, especially strawberries, are also cultivated. Agriculture is the largest single industry, and owes its new prosperity, to a large extent, to the T. Valley Authority. Stock raising has declined since the beginning of the cent., but is still important, especially in the Nashville Basin and Great Appalachian area. The fields of bituminous coal cover an area of over 4400 sq. m. Other mineral products are pyrites (first in the U.S.A.), phosphate (second), iron, copper, lead, zinc, manganese ore, clay, marble, and limestone. There are flour and grist mills, sawmills and foundries, blast furnaces, textile factories, and tobacco, cotton seed, oil and cake, and leather are prepared. Nashville is the cap. (pop. 174,307), but the largest city is Memphis (396,000), whilst Chattanooga (131,040) and Knoxville (124,770) are also important. Norris Dam is 27 m. N. of Knoxville. During the Second World War production of the atomic bomb was carried out at Oak Ridge, a 'new' tn 9 m. from Norris Dam, built specially to house the workers. It was opened to the public in Mar. 1949. T. has good rail and air services, and in the Mississippi and the T. Rs. has excellent natural waterways. Education is compulsory and there are 49 univs., colleges, and professional schools, including 8 for Negroes. The state univ. is at Knoxville. The leading religious denominations are S. Baptists, S. Methodists, and Negro Baptists. T. was explored by De Soto in 1540, and first settled in 1757, as part of N. Carolina. It had its first settlement in the Watauga Valley, led by James Robertson in 1769; admitted to the Union in 1796; seceded, 1861; readmitted, 1866. Its General Assembly consists of a Senate and a House of Representatives; it is represented in Congress by 2 senators and 9 representatives. Pop. (1950) 3,291,718. See T. Oldland, *Tennessee*, 1946. See also TENNESSEE VALLEY AUTHORITY.

Tennessee River, trib. of the Ohio, U.S.A. The Holston and French Broad, which unite near Knoxville, Virginia, are

the headstreams. The T. winds through E. Tennessee, Alabama, W. Tennessee, and Kentucky, and finally reaches the Ohio at Paducah. It is now navigable from the mouth 635 m. upstream. Length 652 m.

Tennessee Valley Authority (T.V.A.), created by the Tennessee Valley Act in 1933. The authority initiated regional planning on a scale never previously attempted. Among the reasons why the Tennessee Valley was selected as the site of this great experiment was the existence of a large gov.-built nitrate plant, the Muscle Shoals nitrate works at the Wilson Dam, built during the First World War. Proper control of the Tennessee R. was also crucial for the prevention of disastrous floods on the lower Mississippi. There was further the consideration that flood control could be readily related to improved navigation and to the profitable generation of electric power; and the needs of this backward region could largely be met by cheap electric power, which was supplying 145 municipalities and rural power co-operatives in 1951. The Tennessee valley used to be known as one of the most depressed areas of the U.S.A., affecting parts of the states of Alabama, Kentucky, Missouri, Virginia, Georgia, and N. Carolina. Its disastrous state was due to reckless exploitation by early settlers: the soil was barren and the woods had been cut down; the rivs. frequently flooded. Under the T.V.A. water control was begun. A total of 27 dams was built, and facilities for river traffic improved. Co-ordinated research plans were undertaken throughout the entire area, which is approximately 45,000 sq. m. Soil regeneration, afforestation, malaria control, and similar measures were scientifically applied. National parks were laid out, tourist facilities organised, and cultural and educational activities promoted. The whole project affords a valuable lesson in the possibilities of judiciously applied regional planning, though it was opposed by numbers of influential interests. It should be pointed out that the financial structure of the project has been severely criticised by orthodox economists. Over \$900m. had been spent by T.V.A. by the end of the 1951 financial year, and had increased the income of over 3,000,000 people who had previously been below the 'poverty line'. The ann. revenue for the fiscal year 1951 was \$70,300,000.

Tenniel, Sir John (1820-1914), cartoonist and illustrator, b. London. T. studied at the Royal Academy Schools. His first serious picture appeared at the exhibition of the Society of Brit. Artists in 1836. His design for a mural decoration of the new palace of Westminster in 1845 resulted in his being commissioned to paint a fresco in the House of Lords. Meantime his reputation as a humorous artist had grown, and in 1850 Mark Lemon invited him to succeed Richard Doyle as joint cartoonist with John Leech in *Punch*, his illustrations to Aesop's *Fables* having attracted much attention. His first cartoon was 'Lord Jack the Giant-Killer,' representing Lord John

Russell attacking Cardinal Wiseman. Some 2300 cartoons and many smaller drawings were executed by T. before he severed his connection with *Punch* in Jan. 1901. In them can be traced a political hist. of the period (see illustration in article GREAT BRITAIN). His drawing and the originality of his conceptions coupled with his sense of humour make him unrivalled as a cartoonist. His illustrations for Lewis Carroll's *Alice in Wonderland*, 1865, and *Through the Looking-Glass*, 1872, have delighted children of all ages, and are his greatest claim to fame. He was knighted in 1893. See C. Monkhouse *The Life and Works of Sir John Tenniel*, 1901; F. Sarzano *Tenniel*, 1948.

Tennis, one of the oldest ball games in existence, is often called real T., royal T., or court T. to distinguish it from lawn T., a game which was evolved from T. about 1870. Even in 1100 the game is known to have resembled very closely the T. of to-day.

The royal T. court at Hampton Court is the oldest place in the world where a ball game is still played. It was built in 1529 by Henry VIII, and has served as a model for all later courts erected in England. Henry VII and Charles II were good players. Edward VII played at Princes' when Prince of Wales. Among other courts in active use to-day are those at Lord's and Queen's in London, and at Manchester, Leamington, Oxford, Cambridge, Moreton, Murrel, and elsewhere. The game has been ousted in general popularity by lawn T. and squash owing to the expense of building and maintaining a court.

Regulation courts measure 96 ft by 31 ft 8 in. Round the 2 ends and along one of the side walls runs the penthouse, a sloping roof over the dedans, galleries, and grille. (It is 7 ft wide and is 7 ft 1½ in. high at the side of the court and 10 ft 7 in. at the farther edge.) Across the middle of the court is stretched a net, 5 ft high at the sides and 3 ft in the centre. In the back wall on the service side is a large rectangular opening—the dedans. On the back wall of the hazard side is a small square opening—the grille. A ball struck so that it enters the dedans, the grille, or the gallery on the hazard side farthest from the net, known as the winning gallery, wins the point outright. On the main wall, near the grille, is a projection known as the tambour. The winner of the toss has choice of ends and usually takes the service side. A service to be good must strike the penthouse at least once on the hazard side of the court and drop into a prescribed area on the floor. The striker-out may volley the service or return it at first bounce. Basically the scoring is as in lawn T. except for a great number of variations; e.g. if the server fails to touch the ball with his racquet when it is returned, the marker watches where the ball falls on its second bounce, and calls the chase, the floor being marked with chase lines for this purpose. That point is held in abeyance, and when 2 chases have been made the players cross

over, and the one who is now striker-out must make a better, i.e. shorter, chase in order to win the point. If he makes the same chase, the score remains unaltered, and the marker calls 'chase off.' If either player is at game point, they cross over if one chase is made.

A short chase is made by playing the T. 'stroke,' i.e. a heavily cut stroke that comes down sharply off the wall below the dedans. There are also chases on the hazard side. A set is the best of 11 games. The balls are solid, and should not be less than 2½ in. and not more than 2¾ in. in diameter. They should weigh not less than 2½ oz. and not more than 2¾ oz. There are no restrictions as to size or shape of racquets. The game is played by 2 or 4 players.

The first recognised world champion was Clerge (France, 1750). Pierre Etchebaster (France) was world champion from 1928 till he retired in 1955. The present world champion is Albert Johnson (Great Britain). Recent amateur champions are E. Baerlein (1914–27, 1929–30), L. Lees (1928, 1931, 1933–7, 1946), Lord Aberdare (1932, 1938), W. D. Macpherson (1939), Lord Cullen (1947), P. Kershaw (1948), Ogden Phipps (1949), Alastair Martin (1950), Hon. M. G. L. Bruce (1953, 1954, 1956, and 1957), and R. C. Riseley (1955). See C. G. Heathcote, *Tennis, Lawn Tennis, Rackets, Fives*, 1903, and Lord Aberdare (ed.), *Rackets, Squash Rackets, Tennis, Fives and Badminton*, 1933.

Tennis, Lawn, see LAWN TENNIS.

Tennyson, Alfred, 1st Baron (1809–92), poet, b. Somersby, Lincs, son of the rector of Somersby, and younger brother of Charles Tennyson-Turner and Frederick T. (q.v.), who were both poets. He was educ. at Louth Grammar School and at Trinity College, Cambridge. It is only in recent years that research has shown how unhappy T.'s childhood and youth must have been. His father was eccentric and morose, and later became mentally unbalanced, and the whole family displayed neurotic tendencies. Biographers suggest that this background accounted for much of T.'s remarkable sensitivity and reserve in later years. In 1827 he pub., with his brother Charles, a vol. called *Poems by Two Brothers*, to which Frederick had also contributed. At Cambridge T. won the chancellor's medal for Eng. verse in 1829 with a poem on 'Timbuctoo,' and next year brought out a vol. of *Poems, chiefly Lyrical*. This contained some verse of great promise, and was favourably reviewed by Leigh Hunt, though Blackwood made some scathing criticisms. T. was deeply hurt by these, and sought an escape in a tour of France, Germany, and Italy with Arthur Henry Hallam (q.v.). From the pictorial impressions he gained on this tour he took the inspiration of many of his later poems. In 1833 he pub. a vol. which included 'The Lady of Shalott,' 'The Lotus Eaters,' and 'A Dream of Fair Women.' These were unfavourably reviewed by the *Quarterly*, but were liked by the general public, and T.'s work began to be known and admired by a small circle.

He pub. no more poetry for 9 years; this delay was partly due to his sensitive dislike of the bitter criticism which had been directed at his earlier work, but also because in these early years T. wrote far more slowly, and often with more discernment, than he did when he became famous. In 1842 he pub. *Poems*, in 2 vols., containing 'Locksley Hall' and 'Ulysses,' 'The Princess,' 1847, a serio-comic poem, written mainly in epic

ALFRED LORD TENNYSON
Painting by G. F. Watts.

style, but embodying some of his finest lyrical fragments, was T.'s first great popular success, and this ran through 5 eds. in 6 years. But he achieved immediate, and nation-wide fame with *In Memoriam*, which he had begun in 1833, as an elegy to Hallam, who died in that year. The theme expanded under the poet's hands and so the work, while not ceasing to be personal, became a great religious poem as well. It expresses the spiritual conflict which followed upon his friend's death, and sets forth his faith in God, immortality, and the 'one far-off divine event to which the whole creation moves.' *In Memoriam* was pub. anonymously in 1850. It was praised lavishly on all sides, and T.'s improved financial position enabled him to marry Emily Sellwood, to whom he had been engaged for sev. years. This was an extremely happy marriage. In April 1850 Wordsworth died, and the poet-laureateship was offered to Samuel Rogers (q.v.), who declined it on account of his advanced age. T. was then offered the honour, and immediately accepted.

The 'Ode on the Death of the Duke of Wellington' appeared in 1852, and 3 years later the popular 'Charge of the Light Brigade' and 'Maud.' Of all poets laureate, T. was perhaps the best able to produce patriotic stanzas which possessed inspiration and real poetic quality;

but work of this type was not his true *métier*, and it is by his lyrics that T. should be judged, though 'Maud' has scenes of great power and contains some of T.'s finest poetry. In 1859 *Idylls of the King*, variations in poetic form on the Arthurian romances, were pub. These contain some of T.'s loveliest descriptive passages, and have a music and a pathos which links them with the much earlier 'Lady of Shalott.' T.'s Arthurian legends have not the vigour and fire of Malory's interpretation; but they possess a stately, rich grandeur equally effective in describing an ornately vivid tournament scene, the pathos of Elaine, and the final tragedy of the defeated Arthur. His later poems were *Tiresias*, 1885, *Locksley Hall, Sixty Years After*, 1886, *Demeter and Other Poems*, 1889, including 'Crossing the Bar,' and *The Death of Oenone*, 1892. From 1853 to 1869 he had lived at Farringford, Is. of Wight; he then built a house at Aldworth, near Haslemere, which was his home till his death. In 1884 he was raised to the peerage. He died in his 84th year, and received a public funeral in Westminster Abbey.

The poetry of T. is characterised by a wide outlook, by intense sympathy with the deepest feelings and aspirations of humanity, a profound realisation of the problems of life and thought, an exquisite sense of beauty, and a marvellous power of vivid and minute description often achieved by a single felicitous phrase, and heightened by the perfect matching of sense and sound. No poet has excelled him in precision and delicacy of language and completeness of expression. As a lyricist he ranks with the highest in Eng. poetry, and he even possessed a share of humour, as is shown in the 'Northern Farmer' and other pieces. Above all, he was the perfect mouthpiece of his age, both in its merits and its shortcomings; and for this reason his work was in the 20th cent. to meet with the same disfavour as became attached to 'Victorianism.' But when the volume, variety, and finish of his writings are considered, he must be ranked among the greatest Eng. poets. There are memoirs of T. by his son Hallam T., 1899, and his grandson Charles T., 1949. See also lives and studies by A. Lang, 1901; A. C. Lyall, 1902; H. Nicolson, 1923; H. l'Anson Fausset, 1929; also W. H. Auden, *Tennyson: an Introduction and a Selection*, 1946.

Tennyson, Charles, see TURNER, CHARLES TENNYSON.

Tennyson, Frederick (1807-98), poet, b. Louth, Lincs, eldest brother of Alfred. Lord T. (q.v.). Educ. at Eton and Cambridge, he passed most of his life in Italy and Jersey. He contributed 4 pieces to the *Poems by Two Brothers*, and pub. *Days and Hours*, 1854, *The Isles of Greece*, 1890, *Daphne*, 1891, and *Poems of the Day and Night*, 1895.

Tenor, see JOINERY.

Tenor: 1. Highest normal adult male voice, the compass being from tenor C to about treble B, i.e. an octave below soprano. It is so called because in old

polyphony it was the T. part which 'held' the *cantus firmus* (if any), around which the other parts were woven.

2. Instrument, especially the viola, playing part between bass and alto.

3. Tenor bell, the largest of a peal or set.
Tenrec, or **Tailless Hedgehog**, see **CENTETES**.

Tension. Newton's third law states that action and reaction are always equal and opposite. Where the action and reaction of 2 bodies tend to keep them apart, these constitute a thrust, but where they tend to keep 2 bodies together they constitute a T. A good illustration is a tug of war, the T. in the rope being the same everywhere. T. is measured in the same way as other forces—in poundals, or dynes in the C.G.S. (centimetre-gramme-second) system.

Tent, movable dwelling or shelter made of cloth, skins, or tree bark supported by poles and secured by ropes and pegs. T.s have been used by nomadic peoples since the dawn of hist. Those used by the Bedouin Arabs are made of strips of woven goat's hair and have changed little in construction since O.T. days. The *tept* of the N. Amer. Indian is a conical-shaped T. made generally of skins or tree bark stretched over a tripod of poles. Also in the N. Amer. continent is found the flimsy summer skin T. of the Eskimo. Probably the most luxurious T. used by nomadic tribes is the Mongol *yurt*, a felt-covered dwelling with walls of latticed hurdles; richly embroidered felt curtains line the interior and form partitions. T.s have long been recognised as a means of housing troops in active service areas. In the W. world T.s are now generally used by people visiting open spaces, enabling them to remain independent of permanent dwellings. Modern T.s vary in size from the smallest one-man sleeping shelter to the marquee of many hundred ft in length, but have in common the fact that they are generally made of canvas suspended on a minimum framework of poles—sometimes only a single pole—and are held secure by adjustable guy-lines of cord or rope attached to pegs in the ground.

Tenterden, **Charles Abbott**, first Baron T. of Hendon (1762–1832), b. Canterbury. His father was a barber. Educ. at King's School, Canterbury, and Corpus Christi College, Oxford. He studied law, was admitted to the Bar, and became a special pleader. He was made recorder of Oxford in 1801, and in 1807 pub. his treatise *Law relative to Merchant Ships and Seamen*, which is still an authority in mercantile law.

Tenterden, municipal bor. (since 1449) of Kent, England, 18 m. SSE. of Maidstone, and a member of the Cinque Ports Confederation as a limb of Rye. Its 13th-cent. church (St Mildred's) is crowned by a lofty Perpendicular tower. T. forms a shopping centre for an agric. area. Pop. 4500.

Tenths: 1. The tenth part of the ann. income of an eccles. living which formerly went to the Pope, but at the Reformation was transferred to the Crown. Afterwards various benefices were exempted

from payment of T. altogether (see under **QUEEN ANNE'S BOUNTY**; **TITHE**).

2. In music, the octave plus a third; an interval comprehending 9 conjoint degrees, or 10 sounds, diatonically divided.

Tentyra, or **Tentyris**, see **DENDERA**.

Tenure, **Feudal**. **Tenure** is defined by Williams as the relation between feudal lord and tenant of land (*Real Property*). This is sufficiently accurate because the feudal system is the foundation of modern Eng. real property law, although the fabric of that system was effectually shattered in the early part of the 17th cent. The theory that all land was held immediately or immediately of the sovereign in return for either free or base services was essentially a Norman innovation into England adapted by the Conqueror from continental feudal institutions. In return for his loan of land the feudal tenant was bound to perform either *free* or *base* services. From these services were developed respectively freehold tenure and copyhold through tenure in villeinage. Of freehold tenures the most honourable was that of knight service. Most of the ancient feudal incidents were abolished by the Statute of Tenures, 1660, which assimilated knight service to 'free and common socage.' Generally speaking, all the ancient forms of tenure were abolished by the Law of Property Act, 1925. See also **DE DONIS**; **ENTAIL**; **ESCHEAT**; **ESTATE**; **FORFEITURE**; **LAND**; **LAND LAWS**; **LANDLORD AND TENANT**; and also under the various forms of tenure.

Tenzing Norgay (1914–), Sherpa mountaineer who climbed to the summit of Everest (29,002 ft) with Edmund Hillary on 29 May 1953. B. at Tsa-chu, near Makalu, and bred in the village of 'Thami (12,000 ft) in Solo Khumbu, at 18 years of age he ran away from home to Darjeeling and became a mt. porter. His expeditions are as follows: 1935: Everest, and Kabru in Sikkim. 1936: Everest, and Garhwal. 1937: Garhwal. 1938: Everest (when he carried loads to 27,200 ft), and Garhwal. 1939: Trich Mir in the Hindu Kush. 1946: Bandar Punch in Garhwal. 1947: N. side of Everest with Denman, and as sirdar to Kedarnath (22,770 ft, of which he made first ascent) and Satopanth (23,213 ft), both in Garhwal. 1948: Lhasa. 1949: Bandar Punch (20,720 ft, of which he made first ascent). 1950: Nanga Parbat. 1951: as sirdar to Nand Devi, when he climbed Nanda Devi E. (24,391 ft), and to the Kangchenjunga massif. 1952: twice to Everest, when he climbed with Lambert to 28,200 ft in May and to 26,575 ft in Nov. Tenzing received the George Medal after his ascent of Everest in 1953. He is now head of the Himalayan Institute of Mountaineering, a school of mt. training centred at Darjeeling. Author of *Man of Everest*, 1955 (his autobiography as told to and written by J. R. Ullman).

Teocalli, see **MEXICO**, *Archaeological Research*.

Teotihuacán ('Abode of the Gods'), remains of an ancient Toltec, 24 m. N.E. of Mexico city. It is famous for its pyramids, which form the largest artificial

tumuli on the Amer. continent. The Pyramid of the Sun (216 ft) has terraced sides and wide stairs leading to the top; the Pyramid of the Moon is 140 ft high. There are also the remains of temples to Aztec gods. The remains cover an area of about 8 sq. m. See S. Linné, *Archaeological Research at Teotihuacan*, 1934.

Tephigram (*T_g-gram*), thermodynamic diagram used in meteorology to complete (in a vertical direction) the weather analysis achieved horizontally in a weather map. It was introduced by Sir Napier Shaw, its name being derived from the main co-ordinates, temp. (*T*) and entropy (ϕ), q.v. If air expands (as it must in ascent, for pressure decreases with height) without absorbing heat from any source its temp. falls because of the work done in expansion. This is an 'adiabatic' expansion and the consequent rate of loss of temp. with height or 'lapse rate' is constant at 5.4° F./1000 ft. When the air has cooled to its dew point the water vapour it contains becomes saturated, and any further lifting above this level, called the condensation level, causes condensation into cloud droplets which are carried up with the rising air, and eventually rain or snow may be formed (see further under RAIN). The liberated latent heat of condensation warms the air somewhat, and the new 'saturated adiabatic' lapse rate is therefore less than the 'dry adiabatic' above, the difference being greatest at high temps., where most water vapour is available for condensation. The *T*. has 5 sets of lines on it: (1) slightly curved diagonal lines representing equal pressure; (2) vertical lines representing equal temp.; (3) dry adiabatics or lines of equal entropy, represented by horizontal lines; (4) saturated adiabatics, represented by curved lines which become almost parallel to the dry adiabatics at low temps. where there is little moisture in the air; and (5) steeply sloping lines representing humidity mixing ratio of saturated air (see further under HYGROMETER). A point on the *T*. can be defined by temp. and pressure, and it can therefore represent the state of a small parcel of air; and a line (the 'environment curve') can equally represent the state of the air at all levels. Vertical motion (i.e. between 2 pressure levels) is represented by a movement of the point along the appropriate adiabatic (saturated or dry); the dew point (which may be defined as the temp. to which the air must be cooled to achieve saturation) moves along a saturated mixing-ratio line, and where it meets the corresponding dry adiabatic is the condensation level. It is therefore easy to detect and measure on a *T*. the movement of air over colder and warmer surfaces, up and down hills and over or under other masses of air, and the ascent or descent caused by regional inflowing or outflowing.

Atmospheric Stability. If the environment curve shows a greater lapse rate than the corresponding adiabatic (dry or saturated according to whether the air is dry or saturated) air slightly disturbed will be warmer (and lighter) than its surroundings in ascent and cooler (and

heavier) in descent. Convection is then likely and the atmosphere is unstable. The greater the instability the more violent the convection, the most violent being in thunderstorms, tornadoes, and waterspouts (q.v.). If the lapse rate is less than the corresponding adiabatic the air is stable and no convection occurs. Limited depths of instability (e.g. near the earth on a sunny day) may be extended to great heights by convection reaching above the condensation level, with consequent decrease in adiabatic lapse rate for ascending air; instability may also develop by bodily lifting until much of the air becomes saturated. All these effects can be traced easily on a *T*.

Air Mass Analysis. Coming from different geographical regions, air masses (see METEOROLOGY) have distinctive environment curves on the *T*. The distinction is especially clear if 'Normand' curves formed by joining condensation-level points corresponding to each point of the environment curve are used. The Normand curves have the property of not changing their position relative to the curved saturated adiabatics throughout any lifting or descent, or even if any rain falls from or is evaporated into the air. One air mass lying over the top of another as in a front generally appears as a distinct discontinuity in the Normand curve, even if it appears to be quite smooth in the environment curve. The shape of the Normand curve can be altered only by radiation, which changes the pattern in lower levels or, very slowly, near cloud tops, by mixing, which tends to uniformity, or by horizontal inflow and outflow, which extends or squashes the pattern in height. *T*s. can thus help to identify air masses even if their previous hist. is unknown.

See W. N. Shaw, *Manual of Meteorology*, 1926; Admiralty, Hydrographic Dept., *Admiralty Weather Manual* (H.M.S.O.), 1938, 1941; D. Brunt, *Physical and Dynamic Meteorology*, 1939, 1941; S. Petterssen, 'Convection in Theory and Practice' (*Geofysiske Publikasjoner*, Oslo, vol. xvi, No. 10), 1946.

Tephilin, see PHYLACTERIES.

Tepic, cap. of the state of Nayarit, 415 m. NW. of Mexico City. It is a popular spa, and manufs. include cotton-stuffs, coffee, sugar and cigars. It is the centre of a mining area and has rail and air facilities. Pop. 17,600.

Teplice (or **Teplice-Sanov**; Ger. **Teplitz-Schönau**), Czechoslovak tn in the region of Ústí nad Labem (q.v.). It is in the Biela valley at the foot of the Erzgebirge (q.v.), and is a popular spa. The dist. has coal mines, and *T*. has sev. manufs., including paper, glass, and pottery. Pop. 45,200.

Teplitz (-Schönau), see TEPLICE.

Teramo: 1. Prov. of Italy, in N.E. Abruzzi e Molise (q.v.). It is mainly in the Apennines (q.v.) and has high mts in the SW. (Gran Sasso d'Italia, q.v.) and W. There is a coastal plain on the Adriatic in the E., and there are many fertile riv. valleys; the chief rivs. are

the Tordino and Vomano. The prin. tns include T. and Atri (qq.v.). Area 770 sq. m.; Pop. 275,000.

2. It. tn, cap. of the prov. of T., on the Tordino, 26 m. N.E. of L'Aquila (q.v.). It has a cathedral with a remarkable 14th-cent. Gothic portal, and there are Rom. remains. Textiles are manuf., and there is a trade in agric. produce and wine. Pop. 38,500.

Teraphim, biblical term of uncertain etymology, indicating probably small portable images (Gen. xxxi. 19, 35) such as have been dug up often in the course of excavation. They were household deities, and may have constituted a sort of legal title of ownership for the house. They have often been compared to the Rom. *lares* and *penates*, which were supposed to protect the home and bring it good luck. The T. were closely associated with the practice of divination (1 Sam. xv. 23; Zech. x. 2); would drive away evil spirits and plague demons (1 Sam. xix. 13).

Teranda, see PRIZREN.

Teratology, science dealing with abnormal developments of formations of parts of the body, and with monstrosities. See ALBINISM; BOTANY; CLUBFOOT; DEFORMITY; DWARF; GALLS; GIANTS; HERMAPHRODITE; HERNIA; HYBRID; PATHOLOGY; etc.

Terbium, metallic chemical element, symbol Tb, atomic number 65, atomic weight 159.2. It is a member of the group of rare earths (q.v.).

Ter Borch, Terborch, or Terburg, Gerard (1617-81), Dutch painter, b. Zwolle. He studied under his father, Geert Ter Borch, and later in Haarlem under Molijn, and in Italy and France, and visited England, Germany, and Spain. One of his masterpieces, 'Peace Congress of Münster', is in the National Gallery, London. He painted many distinguished interiors with figures, 'The Letter' (collection of H.M. the Queen) being an example. He delighted in rich costumes, and bathed his pictures in a clear, silvery tone. See lives by F. Hellens, 1911, and W. Krothes, 1921.

Terce, in Scots law, a real right whereby a widow who has not accepted any special provision is entitled to a liferent (q.v.) of one-third of the heritage owned by her husband at the date of his death. The corresponding right of a widower to a liferent of his wife's heritage is called *Courtesy*.

Terceira, see AZORES.

Terbène, colourless liquid consisting of terpene and other hydrocarbons. It is prepared by treating turpentine with successive quantities of sulphuric acid and distilling the product. The smell of T. resembles thyme or pinewood, and it is used as an antiseptic and deodoriser.

Terbenth, or Turpentine Tree, see PISTACIA.

Teredo, Ship Worm, Woodworm, or Pileworm, genus of lamellibranch molluscs with a long worm-like body clothed in a thin shelly tub or sheath. The true bivalve shell is small and occurs at the thicker end where it protects the various organs. At the more slender end are 2

tubes, one of which conveys water to the gills and the other expels it with excavated matter. With its shell valves it bores into timber, and is very destructive to ships, piers, and submarine cables. From 1914 to 1920 it caused damage in San Francisco Bay estimated at \$10m. Francis Drake's *Golden Hind* was destroyed by the T.

Terek, riv. in the Caucasus, rising S. of Kazbek Mt. It traverses the main Caucasian range through Dar'yal gorge, flowing NW. until it reaches the lowland, then E. into the Caspian Sea. Length 350 m.

Terence (Publius Terentius Afer) (c. 195-159 BC), Rom. comic poet, b. Carthage, probably of Libyan stock. Brought to Rome as a slave by P. Terentius Lucanus, he received a good education and was afterwards manumitted. Six of his plays are extant: *Andria*, 166, *Hecyra*, 165, *Heauton Timoroumenus*, 163, *Eunuchus*, 162, *Phormio*, 162, and *Adelphi*, which was first performed at the funeral games of L. Aemilius Paulus, 160. Four of these are adaptations from Menander, 2 from Apollodorus. Supreme both in point of style (simpler and more elegant than that of Plautus) as well as of dramatic skill (plot and character-study), T. influenced many later writers, including Molière. The best edition is that of R. Kauer and W. M. Lindsay, 1926. See G. Norwood, *Terence*, 1923; W. Beare, *The Roman Stage*, 1950.

Teresa, or Theresia, St (1515-82), Sp. nun and monastic reformer, b. Teresa Cepeda de Ahumada, at Avila. She entered a Carmelite convent in her native tn in 1533; but seeing the relaxation of discipline within the religious orders, she determined on reform, and set about founding a house in which all the original rules of the Carmelite order would be observed. She met with great opposition from clerical and lay authorities, but having obtained permission from the Pope, she estab. (1562) the auct Carmelite rule at a small house in Avila which she dedicated to St Joseph. Here the sisters (at first only 4 in number) lived according to the primitive rule. After a time the number was increased to 13, and T. herself took up her abode with them, spending, as she says, the 5 happiest years of her life. Her energy and administrative ability were exceptional; between 1562 and her death she founded 15 new houses directly, and 17 through others. With the help of St John of the Cross (q.v.) she estab. her reform among the Carmelite friars. It is estimated that her work did much to prevent the spread of Protestantism to Spain. It inspired the leaders of the Counter-Reformation (q.v.) all over Europe. She combined practical common sense and industry with extraordinary mystical graces, which are described in her writings. These latter are among the classics of Sp. literature and masterpieces of mystical theology. T. was canonised in 1622. Her feast is on 15 Oct. Her works include *The Way of Perfection*, *The Castle of the Soul*, and *The*

Book of the Foundations, all of which have been trans. into Eng. by E. A. Peers, 1946. See *lives* by G. Cunningham-Graham, 1894; H. Waack, 1947. See also *Victoria Sackville-West, The Eagle and the Dove*, 1943.

Teresina, Brazil, cap. of Piaul state, in a cotton, sugar, rice, and cattle area. Pop. 69,000.

Tergeste, see TRIESTE.

Ter-Gouw, see GOUDA.

Tergoviste, see TIRGOVISTE.

Terhune, Albert Payson (1872-1942). Amer. writer of animal stories, b. Newark, New Jersey. Educ. at Columbia Univ. he travelled in Egypt and Syria, and wrote *Syria from the Saddle*, 1896. Back in America, he became a journalist, but from 1919 concentrated on writing about dogs. *Lad: a Dog*, 1919, had a sequel, *Further Adventures of Lad*, 1922. Other books are *Bruce*, 1920, *Buff, a Collie*, 1921, *His Dog*, 1922, *Wolf*, 1924, *The Heart of a Dog*, 1925, *Bumps*, 1927, *A Dog Named Chips*, 1931, *The Way of a Dog*, 1934, and *A Book of Famous Dogs*, 1937. *Now That I'm Fifty*, 1925, and *To the Best of My Memory*, 1930, are autobiographical.

Terminable Annuities, see PUBLIC DEBT.

Terminal Velocity. If a body moves under the influence of a continuous force in a resisting medium, the resistance being some function of the velocity of the body, there is a limit to the velocity that it can attain. This limit is known as the T. V., and is the velocity to which that of a body falling through the atmosphere continually tends. The T. V. is small for snowflakes, greater for drops of rain, and greater still for hailstones, and it depends largely on the size, shape, and density of the falling body.

Terminator, the line which divides the dark from the illuminated portion of the disk of the moon or of a planet.

Termini Imerese (ancient *Thermae Himeraenses*), fishing port and tourist resort in Sicily, on the N. coast, 19 m. SE. of Palermo (q.v.). In the higher part of the tn is a beautiful 16th-cent. cathedral, and parts of the ancient city walls remain. The Gk city of Himera (founded 648 bc) was razed in 408 bc by the *Carthaginians*, who built a new town on the opposite bank of the riv. From a warm medicinal spring in its neighbourhood came to be called *Thermae Himeraenses*. It was the birthplace (361) of Agathocles, tyrant of Syracuse from 317 to 289 bc. There are remnants of Rom. buildings, including a theatre. Hot mineral springs are found in the vicinity. The tn has a trade in agric. produce, olive oil, and fish. Pop. 24,800.

Terminus, Rom. god of boundaries and frontiers. His cult was supposed to have been introduced by Numa, who made everyone mark the boundaries of his land with stones consecrated to Jupiter, and offer yearly sacrifices at these stones. This festival was the *Terminalia*, celebrated on 23 Feb.

Termites, order of insects, Isoptera, characterised by the possession of biting

jaws and by the absence of a metamorphosis. T. are the only insects other than those belonging to the Hymenoptera which are known to exist in organised communities. In their habits they resemble ants in many respects, and are often called 'white ants', though structurally they differ from ants very considerably, while their communities are differently composed. The communities consist of 'kings' and 'queens', which are fertile males and females that have cast their wings by a rupture at a transverse suture close to the root, and of infertile males and females whose wings never develop, and who become 'soldiers' or 'workers' according to the nature of their food. The head is large, and though many forms are blind, others have compound and simple eyes. The 'soldiers'

TERMITES

A, male; B, soldier; C, worker; D, female distended with eggs; E, 'nest.'

are provided with especially large heads and powerful mandibles. The queen's abdomen becomes enormously swollen, her ovaries producing eggs at the rate of about 1 per sec. She and the king are usually confined in the central cell in the nest, and in case of disaster to them, nymphs are always in readiness to take their places, after stimulation of their reproductive organs by special feeding. T. are confined to the tropical and warmer temperate regions, but some occur in S. Europe even, recently, in N. Germany. They feed on wood and waste substances, and construct earthen tunnels and galleries, cementing the walls of their runs with their excrement, which hardens like brick. Some of the tropical species raise vast earthen nests as much as 20 ft. high. They are very destructive, especially of woodwork and of wood foundations of buildings. Wood treated with creosote is immune, and wood that has been attacked may be cleared by fumigation.

Termonde, see DENDERMONDE.

Terms: 1. In law the limitation of an estate or the whole time or duration of an estate, as a lease for the T. of 21 years, for

the T. of 3 lives, etc. See also LIMITATION OF ESTATES; SHELLEY'S CASE, RULE IN; VENDORS AND PURCHASERS.

2. The law T. or portions of the year during which the high court sits. They are 4 in number, viz. Hilary, which usually begins about 11 Jan. and ends about the end of Mar.; Easter, which begins in the early part of April and ends in the middle of May; Trinity, which begins towards the end of May and ends towards the end of July; and Michaelmas, which begins in the first week in Oct. and ends just before Christmas. The 'Inns of Court' T., called by the same names as the above, are the 'dining terms' for students, who in the process of qualifying for call to the Bar fulfil the notion of residence that obtains in colleges or other places conferring degrees, by eating dinners during term time.

3. In univs. and colleges the time during which instruction is regularly given to students. Schools have adopted the same system. In the U.K. there are usually 3 T. The academic year starts in Sept./Oct., and there are breaks at Christmas, Easter, and during the summer months.

4. In formal logic, the expression in language of the notion obtained in an act of apprehension. T. are divided into simple, singular, universal, common, univocal, equivocal, abstract, concrete, etc. See also SYLLOGISM.

5. In algebra, a member of a compound quantity, as a , in $a + b$; or ab , in $ab + cd$.

Tern, riv. of Shropshire, England, which joins the Severn at Atcham. Length 32 m.

Tern, or Sea Swallow (*Sterna*), genus of birds resembling the gulls, to which they are allied, but smaller and slenderly built and with a forked tail. They are extensively distributed, especially in temperate climates. Though poor walkers and swimmers, they are very active on the wing, skimming the surface of the sea from sunrise to sunset in search of small fish and other marine animals. A number of species occur in Britain, the commonest of which is *S. hirundo*, with grey plumage. The others are the sooty T. (*S. fuscata*), the Arctic T. (*S. macrura*), the Sandwich T. (*Thalasseus sandvicensis*). The Arctic T. is remarkable for the range of its migration, from Greenland, N. America, and N. Europe as far S. as the Antarctic. The black T. and other similar species known as marsh T.s are now placed in the genus *Chlidonias*. They are distinguished by their shorter bills, short and slightly forked tails, and less fully webbed feet.

Ternate, tn and is. in the Malay Archipelago, one of the Molucca Is., Indonesia. Of volcanic origin, its mts rise to 5627 ft, and it is densely wooded. Area 41 sq. m.; pop. (1930) 13,000; (1940) 7000. Exports are timber, copra, and spices. T. was discovered by the Portuguese in 1522, but was under Dutch sovereignty by 1683. Occupied by the Japanese in the Second World War, it became part of Indonesia in 1950.

Terneuzen, seaport in the prov. of Zeeland, Netherlands, situated on an arm

of the Scheldt, 28 m. WNW. of Antwerp. It is at the end of the 20½ m.-long Ghent-T. canal. Pop. 14,670.

Terni: 1. Prov. of Italy, in S. Umbria (q.v.). It is in the Apennines (q.v.), and consists of 3 mt blocks, separated by the broad valleys of the Tiber (q.v.), Paglia, and Nera. The prin. tns include T. and Orvieto (qq.v.). Area 836 sq. m.; pop. 226,000.

2. (Anct Interamna Nahars or Interamna Umbrica), It. tn, cap. of the prov. of T., 40 m. SSE. of Perugia (q.v.). Its site is believed to have been occupied since 1000 BC, and the tn has Rom. remains and early Christian tombs. The cathedral (13th-17th cents.) has a 10th-cent. crypt. There was severe damage during the Second World War. T. has important steelworks and iron foundries, as well as chemical, engineering, and textile industries, and lignite deposits. It is thought to have been the bp. of Tacitus (q.v.). Pop. 84,600.

Ternopol' (Ukrainian Ternopil', Polish Tarnopol'): 1. Oblast in Galicia (W. Ukraine), on the Volhynia-Podolia upland N. of the R. Dniester, in the Black Earth belt. There are lignite and peat deposits. Wheat, sugar beet, and sunflowers are grown, and cattle and hogs raised; there are varied food industries. For hist. see GALICIA. Area 5,300 sq. m.; pop. (1956) 1,090,000, mostly Ukrainians, also Jews (before 1946 also Poles).

2. Cap. of the above, 78 m. SE. of L'vov. It is a major railway junction (5 lines), with some industry. Founded in 1540 as a fortress, it became an important trading centre; it has been prov. cap. since 1921. Fierce fighting took place here in 1944. Pop. (1956) 32,000 (1940, 46,000), before the war half Jewish.

Terpander (7th cent. BC), Gk musician and poet, b. Antina in Lesbos. He has been described as the father of Gk lyric poetry, but no genuine fragment of his work survives.

Terpenes, general name given to hydrocarbons which occur in essential oils, having a molecular formula $(C_5H_8)_n$. They can be classified as mono-T.s ($n = 2$, e.g. *p*-cymene), sesqui-T.s ($n = 3$), di-T.s ($n = 4$), and tri-T.s ($n = 6$). They are all volatile and unsaturated compounds, the most important being limonene, camphene, and pinene (q.v.), many of them being derivatives of *p*-cymene (*p*-methyl isopropyl benzene). There are also derivatives of T.s such as alcohols (e.g. terpineol, menthol), Terpene ketones (e.g. carvone, camphors, menthone), Terpene ethers (e.g. cineol), and acyclic members (e.g. geraniol, citral, and myrcene).

Terpsichore (Gk 'delighting in the dance'), goddess of song and dance. See MUSES.

Terra, or Tellus, see GAIA.

Terra Australis Incognita, vast unknown continent which was commonly believed to lie beyond the ocean of the S. hemisphere as a counterpart to the land masses of Europe, Asia, and Africa. The belief was held by the geographers of antiquity and the Middle Ages and was only finally

exploded by Capt. James Cook in the late 18th cent. T. A. I. was believed to stretch in a solid mass as far N. as Tierra del Fuego as late as the 16th cent. Discoveries by Magellan, Drake, Torres, Tasman, and other explorers gradually brought about a realization that this supposed land mass did not exist; finally, Cook ascertained the limits of Australia and of the Antarctic continent and proved the original theory entirely false.

Terra Cotta (It. 'baked earth'; Lat. *terra cotta*), hard, unglazed pottery fabric, used for bricks, tiles, and architectural ornaments, as well as for tombs and coffins, vases, and statues. It may be left with its natural brownish red surface unglazed and uncoloured, or it may be painted as was customary among the Greeks, or it may be covered with enamel.

See R. A. Higgins, *Catalogue of Terracottas* (British Museum), vol. 1, 1954.

Terra di Lavoro, see CASERTA.

Terra Japonica, see CATECHU.

Terra Sigillata, see SAMIAN WARE.

Terraces, in geology, are horizontal shelves or benches on hillsides or on sloping ground. Riv. T. occur wherever the valley has been sufficiently widened and graded to allow formation of flood-plain. On reduction of the level of the flood-plain, the portions resting on the valley slopes are left as ledges, and indicate the various steps in the processes of erosion and oscillations in sea-level. Smaller T. are formed in higher courses of rivs. by the washing up of material forming the banks; they are not level, but have a slight gradient towards the riv. See also BEACHES, RAISED.

Terracina, or **Tarracina**, It. tn, in Lazio (q.v.), on the Tyrrhenian Sea, 23 m. SE. of Latina (q.v.). Originally a tn of the Volsci (q.v.), under the name of Anxur (q.v.), it became in time a Rom. colony. The cathedral (11th-17th cents.) stands on the site of an ant. temple; a Rom. aqueduct remains, and overlooking the tn is a ruined temple of Jove. There was much damage during the Second World War. The tn has a trade in agric. pro-

duce, and the muscatel wine of the region is well known. Pop. (tn.) 21,900; (com.) 26,400.

Terramare (from It. *terra*, earth, and *marna*, marl), natural fertiliser found in the valley of the R. Po, Italy, in flat-topped mounds which were vils. of peoples of a Bronze Age culture. The settlements, which were built on pile foundations but which were nevertheless on land, have taken generally the name of the fertiliser. See C. F. C. Hawkes, *The Prehistoric Foundations of Europe*, 1940.

Terramycin, see ANTIBIOTICS.

Terranova di Sicilia, see GELA.

Terrapin, name given to various tortoises of the families Testudinidae and Dermatemnydidae some of which, especially *Malacoclemmys terrapin*, found in the salt marshes on the E. shores of N. America, are highly valued as food. Among the most important are the yellow-bellied, the red-bellied, the chicken, and the salt-water T.s. They are all active swimmers, their clawed digits being united by a web. They are almost omnivorous, but feed chiefly on aquatic animals. In America and Australia they are commonly kept and fattened in captivity. See also TORTOISE.

Terre Adélie, Fr. sector of the antarctic mainland between longs. 136° and 142° E., administratively part of the *Terres australes et antarctiques françaises* (q.v.) since 1955. It was first visited by Dumont d'Urville (q.v.) in 1840, Charles Wilkes (q.v.) landing on the same coast in the same year. Fr. expeditions, *Expéditions Polaires Françaises*, led by P.-E. Victor (q.v.) have explored and mapped much unknown land since 1948. See M. Marret, *Antarctic Venture*, 1955.

Terre Haute, city, co. seat of Vigo co., Indiana, U.S.A., on Wabash R. 68 m. WSW. of Indianapolis in an agric. and coal-mining region with clay pits. It manufs. bricks, tiles, chemicals, metal products, glass, etc. It has a state teachers' college and the Rose Polytechnic Institute. Pop. 64,200.

Terre-Neuve, see NEWFOUNDLAND.

Terrill, city of Kaufman co., Texas, U.S.A. Cotton is the chief manuf. Pop. 11,500.

Terres Australes et Antarctiques Françaises, Fr. antarctic possessions, estab. by law No. 55-1052 and previously administered (since 1924) as dependencies of Madagascar (q.v.). They consist of Ile St Paul, Ile Amsterdam, Iles Crozet, Iles de Kerguelen, and Terre Adélie (q.v.). See *Polar Record*, Vol. 8, No. 52, 1956, p. 62-3.

Terrestrial Magnetism, see GEOMAGNETISM; MAGNETISM, *Terrestrial magnetism*.

Terrier, term originally applied to dogs which pursue rabbits and other game into their burrows. The Kennel Club lists the following as true T.s: Airedale, Australian, Bedlington, Border, Bull, Cairn, Dandie Dinmont, Fox, Irish, Kerry Blue, Lakeland, Manchester, Norwich, Scottish, Sealyham, Skye, Staffordshire Bull, Welsh, and West Highland White. But the word is also now applied to a number of breeds, many of which are too large and some too

pampered to justify the name; these include Boston T.s. The true T. is a particularly intelligent dog. *See separate articles.*

Terrier, Old English, or White, old terrier breed, which after the Kennel Club's abolition of cropping became very rare, in spite of the fact that it is the only Eng. terrier so called. The head should be long, narrow, and flat, with a sharp tapering muzzle, muscular jaw, pronounced stop, and black nose. The eyes should be small and black, set fairly close together; the ears, formerly prick, should be round and flat. The rather long neck should be muscular; the forelegs straight, and the thighs comparatively large and muscular. The whip tail should be carried low. The coat must be close, hard, short, and glossy, and pure white—colours such as blue not being favoured. The ideal weight is between 10 and 15 lb.

Terries, William (1847-97), actor, *b. London*, his real name being Wm Charles James Lewin. He was educ. privately. He tried sev. careers, but went on the provincial stage in 1867, and soon came to London. His best parts were Squire Thornhill in *Olivia* and William in *Black-eyed Susan*. He was very popular as a hero of melodrama, playing for years at the Adelphi Theatre, at the stage door of which he was assassinated by a mad and obscure unsuccessful actor.

Territorial Army. History. When the Brit. infantry was territorialised under Lord Cardwell's scheme of 1881, volunteer rifle corps were linked with regular and militia units to form the regimental dist. For this reason most T. A. infantry units now bear the title of a line regiment (e.g. Green Howards) with a battalion number 4 or above. There are exceptions to this, of the following order: 'expatriate' units with titles like London Scottish; battalions from cos. which do not support a regular regiment, such as Hertfordshire and Monmouthshire; numerous London Light Infantry units with roots in the 1859 Volunteer Movement such as the Artists' Rifles, Queen's Westminsters, etc.; and the unique Honourable Artillery Company, which was formed before the regular regiments existed; nevertheless, every T. A. unit is affiliated to some regular unit whether it shares its name or not. Under the Cardwell scheme this affiliation meant little in practice, but after the passing of the Territorial and Reserve Forces Act of 1907 and Lord Haldane's administration of it, liaison between regular and T. A. units became a reality. Under this Act co. associations were formed which raised and administered (but did not command) the new territorial force. These associations still function.

The territorial force was intended at first for home service only, but provision was made for individuals to volunteer for overseas service. In 1914 so many of the 11,900 officers and 302,000 other ranks did so volunteer that war units were mobilised in their entirety and brigaded in the 15 territorial (and yeomanry) divs., which took part in the First World War (*see*

table below). The 14 mounted brigades which completed the force up to 1914 were not employed as such, but the 53 regiments of which they were composed went to reinforce other armies or to form the 74th Div., where units came from all parts of the U.K. The other 14 divs. were at first known only by their regimental designation, and the now well-known numbers were not allotted until May 1915; the regimental titles are shown in the first column of the table at the end of this section.

Up to 1914 the defence forces by land consisted of: first line, regular army; second line, special reserve; third line, territorial force. In 1920 a reorganisation promoted the territorial from third to second line and renamed them the T. A.; the special reserve reverted to its old name of militia (q.v.), but in practice no militia was raised until 1938. The 1920 estab. provided for the same 14 infantry divs. (but only 2 brigades of cavalry), some army troops, and a coast defence and an anti-aircraft (A.A.) component. Now the obligation to serve overseas was placed on all members. A small proportion of the cavalry was mechanised. About 150,000 men were recruited, and numbers remained at about this figure until 1938. In 1935 a new estab. was drawn up and partly put into effect: 46 and 47 Divs. were disbanded and went to fill the ranks of 5 A.A. divs.; the field force was now to consist of 9 infantry, 3 motorised, and 1 armoured div. Now for the first time old promises were implemented: some brigades and a few divs. were commanded by T. A. officers, and the deputy director general was also a T. A. officer. In 1938

Regiment	Divisional Numbers	
	1914-18	1939-45

All England . . .	74 cavalry	—

numbers rose to 204,000, and between then and the outbreak of war almost doubled. But of these 405,000 some 107,000 belonged to air-defence units, so that approximately the same numbers were available for the field force as in 1918. During the war the T. A. ceased to exist as a separate force, and recruiting for it ceased. But the fusion of regular T. A. and conscript elements in the air-defence

force, which then retained only men of certain medical categories, had the effect of releasing enough fit men to form a further 7 divs., largely composed of territorials, for the field force (these divs. are shown second in the second column of the table).

As in 1920, so on 1 Jan. 1947, the T. A. was re-estab. There are besides the field force some independent brigades and a much higher proportion than heretofore of corps, army, and G.H.Q. troops, to be drawn principally from regions where the field force div. has been disbanded. National servicemen, on completion of full-time service with the regular army, up to 1957 undertook a further 3½ years' part-time service in the T. A.; they were required by law to complete a total of 45 days' training with the T. A. during these 3½ years. In 1956 a further reorganisation took place. Provision was made for 10 infantry divs, 2 being earmarked for N.A.T.O.

Pay and Conditions of Service. The permanent staff of T. A. units (adjutants, quartermasters, instructors, some unit commanders) is composed of regular officers and N.C.O.s. Officers of the T. A. must be British subjects, and promotion conditions follow much the same lines as for regular officers. 'Boys' (i.e. recruits under 18) are no longer listed. When in camp, territorials receive pay and allowance on the same rate as regulars. Travelling expenses from home to place of training are paid. All ranks receive a bounty if present on embodiment, and all except officers receive an ann. bounty (originally £3, now £12) on completing ann. training. The requirements of the latter vary from term to term, but amount generally to about 15 full days and some 50 drills of 2 hrs each.

Territorial Waters. Most modern states recognise the sovereignty of every other state over its own marginal waters. The limit is generally fixed at 1 marine league from the shore measured from low-water mark. This distance of permissible appropriation is the subject of much criticism by writers on international law, because it was in its origin suggested by the supposed range of a gun; the tremendous range of modern artillery has made the distance meaningless (see on this W. E. Hall, *International Law* (8th ed.), 1924). Three m. at low-water mark, however, remains the minimum claim to sovereign control of the high seas. A more extensive jurisdiction to the waters surrounding their coasts is claimed by some states, though this extended claim may be restricted to certain specific purposes. The acquittal for want of jurisdiction of a Ger. prisoner charged at the Central Criminal Court with manslaughter through the running down of the *Strathclyde* by the *Franconia* (in the famous trial of *Reg. v. Keyn*, 1876) 2 m. off Dover led to the passing of the Territorial Waters Jurisdiction Act, 1878. By that Act the Eng. courts have jurisdiction to arrest and try persons, whether Brit. subjects or not, for offences com-

mitted on the high seas within the T. W. of the Crown, i.e. within 1 marine league from the coast. A conference on the Law of the Sea at Geneva in 1958 failed to agree to the demand of Iceland and others that the limit of T. W. should be extended to 12 m. All attempts at a compromise solution proved abortive. See L. Oppenheim, *International Law* (vol. 1, *Peace*, 8th ed.), 1947.

Terror, Reign of, see FRANCE: History.

Terry Family, Eng. actors and actresses. **Benjamin Terry** (1818-92) and his wife were well-known provincial actors, although in their later years they also had engagements in London with Mauready and Charles Kean. Their children were: (1) *Kate Terry* (1844-1924), the eldest of the family, made her first appearance on the stage in 1850, and the next year came to London and was engaged by Charles Kean. She appeared as Cordelia, Ophelia, Ariel, Juliet, Viola, all of which she played with remarkable success, but especially made a great hit in 1862 by her part of Mrs Union in *Friends or Foes*. (2) *Dame Ellen Alicia Terry* (q.v.) (1848-1928). (3) *Marion Terry* (1856-1930) won a great reputation as an actress, notably in *Lady Windermere's Fan*, in which she reappeared in 1911 at St James's Theatre. (4) *Florence Terry* (d. 1896) played in *The Iron Chest* with Irving, and was the original Little Nell of Halliday's play. (5) *Fred Terry* (1865-1933) first appeared on the stage in 1880 under the Bancrofts. Together with his wife, Julia Neilson (q.v.), he played in *Sweet Nell of Old Drury*, *Hyacinth*, *As You Like It*, *The Scarlet Pimpernel*, *Henry of Navarre*, etc. His daughter *Phyllis Neilson-Terry* (b. 1892) became well known as a Shakespearian actress.

Topical Press

DAME ELLEN TERRY

Terry, Dame Ellen Alicia (1848-1928), actress, b. Coventry, daughter of Benjamin T., an actor. She made her first appearance on the stage as the boy Mamilus in *The Winter's Tale* in 1856 at the Princess's Theatre under the management of Charles Kean. In the same company she played Puck in *Midsummer*

Night's Dream and Arthur in *King John*. In 1863 she played in various companies in London, including the role of Beatrice in *Much Ado*. She married the painter George Frederick Watts, nearly 30 years her senior, in 1864, but they separated a year later. Ellen T. returned to the stage in 1866, at Queen's Theatre, Long Acre, where she first acted with Henry Irving. In 1875 she scored a great success as Portia in *The Merchant of Venice*, revived at the Prince of Wales's Theatre under the management of the Bancrofts. While in John Hare's company at the Royal Court Theatre, she married E. A. Wardell (Charles Kelly, d. 1885), and won great praise for her Olivia in Wills's *Vicar of Wakefield* in 1878. The same year she was engaged by Irving as leading lady at the Lyceum, where she acted constantly for 13 years, appearing as Ophelia, Portia, Desdemona, Juliet, Beatrice, Viola, Lady Macbeth, Katharine (*Henry VIII*), Cordelia, Imogen, and Volumnia (*Coriolanus*). She appeared with Mrs Kendal in Tree's revival, at His Majesty's, of *The Merry Wives of Windsor*, in 1902. Her stage jubilee was celebrated in 1906. In 1907 she married James Carew, an Amer. actor. Among her later parts were Cicely Waynflete in Shaw's *Captain Brassbound* and Alice in Barrie's *Alice Sit-by-the-Fire*. Ellen T. was one of England's greatest actresses. Her interpretation of Portia was famous throughout the Eng.-speaking world, and most critics agree that it has never been excelled. Her exquisite voice and skilful use of gesture were perhaps best seen in her Shakespearian performances. With Irving Ellen T. helped to raise the international reputation of Eng. acting; her interpretations played a considerable part in the success of the Shakespearian revival. Her influence, particularly in tragedy, has not decreased since her death. She received sev. honorary degrees, and in May 1922 the Grand Cross of the Order of the Brit. Empire. See her autobiography 1908; E. Gordon Craig, *Ellen Terry and her Secret Self*, 1930; E. Craig and C. St John (eds.), *Ellen Terry's Memoirs*, 1932; C. St John (ed.), *Ellen Terry and Bernard Shaw: a Correspondence*, 1931.

Terry, Sir Richard (Runciman) (1865-1938), musicologist, b. Ellington, Northumberland. After various appointments he became organist and choirmaster at Downside Abbey in 1896 and at Westminster Cathedral in 1901, where he remained until 1924. He did great work there accompanying the mass and divine office according to the highest musical standards and traditions, and he wrote on and ed. much church music. He also had a specialist's knowledge of sea shanties and carols. He was knighted in 1922.

Terschelling, one of the W. Frisian Is. (q.v.), Netherlands. It is 16 m. long and 3 m. wide. West T. is the chief vil. The inhab. are mainly engaged in fishing, and there is a considerable tourist trade. Pop. 3580.

Tertian Fever, see under MALARIA.

Tertiaries, see FRANCISCANS.

Tertiary, or **Cainozoic**, era of geological time extending from the close of the Cretaceous Period to the beginning of the Glacial Period; the same terms are used to denote the rocks formed during this era. T. strata are divided into 4 systems, the Eocene, Oligocene, Miocene, and Pliocene, the last being the youngest. During the T. era, great disturbances in the earth's crust led to the development of many present-day topographical features. The Alps, Himalaya, Atlas, and Cordilleras were largely formed in T. times. The volcanoes of the Andes, Iceland, and Japan were active then. During the deposition of the T. strata, older forms of life became extinct and were replaced by species of animals and plants closely related to those of the present day. The mammals and the flowering plants underwent great development. Near-human creatures capable of using tools probably first appeared towards the end of the era. In Britain T. strata occur mainly in the S. and E. of the country, but T. volcanoes existed in W. Scotland, the Hebrides and N. Ireland.

Tertis, Lionel (1876-), viola-player, b. W. Hartlepool. He studied music at Leipzig and in London. T. became a brilliant viola-player and a great teacher, and in addition has arranged much music for the viola.

Tertullianus, Quintus Septimius Florens (c. 160-230), Christian apologist, b. probably at Carthage, attained to some eminence as an advocate or rhetorician. At Carthage, probably, he was converted to Christianity, c. 190, and at once ordained priest, where we are not told. He speaks of having been at Rome, and he could write Greek. About the end of the 2nd cent. he became a Montanist (q.v.), according to Jerome because of the envy and insults of the Rom. clergy, but a more adequate and probable reason lies in the character of T. himself. He was a rigorist and violently opposed the restoration to communion of penitent adulterers and fornicators conceded by Agrippinus, Bishop of Carthage. T. holds one of the first places among the Lat. fathers for learning and intellectual power. His writings are apologetic, practical, and doctrinal. The *Apology* written at Carthage, probably in the reign of Severus, contributed largely to the better understanding of Christianity and the mitigation of persecution. See *Vienna Corpus Scriptorum Ecclesiasticorum Latinorum*, vol. xx (1890); E. Leigh-Bennett, *Handbook of the Early Fathers*, 1920; R. E. Roberts, *The Theology of Tertullian*, 1924; J. Morgan, *The Importance of Tertullian in the Development of Christian Dogma*, 1928; T. Brand, *Tertullians Ethik*, 1929; P. Galtier, *L'Eglise et la remission des péchés aux premiers siècles*, 1932; G. Bardy, 'Tertullien', *Dictionnaire de Théologie Catholique* (Vacant-Mangnot), 1946.

Teruel: 1. Sp. prov., in Aragon (q.v.). It is very mountainous, the highest point being in the Sierra de Jabalambre (6568 ft), and has sev. large rivs. including

the Guadalavir (q.v.), the Guadalupe, and the Jiloca. The Tagus (q.v.) has its source on the border between T. and Cuenca. T. has deposits of iron and lignite, and produces cereals, fruit, oil, and wine. Area 5722 sq. m.; pop. 237,000.

2. (Anct Turba) Sp. tn, cap. of the prov. of T., on the Guadalavir. Portions of its anct walls remain, and the tn has a Gothic cathedral, badly restored, fine old houses, sev. *mudéjar* towers, and a 16th-cent. aqueduct. It was besieged and taken by the republicans during the Civil war of 1936-9, but was later recaptured by the insurgents. Pop. 19,450.

Terylene, a synthetic textile fibre formed by condensation polymerisation of terephthalic acid and ethylene glycol

Imperial Chemical Industries

TERYLENE STAPLE FIBRE PRODUCTION,
WILTON

Individual tows of Terylene are brought together before entering the drawing and crimping machine.

(known to motorists as antifreeze). T. was discovered in the U.K. in 1941. Methyl terephthalate is preferred to the free acid, as the former is more easily purified.

This, on further condensation, gives the polymer T., viz.

The fibre melts at 245° C., is melt spun and cold drawn. It has a high tensile strength, but is more resistant to water and more inflammable than nylon (q.v.). It has a wide range of uses as a clothing fabric. In the U.S.A. it is called Dacron.

Terza Rima, It. metre consisting of sets of 3 lines, the middle line of each set rhyming with the first and last of the succeeding set. Dante's *Divina Commedia* is the most famous example. Wyatt was the first in England to use T. R. The form *aba, bcb, cdc* shows that it is continuous in movement; thus in Shelley's *Triumph of Life* the closing line of the stanza rarely coincides with the end of a sentence; and further instances may be found in Byron's *Prophecy of Dante*, though in his *Francesca of Rimini* he avoids the interlocking of stanzas, as does Browning in *The Statue and the Bust*.

Teschen, anct tn and duchy in Silesia (q.v.), on the Olza (Olsa). In 1625 it became an apanage of the Bohemian court, and in 1723 passed to Austria. In 1920 it was divided, along the line of the riv., between Poland and Czechoslovakia, forming 2 tns: Těšín (q.v.) in Czechoslovakia, and Cieszyn (q.v.) in Poland. In 1938, after the Munich Pact (q.v.), Poland seized Těšín; but it was restored to Czechoslovakia in 1945, the Polish inhab. being given certain privileges.

Tesho, or Tashi Lama, see LAMAISM.

Těšín, or Český Těšín, Czechoslovak tn in the region of Ostrava (q.v.). It is divided by the R. Olza (Olsa) from the Polish tn of Cieszyn (q.v.) with which it once formed 1 tn (see TESCHEN). It is in a coal-mining dist. and has textile manufs. Pop. 12,100.

Tesla, Nikola (1856-1943), Amer electrician and inventor, b. Smiljan, Croatia. He emigrated to America in 1882. He worked for some time with Edison, and is chiefly noted for the T. coil; this is of low self-induction, but produces a rapid alternating oscillatory current capable of long-distance transmission. It induces luminosity in a T. tube placed near. The currents have been experimented with for the cure of lupus. From 1903 he was chiefly engaged in developing telegraphy and telephony, and on plant for transmission of power from Niagara. He was awarded the Edison medal in 1917. See J. J. O'Neill, *Prodigal Genius*, 1945.

Teso, **Iteso**, or **Itesot**, a Nilo-Hamitic people of Uganda, now settled in the low country N. of Lake Kioga. They grow much cotton and number 400,000, the second largest tribe of Uganda. See J. Lawrance, *The Iteso*, 1957.

Tessedik, Sámuel, see SZARVAS.

Tessenderloo, tn in the prov. of Limbourg, Belgium, 15 m. NW. of Hasselt. It is the seat of an important chemical industry. Pop. 8800.

Tessera-ae, small cubes of natural stone, pottery, marble, or glass used in the

construction of mosaic floors. The Rom. mosaics were especially notable.

Tessin, see TICINO.

Test, riv. of Hants, England, rising near Ashe. Stockbridge and Romsey are the largest places on its banks. It enters Southampton Water. Length 30 m.

Test Act. By the T. A., 1673, all office-holders of the Crown, civil and military, were obliged within 6 months after appointment to make a declaration against transubstantiation, take the sacrament in accordance with the ceremony of the Church of England, and take the oath of supremacy. This Act was usually conjoined with the Corporation Act, 1661, which compelled all holders of municipal offices to take the sacrament, a provision aimed at both Presbyterians and Rom. Catholics. Lord John Russell in 1828 carried a motion for their repeal, but both had by then in fact been ineffective for sev. years.

Test Matches, see CRICKET.

Test-papers, paper slips impregnated with some chemical reagent. Litmus papers are used for testing for acids and alkalis, acids turning the blue variety to a red colour, and alkalis turning the red papers to a blue. Paper containing lead acetate is used as a test for hydrogen sulphide, which turns it brown. Oxidising agents, such as chlorine, ozone, etc., are tested for with papers containing potassium iodide and starch, which are turned blue by their presence. Turmeric paper, yellow in colour, is used as a test for alkalis and boric acid, which cause it to become brown.

Testament, see BIBLE.

Testament, see WILLS AND TESTAMENTS; COVENANT.

Testamentum Domini, produced probably in Asia Minor between 350 and 550. Based on the *Apostolic Tradition* of Hippolytus (q.v.), it was cherished by the Monophysite Churches. See J. Cooper and A. J. Maclean, *The Testament of our Lord*, 1902.

Testes, Testicles, or (in the U.S.A.) **Spermaries**, reproductive organs (gonads) of the male animal, in which are manufactured the reproductive cells (spermatozoa or sperms) whereby the eggs are fertilised. There is usually a single pair of T. in each individual.

Testimony, see DECLARATIONS OF DECEASED PERSONS.

Testing Clause, in Scots law, technical name for the clause in written deed or other formal legal instrument which authenticates the document according to the forms of law. It contains a record of the number of folios of which the document consists, the names and designations of the witnesses to the writer's signature, and the date and place of execution.

Testing of Metal, see METAL TESTING.

Testudo, see TORTOISE.

Testude (Latin 'tortoise'), technical name applied to a Rom. military formation used when attacking fortified positions. The soldiers raised their shields well above their heads and interlocked them to form a protective covering.

Tetanus, or **Lockjaw** (from Gk *teinein*, to stretch), infectious disease characterised by violent muscular contractions. The cause of the disease is the introduction into a wound of the *Clostridium tetani*. The existence of this micro-organism was demonstrated by Nicolaier in 1885, but a pure culture of it was first obtained by the Jap. scientist, Kitasato, in 1889. The germs are not themselves carried away in the blood-stream, but they set free toxins of poisons of unparalleled virulence, *grahpa* of a drop of a cultivated example having been known to kill a mouse. The toxin acts upon the cells of the central nervous system causing uncontrollable tonic spasm of the voluntary muscles. The bacillus of T. forms resistant spores which are found in soil, animal excrement, etc., and it obtains an entrance to the body through a wound which has become contaminated with dirt. The disease is particularly prevalent in agricultural districts where heavy manuring of the ground is carried out. There is no truth in the supposition that wounds in the thumb are particularly liable to set up T. The duty of cleaning a wound which has come into contact with soil should never be neglected, as the development of the injurious toxin proceeds with fatal rapidity. The first sign of the disease is a feeling of stiffness at the back of the neck and difficulty in swallowing; the muscles of the jaw are then affected, with the result that the mouth is opened with difficulty, and afterwards becomes closely shut. The stiffening of the muscles proceeds to the body and limbs, until parts of the body become absolutely rigid to the touch. Besides the constant rigidity, there occur convulsions at intervals which may be as short as 10 min. The muscles are then contracted with such violence that they may become ruptured or lead to the fracture of a bone. The absence of complete relaxation serves to distinguish lockjaw from the spasms associated with strychnine poisoning. The treatment of T. should commence with an effort to make the wound surgically clean. T. antitoxin has been found life saving in treatment, and is given as a routine in cases with contaminated wounds, but when a patient has been demonstrably attacked the development of the toxin has usually proceeded too far for any injection treatment to be of avail. Curare ('arrow poison') and other relaxant drugs are now given to relieve the spasms of the muscles. T. is much more likely to be fatal if it occurs soon after a wound than if its onset is delayed. Thus an onset within a week of wounding gave a death rate of 60 per cent, whereas when the onset was delayed to 36 days the rate was only 15 per cent. Immunisation against T. is now possible by means of neutralised toxin (a toxoid) on the same lines as immunisation against diphtheria. Use of T. toxoid as a prophylactic during the Second World War was highly successful and no cases of T. occurred in those who had received routine inoculation.

Tetanus (in horses), see HORSE (DISEASES).

Tetany. The syndrome to which this name is given is characterised by localised neuro-muscular irritability, manifesting itself, in typical cases, as a carpopedal spasm, i.e. a tonic spasm of the hands and feet, in which the hands assume the so-called accoucheur position (fingers and thumb approximated), the arms are held close to the body, the knees are flexed, and the feet are in the equinovarus position. In severe cases all the muscles of the body may be affected. It is frequently associated with *laryngismus stridulus*. It may result from (a) disease or damage to the parathyroids (the latter may occur in very radical operations on the thyroid); (b) disturbances of calcium metabolism; (c) alkalosis (e.g. following over-administration of alkalis in cases of peptic ulcer); (d) hypomagnesia, either voluntary, hysterical, or after exercise. In children it usually occurs in association with rickets, when the deficient absorption of calcium is due to lack of vitamin D. It may occur in cases of pyloric stenosis with vomiting, chronic diarrhoea, chronic interstitial nephritis, high intestinal obstruction, and in certain cases of poisoning, e.g. by arsenic, lead, chloroform, and morphine. Treatment, which should include that of the associated condition, consists of administration of parathormone and calcium, either by the mouth or intramuscular or intravenous injection.

Tetbury, mkt tn and SW. of Gloucestershire, England, 10 m. SW. of Cirencester, and 8 m. from Stroud, on the W. region of the Brit. Railways. It is a centre of the agric. trade. Pop. (rural dist.) 6700.

Tete, an important trading centre on the banks of the Zambezi, founded by Portuguese in 1531, on the main road between S. Rhodesia and Nyasaland. The Zambezi is crossed by ferry. Large coal deposits have been found in this area, and a small quantity of alluvial gold is obtained.

Tethys, daughter of Uranus and Gaea, and wife of Oceanus, by whom she was the mother of the Oceanides and the riv.-gods. She was also the teacher of Hera.

Tethys, one of the satellites of Saturn (q.v.). Mean distance from the centre of Saturn is 183,200 m. Its periodic time is 1 day, 21 hrs, 18 min. Stellar magnitude at mean opposition distance, 10.6.

Tethys Sea, a name given by geologists to a great trough-like ocean which throughout much of the Palaeozoic and Mesozoic eras extended in a general E.-W. direction over the sites of the present Alpine and Himalayan mts. The floor of this ocean or geosyncline was covered by great thicknesses of sediment which were finally forced up above sea-level into long ridges. From these ridges, the present-day mt chains were carved by the forces of erosion. The Mediterranean Sea is a greatly shrunken relic of the Tethys.

Tetiara, one of the Society Is., formerly owned by the Tahitian royal family. 26 m. N. of Tahiti, it is an uninhabited atoll, visited by labourers for copra-making.

Tetraethyl lead (T.E.L.), $Pb(C_2H_5)_4$, was first made in 1859, but only in recent years has it been utilised as an anti-knock constituent of motor fuels, a very small percentage of the compound being enough to allow greater compression without the disadvantage of self-ignition. It is manufactured by heating an alloy of lead and sodium with ethyl chloride in a closed vessel at 80-80°C. It is a poisonous liquid, immiscible with water. For use as an anti-knock it is mixed with ethylene dibromide, which carries off the lead in the exhaust gases.

Tetragrammaton, see JEHOVAH.

Tetrahedron, see POLYHEDRON.

Tetrao, see BLACKCOCK; CAPERCAILLIE; GROUSE.

Tetrarch, ruler over the fourth part of a country. The term was borrowed by the Romans from the Greeks, with whom, however, it had quite a different meaning. On the death of Herod the Great, his dominions were divided among Archelaus, Herod Antipas, and Herod Philip. Part remained under the direct rule of a Rom. procurator.

Tetrazzini, Luisa (1871-1940), It. soprano, b. Florence. She studied with her sister Eva, and with Ceccherini at the Florence Liceo Musicale. She made her first appearance at Florence in 1895. Later she toured Europe, Mexico, and S. America. She appeared in London at Covent Garden in 1907, as Violetta in *La Traviata*. Her brilliant coloratura fitted parts calling for that kind of skill, and she achieved particular successes in the title-part of *Lucia di Lammermoor*, and as Amina in *La Sonnambula*. In 1921 she pub. her reminiscences, *My Life of Song*.

Tetricus, Caius Esuvius, last of the pretenders who ruled Gaul during its separation from the empire. He reigned from AD 270 to 274, when he was defeated by Aurelian at Châlons.

Tetridopyrrol, see IONOL.

Tetryl, powerful explosive, formula $C_7H_5O_6N_3$; melting point 129.1°C. It is obtained by nitrating pure dimethylaniline with nitric and sulphuric acids and washing and crystallising from acetone. It burns smoothly, but detonates violently on striking. It is also used as a booster. See EXPLOSIVES.

Tetschen, see DĚČÍN.

Tettenhall, urban dist. of Staffordshire, England, 2 m. from Wolverhampton. Until 1950 a 'Royal Free Chapel,' dating from about 975, was at T.; though partially destroyed by fire, it is now being restored. T. College is a Free Church school, incorporated in 1915. Pop. 10,000.

Tetuan, Duke of, see O'DONNELL, L.

Tetuan, tn of Morocco, on the Mediterranean, 40 m. SE. by E. of Tangier, and a few m. S. of the strait of Gibraltar. The tn is surrounded by walls and includes a citadel. The chief industries are tile works and inlaying. T. was the H.Q. of the former Sp. Zone in Morocco. Pop. (1950) 80,732.

Tetzel, Johann (c. 1465-1519), Ger. Dominican friar, b. Leipz. By the scandalous manner in which he carried on the

traffic in indulgences T. roused Luther to precipitate the Ger. Reformation in 1517. T. was later discredited and retired to a monastery. See life by F. Koerner, 1880; also G. Buchwald, *Unbekannte Predigten von Tetzels*, 1930.

Teucer, see **TROY**.

Teutoburger Wald, range of hills in Germany, on the N.E. borders of the *Land* of N. Rhine-Westphalia (q.v.), running NW. from Detmold (q.v.). It stretches for some 60 m. and is heavily wooded. The highest peak is Volmerstod (1520 ft). It is reputed to be the scene of the battle in which Arminius (q.v.) and the Ger. tribes defeated the Rom. legions under Quintilius Varus (AB 9). There are sev. spas. Coal, iron, and zinc are found.

Teutonic Knights, one of the great semi-religious orders of knights founded during the period of the crusades. It originated in a brotherhood formed by certain Ger. merchants of Bremen and Lübeck to alleviate the sufferings of the attacking troops during the siege of Acre in 1190. A hospital was started, and as a result the T. K. of the Hospital of St Mary of Jerusalem were founded. The new order, distinguished by a white mantle with a black cross, was formed on the model of the Knights Hospitalers (q.v.), and its members were also pledged to tend the sick, to protect the Church, and to wage war against the heathen. In 1198 the hospital was turned into an order of knighthood. The T. K. conquered Lithuania and the Baltic regions of Prussia during the 13th and 14th cents. For a cent. their H.Q. were at Acre (1191-1291), but the seat of the order was transferred to Marienburg in 1308. Their defeat at the hands of the Poles and Lithuanians at Tannenberg (1410) struck a great blow at their prestige and the order declined rapidly. It had already departed from its original moral standards. In 1525 the 'high master,' Albert of Brandenburg, apostatised from the Faith, and the order was secularised. It was suppressed by Napoleon in 1809.

Teutonic Languages, equivalent term for Germanic languages, see **INDO-EUROPEAN LANGUAGES**.

Teutons (Teutones), Ger. tribe, first mentioned by the Gk navigator Pytheas (q.v.), who encountered them on the Holstein coast. They migrated and wandered with the Cimbr (q.v.) 120-102 BC and, becoming a threat to N. Italy, were annihilated in battle by the consul Marius at Aix-en-Provence in 102 BC. The name T. later became a synonym for Germans.

Tevere, see **TIBER**.

Teverone, see **ANIENE**.

Teviot, riv. of Roxburghshire, Scotland, rising in the SW. of the co., and flowing NE. to join the Tweed at Kelso. It has good salmon and trout fishing. The valley it drains is called Teviotdale. Length 37 m.

Tew, Great, vil. of Oxon., England, 5 m. E. of Chipping Norton. Most of the houses, of mellow local stone, were built during the 17th cent., and G. T. is one of the earliest existing examples of a planned vil. The subsequent replanning of the

estate on landscape and ecological principles in the early 18th cent. suggests that it was carried out by John Loudon (q.v.). Pop. 340.

Tewkesbury, municipal bor. and mrkt tn in Gloucestershire, England. It is situated on the Avon, close to the point where that riv. joins the Severn, 10 m. N.E. of Gloucester. The 'Bloody Meadow' on the S. side of the tn was the site of the fiercest combat of the battle of T. 4 May 1471, one of the bitterest battles of the Wars of the Roses, in which the Lancastrians were routed. T. was settled in Rom. times and in 1087 was a bor. and mrkt. Its most magnificent building is its abbey church, all that is left of a great Benedictine abbey, erected in the 12th cent. on a Saxon foundation. Monuments include the Beauchamp Chantry (1422) and the tomb of Hugh Despenser (d. 1349). Prince Edward, son of Henry VI, is reputed to be buried under the tower. T. has a 16th-cent. grammar school and sev. old timbered houses. In Tudor times it was famous for mustard making; now it is an agric. centre. Mrs Craik's *John Halifax, Gentleman* is set in T. Pop. 5446.

Texarkana, dual city of Bowie co., NE. Texas, and cap. of Miller co., NW. Arkansas, U.S.A., astride the state line near I-49. R. T. has 2 municipal govts. It is the rail centre, with shops, and a shipping, processing, manufacturing centre for a livestock, dairying, and agric. region (cotton). It manufs. lumber and wood products, caskets, fertiliser, feed, cottonseed oil, food products, refined sulphur and lead, and clothing. Pop. 40,628; 24,753 in Texas, 15,875 in Arkansas.

Texas, 'the Lone Star State,' the southernmost of the central states of the U.S.A. and the largest (263,644 sq. m.) in the Union, with a coast-line along the Gulf of Mexico, stretching for 370 m. from Mexico NE. to Louisiana. It is more than 3 times as large as Great Britain. Its extreme length is 760 m. and extreme breadth 620 m. It is separated from Mexico, on the SW., by the shifting Rio Grande; New Mexico and Mexico border it on the W., Oklahoma and New Mexico on the N., and Arkansas, Oklahoma, and Louisiana on the E. The general slope is NW. to SE. The 'Llano Estacado' is a barren plateau in the W., with a mean elevation of from 3000 to 5000 ft. The descent to 1000 ft is swift, and then come the fertile tracts of rolling prairie, with plentiful forests of yellow pine in the E., and with fat pastures alternating with rich corn lands—tracts which extend terracewise to the fertile lowlands and barren swamps of the coastal belt. Behind Padre Is., which hugs the shore for over 100 m. northward from the mouth of the Rio Grande to that of the Nueces, is a region of white sands, known as 'the desert.' With the exception of the lied and Canadian, which carry their waters eastward to the Mississippi, all the rivs., including the Brazos, Colorado, and Trinity, drain SE. to the Gulf of Mexico. T. is too large to enjoy a uniform climate and it has extremes ranging from tem-

perate to sub-tropical. The air in the W. is remarkable for its dryness. T. is one of the great granaries of the world, and one of the chief agric. states of the Union. Its agric. potentialities are indeed enormous, vast areas of available arable land not yet being under cultivation. Since 1930 the problem of soil erosion, from both wind and water, has been increasingly studied. In 1939 a Soil Erosion Act was passed. Since then about 150 soil-conservation dists. covering approximately 136,000,000 ac. have been estab. In 1939 nearly half the irrigable land in T. was irrigated. Results of such care include the 'Magic Valley' of the Lower Rio Grande, formerly almost desert, where citrus fruits and vegetables are now grown. T. leads all the states in value of agric. crops per annum. Maize, oats, wheat, and rice are important crops. Cotton is of great importance, T. producing about a seventh of the world's supply. Other agric. products are fruit (especially peaches, oranges, and grapefruit), potatoes, sweet potatoes, and other vegetables, peanuts, and sorghum. Much of T.'s farming is done by large-scale, highly mechanised, commercial farms, which now form a majority, though a large number of small farms still remain. Stock-raising is of vital importance, T. being one of the great cattle states. It raises over 20,000,000 head of live-stock, including cattle, swine, sheep, horses, and mules. Petroleum is the most valuable mineral product, representing nearly half the U.S. total output. The outputs of clay, coal, and Portland cement are also considerable. Lignite, sulphur, natural gas, quicksilver, and silver are also present and in the W. are great potash fields, as yet unexploited. It produces over 70 per cent of all the sulphur in the U.S.A. T. is the only source of helium in the country. Slaughter-houses and meat-packing stores, and after them flour and grist mills, are profitable industries. But lumbering and timbering, cotton mills, and the manuf. of cotton-seed oil and cake are very thriving, whilst iron founding and the making of machinery and cars as well as rice cleaning are making T. an increasingly industrial state, a process accelerated by the building of war plant and 'new tns. to house their workers during the Second World War. Much of the labour is done by Mexicans, some of the frontier tns. having a pop. half Mexican.

Education is compulsory between 7 and 16 years of age. In 1948 increased educational provision was made for Negroes. There are 78 listed institutions for higher education, including 10 for Negroes. Chief religious bodies are the Rom. Catholic, S. Baptists, Methodists, and Negro Baptists. Segregation of white and coloured races is statutorily enforced. The state has good harbour facilities and has over 1000 m. of navigable waterways. There are over 17,000 m. of railways and over 27,000 m. of state highways. In 1950 T. had more than 600 airfields. The Houston Ship Canal, 57 m. long, connects Houston with the Gulf of Mexico, making that city the largest inland cotton mkt.

in the world. Galveston is connected with the mainland by a causeway 2 m. long. The cap. is Austin, pop. 132,000, where the univ. of T. is situated. Other large cities are Houston, 598,000; Dallas, 434,500; San Antonio, 408,000; Fort Worth, 279,000; El Paso, 130,000; Corpus Christi, 108,300. Galveston has a pop. of 66,600. Increased industrialisation during the Second World War accounts for much of the large increase in T.'s city pops.

The Sp. explorers De Vaca and Coronado (qq.v.) were the first to explore the region now known as T. (the name was that of an Indian tribe), but the first permanent settlement was made by La Salle in 1685 at Fort Saint Louis. T. was surrendered by the French to the Spanish in 1713, who founded many religious missions. These contributed greatly to the conversion of T. not only to Christianity, but from a waste land into a civilised country. When Mexico revolted and became independent in 1821, Coahuila and T. formed 1 state. T. was colonised to a large extent by Americans and English, and when trouble broke out with the Mexican Gov., T. was constituted an independent rep. in 1836. In 1845 it sought and gained admission as a state of the U.S.A. After the Mexican War, which was precipitated by this admission, T. prospered. In 1861 it seceded with the S. states. The legislature consists of a Senate of 31 members and a House of Representatives of 150. Two senators and 21 representatives attend Congress. Pop. 7,711,194. See C. R. Wharton, *History of Texas*, 1935; R. N. Richardson, *Texas*, 1943; J. Frank Dobie, *A Vaquero of the Brush Country*, 1949.

Texas City, port of Texas, U.S.A., on the Bay of Galveston, 5 m. N.W. of Galveston city. In 50 years it has grown from a hamlet into one of the U.S.A.'s largest ports, dealing with rather more trade than San Francisco. A severe explosion on a ship in T. C. harbour in 1947 killed over 600 people and destroyed much of the city. Pop. 16,600.

Texcoco (Tezcucoc), anct. cap. of the Aztecs in Mexico state on the central plateau of Mexico, with many archaeological remains in the dist. Woollens, glassware, and caustic soda are the modern manufs. Altitude 7400 ft. Pop. 5450.

Texel, the largest of the W. Frisian is., in the prov. of N. Holland, Netherlands, covering 71 sq. m. It is separated from the mainland by the 2-m. broad Marsdiep and is reached by boat from Den Helder. At one time it was joined to the is. of Vlieland and the foreshore beyond. The N. part of the is. is called Eierland or Egg Land from the bird observatory erected in this part of the is., where thousands of birds belonging to more than a hundred species breed every year. Of late years the is. has been much frequented by tourists, and by holiday-makers as a camping centre. In 1945 it was liberated by the Russian prisoners-of-war who had been quartered there. The

whole is. forms 1 municipality; the inhab. live by sheep-breeding, agriculture, and fishing. There are considerable exports of lambs to England. T. ewe-cheese is famous as a Dutch export. The farmhouses on T. have a peculiarly square shape, with tall pyramidal roofs (*stolpen*). It was off T. in 1653 that an Eng. fleet under Monck beat a Dutch fleet under Tromp, who was killed during the battle. Pop. 10,400.

Textiles, see FABRICS, TEXTILE; CLOTH MANUFACTURE AND FINISHING; COTTON SPINNING AND MANUFACTURE; WOOL; RAYON; NYLON; MAN-MADE FIBRES.

Teyte, Maggie (1888—), soprano, b. Wolverhampton, studied in London and Paris, made her début at Monte Carlo in 1907 and then appeared at the Paris Opéra-Comique. In 1908 Debussy chose her to sing the heroine in his *Pelléas et Mélisande* at that theatre. In later years she excelled as an interpreter of songs, especially Fr.

Tezcuco, see TEXCOCO.

Teztlutlán, in the state of Puebla, Mexico. There is agric. production and processing, and copper is mined near by. Altitude 6900 ft. Pop. 8390.

Thackeray, William Makepeace (1811–1863), novelist and essayist, b. Calcutta. His father, Richmond T. was in the service of the E. India Company. He died in 1815, leaving his son an inheritance of nearly £20,000. T. was sent to England in 1817, and was educ. at Charterhouse, and at Trinity College, Cambridge, where he was a friend of Fitzgerald and Tennyson. He left the univ. after a year and travelled in Germany, staying chiefly at Weimar. In 1831 he entered the Middle Temple, but did not long pursue his legal studies. He spent much of the following year in Paris, and in 1833 became part owner of a weekly paper, the *National Standard*. The paper came to an end in the following year, when its losses were borne by T. The remainder of his patrimony disappeared with the failure of an Indian bank in 1833. He was at this time in Paris studying art. He now hoped to earn his living as an illustrator, and in April 1836 pub. *Flore et Zephyr—Ballet Mythologique*, a set of eight plates. In Aug. he married Isabella Shawe, and shortly afterwards he became Paris correspondent of the daily newspaper, the *Constitutionnel*. This also failed, and in Mar. 1837 he returned to London, where his daughter Anne Isabella, later Lady Ritchie, the eldest of his 3 children, was born. To this period belong his contributions to *Fraser's Magazine*, including the *Yellowplush Correspondence*, 1837–8, and *Catherine*, 1839–40. From then onwards his life was permanently clouded by his wife's insanity. The *Paris Sketch Book* followed *Catherine* in 1840, but was unsuccessful. This was followed in 1841 by *Comic Tales and Sketches*, collected periodical writings, which revealed the two pseudonyms 'Yellowplush' and 'Michael Angelo Titmarsh' as the same person. In 1842 he visited Dublin, and *The Irish Sketch Book* appeared in 1843.

His friendship with Mrs Brookfield, begun in 1842, marked by a correspondence extending over many years, was one of the major influences of his life.

At this time recognition as a writer was slow in coming. *The Great Hogarty Diamond* was refused by *Blackwood's Magazine* and appeared serially in *Fraser's*, 1841, as also did *Barry Lyndon* in 1844. This was one of his greatest works, excelling in irony and brilliant wit. Since 1842 he had contributed regularly to *Punch* and increased his reputation with *The Book of Snobs*, which appeared there, 1846–7. *Mrs Perkins' Ball*, 1846, a 'Christmas Book,' brought him further popularity, but he did not become really famous until the pub. of *Vanity Fair*, which was brought out in monthly parts from Jan. 1847 to July 1848. The first ed. in 1 vol. was pub. in 1848. Its success was slow at first. As soon as it was finished he began work on *Pendennis*, and the first of 24 monthly parts appeared in Nov. 1848. These 2 works placed him in the front rank of living novelists. In 1851 he resigned from the *Punch* staff in order to devote himself to the writing of *Esmond*, which was pub. in Oct. 1852. The same month he sailed to America, where he gained a great success with his lectures on *The English Humorists of the Eighteenth Century*, which had been delivered in London and the provs. the previous year. *The Newcomes* was pub. in monthly parts from Oct. 1853 to Aug. 1855. While it was coming out *The Rose and the Ring*, a delightful extravaganza, appeared (1854). In 1855 T. repeated his Amer. success, travelling widely and lecturing on *The Four Georges*. These lectures were also given in England and Scotland on his return from America in 1856. The following year he unsuccessfully contested Oxford in the Liberal interest. *The Virginians* came out in 1857–9, and in 1860 T. became first editor of the *Cornhill Magazine*, to which he contributed *Lovel the Widower*, 1860, *The Adventures of Philip*, 1861–2, and the delightful *Roundabout Papers*, 1860–3. He resigned the editorship in 1862. At the time of his death he was engaged upon *Denis Duval*, the fragment of which has been pub. (1864).

T. has been hailed by many critics as the lineal literary descendant of Henry Fielding (q.v.), and as only second to him as an Eng. novelist. In temper and style he had inherited much of the 18th-cent. literary tradition; but his work shows a blending of many influences, and he really stands apart from any of the other great novelists of his own or the previous cent., though possessing characteristics of sev. His writing is finely seasoned with a highly developed wit and irony, as polished and sustained, on occasion, as that of Swift or Pope, but without their bitterness, for T., though a realist, and disdainful of romantic tales, was a sentimentalist at heart, and could rival Dickens in the art of pathos. T.'s novels are all set on a grand scale, and the excellence of his characterisation and his pungent comments, given from a deep and

kindly knowledge of life, make up to a large extent for his indifferent plots (with the exception of *Esmond*, the plan of which was carefully prepared). Though, as his candidature for Parliament shows, T. was not indifferent to the political problems of the day, he did not write with the purpose of aiding specific social reforms or moral changes, called for by existing conditions, as Dickens and George Eliot did, and this probably accounts for his eclipse from popular favour in the early 20th cent. T. was, however, passionately interested in people as individuals, laughing at their foibles, and sympathising with the problems evolved by their particular traits of character. Such preoccupation with character needed a broad, spacious stage, untroubled by the diversions of the 19th-cent. Eng. scene, and so, frequently, T. turned almost unconsciously to the 18th cent. and the early years of the 19th, and on to this canvas stamped many qualities which could in fact come only from his own time, while in *Esmond* he immersed himself entirely in Marlborough's age, and produced one of the best historical novels in the Eng. language.

Collections of T.'s works include those by Lady Anne Ritchie (13 vols.), 1898-9. The ed. by Lewis Melville (20 vols.), 1901-7, is complete and has all the original illustrations. T. was one of the greatest of Eng. letter writers, and his *Letters and Private Papers* were ed. by G. N. Ray, in 4 vols., 1945. There is an important biography by Lewis Melville, 1899. See also A. Trollope, *Thackeray*, 1879; G. Saintsbury, *A Consideration of Thackeray*, 1931; M. Elwin, *Thackeray, a Personality*, 1932; J. W. Dodds, *Thackeray, a Critical Portrait*, 1941; L. Stevenson, *The Showman of Vanity Fair*, 1947; and G. N. Ray, *The Buried Life*, 1952.

Thaddaeus, see JUDAS.

Thailand (Siam), independent kingdom of the Indo-Chinese peninsula, bounded on the N. by Burma and Laos, on the E. by Laos and Cambodia, S. by the Gulf of Siam and W. by Burma. Lower T. extends down the Malay Peninsula, and is bounded by the Gulf of Siam on the E., the Brit. Malay States on the S., and the Bay of Bengal on the W. The total area of the country is 200,148 sq. m. (514,000 sq. kilometres). The peninsula slopes downwards to the ocean from the NW. and the great mt ranges of Tibet. The prin. rivs. are the Salween, which for 200 m. forms the boundary of Burma and T.; the Menam with its trib. the Meping, which are Thai throughout their length; and the Mekong, which forms most of the Laos boundary, and its trib., which water the E. plains. The country is naturally divided into 3 regions: the NW. mountainous dist., the great central plain, which slopes down to the sea, and the narrow strip of lower T. which has some lofty mts and is covered with dense forest. The climate is not extreme; the plains are healthy, enjoying dry, fresh air and cool nights; but in the mountainous dists. the atmosphere is humid and malarial, and very trying to Euro-

peans. The flora resembles that of Burma: mangroves, rattans, and other palms flourish in the coast region; the great fertile plains are covered with rich rice fields and plantations of coconut and areca palm; farther up in the damp highlands great apple-trees grow by the side of peaches, vines, and raspberries. The teak-tree grows freely on the higher ground, and is much valued for its hard timber, which is floated down to Bangkok and exported; T. is the largest teak-producing country in the world. Sev. Brit. companies hold leases for the exploitation of the teak forests of North T. Pineapples, custard-apples, bread-fruit, and mango flourish freely. The country is rich in big game.

Products. The minerals include gold, silver, rubies, sapphires, tin, copper, iron, and coal. Tin mining is a flourishing industry, chiefly on the W. coast, especially on Phuket Is. Wolfram is also found. Rubies and sapphires are mined in the Chantabun dist. The forest dept is officered by experts from the Indian Forest Service, and forms a valuable industry. Rice is the chief crop, both for internal consumption and for export. Rubber-trees have been planted in Lower T. Large tracts of land formerly lying waste are being opened up by irrigation. Rice-mills and saw-mills and a few potteries and distilleries are all T. can boast of in the way of factories. Her commerce with India and China dates back to the beginning of the Christian era. Eighty-five per cent of the trade was with the Brit. Empire before 1939, and incomplete figures available suggested a considerable revival of commerce between T. and Britain from 1946 to 1949. The bulk of the country's trade is carried on through the two great ports of Singapore and Hong Kong, and the revenue in 1948 was estimated at £168,017,579. There are 2100 m. of state-owned railways, including a line connecting Bangkok with Singapore. Railways from the cap. run to Varinar (360 m. NE.), Chientmai (460 m. N. of Bangkok), Aranya Prades (160 m. E.), and Padang Besar (618 m. S.), and there are sev. branch lines. There are internal air services and some 5000 m. of telegraph lines.

Government. The pop. is estimated at 20,277,000 (1955), of this the majority are Thai, and the remainder are Laos, Chinese, Malays, Cambodians, and Burmese. Until 1932 the king was an absolute monarch, but on 24 June of that year a *coup d'état* was carried out and the king was called upon to rule as a constitutional monarch. Under the constitution of 1932 supreme power resides in the nation, and the king, as head of the nation, exercises legislative power by and with the advice of the People's Assembly, and executive power through the State Council. The president and 14 members of this council are selected from the Assembly, which consists of 166 members, half of whom are elected and half nominated. The State Council is appointed by the king. For purposes of administration T. is divided into 70 provs., each under a commissioner who

is responsible to the minister of the interior.

Religion and Education. Buddhism is the prevailing religion of the country, and there are about 16,500 temples. Education, though now under national control, is mostly given through the temples. Primary education is compulsory and, in the local public and municipal schools, free. There are about 400 gov. schools, over 10,000 local schools under gov. inspection, and some 300 municipal schools. Girls now form some 31 per cent of the scholars. A univ. was opened at Bangkok in 1917. There are few tns with a pop. of over 10,000 people. Bangkok is the cap. of T., and other important tns are Chiang-Mai in the N. and Chumpton in

and T. began as early as 1680, and later hist. shows T. to form merely the buffer state between Fr. and Brit. possessions in the Far E. Eng. traders were in T. in the early part of the 17th cent., and later the E. India Company attacked some Thai through jealousy at the employment of Englishmen not in their service, which led to a massacre of Eng. at Mergui in 1687.

In 1855 a treaty was signed in which T. agreed to a Brit. consul in Bangkok, and Englishmen were allowed to own land and new trade facilities were granted. Similar treaties with other powers were arranged. Trouble arose about the Fr. and Brit. boundaries; the Thai and French fought out their difference of opinion on the ownership of sev. ports on

BANGKOK
National Assembly.

the S. The Thai call their country Muang-Thai, or land of the free.

History. It is difficult to trace the early hist. of the country, many influences from outside races having altered its civilisation. Little is known of its prehist., and all the more welcome is an account given by an allied prisoner who was forced by the Japanese to work on the jungle railway (see *Practical Prehistoric Society* for 1948). Hindu remains are scattered all over the country; it is also probable that for cents. T. remained trib. to the Cambodians. In 1350 the city of Ayuthia was estab. as the cap., and Uthong, the king, must be regarded as the first Thai monarch who ruled all T.; his dynasty lasted for 200 years. The modern hist. of the country begins with the usurpation of the throne by a Chinese gen. called Phya Tak, who settled himself at his new cap. of Bangkok after defeating the Burmese; he was the founder of modern T. In 1782 he was overthrown by one of his gens., who estab. the present dynasty. The intercourse between France

and the E. of the R. Mekong; the Thai were obliged to accede to the demands of the French after 10 days' blockade of the chief port. In 1895 negotiations took place between France and Britain concerning their respective frontiers, and in 1907 a further convention was made with France modifying and arranging the extra-territorial rights enjoyed by France and Great Britain. In 1909 a treaty was signed ceding to Great Britain suzerain rights over the S. states N. of Brit. Malaya. The treaty was costly to T. but opened up a mkt for the trade of Europe. A new commercial treaty was signed in 1925, giving T. jurisdictional and fiscal authority over these states. King Chulalongkorn, who d. in 1910, enjoyed a most illustrious reign, and assisted greatly in promoting the welfare of his country; his son who succeeded him was Vajiravudh, or Rama VI. He was succeeded by his brother, Prajadhipok, in 1925. A bloodless *coup d'état* in June 1932 estab. the monarchy, hitherto absolute, on a constitutional basis. In

1935 Prajadhipok abdicated and 10-year-old Ananda Mahidol was proclaimed king, a council of regency being appointed to act during his minority. T. declared war on Germany and Austria-Hungary in 1917, and became a member of the League of Nations. Hostilities between T. and Fr. Indo-China in 1940-1 ended by Jap. mediation, which was, of course, in no sense disinterested, Japan's object being to acquire T. herself as a jumping-off ground for the invasion of Burma and of India. Under a treaty of peace, 6 May 1941, Vichy France ceded to T. considerable tracts of ter. in Laos and Cambodia in return for a financial consideration. The non-aggression pact between T. and Great Britain, ratified at Bangkok on 2 July 1940, was, like that with France of the same year, soon nullified when Japan invaded Malaya. T., as a pawn in Jap. imperialist politics, declared war against Great Britain and the U.S.A. on 25 Jan. 1942. Aided by the Thai and subsequently by disaffected Burman elements the Japanese invaded Burma. Nearly 12 months later Bangkok was bombed by U.S. airmen for the first time (see further BURMA, SECOND WORLD WAR CAMPAIGNS IN).

Peace was signed on 1 Jan. 1946 between Britain and India on the one part and T. on the other, providing for the return to Britain of the 4 Malay and 2 Shan states ceded to T. by Japan in July 1945. Britain and India also undertook to support T.'s candidature for membership of the U.N. France, too, made peace, but not until nearly a year later. In 1946 T. appealed to the U.N. to lay her case before the Security Council concerning her Indo-Chinese frontier with France. On 17 Nov. 1946 she concluded a treaty with France by which she restored the Indo-Chinese ter. ceded by the Vichy gov. in 1941 and annulled the convention of Tokyo of 9 May 1941. The young king, Ananda Mahidol, was found murdered in a bedroom at the Barompinan Palace (9 June 1946) with a bullet wound in his head. He had spent the war years at Lausanne, where he was educ., and only returned to T. 6 months before his death or after an absence, save for his coronation, of 13 years. His younger brother, Phumibol Aduldet (b. 1928), succeeded him. The council of regency was overthrown on 9 Nov. 1947, by a military *coup d'état* led by Pibul Songgram, a strong opponent of Communism, who thereby became Prime Minister and virtual dictator. Another *coup d'état* in 1951 restored the constitution of 1932 (whereby the monarchy had been made a constitutional one), and estab. F.-M. Pibul's position even more powerfully. T. was the first of the participating countries to ratify (Sept. 1954) the SE. Asia defence treaty.

Language and Literature. The language of the Thai belongs to the Tai group of the Thai-Chinese family; in T. the prevailing language is Lao, though many of the hill tribes have distinct languages of their own. Thai in writing is read from left to right, and in MS. there is no space

between the words, making it difficult for those who are not experts. The literature of the country consists mainly of mythological and historical legends, many of Indian origin; there are many works on astrology and the casting of horoscopes, on success in love affairs, and on magic; some are of great age. One class of literature worthy of mention is the *Niti*, or old tradition of good counsel, such as *Rules for the Conduct of Kings*; on such works the youth of T. are fed at present. The oldest monument in T. is the inscription of King Ram-Khambheng (1292), an example of Thai literary style. King Boroma-Trailoke-nath (1443-88) was one of T.'s greatest poets. See R. le May, *An Asian Arcady*, 1926, and *Siamese Tales* 1930.

Art and Music. Thai art is not generally exceptional, but the temple in Lampun and a number of temples in Bangkok are competent examples, with little variation, of styles of Buddhist architecture frequently found in India. Thai music is closely allied to that of India and Indonesia; it has a tone-system almost incomprehensible to W. ears. A style of dancing of great beauty has been evolved in which the whole body is used to convey expressions ranging from near-stupor to the heights of frenzy.

See Sir John Bowring, *The Kingdom and People of Siam*, 1857; K. Stumpf, *Tonsystem und Musik der Siamesen*, 1901; J. G. D. Campbell, *Siam in the Twentieth Century*, 1902; P. Loti, *Siam* (Eng. trans. by W. P. Baines), 1913; K. Döhring, *Buddhistische Tempelanlagen in Siam*, 1920, and *Kunst und Kunstgewerbe in Siam*, 1925; W. A. R. Wood, *A History of Siam*, 1926; R. Wheatcroft, *Siam and Cambodia*, 1928; E. Koverup, *Friendly Siam*, 1928, and *The Coinage of Siam*, 1933; B. Swarup, *Theory of Indian Music*, 1933; P. L. Rivière, *Siam*, 1937; R. Le May, *Concise History of Buddhist Art*, 1938; K. P. Landon, *Siam in Transition*, 1940; V. Thompson, *Thailand: the New Siam*, 1941; L. Vallot, *Histoire de la danse*, 1942; H. G. Wales, *Ancient Siamese Government and Administration*, 1943; Sir J. Crosby, *Siam; at The Cross Roads*, 1945.

Thais, Athenian courtesan, who accompanied Alexander the Great on his expedition into Asia.

Thaler, abbreviation for Joachimsthaler, silver coins coined at Joachimsthal, Bohemia, in 1519. From 1857 to 1873 the T. was the unit of the Ger. monetary union, being equivalent to 3 marks, but after this it fell into disuse. The word dollar is derived from T.

Thales (fl. 600 BC), Gk philosopher, first of the Seven Sages (q.v.) of Greece, b. Miletus. He taught that water or moisture was the one element from which all things evolved. He appears to have owed much to the astronomy of the Egyptians and to the civilisation of Mesopotamia. He is regarded as the founder of abstract geometry, of the strict deductive form as shown in Euclid's collections; he is said to have shown how to calculate the distance of a ship at sea, and

the heights of objects. In astronomy he was credited by the ancients with the prediction of the total solar eclipses identified by Airy, Zech, and Hind with the date 28 May, 585 B.C.; he is said to have noted the 'Lesser Bear' and to have shown its superiority for the purposes of navigation.

Thalia: 1. Goddess of Comedy; see *Muses*.

2. One of the Charites (Graces).

Thallium, metallic chemical element, symbol Tl, atomic number 81, atomic weight 204.2. It was discovered by Crookes (1861) in the seleniferous deposits from sulphuric acid manufacture. It occurs in small quantities in iron pyrites, and also occurs associated with copper, silver, and selenium in the mineral 'crookesite.' The metal is prepared by displacement from its solutions by means of zinc. T. compounds give a bright green line in the spectrum (hence the name, from Gk *thallos*, a green shoot); some of them find a use in the manuf. of optical glass.

Thälmann, Ernst (1886-1944), Ger. Communist politician, b. Hamburg. He was a member of the Reichstag, 1924-33, and stood as Communist candidate for the presidency in 1932. After Hitler came to power T. was sent to a concentration camp and was probably executed at Buchenwald in Aug. 1944.

Thame, mkt tn and urb. dist. of Oxon., England. It is situated on the R. T., 13 m. from Oxford and 45 m. from London. Its chief building is the church of St Mary the Virgin, which is an exceptionally large church in mainly Early Eng. and Perpendicular style, containing some interesting brasses. T. has a 16th-cent. grammar school and a famous inn known as the 'Spread Eagle.' The riv. has its source in the Chiltern Hills and flows past T. to the Thames, which it joins near Dorchester; it is 35 m. long. Pop. 3600.

Thames, riv. of England, rises near Cirencester in the Cotswold Hills and follows a course of 210 m. to the Nore, where it debouches into the North Sea. It is England's largest and most important riv. At Gravesend, the head of the estuary, it has a width of $\frac{1}{2}$ m., gradually increasing thence to 10 m. at the Nore. Tidal waters reach Teddington, 60 m. from the mouth, where is the first lock from the sea (except for the tidal lock at Richmond). There are in all 47 locks, St John's Lock, Lechlade, being nearest the source. The normal rise and fall of the tide is from 15 to 23 ft at London Bridge and from 13 to 19 ft at Tilbury. Until the Tower Bridge was built, London Bridge was the lowest in the course; the reach between these 2 bridges is known as the 'Pool of London.' Lying some 5 m. SW. of the Nore (q.v.) is the mouth of the Medway (q.v.) estuary, at the head of which lie Chatham with important naval dockyards, Gillingham, and Rochester (q.v.). Gravesend (q.v.), on the S. bank of the riv. some 24 m. from the Nore, has developed at a point where vessels formerly awaited the turn of the tide.

Tilbury (q.v.), important as the terminus of many ocean-going liners, lies opposite Gravesend on the N. bank. At Woolwich (q.v.), some 20 m. above Tilbury, is the arsenal; Greenwich (q.v.), a little farther up-riv., has the Royal Naval College. Between Tilbury and London Bridge (some 26 m. up-stream) stretches the London dock system and many wharves. The embankments of the T. in London were the work of Sir Joseph Bazalgette (1819-91) (q.v.), chief engineer of the Metropolitan Board of Works. The Albert Embankment on the S. side was completed in 1869, the Victoria Embankment from Westminster to Blackfriars in 1870, and the Chelsea Embankment from the Royal Hospital to Battersea Bridge in 1874. In Jan. 1949 work was started on a new embankment, designed by J. Rawlinson, chief engineer of the L.C.C., on the S. side from County Hall to Waterloo Bridge. The riv. is spanned by over 50 bridges, including Tower Bridge (a bascule bridge), and suspension bridges at Hammersmith and Marlow. The chief tunnels under the T. are the T. Tunnel, completed by Brunel in 1841, now used for railway only, the Blackwall Tunnel (1897) from E. India Dock Road to E. Greenwich, and Rotherhithe Tunnel (1918) from Shadwell to Rotherhithe. In 1948 a scheme was put on foot for the maintenance of the tow-paths from Teddington to Cricklade as a riverside walk. The Port of London Authority (q.v.) is responsible for the control and conservation of the riv. below Teddington; above Teddington the T. Conservancy (q.v.) is the responsible authority.

Steamers ply regularly from Kingston to Folly Bridge, Oxford, during the summer. The scenery along this part of the riv. is pleasant, varied, and in some places beautiful, e.g. at Cliveden, Cookham, Sonning, and Pangbourne. There are fine bridges at Richmond, Hampton Court, Chertsey, Maidenhead, and Shillingford. Henley, Wallingford, Dorchester, and Abingdon are pleasant places, and Eton and Windsor (qq.v.) are famous. Above Folly Bridge the riv. passes gasworks and allotments, but these may be abolished when Oxford finally agrees on its plans for future development. Skirting the breezy expanse of Port Meadow, the riv. passes Godstow and the lovely Wytham Woods. From here all along the 50 m. to its source beneath a tree in 'Trewsbury Mead,' the T. glides through trampled meadows, its course interrupted only by the small tns or vils. of Lechlade and Cricklade and the charming stone-built hamlets of Kilmecott and Ashton Keynes. In these upper reaches there are 2 picturesque medieval bridges—New Bridge and Radcot Bridge. Motor launches can reach Lechlade; beyond that point it is possible to canoe up to Cricklade, but the final 10 m. to the source of the T. is best traversed on foot, through great meadows spangled in spring with cowslips and fritillaries. It is a peaceful and most attractive walk.

Until the 19th cent. the London T. was an important means of transport for passengers; the names of 'stairs' are

traces of the great passenger barge traffic. Since the Second World War passenger traffic on the T. has been revived by 'water buses.' The T. has been frozen over at various times, the earliest recorded occasion being AD 1150. See H. Belloc, *The Historic Thames*, 1914; J. H. Salter, *Guide to the Thames* (31st ed.), 1929; C. F. Smith, *The Thames*, 1931; A. Bell, *Said Noble River*, 1937; A. G. Thompson, *The Royal Thames*, 1937; Robert Gibbings, *Sweet Thames Run Softly*, 1940; M. S. Briggs, *Down the Thames*, 1940.

Thames, riv. of Canada, which flows across the Lakes Peninsula in Ontario, between Lakes Erie and Huron, and into Lake St Clair, after a course of 150 m. The chief city on it is London (q.v.).

Thames, New Zealand, gold-mining centre, 46 m. ESE. of Auckland in T. Co., N. Is. Pop. 5007.

Thames Conservancy. The conservation of the Thames was granted to the Conservators of the River Thames (the T. C.) in 1857, the powers being reconstituted in 1894. The duties relative to the lower part of the riv. devolved upon the Corporation of London until 1857, those relative to the upper part upon the Upper Thames Commissioners until 1866, when under the Thames Navigation Act the riv. from Staines to Cricklade, Wilts, was added to the Conservators' jurisdiction. The Port of London Authority (q.v.), by an Act of 1908, took over all rights and duties of the Conservators in respect of the riv. below Teddington. Since that date the Conservators' powers and duties have been further amended by the Thames Conservancy Acts of 1910, 1911, 1921, and 1924, and subsequently consolidated in the Thames Conservancy Act, 1932. This Act was amended by the Thames Conservancy Act of 1950, when the number of Conservators was increased to 38. By the Land Drainage Act, 1930, the Conservators were constituted the Drainage Board of the Thames Catchment Area, and exercise jurisdiction over 2392 m. of 'main riv.' comprising the Thames itself above Teddington and part or the whole of certain tribs. The riv. above Teddington Lock towards its source is exclusively governed by the by-laws of the T. C. Board. The prin. duties of the board have to do with the preservation of the riv. from pollution, both in the main stream and in tribs., the protection of fisheries, the control of navigation, and drainage, etc.

Thames Ditton, residential dist. of Surrey, England, forming part of the urb. dist. of ksher. The Swan and Angel Hotels are 16th-cent. foundations, and there are almshouses of the early 18th cent. Pop. 9600.

Thane, or **Thegn**, A.-S. rank, which originally seems to have been applied to the personal followers of the king and had a distinct military significance. Early laws give the wergild (q.v.) of a T. as between that of a ceorl and an earl. The complex society of later Saxon England suggests that the T. was no longer confined to a class of fighting nobles, bound to the king by personal loyalty, but could

include successful merchants and ceorls. It appears to have become essentially a mark of social standing. Historians no longer suggest that the Norman knight derived from the Eng. T. The T.s did not hold their land by military tenure, but were bound to fight for their king by bonds of loyalty. They received their lands of him as a reward for past services. See Sir F. Stenton, *Anglo-Saxon England*, 1943.

Thanet, Isle of, extreme E. part of Kent which was formerly separated from the mainland by the R. Wantsum which remained in part navigable up to the end of the 15th cent. Ebbsfleet is generally accepted as the landing place of the Saxons in AD 449, and in the same area St Augustine and the Christian missionaries made landfall in 597. The is. was in the full stream of Brit. hist. for many cents., and its famous churches bear evidence of its great importance from early times. It has exceptionally bracing air, and is now well known for its watering-places of Margate, Broadstairs, and Ramsgate, the latter being also a seaport with a busy harbour. See J. Lewis, *The History and Antiquities . . . of the Isle of Thanet* (2nd ed.), 1736.

Thanet Sands, lowest div. of the Eocene system (q.v.) exposed along the margin of the chalk in the E. part of the Thames Basin and particularly in E. Kent, especially in the Thanet dist. Some 70 species of marine fossils are known. T. sand is used for moulding; its occurrence in W. Kent determined the site of Woolwich Arsenal.

Thanh-hoa, cap. of prov. of same name in N. Annam (q.v.) and situated 2 m. S. of the lt. Ma, 15 m. from the sea. There is a citadel, a Rom. Catholic cathedral, and a centre for the old triennial examinations held by the imperial court of Viet Nam. The prov. produces large quantities of rice, and pottery is manu.

Thanksgiving Day, ann. festival of thanksgiving in the U.S.A., celebrated as a national holiday according to the choice of President Lincoln in 1864, on the last Thursday in Nov. In 1941 President Roosevelt further defined the date of celebration as the fourth Thursday in Nov. It is in essence a national harvest celebration, and was first observed by the Pilgrim Fathers at Plymouth in 1621, after they had gathered in their first harvest.

Thann, Fr. tn. cap. of an arron., in the dept of Haut-Rhin, on the Thur. It has a fine 14th-16th-cent. church, and famous vineyards. There are textile and machinery manufs. Pop. 6000.

Thapsus, anc. city of N. Africa, 30 m. SE. of Susa. In 46 BC Julius Caesar here routed the Pompeians under Cato, Scipio, and Juba, so ending the war in Africa.

Tharaud, brothers, Jérôme (1874-1953), Jean (1877-1952), Fr. writers. Their reputation is based primarily on their jointly signed travel stories. They describe with great precision and soberness the picturesque life in Morocco (*Rabat*, 1918; *Marrakech*, 1920); they give an

account of their impressions on the Balkan war (*La Bataille à Scutari d'Alban*, 1917); they discuss conditions in the Holy Land and in different Jewish communities (*Quand Israël est roi*, 1922; *L'an prochain à Jérusalem*, 1924). Later works include *Vienne la Rouge*, 1934, *Le Passant d'Éthiopie*, 1936, and *Crucelle Espagne*, 1937. Jérôme was reporter in many different parts of the world, and their works combine the precision of the reporter style with a classical elegance and a great gift of evocation. Jérôme was elected to the Fr. Academy in 1940, Jean in 1946. See J. Bonnerot, *Jérôme et Jean Tharaud*, 1927.

Tharawady, tn and dist. of Lower Burma. Rice is produced. The cap. is T., 68 m. NW. of Rangoon. Area 2851 sq. m.; pop. (dist.) 594,000; (tn) 9000.

Thasos, or **Thasus**, is. in the N. of the Aegean Sea, off the coast of Thrace, supposed to have derived its name from Thasos, son of Poseidon or Agenor, leader of the Phoenicians. It was early taken possession of by the Phoenicians, on account of its valuable gold mines. T. was afterwards colonised by the Parians, 708 BC, and among the colonists was the poet Archilochus. The Thasians once possessed a considerable ter. on the coast of Thrace, and were one of the richest and most powerful peoples in the N. of the Aegean. They were subdued by the Persians under Mardonius, and subsequently became part of the Athenian maritime empire, though they revolted against Athenian rule unsuccessfully sev. times.

Thatching, art of roofing houses or protecting stacks of hay or grain with a covering of reeds, rushes, straw, etc. Thatch should be at least 12 in. in thickness and laid to a pitch of 45 degrees. Best or true Norfolk reed is used in T. Norfolk reed with an admixture of lesser reed mace lasts longer, besides being less expensive than best reed. Wheat or rye straw is considerably cheaper than reed, but may require renewal after 20 years, whereas reed thatch should last about 75 years. Heather also provides a durable thatch but in exposed places is liable to strip.

Thaton, tn and dist. of Lower Burma, in the Tenasserim div., formerly a seaport, and the cap. of the Mon kingdom, now about 10 m. from the sea. Area of dist. 4890 m.; pop. (dist.) 594,000; (tn) 21 600.

Thau, **Étang de**, Fr. lagoon in the dept of Hérault. On the narrow strip of land separating it from the Mediterranean is situated the tn of Sète (q.v.).

Thaulow, **Frits** (1847-1906), Norwegian painter. During his early days he was a pupil of the Norwegian romantic painter Gude (q.v.); later, when in Paris in the 1870s, he came under the influence of Corot and Daubigny. After his return to Norway he was known especially for his landscape paintings of wintry scenes in Norway. He is represented in the Nasjonalgalleriet, Oslo.

Thaw, the melting of snow and ice. A partial and temporary T. may be caused by the sun's heat in the hours around

noon; but a permanent T., particularly in the Brit. Is., is mostly due to a complete change of air mass, as for instance from northerly or easterly winds to comparatively warm westerly winds from the Atlantic. In northerly or cold continental regions the 'spring T.' is a pronounced ann. event, the ice-bound seas, lakes, and rivers breaking up and the winter snows melting.

Thaxted, tn of Essex, England, 7 m. N. of Great Dunmow. It was important in medieval times, and was formerly a bor., incorporated by charter of Philip and Mary. It is famous for its massive Perpendicular church, which has a fine crotched spire (181 ft), and is one of the finest in Essex. The guildhall in Town Street is a picturesque, 3-storeyed timber-framed building of mid-15th-cent. date, and is of great interest as it is one of the few remaining medieval guildhalls in England. Horham Hall is in the par. Pop. 1800.

Thayet-myo, cap. of the dist. of T., Lower Burma, on the Irrawaddy. The chief products are rice, cotton, and oilseeds. Pop. (dist) 297,500; (tn) 15,000.

Theatines, Rom. Catholic religious order of priests, marked by its extreme observance of poverty. They were founded in 1524 by Gaetano dei Conti (1480-1547), canonised in 1671, and Giovanni Caraffa, afterwards Pope Paul IV, with the object of restoring the standard of clerical life and recalling the laity to the practice of virtue. They exist to-day mainly in Italy. There are also Theatine nuns, founded by Ursula Benincasa in 1583.

Theatre, place designed for enabling an audience to see the performance of plays, consisting of a stage and an auditorium, with ancillary accommodation for actors and audience.

Greco. The religious origins of the drama (q.v.) made it from the beginning essentially a popular art so that the T. in which it was presented had to provide ample standing and, later, seating accommodation for the participating spectators. In the earliest T.s these simple requirements were met by a suitable hillside with a level circular space (*orchestra*, orchestra) at the bottom, in the centre of which an altar was erected. The primitive Gk T. thus assumed its shape, having seats in a slightly extended semicircle (the *theatron* or auditorium) around the orchestra. At Athens, about 465 BC, the orchestra was moved 50 ft forward, and on the farther side a small wooden hut (*skēnē*) was built as a dressing-room for the actors. It had a long front wall with projecting wings towards either end, between which a stage was probably raised a ft above the level of the orchestra. This stage was possibly backed by a row of columns (*proskēnion*, proscenium), originally also of wood, behind which was the wall pierced by doors for the actors' entrances and exits. At each end of the extended semicircle of the auditorium was a passageway (*parodos*), between stage and auditorium.

By the 3rd and 2nd cents. BC, the chorus had practically disappeared from

tragedy, and though choral odes were still retained in comedy, they had become separate interludes. The *skéné* was generally 2-storeyed, with a row of columns some 10 ft in front, the spaces between filled in with painted boards, and on top a platform on which the actors performed. Immediately behind and above this was the *proscenium*, which usually had 3 doors. By Graeco-Rom. times the stage front and the background had been altered. The *proscenium* was more elaborate, and dominated the T. with its columns, doors (7 at Ephesus), and architectural embellishments. Spectacular scenic effects were eagerly sought. Projecting wings (*paraskénia*) now formed part of the structure of the T. Low platforms carrying scenic effects could be pushed on to the stage through the doors; semicircular and triangular turntables painted with tragic, comic, and satiric designs; a hook-and-pulley device for lowering and raising divinities from and to the heavens; trap-doors in the orchestra

through which ghosts and spirits could appear; means of producing thunder and lightning, fires, etc., are all either recorded or to be inferred from a study of the plays. Stage costume was highly stylised. Certain conventions fully estab. by Aeschylus's day remained unchanged from then till Rom. times. Although the earlier tragedies and comedies had usually been set in the legendary era, the tragic actor's dress was always that of the 5th cent. (see COSTUME DESIGN, THEATRICAL).

The Rom. T. differed from the Gk T., first, in having nothing to do with religion, and secondly, in being built on level instead of sloping ground, possibly for the sake of a more imposing architectural exterior. The auditorium was an exact semicircle around the orchestra space, the farther half occupied by the stage, the front half being used sometimes

for additional seating accommodation and sometimes for gladiatorial or other spectacular displays, when it could be railed off to protect the audience. The stage doors in the front wall (*hypocentrum*) and steps down from the stage to the orchestra were usual. This wall was no longer plain but decorated in keeping with the embellishment of the *frons scenae* at the back of the stage, from which a roof reached out over it. Awnings over the auditorium were also provided. The earlier elaborate portals over the *parodoi* were transformed into covered passages.

Gk tragedy and comedy introduced to Rome degenerated into dance and satirical mime, and the status of the Rom. actor never approached the dignity of that of his Gk predecessor. In the original Gk drama the poet himself would play the leading part and train the chorus. Actors were originally amateurs, but later companies of actors were formed with their own guild and were held in high esteem. In Rome the custom of maintaining permanent troupes of actors, mostly slaves, and the introduction of women to the stage, made the profession generally despised.

The Middle Ages. Though the T.s were destroyed by Lombard invasion in the 6th cent., the players survived. The rich had always hired them for private entertainments, and continued to do so. The barbarians, moreover, were accustomed to keep court poets to enshrine their triumphs in epic narrative. By AD 800 these 2 employments merged in the household minstrel (*menestrier*). Less fortunate actors took to the road and became tumblers, acrobats, puppet-masters, dancers, singers, masks, etc., known generally as *jongleurs*, and these with the later *goliardi*, the wandering scholars (mostly defrocked clerks and students travelling between the univs.), noted for their ribald satires, formed the vast body of nomad players, the *histriotes*, of the 11th to 13th cents.

Once again the T. was reborn of religion when in the 10th cent., on the occasions of the greater feasts of Easter and Christmas, there began to be introduced extraliturgical anthems, originally sung antiphonally by the clergy and later accompanied by actions, such as the *Quem queritis* of Easter Day (see also EASTER SEPULCHRE). They served to illustrate the gospel stories and were actual interpolations in the services of the church. Out of these simple beginnings grew the play-cycles covering the full stories of the Resurrection and the Nativity. The plays became so popular that early in the 12th cent. the crowds were more than the churches could hold. Performances were given in refectories and in the open—the churchyard or the market-place. The plays were arranged as they had been inside the church, the settings for each scene, wooden platforms and stages, known in England as 'houses,' erected in front and on either side of a cross in the same relative position to it as before they had been to the main altar (see MIRACLE PLAY).

On the Continent such stationary settings were the general rule, but in England, with a few exceptions, it became the practice to mount the 'houses' on wheels and tour the town in procession, each 'house' stopping to perform its scene at pre-arranged stages. By the 13th cent. the whole of hist. from the Creation to the Judgment was incorporated in the various cycles, and the clergy, even helped out by the wandering scholars, were unable to provide enough actors for the major festivals. The laity were thus called in to take part, and between 1350 and 1450 they gradually took over the financing, production, and entire control of all public performances.

Similar conditions prevailed on the Continent, except that there the plays were also produced by companies of actors which had no counterpart in England. In France the most famous of these was the *Confrérie de la Passion*, estab. by royal patent in 1402, and the first permanent theatrical troupe to have its own T. in Europe.

Renaissance: Italy. In Italy during the Renaissance companies of young men specially associating for the purpose, more after the Fr. than the Eng. manner, had taken over the miracle plays (*sacre rappresentazioni*) from the Church, while the travelling players, starting from fair-ground and street corner, had by the 16th cent. evolved the unsurpassed *Commedia dell'Arte* (q.v.). At the turn of the 15th cent. the contemporary study of perspective was applied to theatrical *décor* and a type of classicised medieval multiple-setting evolved. In 1551 Sebastiano Serlio in his *Architettura* advocated a synthesis of classical and medieval practice in a stage on which stock settings with corresponding perspective back cloths could be erected according to the play performed. These settings were constructed, like the medieval 'houses,' in canvas and lath, which would give them an appearance of solidity. The action of the play took place as in classical and medieval practice in the open (on the *platea*). The Teatro Olimpico at Vicenza, built (1580-4) to the design of Palladio, combined Rom. solidity with medieval multiplicity. A long, narrow front stage was backed by an ornamental architectural proscenium, with a perspective view shown through a large central arch (the former *porta regia*), flanked on either side by small doors. The Teatro Farnese at Parma (1618-19) introduced the proscenium arch, and was also the first T. to have seats in the orchestra up to the stage. Accounts of classical 'machines' were studied and ingenious scenic effects contrived; movable scenery is first heard of at Venice in 1639. A curtain was installed, but was mostly used only at the beginning of a performance to surprise the audience by the sudden revelation of a particularly striking opening set.

Renaissance: France. As Renaissance ideas reached France, medieval and classical methods were similarly though more directly combined. Fr. drama did not yet observe the unities as strictly as It.,

and to present the sev. settings required for each play *décor simultané* was used, as many Serlesque type 'houses' and perspectives being set up together on the stage as a play required. Scaliger's comment, in 1561, that actors in France when silent were presumed not to be on the stage, is in keeping with this system of production.

The Elizabethan Stage. In England the traditional drama, the new classical influence, and humanist teaching were alike dominated by the Reformation. The first public T., known as The Theatre, was built in 1576 by an actor, James Burbage, who, to escape interference by the city authorities, chose a site at Shoreditch outside the city walls. Within a

THE ELIZABETHAN THEATRE

The Swan, on Bankside: a reproduction, reduced, of a drawing by Arend van Buchell.

year a second T. called the Curtain was built not far away. We know nothing about these except that they were regarded as 'sumptuous.' The Swan was built by Francis Langley about 1595. A drawing of this building, made by a Dutchman, Arend van Buchell, based on a description given him by his friend Johannes de Witt of Utrecht, who visited the T. in 1596, is the earliest information we have about these first London T.s. It shows a building of 3 galleries, which are roofed, and in the galleries are seats; the centre is open to the sky, and there

is a large platform stage; there is standing space for spectators on 3 sides. The drawing shows 3 people acting on the stage. Over the stage is a canopy, known as the heavens, which in the drawing covers only a small part of the stage, but was probably over the whole of it. At the rear of the stage there are 2 doors, and over them a balcony, with people in it. At the top there is a thatched room with a flag and a trumpet. The Swan was said to accommodate in its seats 3000 persons, which was probably an exaggeration, for a large number of spectators had to stand in the pit. In 1599 there was built the most famous of all T.s, the Globe, also on Bankside. It was a handsome building, constructed of timber, plastered, with thatched roof, surpassing all the other T.s, but practically nothing is known about it except by conjecture, based upon references to the building in plays, etc., and upon the contract for building the Fortune T. shortly after, which refers to the Globe. It is conjectured that it was 84 ft wide between the outer walls and that the width of the pit was 58 ft. There were 3 roofed galleries, with 3 rows of seats in each. The stage was, possibly, 43 ft long and 23 ft wide, and extended to the middle of the pit: there was a heavens or canopy over it; at the back there were doors at each side, and in the centre a curtained inner stage. Over the inner stage there was a balcony, also curtained, which may have projected. There were traps in the floor of the stage for ghosts, etc. Actors and properties could be let down from the heavens. There was one entrance to the T. for spectators and another at the rear of the stage for the actors; the 'tiring' rooms for the actors were at the rear of the stage, probably on sev. floors. The admission was 1d., increased for special performances, which entitled to standing room in the pit. Those who wanted to go into the galleries paid another 1d. for entrance to the gallery staircase, which allowed for a seat in the third gallery; if a seat in the first and second gallery was required a third 1d. would be paid. The galleries on each side of the stage contained gentlemen's boxes, for a seat in which 1s. would be charged. Spectators were allowed on the stage, for which perhaps 1s. was charged. Performances were given in the afternoon, by daylight; on such a stage Shakespeare's plays were performed. There can be little doubt that the open platform stage enabled Shakespeare to do all he wished. It was richly decorated, elaborate properties would be used, and the dressing of the actors was magnificent. Heraldry and music were important features. The Fortune T. was built by Philip Henslowe and Edward Alleyn, the actor, in the par. of St Giles, Cripplegate Without, in 1600. It was square, 80 ft each way, constructed of wood or a brick and tile foundation and covered with plaster. It was 3 storeys high. It was burnt down in 1621 and rebuilt at once, but dismantled in 1649. London was well supplied with T.s until the Civil war

put an end to all theatrical activity. There were one or two T.s with roofs called 'private theatres' notably the Blackfriars and the Cockpit.

The masque was a private entertainment of an expensive and elaborate kind given in palaces or lords' houses. It consisted of scenic display, dancing, and music, in which the guests took part, and was not considered to have any relation to the T. Inigo Jones designed a building for these entertainments at Whitehall known as the Cockpit in which plays were given at the Restoration (see MASQUE).

The Restoration Theatre. When Charles II came back from exile with ideas of the Fr. and It. T.s, which were entirely different from the old Eng. T., he gave patents to Sir W. Davenant and to Thomas Killigrew to set up 2 companies of players, Davenant's to be his brother James's and Killigrew's to be his own, and to build T.s. They got to work at once and performed in converted tennis courts and other buildings, until Killigrew took a site in Bridges Street and in 1663 opened the first T. Royal, Drury Lane, to become one of the most famous T.s in the world. It was a covered T. with a glass roof, benches in the pit, 2 galleries, a royal box at the back in the centre, and a stage rather like that of the old T.s except that scenery in perspective could be used on it. Performances were still given in the afternoon by daylight. Then Davenant instructed Sir Christopher Wren to design a new T. for his company. This was opened as the Duke's House in 1671, and was a wonderful building, seating 1000, with an enormous gilt proscenium arch, on the top of which was situated the orchestra; the scenes were placed behind the arch, while the acting took place on the stage in front of it.

On 25 Jan. 1672 the T. Royal was burnt down and a second T., designed by Sir Christopher Wren, was opened in 1674. This T. lasted until 1791. It was rectangular, with 3 galleries, each with 4 rows of seats, the first gallery being divided into boxes; the entire floor was devoted to the benches for the pit. The stage projected 17 ft beyond the proscenium arch; on each side there were 2 proscenium doors with windows over them. Neither T. was popular and in 1682 the 2 companies were amalgamated and played at the T. Royal, abandoning the Duke's House. There are sev. points to be noted in the Restoration T., which entirely transformed the drama and acting from what they had been in England. The first is that women appeared on the stage, for it was Charles's order that they should do so, and he inserted a clause to that effect in the charter of Drury Lane Theatre. Women had never appeared on the Eng. stage (except when a Fr. company visited London), for acting had been done by men and boys. It was part of the Puritan objection to the T. that boys dressed up as women. The appearance of actresses transformed the drama, and they soon took a predominating part, often appearing in men's parts, and plays were written to exploit their charms, and

movable scenery was also used. Spectacle for its own sake became one of the leading features of the T. The audience was placed farther and farther from the stage so as to get the full advantage of the scenes in perspective, and the apron stage became more and more reduced; then the actors were forced to play in the scenes, though for a long period, indeed until the first quarter of the 19th cent., they insisted on using the apron too. Thus arose the 'picture-frame' stage and the convention of the 'fourth wall.' Finally, the 2 patents granted by Charles had created a monopoly, the most effective stronghold upon the T.s that could have been conceived.

joining the W. End of London, with a number of 'private' T.s and a number of T.s in the suburbs. The designs of all the T.s are largely based on Wyatt's Drury Lane, being smaller versions of what is practically a Fr. form of T. building. There are no really modern buildings in London. This applies to other cities in England; also to Stratford-on-Avon, where the original Shakespeare Memorial T., opened in 1879, was burnt down in 1926; it was rebuilt in 1932, but repeated the general plan of the Fr. T.

18th Century: Italy. In Italy throughout the 18th cent. there was considerable theatrical activity, and, abandoning the original Renaissance rectangular build-

18th and 19th Centuries: England. The heaviest blow the T. sustained was Horace Walpole's Licensing Act of 1737, which prohibited T.s anywhere except by the authority of letters patent from the king or a licence from the lord chamberlain. Not until 1788 was this severe restriction upon building relaxed, when an Act enabled T.s to be built under justices' licence, though it did not apply to London or 20 m. around.

In London, however, the T. monopoly continued, and there was continual rivalry between the 2 patent T.s of Drury Lane and Covent Garden. They both opposed the unlicensed playhouses, which had no legal right to produce legitimate drama. There was great objection to the monopoly, and in 1843 the Theatre Act was passed, which, with minor amendments, governs the T. throughout the country to-day (see THEATRES, LAWS RELATING TO). There were in 1950 42 T.s in or ad-

ings, many new T.s were built in semi-circular and horseshoe form. The main experimentation was in the position of the proscenium arch. At first action was placed before it, the scenes being set behind, but early in the cent. all action was placed behind the arch, the platform stage being completely abolished. This form of stage was copied in France, whence a cent. later it was transported to England. There was practically no development in T. building anywhere throughout the 19th cent. and the picture-frame stage was firmly estab. for spectacle and realism.

20th Century. The most important influence in the 20th cent. T. was Gordon Craig's, whose ideas of staging were so inappropriate to the picture-frame T., however, that his ideas of production could not be reconciled with the requirements of the commercial T. Craig's ideas were the basis of the work of Max Rein-

hardt in Germany and Austria, where in great spectacular shows such as *The Miracle*, and in performances at the Grosses Schauspielhaus in Berlin, he applied Craig's simplicity, immensity, and theatrical effectiveness. In France Jacques Copeau at the Théâtre du Vieux Colomier transformed the stage into a semi-permanent setting for plays.

In the U.S.A. the estab. of the T. was slow, owing to Puritan opposition, but made headway in the 19th cent., when much T. building was carried out; but the centre of the commercial T. remains in New York city, where it is a leading element in the city's entertainment industry. The T.s were built on European designs, and no developments took place. In the little T.s that sprang up all over the country under amateur control a good deal of experimentation was done in modernising the stage and in the creating of intimate T.s, and a T. is now a normal part of Amer. univ. equipment. The Folger Shakespeare Library in Washington, the greatest Shakespearian collection in the world, is housed in a building constructed on the design of an Elizabethan playhouse, the detailed contract for the Fortune T. of 1600 being closely followed. Thus America has an example of a Shakespearian playhouse, but it is not used for performances. Stage design in America owes much to the work of Robert Edmond Jones and Norman Bel Geddes, and to-day the expressionist or constructivist setting is often seen in use.

Production and Management. The original acting companies in the Elizabethan T. were self-governing, and Shakespeare's company, known as the King's, had its own T.s, the Globe and the Blackfriars. Other Elizabethan T.s were built by business men such as Philip Henslowe, who for a period had Edward Alleyn the actor as partner, and by building speculators. At the Restoration the 2 London T.s were built by the patentees, who had financial support from investors. The Brit. T. has continued to be a private enterprise in London and throughout the country. Generally speaking, the ownership and management of T.s has been in other hands than those responsible for the production of plays, though there have been exceptions. The production of plays is mainly in the hands of commercial groups, who with their own money or the money of 'backers' provide the considerable finance required. Some of these commercial groups, which operate in London and in most large cities, are on a permanent basis. There are exceptions to these commercial interests, such as the Old Vic, some of the repertory companies, the Stratford-on-Avon Shakespeare Festival Company, and other companies formed with the object of sustaining theatrical art. The Arts Council is a gov.-appointed body with Treasury support (formed in 1940 as C.E.M.A.), one of whose objects is to support the T. as an art.

In France, Germany, and many other countries the T. has been under state or royal patronage, the T. being provided and the performances given as national

or civic enterprises, but most T.s are private enterprises. In Soviet Russia and other Communist-controlled countries the T. is state controlled and used for propaganda and public education. In England public money is now being made available for the T.

The Brit. Gov. is to provide the sum of £1m. for a National T. on a site provided by the London Co. Council, but economic conditions have not yet allowed the scheme to be carried out. Under the Local Government Act, 1948, local authorities are empowered to build and manage T.s. At present the stage is organised to provide pictures in perspective or interior sets of a realistic kind. Stage management is a highly specialised occupation observing, largely, traditional methods. Some stages (e.g. Drury Lane) have mechanical devices enabling the floors to be raised or lowered in sections, and all stages provide for scenery, sometimes complete sets, to be 'flown.' The use of the space over the stage for raising or lowering properties or actors has existed since the Elizabethan T. with its 'heavens.' Movable floors (e.g. Stratford-on-Avon Memorial T.) enable settings to be transposed into the 'wings,' and revolving stages are often employed. Stage lighting is now sometimes operated by remote control from the auditorium.

Acting. The essential art of the T. is acting, to which all other theatrical arts are subordinate. At all times acting has been conditioned by theatrical buildings as well as by the requirements of the drama, so that there have been considerable differences in acting from period to period and from country to country. The original Gk actors were the dramatists who took the part of the protagonist, and the poet Thespis (535 BC) gave his name to the art of acting. When plays in the 5th cent. were first performed by professional actors they were always men. The most famous Rom. actor was Quintus Roscius (d. 62 BC), excellent in tragedy and comedy, who wrote a work on acting. Women did not perform on the Rom. stage until the 2nd cent. AD, when spectacle and pantomime were the main dramatic fare. By the 6th cent. there was an end of acting in Europe. Its revival came through the teaching of the clergy both in Church and schools, and in the Middle Ages there were performances everywhere, by amateurs, of mystery, allegorical, and comic plays. Companies of actors existed in England from the 15th cent. onwards, attached to the households of great lords. In Italy in the 16th cent. arose the *Commedia dell'Arte*, one of the greatest schools of comedy acting. In the 16th cent. the Burbages estab. the actor's art as a permanent feature of London life. Thereafter there were many famous actors, the first being Richard Burbage and Edward Alleyn, and there is evidence that Shakespeare was an actor. Continental acting was early adapted to the picture-frame stage, but Eng. acting did not fully accommodate itself to this form of staging until the 19th cent. No school of acting exists in

England comparable with the *Comédie Française*, which since the late 17th cent. has maintained a standard of classical acting in France. The feature of Eng. acting has always been its naturalism. At all times the activities of amateur actors have been considerable in England, and amateur drama is now one of the most important cultural activities in the country, the number of amateur societies being reckoned to be 25,000.

Théâtre Libre, see FRENCH LITERATURE.

Theatre Royal. In London Drury Lane Theatre (q.v.), the Haymarket Theatre (q.v.), and the Royal Opera House, Covent Garden (see COVENT GARDEN THEATRE) are permitted to use this title. The title of T. R. in respect of the Haymarket was granted only for the lifetime of Samuel Foote (d. 1777).

Theatre Royal, Bristol, oldest playhouse in England, opened in 1766. The plan owes much to the Drury Lane Theatre of 1674, but the auditorium is believed to be the first in England constructed in a horseshoe shape. After its opening licensing difficulties were experienced until, in 1778 by a special Act of Parliament, letters patent were granted. Almost every actor of note since 1766, except David Garrick, has appeared on its boards. The theatre is now under the control of the Arts Council, and is the home of the Bristol Old Vic Company.

Theatres, Laws Relating to. By the Theatres Act, 1843, all theatres for the 'performance of stage-plays' must be licensed. Stage-play by section 23 includes 'every tragedy, comedy, farce, opera, burletta, interlude, melodrama,

pantomime, or other entertainment of the stage.' The lord chamberlain is the licensing authority as to all theatres (except patent theatres, the only existing examples of which are Drury Lane and Covent Garden) within the parl. boundaries of London and Westminster, and in the bors. of Finsbury, Marylebone, Tower Hamlets, Lambeth, Southwark, New Windsor, and Brighton. In co. bors. the licences are granted by the tn councils, in non-co. bors. by the co. council, while the L.C.C. is the authority for those parts of London which are not within the jurisdiction of the lord chamberlain. A licence will be granted to the manager of the theatre only. (As to licensing of plays, see CENSORSHIP OF THE DRAMA.) Keeping a 'theatre' without a licence entails a penalty of £20 for every day; representing for hire a stage play in an unlicensed place, a daily penalty of £10; performing in public a new play without the leave of the censor, £50, and avoidance of the theatre licence. In regard to structural requirements for the prevention of fire, the L.C.C. has power under the London County Council (General Powers) Act, 1915, to revoke music and dancing licences if the terms or conditions on which they were granted are contravened, and under a similarly entitled Act of 1923, the council may vary the conditions attached to licences for stage plays granted by it under the provisions of the Disorderly Houses Act, 1751, the Cinematograph Act, 1909, or any amending Act. The enforcement of fire regulations is also provided for under the London County Council (General Powers) Act, 1923, and, in the metropolis, the council can close theatres for breach of the regulations. Provision is now made for compulsory registration of theatrical employers under the Theatrical Employers Registration Act, 1925, the object of which Act is to prevent persons of no substance from engaging companies and then abandoning them or failing to pay their salaries. All theatrical employers must hold a certificate of registration issued by the appropriate authority, which is the co. or bor. council or, for the metropolis, the common council. The Act does not apply to an employer or his agent having a licence under the Theatres Act, 1843, or a music and dancing licence; or to persons who employ for charitable performances, and not for gain or by way of business. By an amending Act of 1928 the registration authority can institute and prosecute proceedings against and oppose applications by persons whose certificates have been cancelled; and they can also refuse, cancel, or suspend the registration of a person who has been convicted of an offence involving dishonesty. Places licensed for music and dancing are exempt from the provisions of these 2 Acts. Restrictions are imposed by the Children and Young Persons Act, 1933 (re-enacting analogous provisions of the Education Act, 1921, and the Children (Employment Abroad) Act, 1913, respectively), on children taking part in entertainments, and on the taking of

children or young persons out of the U.K. with a view to their singing, playing, performing, or being exhibited for profit. The proper course where it is proposed to put a child on the stage is to obtain the leave of a magistrate. In Scotland, where the fitness of a child for training is proved, the petty sessional court will grant a licence allowing it to be trained for the stage, provided the court is satisfied that provision has been made to secure kind treatment. Dramatic and musical performances are protected by the Musical Performers' Protection Act, which prohibits unauthorised persons from making records (i.e. any mechanical contrivance for reproducing by sound) of any such performances; but it is a good defence to prove that the record was not made for purposes of trade. *See also* CENSORSHIP OF THE DRAMA; MUSIC AND DANCING LICENCES. *See* Ivamy, *Show Business and the Law*, 1956.

Thebaine ($C_{17}H_{17}NO_3$), one of the alkaloids contained in opium (q.v.) in combination with meconic acid. It is very poisonous, causing severe convulsions. It gives a blood-red coloration with concentrated sulphuric acid.

Theban Legion, The, legion of the Emperor Maximilian Hercules, which consisted of Christians recruited in Upper Egypt. Traditionally the entire legion was massacred in 287 when its members refused to take part in the pagan sacrifices prepared by Maximilian at Agaunum, Switzerland, before engaging in battle. The names of some of the legionaries are known. A basilica was built at Agaunum (St-Maurice-en-Valais) in the 4th cent. to enshrine the martyrs' relics. Some authorities question whether the whole legion was massacred. The feast of the T. L. is celebrated on 22 Sept.

Thebes (Gk *Thebai*, Egyptian *Wast*, later *Ne* 'the city,' sometimes **Ne-Aman** hence biblical No-Amon, 'the city of Amon'); 1. Name of anct city of Upper Egypt, known latterly as Thebais; surviving to-day in the magnificent ruins of Karnak and Luxor, which mostly date from the New Kingdom, when it was the cap. It rose into prominence under the princes who as the 11th dynasty reunited Egypt, one of whom, Mentuhotep III, has left a fine funerary temple at Deir el Bahri on the W. bank. T. was particularly developed by the 18th dynasty, who enriched the whole area with monuments and began the long series of royal tombs in the Valley of the Kings behind Deir el Bahri, where Hatshepsut built her graceful funerary temple alongside that of Mentuhotep III, and Amenhotep III built his farther S., of which only the Colossi of Memnon survive; at Medinet Habu, farther S. still, he constructed a palace and great lake for his queen Ti. y.

Thebes was the centre of worship of Amen-Ra, with his consort Mut the vulture mother-goddess and their son Khons. Each king added to the great temple of Amen at Karnak, and the priests of Amen became excessively rich and powerful. They suffered a temporary setback under Akhnaton (q.v.), but under

the 19th dynasty the architectural magnificence of Thebes increased. Seti I and Rameses II built great additions to the temples of Karnak and Luxor, and funerary temples on the W. bank. Rameses III built a temple and tower at Medinet Habu. The 25th dynasty made T. their capital, but under them it was sacked by the Assyrians. Homer describes T. as

André Roos

TIEBES, UPPER EGYPT

Temple reliefs at Medinet Habu of Rameses III (1198-1167 bc; 20th dynasty) making offerings to Amen-Ra.

'hundred-gated' referring to the monuments.

Under the Ptolemies, it ceased to be the capital of Upper Egypt, but as always it was liable to be the centre of nationalist movements. It was severely punished after a rising in 86 bc by Ptolemy VII and destroyed in the reign of Augustus for another rising.

See also EGYPT, History.

2. Chief city of Boeotia in anct Greece and bp. of Pindar. Its position was well defended, since it was situated in the middle of a plain surrounded by mts. No city is more famous in the mythical ages of Greece than T. It was here that the

use of letters was introduced from Phoenicia. T. was the traditional bp. of Dionysus and Heracles and the native city of Thresias the soothsayer and of Amphion the musician. It was also the scene of the tragic fate of Oedipus, and of the war of the 'Seven against Thebes.' Soon afterwards, the Epigoni or descendants of the 7, marched against T. to avenge their fathers' death, captured the city, and destroyed it. The first historical trace of the city is found in the conquest by the Boeotians about the year 1100 BC. T. then became the chief city of a confederation. She became the closest ally of the Spartans, and during the Peloponnesian war was Athens' bitterest foe. At the close of the war, however, she allied with Athens against Sparta, but the city was conquered and garrisoned by the Spartans. After the battle of Leuctra (371 BC) for a short time she became, under Epaminondas, the most powerful state in Greece; but with the death of Epaminondas at the battle of Mantinea, 362, T. lost her newly won supremacy. She was defeated and captured by the Macedonians, and utterly destroyed, with the exception of the temples and Pindar's house, by Alexander the Great (336 or 335 BC). The tn was restored in 316 BC.

Thecla, Saint, Gk saint of the Christian Church, who lived in the 1st cent. The *Acts of Paul and Thecla*, which was written in the 2nd cent. and is often untrustworthy, describes her as a member of a noble family in Iconium, in Lycaonia, who was converted by the preaching of St Paul. She is said to have followed him, dressed in boy's clothes, and to have suffered many cruel tortures for her faith. St T. is said to have died in Seleucia. Though the story seems to have a factual basis, it appears to have become much embellished. Her feast-day is on 23 Sept.

Thecodonts, small, lizard-like, bipedal Triassic reptiles with sharp teeth set in sockets, which were probably the ancestors of the more advanced archosaurs or ruling reptiles (dinosaurs, pterosaurs, crocodiles).

Theft. In most communities, ancient and modern, the institution of private property has occasioned the formulation of copious laws for the redress of violations by T. of the exclusive rights of ownership. But in an age of ungoverned violence, when legislators or law-givers had not as yet attained to the conception of the preservation of public order for its own sake, the legal code of an ancient state reflected a very different view of the moral aspect of stealing from the modern view, or even from that of the earliest Christianised communities. Maine asserts with a great show of probability that the ancient Roman and Greek codes had no real law of crimes at all, and that such penal laws as they do reveal are no more than the law of wrongs or torts (see TORT). The first civil wrong recognised by the Twelve Tables was that of *furtum* (T.), and even assaults and violent robbery were no more than *delicta* (torts). All such wrongs gave rise to an *obligation* or *vinculum juris*, the fulfilment

of which was considered complete with the payment of money. T. is defined in the *Institutes* of Justinian as 'the fraudulent dealing (*contrectatio rei fraudulosa*) with a thing itself, or with its use, or its possession; an act which is prohibited by natural law.' This definition affords some striking points of resemblance to most modern definitions of stealing (cf. that of larceny in Eng. law, under LARCENY). Though, whether by reason of the influence of Christian ideas or the attainment of a more subtle analysis of motive, the text of the *Institutes* continues: 'A person, however, who borrows a thing and applies it to a purpose other than that for which it was lent, only commits theft if he knows he is acting against the wishes of the owner . . . for there is no theft without the intention to commit theft.' In England the doctrine of the King's Peace was the foundation of T. as a public wrong; on the Continent it is to be traced to the source of *Naturrecht* or Natural Law (see JURISPRUDENCE AND JUS GENTIUM). The A.-S. laws of Ina, Athelstan, and others respecting the punishment of T. reveal a curious compromise between the Draconian severity of a pagan state and the mildness inculcated by the Christian missions from Rome; death was nominally the punishment in cases of T. where the value of the article taken exceeded 12d.; but in practice the thief could always compound his offence by a fine. Up to comparatively recent times, however, felonious T. remained a capital offence (see CAPITAL PUNISHMENT). At the present time T. connotes a variety of cognate but distinct offences, varying from larceny (q.v.) to fraudulent breach of trust. See also BURGLARY; EMBEZZLEMENT; FRAUD; LARCENY.

Thegn, see THANE.

Thelme, see CAFFEINE.

Theliss, see TISZA.

Thellusson, Peter (1737-97), Brit. merchant, b. Paris, son of the envoy of Geneva; he settled in London and became naturalised. He amassed a great fortune, and his son, Peter Isaac, was created Baron Rendlesham (1806). His name is remembered for his eccentric will, the harsh provisions of which led to the passing of what is known as the Thellusson Act (1800). By his will T. directed the income of his property to be accumulated during the lives of all his children, grand- and great-grandchildren, who were living at the time of his death, for the benefit of some future descendants to be living at the decease of the survivor, thus keeping within the letter of the rule of perpetuities which allowed any number of existing lives to be taken as the period for an executory interest (see EXECUTORY). For the provisions of the Thellusson Act, see ACCUMULATION. See also PERPETUITY.

Thelypteris, family Polypodiaceae, a rhizomatous genus of about 500 species, cosmopolitan, with 2 deeply, pinnatifid cut leaves. *T. dryopteris*, Oak Fern, T.

phaeopterts, Beech F., *T. palustris*, Marsh F., *T. robertiana*, Limestone F., and *T. oreopterts*, Mountain F., are all native to Britain; sometimes placed under *Dryopteris*.

Theme, in music, prin. melodic feature in a composition, differing from a subject by greater length and more self-contained completeness, a subject being usually susceptible to development, e.g. in a fugue or sonata-form work, whereas, a T. may be said more often to undergo restatement or decorative elaboration, especially in varied form. Sets of variations are always based on a T.

Themis, daughter of Uranus and Gaea, and by Zeus mother of Eunomia, Dike, and Irene; the personification of law and order who presided over the oracle at Delphi before Apollo.

Themistius (c. AD 317-388), Gk philosopher and rhetorician, was a native of Paphlagonia. He settled in Constantinople about 345, where he became a senator (355) and prefect (383). He wrote 34 speeches, and paraphrases of various works of Aristotle. The *editio princeps* is that of Aldus (Venice, 1534). There is an ed. of the *Orationes* by W. Dindorf, 1832, and of the *Paraphrases* by M. Wallies and others in *Commentaria in Aristotelem Graeca*, 1903. See L. Méridier, *Le philosophe Themistius devant l'opinion de ses contemporains*, 1906.

Themistocles (c. 528-462 BC), Athenian soldier and statesman. He was always ambitious, and began his career by setting himself in opposition to those who had most power, and especially to Aristides, to whose ostracism (483) he contributed. From this time he was the political leader in Athens. T. advocated naval expenditure to protect Athens from Persian invasion, and through his influence 100 new triremes were constructed and the port moved from Phalerum to Piraeus. It was T. who forced the naval engagement at Artemisium and was responsible for the Gk victory at Salamis (480). On the retirement of the Persians, he rebuilt the walls of Athens and strengthened the fortress and harbour of Piraeus. He also removed the *metoikion*, an alien's tax, and thus encouraged many foreign traders to settle in Athens. He appears to have gradually lost his influence with the Athenians soon after the Persian defeat, probably on account of his arrogant manners, and about 471 was accused of peculation (possibly justly), ostracised, and banished from Athens. He retired to Argos, and when accused of treason fled to Corcyra, and finally was welcomed by Artaxerxes. He settled in Magnesia, where he lived till his death. See lives by Plutarch and Cornelius Nepos, and G. B. Grundy, *The Great Persian War*, 1901.

Theobald (d. 1161), archbishop, b. near Thiévoeville, Normandy, studied law under Lanfranc at Bec. In 1138 he was nominated Archbishop of Canterbury by Stephen. It was probably at his instigation that the Pope refused to give his permission to T. to crown Stephen's son Eustace as King of England (1152). Under T. the Church became more

powerful; though he had crowned Stephen, he was ready to resist him whenever he felt the power of the Church threatened. He was one of a select body of experienced Eng. advisers who were appointed by Henry II soon after his coronation as justiciars, and introduced the study of civil law into England.

Theobald, Lewis (1688-1744), critic and translator, b. Sittingbourne. He became an attorney, but turned to literature, made trans. from the Greek, and wrote essays and poems. His *Shakespeare Restored*, 1715, severely criticised Pope's ed., and T. was rewarded with the first place in Pope's satire, the *Dunciad*. T.'s own ed. of Shakespeare, pub. in 1734, has many valuable emendations. See life by R. F. Jones, 1919.

Theobalds Park, Herts, England, near Cheshunt, 12 m. from London. The park takes its name from Theobald's Palace, built by Lord Burleigh in the 16th cent.; James I lived for a time in the palace, and d. there in 1625. The house was pulled down c. 1765 and a second one built. Temple Bar (q.v.), moved from Fleet Street, London, in 1878, stands in the park. The house, formerly the property of the Meux family, is now a Midx co. secondary school.

Theocracy (Gk *theokratia*, government by God), a term applied to the constitution of the Israelitish government as established by Moses, on account of its being under the direct control of Jehovah. This constitution underwent modification with the election of Saul as king, and with the subsequent choice of David, the king 'after God's own heart,' Israel became a theocratic monarchy: the king was considered as mediator between God and his people (II Sam. xxiv. 17). In the books of the Maccabees the concept of God's personal gov. is less apparent (see, however, I Macc. iv. 20).

Theocritus (b. c. 310 BC), Gk pastoral poet, was a native of Syracuse, and the son of Praxagoras and Phyllina. Having studied under Philetas in Cos, he visited Alexandria and obtained the patronage of Ptolemy Philadelphus, in whose praise he wrote the 14th, 15th, and 17th idylls. T. was the creator of bucolic poetry as a branch of Gk, and, through imitators such as Virgil, of Rom. literature. The bucolic idylls of T., 30 of which are extant, are of a dramatic and mimetic character, and are pictures of the ordinary life of the common people of Sicily. He also wrote epic poems. The best editions are those of U. von Wilamowitz-Moellendorf, *Fuclici Graeci*, 1910, and A. S. F. Gow, *Theocritus with trans. and commentary* (3 vols.) 2nd. ed., 1952.

Theodectes (c. 376-335 BC), Gk orator and tragic poet b. Phaselis. His father Aristander caused him to study under Plato, Isocrates, and possibly Aristotle, who dedicated to him one of his treatises on rhetoric. T. also wrote sev. orations and poems on the art of oratory.

Theodicy (*theodikei*), etymologically the justice of God. Our present application of the term is due to Leibnitz (q.v.), who pub. in 1710 his *Essai de Theodicée sur la*

Conté de Dieu, la liberté de l'homme et l'origine du mal, a defence of the justice of God and investigation of the problem of evil. A sub-division of Natural Theology (q.v.) it follows logically from the treatise on the existence and nature of God.

Theodolite, instrument for measuring horizontal and vertical angles, used extensively in surveying. A telescope, giving the line of sight, is mounted on a horizontal axis (at right angles to the

THEODOLITE

The illustration shows one form of Theodolite resting on its levelling screws on a tripod.

A, object-glass and cap; B, upper plate or limb; E, supporting limbs of telescope, etc.; G, body of telescope, and diaphragm; H, eyepiece; K, spirit-level on telescope; M, microscope for vernier; N', verniers; V, levelling-screws; V' and W, slow-motion clamping-screw.

optical axis) fixed in a frame whose vertical axis passes through the centre of a horizontal graduated circle. The telescope can swing in a vertical plane around the horizontal axis, the angle of rotation being measured on a vertical graduated circle. The frame with telescope can rotate about the vertical axis, the movement being measured by 2 diametrically opposite indexes with micro-meters. Modern T.s are of the transit type, in which the telescope can make a complete rotation about the horizontal axis reversing the line of sight. A plumb line is attached to the vertical axis for accurate centring of the T. above the point from which angles are to be measured.

Some T.s have a special centring arrangement independent of the tripod. A circular level on the tripod serves preliminary levelling, the horizontal plate has 2 levels at right angles, 1 in the line of sight; a level is placed on the telescope and sometimes a 'striking level' on the horizontal axis. The graduated scales are now mostly of glass, and images of opposite parts of the horizontal scale are brought under a single microscope by a system of prisms.

Theodor von Neuhoff, *see* NEUHOFF, THEODOR VON.

Theodora (c. AD 508-547), wife of the Byzantine emperor Justinian I, notorious before her marriage as an actress and dancer of ill-repute, was proclaimed empress in 527. She showed great courage in the Nika insurrection (532), and was an able counsellor in all matters of State. Her character suffered no taint after her marriage, and indeed posterity might have known nothing derogatory to her but for the *Secret History* of Procopius, whose other writings extolled Justinian and his Empress. There is no hint of her profligacy in other writers. *See* A. Débidur, *L'impératrice Theodora: Etude critique*, 1885, which is a refutation of Procopius. T. is the subject of a play by Sardou, produced in Paris, 1884. *See also* W. G. Holmes *The Age of Justinian and Theodora*, 1912.

Theodore, name of three Russian tsars, *see* FEDOR.

Theodore of Canterbury, St (c. 602-690), b. Tarsus, Cilicia. He spent some time at Athens and became a monk at Rome. At the age of 66 he was appointed by Pope St Vitalian to the see of Canterbury at the suggestion of the African St Adrian, who accompanied him to England and acted as his adviser. T. has been rightly called the second founder of the see of Canterbury and the first primate of the Eng. church. He travelled extensively over the country, promoted learning, opened schools, consolidated or re-established dioceses, and held the first national council in 673 at Hertford. His activities involved him in disputes with St Chad and St Wilfrid on questions of jurisdiction, but these controversies were amicably settled. St T. has a strong claim to be considered as a prominent figure in Eng. hist. *See* lives by O. Fritzsche, 1847; H. B. Swete, 1880-2; A. Mai, 1832, 1854; E. Sachau, 1869.

Theodore of Ethiopia, *see* ETHIOPIA.

Theodore of Mopsuestia (c. 350-428), bishop, b. Antioch, a friend of St John Chrysostom, who converted him to the ascetic life. Ordained in 383, he was a great preacher and exegete, and became Bishop of Mopsuestia in Cilicia c. 392. He was a voluminous writer, and opposed St Augustine's teaching on original sin. He was attacked after his death for encouraging, by his writing, the heresies of Pelagius and Nestorius, and some of his works were condemned at the 5th Synod of Constantinople, in 553, with the reluctant assent later of Pope Vigilius. *See* L. Patterson, *Theodore of Mopsuestia and Modern Thought*, 1926.

Theodoretus, or **Theodoret** (c. 393–457), Syrian bishop and theologian. Trained by Theodore of Mopuestia and St John Chrysostom (qq.v.), he became a deacon at Antioch, and in 423 Bishop of Cyrus. He was so successful against the heretic Marcionites (q.v.) that he claimed to have baptised 10,000 of them. He protested against the condemnation of Nestorius (q.v.), a friend of his student days, by the Council of Ephesus (432), and was deposed and retired to a monastery (449). But at the Council of Chalcedon (451) he submitted and was re-instated. T. wrote an immense number of works, among them a *History of the Church from 329 to 429*, an *Apology for Christianity*, and a *Concise History of Heresies*. See G. Bardy, 'Théodoret,' *Dictionnaire de Théologie Catholique* (Vacant-Mangenot), 1946.

Theodorie (or **Theoderie**) I, King of the Visigoths (ad 418–51), and son of Alaric I. He succeeded Wallia, and fought the Romans from 425 to 440, defeating them at Toulouse (439), soon afterwards concluding peace with them. Then, joining with Aetius, the Rom. general, against Attila the Hun (450), he was killed in the battle of Châlons (451). **Theodorie II**, his second son, became King of the Visigoths (452–66), after murdering the elder, Thorismond, and ruled over most of Spain and Gaul. He was assassinated by his brother Euric.

Theodorie the Great (c. 455–526), founder of the Ostrogothic monarchy in Italy, b. Pannonia. As a child he was sent as a hostage to Constantinople, and soon after his return to his father, Theodemir, attacked the King of the Sarmatians and captured Singidunum (Belgrade). Theodemir and his son then successfully invaded Moesia and Macedonia, and on Theodemir's death (c. 474), T., after some raids against the emperor Zeno and a rival Gothic chieftain, set out to win Italy from Odoacer, whom he defeated at Verona and then besieged in Ravenna. After the capitulation, T. violated the terms by killing Odoacer (493). T.'s 33 years' reign was a period of peace and prosperity for Italy such as it had not known for cents. He maintained his traditional Arian creed, but was tolerant in religious matters. His closing years were sullied by the judicial murders of Boethius (q.v.) and the latter's father-in-law Symmachus. He figures in the *Nibelungenlied*, being known to the Germans as Dietrich of Berne (Verona). See T. Hodgkin, *Theodorie the Goth*, 1891, 1923; M. Brion, *Theodorie, Roi des Ostrogoths*, 1936; G. Vetter, *Die Ostgoten und Theoderich*, 1938.

Theodosia, see **THEODOSIYA**.

Theodosius, Rom. gen. of the reign of Valentinian I. He fought against the barbarians of Britain and Germany (367), and crushed a Moorish insurrection in Africa (373). The reason of his execution at Carthage (376) is unknown. His son was the emperor Theodosius the Great.

Theodosius I, Flavius, the Great (c. 346–395), E. Rom. emperor, b. in Spain, son of Theodosius, the gen. of Valentinian I.

He became emperor of the E. in 378 at the invitation of Gratian. T. warred successfully against the Goths, and by skilful diplomacy enlisted 40,000 of them as his allies (382). In 388 he defeated the usurper Maximus at Aquileia, and secured the W. throne for Valentinian II, brother of Gratian. After Valentinian's death (392) T. marched against another usurper, Eugenius, whom he defeated near the Frigidus (394), and became sole emperor. After a few months, however, he d. at Milan, and the empire was divided between his 2 sons, Honorius and Arcadius, the former ruling the W., the latter the E. T. was responsible in 380 for the famous massacre at Thessalonica. He did his utmost to countermand the order, but his messengers were too late; and St Ambrose compelled him to do public penance before admitting him to the cathedral at Milan. See T. Hodgkin, *The Empire of Theodosius*, 1889.

Theodosius II (401–50), grandson of T. the Great, and son of Arcadius, succeeding him as emperor of the E. (408). His sister Pulcheria and the praetorian prefect, Anthemius, ruled during his minority. Wars with the Persians (421 and 441), and the Huns under Attila (441–8) were among the chief events of his reign. The *Codez Theodosianus*, in 16 books, was pub. in 438. See J. B. Bury, *Later Roman Empire*, vol. I, 1923.

Theognis of Megara (late 6th cent. bc), Gk elegiac poet and reputed author of a collection of political verses strongly aristocratic in temper. See the edition with commentary by T. H. Williams, 1910; C. M. Bowra, *Early Greek Elegists*, 1938.

Theogony (Gk *theos*, god; *gonos*, seed), genealogy of the gods. Many early Gk poets wrote verse theogonies. Only that of Hesiod (q.v.) is extant.

Theology (Gk *theos*, god; *logos*, science), science of religion, dealing therefore with God, and man in his relations to God. Systematic T. deals with the specific doctrines, principles, and characteristics, e.g. of Christianity. T. is treated under 2 main heads, Natural and Revealed T.; but various causes, especially the application of the theory of evolution to religion and T., gave rise to a Broad or Modernist school of thought, which sought to do away with hard-and-fast divisions. In T., as elsewhere, it minimised the importance or denied the existence of critical points in the world's hist., and traced instead an orderly development. Without an entire break with historic Christianity, no such change can take place with regard to dogmatic T., and modernist T. did not shrink from a drastic modification of the Creeds.

There is a very close affinity between T. and philosophy. While philosophy seeks Being, the ultimate reality underlying phenomena, T. seeks the knowledge of the supreme Being, God in Himself, and in the light of that knowledge of the creature's relation to Him.

Catholic T. of all ages takes its stand upon a divine revelation from without the human mind, though insisting that certain

revealed truths, such as the existence of God, are also within the reach of natural reason and so form part of natural as well as Revealed T. Revealed T. may be analysed according either to its matter or to its method. The division according to its matter gives us the 2 branches of *Fundamental*, and of *Dogmatic Theology* (q.v.); the former concerned with the grounds upon which Revealed T. and religion rest, the Fact of Revelation, the Founts of Revelation, and the way in which it is received; the latter, dealing with the truths so revealed, falls into 2 branches, theoretical (Dogmatic Theology proper) and practical (Moral Theology, q.v.). The division according to method gives us *Positive* and *Speculative T.* *Positive T.* seeks to establish, expound, and prove the truths of T. and is further divided into *Biblical T.* (if it is concerned only with Scriptural sources and proofs), *Patristic T.* (if it draws only upon the Fathers), and *Symbolic T.* (which confines its scope to the creeds and formularies of the Church). Akin to these (as also to Fundamental T.) are also *Polemic* or *Apologetic T.*, which seek to defend and to commend theological doctrine in a hostile, sceptical world. *Speculative T.* makes use of Philosophy and other rational inquiries to probe more fully into the nature and implications of the truths of religion.

Essential to the study of T. is exegesis, the submission of the Scriptures to the Lower and Higher Criticism, and from this follows *Historical T.*, the study of Christian doctrine as it has manifested itself in the hist. of the Church from the formative or Patristic period to the present day. The philosophy of religion, with which Natural T. (q.v.) is now identified, concerns itself with the study of the idea of God, the freedom of God, and the operation of Grace, and finally the nature of immortality, which is also the subject of eschatology (q.v.). The philosophy of religion, which also embraces comparative religion, and the psychology of religion, reached its modern scientific forms only since the Renaissance. It has divided into 2 main streams: the traditional, founded on revelation as it exists in the Scriptures, and the empirical, which, though recognising the Scriptures as the source of doctrine, argues the existence of God from the nature of man. In the 19th cent., mainly through the influence of Hegel, Schleiermacher (qq.v.), and Otto, this subjective view of T. held sway among Protestants. In more recent times they have shown a marked swing away from the importance attached to the religious experiences of man and a return to the importance of revelation in the Word of God. This movement is associated particularly with the work of Karl Barth and Emil Brunner, and was clearly seen in the Ecumenical Council of Churches at Amsterdam in 1948. See also **BIBLE; FAITH; RELIGION.** See H. R. Mackintosh, *Types of Modern Theology*, 1937; K. E. Kirk (ed.), *The Study of Theology*, 1939; C. Van Til, *New Modernism*, 1946; E. Brunner, *Christianity and*

Civilisation, 1947; W. R. Matthews *God in Christian Thought and Experience* (7th ed.), 1947; A. Vidler, *The Theology of F. D. Maurice*, 1949; and C. Dawson, *Religion and Culture*, 1949.

Theophrastus (c. 370-c. 286 bc), Gk philosopher, b. Eresos in Lesbos. Though he had begun to study at Athens before the death of Plato (347 bc), he soon afterwards joined Aristotle (q.v.) at Assos and Mitylene. He became the Stagirate's most able pupil and succeeded him as head of the Peripatetic school in 322 bc. From that time until his death he laboured to consolidate and expand the work of his master, a task which he fulfilled with great success. A close follower of Aristotle's thought and method, he gave particular attention to natural science and botany. His surviving works include *The History of Plants* and *The Causes of Plants* (ed. and trans. by Sir A. F. Hort, 2 vols. Loeb Library), 1916, *From the Metaphysics* (ed. and trans. by W. D. Ross and F. H. Forbes), 1929, and a most readable book entitled *Ethical Characters*, a collection of typical 'bad hats' (ed. and trans. by J. M. Edmonds, Loeb Library), 1929. The fullest account of T. and his work is to be found in O. Regenbogen's article, in Pauly-Wissowa, *Realencyclopädie*, supp. vol. vii, 1950. See also E. Zeller, *Aristotle and the Earlier Peripatetics*, 1897.

Theorbo, obsolete instrument of the lute type, actually a kind of bass lute of large size with a double neck on which only the upper strings are stretched over a finger-board, the bass strings being at the side of it and not capable of producing different notes, except by retuning. The T. came originally from Padua, but there were other examples, including the Eng. one also called Archlute. The It. Chitarrone was a similar instrument, but originated in Rome. The number of strings varied from about 11 to 17. The T. was much used in the 17th cent.

Theorem (Gk *theorēma*, something to be looked at or seen), in mathematics, any proposition which states its conclusion, or makes some affirmation or negation requiring proof, whereas a problem states something which is to be done.

Theory, properly speaking, the mode of making seen and known the dependence of truths upon one another, or a supposition explaining something, especially one based on principles independent of phenomena to be explained. T. is popularly opposed, on the one hand, to fact and, on the other, to practice, but the opposition is not essentially valid, and arises from the imperfection of T.s which cannot be reconciled with the data of experience certain or assumed. The distinction between theoretical and practical labourers in the field of science or art is not strictly a just one, for there is no theorist whose knowledge is based wholly on T., and there is no practical man whose skill is all derived from experience.

Theosophy (Gk *theos*, god; *sophia*, wisdom) claims a high antiquity, coming down from the Neoplatonists, Plotinus,

Iamblichus, and Proclus. It may be defined as a syncretistic religion professing to afford a higher knowledge or more immediate approach to God than is offered by any single religion based on revelation or reason.

Theosophists claim to include in their ranks Paracelsus, Boehme, and the Rosicrucians, and to be of ancient oriental origin, the Sanskrit equivalent being *Brahma-Vidyā*, or divine knowledge. It is based to some extent on oriental mysticism, and is pantheistic in its theology, believing in one absolute, incomprehensible, and supreme deity, who is the root of all nature, and of all that is visible and invisible, and in man's eternal nature, which, being a radiation of the universal soul, is of an identical essence with it, and teaching that by returning to the purity of nature, one can gain certain occult powers. Helena Petrovna Blavatsky (q.v.) (1831-91), a Russian princess, who it is claimed was initiated in Tibet, is the recognised founder of the 2 great branches of to-day. T. is supposed to be preserved by initiates scattered over the world who have attained spiritual perfection, but elect to watch over religion, which they hope to unify under 1 system of ethics. A group of these Arhats, Mahatmas, or Masters, it is said, led Helena Blavatsky to found the Theosophical Society in 1875. Its teachings in general may be said to be founded on the 2 great principles of 'Karma' (q.v.) and Reincarnation (q.v.), or the belief that man must undergo a series of lives until he has assimilated all the soul-experiences and can attain to Nirvana (q.v.). The terminology and the thoughts are derived from Hinduism and Buddhism (q.v.), but T. claims to be distinct from either. After Helena Blavatsky d., W. G. Judge, of America, became the leader, and upon his death the society split into 2 sections, 1 following Katherine Tingley, and the other Annie Besant. See Helena Blavatsky, *Isis Unveiled*, 1877; *The Secret Doctrine*, 1888, and *The Key to Theosophy*, 1889; Annie Besant, *Theosophy and the New Psychology*, 1904. See also KRISHNAMURTI; BLAVATSKY.

Theotocopuli, Domenico, called *El Greco* (1541-1614), Gracco-Sp. painter, b. Phodole, near Candia, Crete, then a Venetian possession. He began painting in the style of the Cretan icon-makers, but then studied in Venice under Titian. The Venetian school, and especially the impassioned movement of Tintoretto's works, moulded his development. He was in Rome 1570-c. 1576, when he migrated to Toledo. In that city, where he lived the rest of his life, he painted for the cathedral the picture 'El Espolio' (the Stripping of Christ) (1579). His masterpiece, one of the world's greatest pictures, 'The Burial of Count Orgaz,' was painted probably in 1587, for S. Tomé, Toledo. T.'s stormy and mystical paintings, especially his religious works, with their foreshortened or strangely elongated figures, vehemently express his spiritual intentions. He reduced his palette to 5 colours, yet believed that colour was more

important than design and used those few pigments to intense dramatic effect. Many of his portrait works are in the Prado, Madrid. He is represented in the National Gallery, London, notably by a version of his 'Christ Driving the Traders from the Temple,' and 'Christ on the Mount of Olives.' His single but immensely impressive landscape 'View of Toledo' is in the Metropolitan Museum, New York. See Manuel B. Cossio's various works on T., especially *El Greco*, 1908; and studies by A. F. Calvert and C. G. Hartley, 1909; A. Moyer, 1911; M. Barré, 1911 and H. Köhler, 1914; Elizabeth du Gue-Tripier, 1925; F. Rutten, 1930; M. Legendre and A. Hartmann, 1937; L. Goldscheider, 1938. See also SPANISH ART.

Thera, or Santorin, Gk is. in the Aegean Sea (q.v.), the most southerly of the Cyclades group, and lying about 60 m. N. of Crete. Its steep shores vary in height from 500 to 1200 ft. The entire N. half is composed of volcanic material, and from the earliest times the is. has been a centre of volcanic agency. The coast-line is some 30 m. long, and opposite the inner or W. curve lies the smaller is. of Therasia. T. and the neighbouring islets are the remnants of a submerged volcano which last erupted in 1925-6. Both T. and Therasia have yielded interesting archaeological discoveries in the form of prehistoric dwellings with antique vases and carefully worked stone instruments. According to Herodotus, Cadmus estab. a Phoenician colony in T. The vills. are built along the edge of the cliffs, which are striking for their black lava tufa and other volcanic strata, much of which is deep red in colour. The cap. T. (pronounced Phera) is a mere vil. The is. produces some cereals, such as barley, as well as figs and olives, but vines are the chief crop. Pop. 9700.

Theramenes, son of Hagnon, a leading member of the Athenian oligarchical gov. of the Four Hundred (411 bc). Subsequently he not only helped to depose the Four Hundred, but was instrumental in securing the condemnation of Antiphon (q.v.) and Archepitolemus. After the capture of Athens by Lysander (404) T. was chosen one of the Thirty Tyrants, one of whom, Critias, afterwards accused him of treason, and he was put to death.

Therapeutics, or Therapy, that branch of the science of medicine which deals with the treatment of disease, and the application of remedies. Remedial agencies are divided into classes, according to general similarity of treatment, e.g. aerotherapeutics (q.v.), balneotherapeutics (q.v.), electrotherapeutics, occupational therapy (q.v.), psychotherapeutics, physiotherapy (q.v.), serum therapeutics (q.v.), vaccine therapeutics (q.v.), hydrotherapeutics or hydropathy (q.v.), thermotherapeutics (by the use of drugs), etc.

Therapnae, tn in Laconia, on the Eurotas, near Sparta, celebrated in Gk mythology as the bp. of Castor and Pollux. Menelaus and Helen were said to be buried here.

Therapsids, mammal-like reptiles of Permo-Triassic age from the Karroo beds of S. Africa. They display radiation into sev. varied groups, and gave rise to the mammals.

Theresa, St. of Avila, see **TERESA, St.**
Thérèse, St. (1873-97), St. Teresa of Lisieux, 'The Little Flower,' Fr. Carmelite nun, b. Alençon, the ninth child of Louis and Zélie Martin. The family moved to Lisieux and at 15 she became Sister Teresa of the Child Jesus in the Carmel there, where she remained until her death. Her autobiography was written under obedience 1894-7, and was not seen outside the convent until after her death. Its publication evoked a world-wide wave of acclamation, and the shower of miracles immediately following her death led to her canonisation in 1925 (commemorated 3 Oct.). Her 'little way' lived under ever-increasing suffering teaches the way of 'spiritual childhood,' and she has become the St of the ordinary man and woman in their daily lives in the world and the patroness of all priests, especially in the mission field, in their vocation of winning souls for Christ. See *The Story of a Soul* (the autobiography of St Thérèse of Lisieux) and numerous biographies and studies, including H. Petitot, *Saint Teresa of Lisieux: A Spiritual Renaissance*, 1948; M. M. Philippon, *The Message of Thérèse of Lisieux*, 1950; and *Autobiography of a Saint* (trans. R. A. Knox), 1958.

Therm, statutory unit of heat, on the basis of which coal-gas is bought and sold. It is equal to 100,000 Brit. Thermal Units (B.Th.U.), and the latter unit is defined as the amount of heat required to raise the temp. of 1 lb. of water through 1° F. (from 60° to 61° F.), and equals 251.9 calories (q.v.). See **PHYSICAL CONSTANTS**.

Thermae, huge buildings erected by the Rom. emperors, and comprising not only baths of various kinds but often libraries, gymnasias, theatres, etc., also. The *tepidarium* was a warm room, with no bath, in which the bather usually spent some time before undressing. The apartment for undressing was the *apodyterium*; the *frigidarium* contained a cold bath, and the *calidarium* contained warm baths. The prin. surviving ruins of T. in Rome were built by Caracalla, c. AD 215, and by Diocletian, AD 306 (converted by Michelangelo, q.v., into the church of Santa Maria degli Angeli). Others were erected by Agrippa, 25-12 BC, and by the emperors Nero, AD 62, Titus, c. 80, Trajan, c. 115, etc. Outside Rome there are interesting remains of Rom. T. at Pompeii in Italy, at Bath and at Wroxeter (Viroconium) in England, near the Musée de Cluny at Paris, and elsewhere.

Thermae Himerenses, see **TERMINI IMERESE**.

Thermae Sellnuntinae, see **SCIACCA**.

Thermal Unit, see **CALORIE**; **ELECTRICITY**; **HEAT**; **THERM**.

Thermidor (from Gk *thermē* heat, and *dōron*, gift), eleventh month of Fr. revolutionary calendar. See **CALENDAR**.

Thermionics and **Thermionic Valve**. T. is the branch of science that deals with the

emission of electrons from matter under the influence of heat. Following the identification of the electron by J. J. Thomson in the closing years of the 19th cent., O. W. Richardson discovered the law connecting the emission of electrons from a body with its temp. This emission can be considered as an evaporation of electrons from the body, and the rate of the evaporation is a function of the temp. of the body; the higher the temp., the greater the rate of evaporation. The evaporation depends on the nature of the surrounding gas, but Richardson found that in a highly evacuated atmosphere the formula $n = A\sqrt{T}e^{-3/2T}$ is a fairly accurate representation of the phenomenon: n is the number of electrons emitted per sq. cm. of the surface of the body per sec., T its absolute temp., e the base of Napierian logarithms, and A are constants, typical of the body. Further investigation by Langmuir led to the discovery that the evaporated electrons form a 'cloud' surrounding the heated body, and that ultimately equilibrium is estab. between the rate of evaporation and the rate of condensation, i.e. the return of the electrons under the electrical repulsion of the electron cloud or 'space-charge.'

The application of the results of Richardson's and Langmuir's researches led to the discovery and subsequent development of modern wireless technique, which depends for its success on the thermionic valve. (See further under **VALVES**.)

Thermit, or **Thermite**, mixture of finely powdered aluminium and oxide of iron ('hammer scale,' Fe_2O_3), the heat of combustion of which produces a temp. of about 2800° C. It was invented by Vauten of London and utilised for welding by H. Goldschmidt of Essen. (See **WELDING**.) T. is used in incendiary bombs.

Thermochemistry, science founded on the law of the conservation of energy, which deals with the thermal effects accompanying chemical actions. Reactions in which heat is evolved are called 'exothermic,' and where heat is absorbed they are termed 'endothermic.' Measurements of the heat of formation of substances, the heat of solution, of combustion, and of the neutralisation of acids and bases, have been determined; also the heat of hydration, the heat of combustion, the heat of ionisation, the heat of dilution, etc. The amount of heat liberated in chemical reaction is determined by allowing it to warm a known quantity of liquid (generally water) whose specific heat is known, and measuring the rise of temp. by means of an accurate thermometer. The water calorimeter generally employed for this purpose consists of an inner platinum vessel surrounded by water contained in an outer vessel of silver, which is protected by poorly conducting material so as to diminish the loss of heat by radiation. The reacting substances, either in the pure state or in solution, are brought to the same temperature and introduced into the inner vessel. The temp. of the

water is taken before and after the reaction, and from the rise of temp., the quantity of water present, and its specific heat (and knowing the water equivalent of the calorimeter) the amount of heat liberated is determined. In order that a reaction may be studied thermochemically it must take place at ordinary temps. and must proceed rapidly to the end. Many reactions which do not fulfil these conditions, such as many processes of combustion, can be made to fulfil them. This is done by causing the substance to be burnt, in the presence of oxygen under increased pressure, in a steel bomb lined with platinum or enamel. Only in a comparatively few cases has it been possible to make direct determinations of the heat value of chemical changes. Thermal values which cannot be determined directly can be calculated indirectly by methods depending on the fundamental principle of T. which was propounded by Hess (see HESS'S LAW). The heat change is dependent only on the initial and final stages of the reaction or system of reaction. Thus the heat of formation of methane cannot be determined directly, but a value may be arrived at by subtracting the heat evolved when methane is burnt from that evolved when the corresponding weights of free carbon and hydrogen are burnt. The unit of heat used in thermochemical measurements is the calorie, or the quantity of heat which is required to raise the temp. of 1 gram of water from 0° to 1° C. The results of measurements are expressed by symbols, which means gram-atomic, or, in the case of compounds, gram-molecular weights of the substances which react. Thus $H_2 + O = H_2O + 68,470$ calories means that 68,470 calories of heat are liberated when 2 grams of hydrogen and 16 grams of oxygen unite at ordinary temp. to form 18 grams of water. If the reacting substances are in solution, the presence of a large quantity of water is denoted by the symbol 'aq'—thus: $KOH_{aq} + HCl_{aq} = KCl_{aq} + 13,700$ calories. Another unit of heat used is 1,000 gram-calories (K).

As well as being of theoretical importance, T. has been found of great value in determining the heating power of fuels for commercial purposes and calorific values of foodstuffs.

Thermodynamics, the science of heat (q.v.) in relation to other forms of energy. At the beginning of the 19th cent. the caloric theory of heat was accepted by scientists generally. According to this theory, heat is a fluid called the caloric which occupies the interstices between the particles of a body. The sum total of the caloric in the universe is constant, and it can neither be created nor destroyed. When a body is heated in a flame caloric passes from the flame into the body, and the exchange increases the temperature of the body and decreases that of the flame. As the weight of a body does not increase when it is heated (assuming chemical changes do not take place), it was evident that the caloric was a weightless fluid. In order to explain the fact that

different substances have different specific heats (q.v.), it was supposed that they possessed different affinities for the heat fluid. A change of state, such as from ice to water, without an accompanying rise of temp. was accounted for on the supposition that there was more room between the particles of water for the caloric, and that a given weight of water therefore contained more caloric than an equal weight of ice. The theory had its uses, and it is interesting to note that the theory of the caloric is implicitly used to-day in the earliest states of instruction in physics. The first experiment which indicated the falsity of the caloric theory was performed by Count Rumford (see THOMPSON, SIR BENJAMIN) in 1798. A quantity of water was placed in a crude calorimeter of gunmetal, and a blunt steel borer pressing on its base was caused to rotate rapidly by means of horse-power; eventually the water boiled, and Rumford demanded to know where the caloric had come from. The calorists gave the unsatisfactory explanation that a small quantity of the gunmetal had been broken up by the borer into fine powder and the caloric had escaped into the water. Rumford was convinced that the caloric theory had been shown to be incorrect and that 'heat is motion.' Nevertheless, the caloric theory held its ground until the researches of Mayer and Joule definitely estab. its falsity in 1849.

The First Law of Thermodynamics. Joule's experiment was essentially as follows. (For diagrams and a fuller discussion, see HEAT.) A special calorimeter was fitted with fixed lateral vanes, between which other vanes attached to a vertical spindle could rotate. Round a pulley mounted on this spindle a double cord was wound, to pass from there over 2 pulleys to lead weights hanging freely. The weights descended, and the water inside the calorimeter was churned, and was thereby heated. By a series of careful measurements Joule discovered that the amount of heat produced was always directly proportional to the mechanical work done in rotating the spindle. Furthermore, the constant of proportionality was always the same. The quantitative result of his experiments was that 772 foot-pounds of work expended produce 1 Brit. Thermal Unit of heat (i.e. the quantity required to raise the temperature of 1 lb. of water 1° F.). Joule's quantitative researches confirmed Mayer's qualitative speculations that Heat is a form of Energy. In 1847 Helmholtz read a paper to the Physical Society of Berlin, *Ueber die Erhaltung der Kraft* (On the Conservation of Force), and he is regarded as one of the founders of the law of the Conservation of Energy which was propounded the same year by Joule in a lecture in Manchester, in which he gave 'the first full and clear exposition of the universal conservation of that principle now called energy.' His ideas met with a hostile reception, not only in Manchester, but also from the Brit. Association itself at its meeting in Oxford that year.

Fortunately the attempt made to stifle the discussion of the paper by the illustrious chairman was frustrated by the enthusiasm of a young man in the audience, Wm Thomson, afterwards Lord Kelvin (q.v.), and from that date the real importance of the principle began to be realised. Expressed in simple terms, the First Law of T. states that work and heat are equivalent. It is an excellent example of a physical law, viz. a law that is based on physical measurements and claims to be a law only in so far as it is justified by those measurements. Refined experiments, notably by Callendar and Barnes, and by Reynolds and Moody, have confirmed Joule's conclusions, and the accepted quantitative relation between heat and work is 1 calorie = 4.186×10^7 ergs or 4.186 joules. Expressed mathematically, the law is written $W = H$, where both are expressed in the same units. A conservative preference for retaining the original units leads to the usual expression $W = 4.186 \times 10^7 H$, where W is measured in ergs, and H in calories. The First Law of T. is a *sine qua non* of the Kinetic Theory of Matter that regards heat as the kinetic and potential energy of the molecules of a substance. Further, it was of importance in leading to the recognition that Heat, Light, Electricity, and Sound are all forms of energy.

T., however, had its origin in an attempt by Carnot 'to determine mathematically how much work can be gotten out of a steam-engine.' Carnot's researches were published in 1824, when he still held to the caloric theory. His theories were subsequently modified by Wm Thomson to accord with the dynamical theory of heat as expressed in the First Law of T. Carnot began by considering an ideal heat engine, performing in a manner that enabled him to deduce the relation between the work done by the engine and the heat taken in from the furnace. A modern statement of his principles is as follows: Carnot's engine, Fig. 1, is a

FIG. 1

cylinder C fitted with a frictionless and air-tight piston D. The piston and the sides of the cylinder are supposed to be perfect non-conductors of heat, while the base is a perfect conductor of heat. The cylinder C can be placed either on a non-conducting slab E or in contact with the

source of heat A at temp. t_1° or with the 'refrigerator,' or, as we should say, condenser, receiver, or 'sink,' B at temp. t_2° . The cylinder may contain air or any other working substance under pressure. Fig. 2 is the pressure-volume diagram of the Carnot cycle of operations performed by the engine. The cycle consists of parts of 2 isothermals (q.v.) AB, CD, corresponding to the temps. t_1° , t_2° , and parts of 2 adiabatics (q.v.) AD, BC. The 4 stages

FIG. 2

corresponding to the parts AB, BC, CD, DA, of a complete cycle are as follows: (i) The cylinder is placed in contact with the hot source t_1° and the piston is allowed to rise slowly so that while the working substance expands it takes up heat from the source, so that its temp. remains constant at t_1° . This isothermal expansion is represented by AB on the indicator diagram. (ii) The cylinder is now placed on the non-conducting slab E and the piston is allowed to rise still farther. The expansion is adiabatic, i.e. no heat is communicated to or abstracted from the working substance during this expansion, in which the temp. falls from t_1° to t_2° ; the expansion is represented by BC on the indicator diagram. (iii) The cylinder is now placed in contact with the condenser at temperature t_2° and the piston is slowly driven inwards, so that while the working substance is compressed it gives up heat to the condenser and its temp. and that of the condenser remain constant at t_2° . The isothermal compression is represented by CD in the indicator diagram. (iv) The final stage is an adiabatic compression. The cylinder is placed on the non-conducting slab and compressed so that its temp. rises from t_2° to t_1° . The adiabatic compression is represented by DA in the indicator diagram and the cycle of operations is now complete.

We can deduce the efficiency of this engine in the following way. Let Q_1 be the heat absorbed by the working substance while in contact with the hot source during the isothermal expansion AB; let Q_2 be the heat rejected by the working substance to the condenser during the isothermal compression, CD.

The mechanical work done by the engine during one complete cycle is then represented by the area $ABNLA + BCPNB - DCPMD - ADMLA = \text{area } ABCD$. By the First Law of T. this work $W = \text{net heat converted into work}$. Hence $W = Q_1 - Q_2$, since no heat is transferred to or from the substance during the adiabatic changes. The efficiency of an engine being defined as the ratio of the mechanical work done to the heat taken in at the source, the efficiency of the Carnot engine is

$$\text{is } \frac{W}{Q_1} \text{ or } \frac{Q_1 - Q_2}{Q_1}.$$

Reversible Engines. Carnot's engine is an ideal one, but it gives us a start in the development of the subject of T. A reversible engine is not merely one that will work in the reverse direction, reverse in the sense that the cycle is performed backwards and work is converted into heat, but one that works backwards so that at each stage of the process the heat taken up (or rejected) is exactly equal to the heat rejected (or taken up) in the forward process. Furthermore, the work done by the engine in the reversed process must be exactly equal to the work done by the engine at the corresponding stage of the forward process. The conditions for reversibility in this sense include: (i) complete absence of frictional forces causing a dissipation of mechanical work; (ii) that no conduction of heat shall take place; (iii) that pressure differences between the working substance and the external atmosphere shall always be so small that 'free' expansion does not take place at any stage. It is clear that no real engine is reversible. Nevertheless, in accordance with the usual practice of discussing the mathematical physics of ideal processes in order to develop the underlying theory of engineering processes, the study of reversible engines leads to valuable results. Carnot's engine is a reversible engine, and from a study of its performance we are led to the conclusion known as *Carnot's Principle*, viz. no heat engine working between 2 given temps. as source and condenser respectively can be more efficient than a reversible one. The formal proof of this principle depends on *The Second Law of T.* Two equivalent statements of this law are as follows: *It is impossible for a self-acting machine, unaided by any external agency to convey heat from one body to another at a higher temperature (Clausius).* In other words, heat cannot of itself pass from one body to a hotter body. Kelvin's statement of this law reads: *It is impossible by means of inanimate material agency to derive mechanical effect by cooling a body below the temperature of the coldest of the surrounding bodies.* In other words, work cannot be obtained by using up the heat of the coldest body of a system.

The Second Law applies only to complete cyclical processes; there is no direct proof of this law. Our confidence in it depends on the fact that it accords with our practical experience, and no objection to it has yet been upheld. The meaning of the law may be realised from the approximate statement that an engine must

work by drawing heat from a furnace and rejecting heat to a condenser. If the condenser is at the same temp. as the furnace, the engine will not work; further, the engine will not work by using up the heat of the condenser and rejecting heat to the furnace.

Proof of Carnot's Principle. Let A be a reversible engine, and let B be an engine working between the same source and condenser as A. Then it follows that the efficiency of B cannot be greater than that of A. For suppose it is; let the 2 engines be coupled together so that B working forwards drives A working backwards, and let B take up a quantity of heat Q from the source, while the amount of working substance in engine A is adjusted so that it delivers Q to the source when working backwards. If B rejects a quantity of heat Q_B to the condenser while A takes up a quantity of heat Q_A from it, then the efficiency of B is $\frac{Q - Q_B}{Q}$, while that of A is $\frac{Q - Q_A}{Q}$.

Since the former is supposed to be greater than the latter

$$\frac{Q - Q_B}{Q_A > Q_B} > \frac{Q - Q_A}{Q}$$

The work done by B is $Q - Q_B$; that done by A is $Q - Q_A$. Hence the compound engine can do an amount $Q_B - Q_A$ of work in an external system. Now the net loss of heat from the source is zero, while the net loss of heat from the condenser is $Q_A - Q_B$. Hence this compound engine does work by using up the heat of the condenser. This violates the Second Law of T. Hence $\frac{Q - Q_B}{Q}$ cannot be greater

than $\frac{Q - Q_A}{Q}$, i.e. no engine can be more

efficient than the reversible one working between the same source and condenser. Similarly, it may be proved of all reversible engines working between the same source and condenser. It is interesting to note that the most efficient heat engines, the steam turbines, actually used to-day have an efficiency of about 33 per cent, and the efficiency of Diesel engines may be as high as 38 per cent.

The whole science of T. is based on the 2 laws already stated. From this point, however, the science develops along 2 main lines: (i) its applications to heat engines; (ii) to pure T., a powerful method of analysis in deriving a variety of important physical and chemical results. The theory of heat engines derives much from the theory of pure T.

Kelvin's Absolute Scale of Temperature. The definition of a scale of temp. is given under THERMOMETER. Kelvin's absolute scale of temp. is independent of the properties of any thermometric substance, and it is absolute in this sense. It is derived as follows: Let Q_1 be the heat taken in at temperature t° by a reversible engine, and let Q_2 be the heat it rejects to the condenser at temperature t_2° . Then its efficiency is $\frac{Q_1 - Q_2}{Q_1}$ and by Carnot's

Principle this is the efficiency of all reversible engines working between the

source and condenser. Hence $\frac{Q_1 - Q_2}{Q_1}$ or $(1 - \frac{Q_2}{Q_1})$ depends only on t_1 and t_2 , or mathematically, $\frac{Q_2}{Q_1} = f(t_1, t_2)$ where f is some unknown function. Suppose we have 2 reversible engines, one working between t_1 and t_2 and the other between t_2 and t_3 , adjusted so that the first absorbs Q_1 from the source and rejects Q_2 to the condenser, while the second absorbs Q_2 from its source and rejects Q_3 to its condenser.

Then $\frac{Q_2}{Q_1} = f(t_1, t_2)$ and $\frac{Q_3}{Q_2} = f(t_2, t_3)$.

If these engines are coupled together they will act as a compound reversible engine absorbing Q_1 at the source t_1 and rejecting Q_3 to the condenser at t_3 .

Hence $\frac{Q_3}{Q_1} = f(t_1, t_3)$. But $\frac{Q_3}{Q_1} = \frac{Q_2}{Q_1} \cdot \frac{Q_3}{Q_2}$.

Hence $f(t_1, t_3) = f(t_1, t_2) \cdot f(t_2, t_3)$.

$$\therefore f(t_1, t_3) = \frac{f(t_1, t_2)}{f(t_2, t_3)}.$$

Suppose, now, t_3 is some standard temp. while t_1 and t_2 are variable. The $f(t_1, t_2)$ may be written as $\phi(t_1)$, where ϕ is some different function, and $f(t_2, t_3) = \phi(t_2)$.

Hence $f(t_1, t_3) = \frac{\phi(t_1)}{\phi(t_3)}$.

and therefore $\frac{Q_3}{Q_1} = \frac{\phi(t_1)}{\phi(t_3)}$.

Kelvin therefore adopted a scale of temp. on which $\phi(t_1) = T_1$; $\phi(t_2) = T_2$. Hence $\frac{Q_3}{Q_1} = \frac{T_1}{T_2}$. In other words, on the $\frac{Q_3}{Q_1}$.

Kelvin scale of temp. the ratio of 2 temps. is defined as the ratio of the heat absorbed at the source to the heat rejected to the condenser by a reversible engine working between those 2 temps. In view of Carnot's Principle the ratio $\frac{T_1}{T_2}$ is the same

whatever be the working substance in the engine, i.e. this scale is independent of the peculiar properties of any thermometric substance, and it is therefore absolute.

A T. thermometer consists of a series of reversible engines each doing the same amount of work W in a cycle. The first takes in Q_1 at temp. T_1 and rejects Q_2 at temp. T_2 ; the second takes in Q_2 at temp. T_2 and rejects Q_3 at temp. T_3 ; etc.

But $W = Q_1 - Q_2 = Q_2 - Q_3 = \dots$ etc., and from above, $\frac{Q_1}{T_1} = \frac{Q_2}{T_2} = \frac{Q_3}{T_3} = \dots$ etc.

$\therefore T_1 - T_2 = T_2 - T_3 = \dots$ etc. Thus equal intervals of temp. are indicated on the absolute scale of temp. When we reach the temp. 0° on this scale usually written 0°K. , the above equations show that the heat rejected to the condenser is zero, i.e. the condenser at that temp. cannot give up any heat to an engine using it as source. This is therefore the lowest possible temp., and the zero of the absolute scale of temp. is the absolute zero of temp. The Kelvin scale

is, of course, an ideal scale, but the scale of a perfect gas thermometer can be shown to coincide with its indications. Now although there is no gas that is perfect, it is possible to reduce the readings of a gas thermometer, such as the hydrogen thermometer, to those of the ideal perfect gas thermometer. Hence all thermometer readings can be referred to the absolute scale of temp., thus avoiding the idiosyncrasies of the different thermometric substances.

Entropy. If a substance undergoing a reversible change takes in a quantity of heat dQ at temp. T , $\frac{dQ}{T}$ is called the in-

crease of *entropy* of the substance. All natural processes are irreversible, and it can be shown that there is always an increase of entropy in such processes. Increase of entropy is accompanied by a loss of available energy in a system. Hence it follows that the processes of radiation, convection, conduction, etc., that involve an increase of entropy of the material universe also involve a loss of available energy in the universe. The entropy of the universe tends to a maximum that will be reached when all temp. differences have disappeared. The available energy in the universe will then be exhausted (Second Law of T.) and the universe will suffer, what Jeans terms a 'Heat-death.' Entropy, like potential energy, has an arbitrary zero. Only changes of entropy are significant, indicating the change of state of a system.

Srivastava, *A Treatise on Heat*, 1950; J. K. Roberts and A. R. Miller, *Heat and Thermodynamics*, 1951; J. L. Fuick, *Thermodynamics from the Classic and Generalized Standpoints*, 1955; M. W. Zemansky, *Heat and Thermodynamics*, 1958.

Thermo-electric Pyrometer, see PYROMETER.

Thermoelectricity. Seebeck found in 1821 that if a circuit consisting of 2 dissimilar metals be taken and the junctions kept at different temps., a steady current will flow in the circuit. The 2 metals are said to form a *thermocouple*, and the Seebeck effect is now widely used for the measurement of temp. In 1834 Peltier found that when a current was passed across a junction of 2 dissimilar metals reversible heating effects occur. Heat is evolved when the current passes one way across the junction and absorbed when it passes in the opposite way. This is called the *Peltier effect*. From thermodynamic reasoning, if a circuit were made of 2 dissimilar metals and one junction were kept at a constant temp., the E.M.F. in the circuit should increase as the temp. of the other junction is increased. It is found, however, that as the temp. of the second junction is gradually raised, the E.M.F. increases to a certain limit, then decreases again, and is finally reversed. Lord Kelvin predicted in 1851 and later

observed that when a current flows along a wire the temp. of which varies from point to point, heat is liberated at a given point in the wire when the current is flowing in one direction, and absorbed when the current is in the opposite direction. This reversible heating effect is known as the *Thomson effect*.

Thermograph, instrument used for automatically recording temperature. There are 3 main types, bimetallic, mercury-in-steel, and electrical-resistance. The bimetallic T. (a standard meteorological instrument) works by the coiling and uncoiling of a strip formed by welding together 2 metals with different coefficients of thermal expansion, the movement being magnified, and transmitted to a pen working on a drum, by levers. The mercury-in-steel type, in which changes in pressure caused by expansion and contraction of the mercury in a metallic bulb are transmitted to the recorder by a narrow-bore steel tube, is specially suitable for remote recording. The electrical resistance thermometer (also suitable for remote recording) depends on the fact that the electrical resistance of a wire (usually platinum or nickel) varies with its temperature. The record is usually made by a recording potentiometer.

Thermometers and Thermometry. The thermometer is any instrument that measures the variations of sensible heat or temp. (q.v.). The effects of temp. on different substances vary considerably, but ignoring the promotion or retardation of chemical action and modification of the properties of matter, we can deal with the relevant change for the present purpose—expansion or contraction. In general, a rise of temp. causes bodies to expand and a fall of temp. causes them to contract, and although there are exceptions to this rule, they do not affect the metals and liquids used in T. Mercury as a thermometric liquid has many advantages over other liquids, amongst which may be noticed its wide range (-40°C . to 356°C . and up to 570°C . under pressure) in the liquid state; its regular expansion, which is very nearly, though not quite, proportional to changes of absolute temp. (q.v.); its utility in fine capillary tubes, which it does not 'wet'; and the expeditious way of obtaining it in a very pure form. On the other hand, alcohol has a lower range (to -80°C .) while pentane can be used as low as -200°C .

Temp. can be ascertained by noticing the change in the volume of a body or a liquid. Two temps. are taken as points of reference: that of melting ice and that of steam given off by water boiling under normal atmospheric pressure, which is 760 mm. of mercury. This is essential, as boiling point is affected by atmospheric pressure. Many other precautions and refinements are necessary in the manuf. of T., and for these details readers are referred to any standard work on Heat. Three T.s are in general use, the Centigrade (or Celsius) (the centesimal scale was adopted by Celsius in 1742), the Fahrenheit, and the Réaumur. On the

Centigrade scale the freezing point is taken as zero and the boiling point as 100° , the space between being divided into 100 equal intervals, each known as a degree. Graduations on the same scale are extended on either side of these standard points, those below freezing point being negative. This scale is usually employed for scientific purposes. On the Fahrenheit scale the freezing point is marked 32° and the boiling point 212° , so that 180° correspond to the range between freezing point and boiling point, and hence 100°C . are equal to 180°F ., or, expressed more simply, $5^{\circ}\text{C} = 9^{\circ}\text{F}$. On the Réaumur scale the freezing point is also taken as zero, like the Centigrade scale, but the boiling point is taken as 80°C . This thermometer is used in some European countries for medical and domestic purposes just as the Fahrenheit thermometer is in Great Britain. Clinical T. in the latter country are always Fahrenheit.

Maximum and minimum T. for recording highest and lowest temps. vary in construction. Rutherford's maximum self-registering thermometer consists of an ordinary mercury thermometer placed in a horizontal position, and having a small piece of steel inside the tube *beyond* the mercury. As the mercury expands with increase of temp. it pushes the steel before it, and as it contracts it leaves the steel in the farthest position to which it has been driven. The end of the steel nearest the surface of the mercury marks the highest temp. since it was last set. The instrument can be reset for another observation by means of a magnet. The minimum thermometer contains alcohol instead of mercury, and *inside* the alcohol contained in the tube there is a small index of glass, with the farthest end touching the surface of the alcohol. This tube is also placed horizontally. As the alcohol contracts it carries the index of glass with it, but when it expands the index is left behind. Thus the end of the index nearest the surface of the spirit shows the lowest temp. The index can be again got into position by inclining the tube.

In addition to the usual T. in which mercury, alcohol, etc., measure the changes in temp. there are other types, such as the metallic thermometer, the platinum resistance thermometer, the thermo-couple thermometer, and the gas thermometer. The metallic thermometer—the best known instrument of this class is Breguet's thermometer—depends on the principle that if 2 strips of different metals with unequal coefficients of expansibility be firmly fixed (e.g. riveted) together and wound into a spiral with the most expansible metal inside, a rise of temp. causes the spiral to unwind. This is due to the greater expansion of the inner strip, and similarly, a fall of temp. causes the spiral to wind up. A needle deflected in the process of winding or unwinding indicates the variation in temp. In the platinum resistance thermometer use is made of the well-known fact that the resistance of platinum to an electric current varies with change of temp. The Wheatstone Bridge enables very small changes in resistance to be detected, and hence the small changes in temp. can be determined. The thermo-couple thermometer is based on the principle of the thermo-couple—that electric currents can be produced by applying heat or cold to one of the junctions in a circuit composed of 2 different metals. If a very delicate galvanometer is used to measure the current the temp. can be deduced, and temps. up to 1500°C . can be measured with great accuracy in this way. (See PYROMETER.) A gas thermometer is much more sensitive than the ordinary types of T., owing to the relatively large coefficient of expansion of gas. It suffers from the defect that it is cumbersome and also requires a large amount of the liquid, etc., the temp. of which is to be found.

The figure shows essential parts of a simple gas thermometer known as the Constant-volume Air Thermometer. The large bulb A and the connecting wide capillary tube contain air or hydrogen, etc., while the tubes BDC form a simple manometer. The instrument is calibrated by placing the bulb in clean, melting ice and allowing the air to take up the temp. of the ice. The vertical tube C is now raised or lowered until the mercury in the vertical tube B is brought opposite some convenient graduation on a scale mounted between B and C, and the pressure of the air in the bulb is then read off from the manometer. In the present instance the pressure would be $P + H$, where P is the height of the mercury barometer and H is the vertical height of C above B. Suppose this pressure is called p_0 . The bulb is now placed in boiling water and the tube C is again adjusted to bring the mercury in B back to the same graduation as before. Hence the name constant-volume air thermometer. Let p_{100} be the pressure of the air in the bulb at the boiling point of water taken as 100°C . 760 mm.; see previous remarks on atmospheric pressure and boiling point. Then a rise of 1°C . on this thermometer is defined as the rise of temp. that produces an increase of pressure of the constant vol. of

air of amount $\frac{p_{100} - p_0}{100}$. The temp. corresponding to any pressure p of the constant vol. of air will be $\frac{p - p_0}{p_{100} - p_0} \cdot 100^{\circ}\text{C}$.

See *Temperature; its Measurement and Control in Science and Industry*, vol. 1, 1941, vol. II, 1955; W. E. K. Middleton, *Meteorological Instruments*, 1943; A. J. Hall, *Fundamentals of Thermometry*, 1953, and *Practical Thermometry*, 1953.

CONSTANT-VOLUME AIR THERMOMETER

Thermonuclear Reaction, a reaction caused by an extremely high local temp. between nuclei which have high velocities. The reaction can lead to the fusion of 2 nuclei of low atomic weight to form a single nucleus, the mass of which is less than the sum of the masses of the 2 original nuclei. The excess mass appears as a relatively large amount of energy. This in turn can cause more light nuclei to react, and produce yet more energy, and a chain reaction can result. More complex nuclear reactions can also take place, but the ones of particular interest are those in which energy is produced at the expense of the total mass of the original particles. A device designed on this principle can therefore explode, or may be controlled to act as a new source of nuclear power (q.v., see ZETA). This has been realised in the hydrogen bomb or H-bomb, which is many times more powerful than the conventional atom bomb (q.v.), which works by fission of heavy nuclei. The main difficulty is to produce a sufficiently high temp. for the T. R. to be initiated. In the H-bomb the source of heat is a fission bomb embedded inside the light elements, and a jacket of fissionable material is usually added to increase the efficiency. See NUCLEUS; HYDROGEN BOMB; ZETA.

Thermoplastics, see PLASTICS.

Thermopylae, often called simply **Pylae**, celebrated pass leading from Thessaly into Locris. The pass of T. is especially celebrated on account of its heroic defence by Leonidas (q.v.) against the Persians in 480 BC.

Thermos Flask, see **VACUUM FLASK**.

Thermostatting, see **PLASTICS**.

Thermostat, instrument for maintaining an appliance set at a predetermined temp. All T.s comprise essentially an element extremely sensitive to temp. changes and a switch or lever. For the simplest form of temp. element use is made of one or other of the following properties: the expansion of metals; the increase in vol. of a liquid; the increase in pressure of a fluid.

T.s which depend upon the expansion of metals are known as the bimetal type and consist of a composite strip of 2 metals with widely different coefficients of expansion. This strip may be used flat or formed into a coil, one end being free and the other fixed. When the temp. alters, the unequal expansion of the 2 metals causes distortion, and an appreciable movement is produced at the free end, which in turn moves the switch or lever. A magnet is sometimes used in the bimetal type so that the completion of the closing operation is positive and quick; this is useful in the control of an electrical device to prevent any sparking which might be caused by a poor contact. The 2 metals usually employed are brass, which has a large expansion, and a steel alloy with a negligible expansion. For liquid heating control the composite strip is in a brass tube which is inserted in the medium. Bimetal T.s are used for many types of temp. control, among which may be mentioned the regulation of boilers, immersion heaters, cookers, and space heating.

The second type of T. consists of a cylindrical bulb, a capillary tube, and a metallic bellows. The system is completely filled with a liquid and sealed, so that the only way in which the liquid can expand when the temp. rises is by pressure on the bellows. Attached to the latter is a rod with spring adjustment which moves the device attached to it. The bellows type is often used where it is necessary or desirable for the sensitive element to be at a distance from the switch or lever. It is used in most refrigerators and in some air-conditioning plants. In space-heating the sensitive bulb is mounted directly on the bellows.

The third or vapour-pressure type T. is similar to the second except that the system is only partially filled with a volatile fluid of a low boiling point, leaving a vapour space. As the pressure of the vapour will vary according to the temp., movement will again be produced by the bellows. See also **FIRE BRIGADES AND FIRE-FIGHTING, Fire Alarms**. See *Temperature: Its Measurement and Control in Science and Industry*, vol. i, 1941, vol. ii (ed. by H. C. Wolfe), 1955; R. Griffiths, *Thermostats and Temperature Regulating Instruments*, 1951.

Thesaurus, see **DICTIONARY**.

Theseus, legendary hero of Attica, son of Aegeus, King of Athens, and of Aethra, daughter of Pittheus, King of Troezen. Brought up at Troezen, when he reached maturity he took his father's sword and sandals, and went to Athens. Acknowledged by Aegeus as his heir, after slaying the Marathonian bull, T. went of his own accord as one of the 7 youths and 7 maidens whom the Athenians had to send every year to Crete, to be devoured by the Minotaur (q.v.). In Crete Ariadne, the daughter of Minos, was enamoured of T., and gave him a sword with which he slew the Minotaur, and a clue of thread by which he found his way out of the labyrinth. Having effected his object, T. sailed away, taking Ariadne. In Naxos, however, Dionysus carried her off. In his grief, T. forgot to hoist the white sail, which was to have been the signal of the success of the expedition; whereupon Aegeus drowned himself in the sea, and T. became King of Athens. T. fought the Amazons and carried off their queen, Antiope, who bore him a son, Hippolytus. He was one of the Argonauts; hunted the Calydonian boar; helped Adrastus to recover the bodies of the slain at Thebes; helped Pirithous and the Lapithae against the Centaurs; with Pirithous abducted the young Helen from Sparta and tried to abduct Proserpina from Hades. In this last-named adventure Pirithous perished and T. was a captive until freed by Hercules. Meanwhile Menestheus aroused the people against T., who, unable to re-establish his authority, retired to Scyros, where he was treacherously hurled from a cliff by the king, Lycomedes, and killed. See L. Cottrell, *The Bull of Minos*, 1955.

Thesiger, Frederick; **Frederick Augustus**; and **Frederick John Napier**; see **CHELMSFORD**, first, second and third **BARONS**.

Thesmophoria, festival of Demeter as founder of agriculture and patroness of marriage, celebrated widely in Greece and especially at Athens. It was held for 5 days in the month Pyanepsion (early Nov.), only married women of Attic birth and stainless character taking part. On the first day (*stenia*) a procession went to the deme (parish) of Halimus. Another theory says that the T. were in honour of Ceres Thesmophoros (law-giver) as the first who taught man the use of laws. The institution of the T. is ascribed by some to Triptolemus, by some to Orpheus, and by others to the Danaids.

Thespieae, anct Gk city near the foot of Mt Helicon in Boeotia. The neighbouring and more powerful city of Thebes dismantled its walls in 423 BC, captured it in 372, and razed it to the ground. At T. was preserved the statue of Eros by Praxiteles.

Thespis (fl. 6th cent. BC), father of Gk tragedy. He introduced into the old tragedy connected with the Dionysian festivals an actor, for the sake of giving rest to the chorus. This actor took various parts in the same piece under various disguises, which took the form of lion masks. See A. W. Pickard-Cambridge, *Dithyramb, Tragedy, and Comedy*, 1927.

Thesprotia, dept of Greece in the prov. of Epirus. Pop. 47,300.

Thessalonians, The *Epistles* to the, were probably written by St Paul from Corinth when he was working there with Silvanus and Timothy (Acts xviii. 5) between AD 51 and 53. They are, therefore, among the earliest of St Paul's epistles, and their genuineness is universally acknowledged. Acts xvii describes St Paul's visit to Thessalonica, and the bad reception he received from the Jews. The Greeks and devout women, however, showed much eagerness, and to them he turned. The *Epistles*, then, which followed each other closely, were addressed to a Gentile audience. The immediate occasion of the First *Epistle* is the good news brought by Timothy of the steadiness of the Thessalonians in the faith in spite of persecution by their countrymen. From it we learn what had been St Paul's message and appeal when he was himself in Thessalonica. He had appealed to the primary feelings of the human heart and then passed on to speak of Jesus, 'who delivereth us from the wrath to come' (i. 10). This particular insistence on the Judgment and the Second Advent had led to much questioning, and in the latter part of the letter St Paul deals with this. His letter, however, did not settle all difficulties, though the news which he later received from Thessalonica was in many aspects encouraging. The expectation of the second coming of the Lord still caused great excitement and the neglect of the duties of daily life. The Second *Epistle* is intended to correct this. See C. Lattey's trans. of the *Epistles* to the Thessalonians, 1913; H. N. Bate, *Guide to the Epistles of St Paul*, 1926; and commentaries by Milligan, 1908; Plummer, 1918; Bicknell, 1939.

Thessalonica, or *Thessaloniki*, see SALONICA.

Thessaly, largest div. of anc. Greece. T. proper is a large plain, drained by the Peneus and its affluents. About 70 m. across, it is shut in on every side by mt. barriers, broken only at the N.E. corner by the valley and defile of Tempe, which separates Ossa from Olympus. There were 2 other dists. included under the general name of T.: one, called Magnesia, being a long narrow strip of country extending along the coast of the Aegean Sea from Tempe to the Pagasaeon Gulf, and the other a long narrow vale at the extreme S. of the country, lying between Mts Othrys and Oeta. Thessaly proper was divided in very early times into 4 dists. or tetrarchies, a div. which we still find subsisting in the Peloponnesian War. These dists. were: (1) Hestiaeotis, in the NW.; (2) Pelasgiotis, in the E.; (3) Thessaliotis, in the SW.; and (4) Phthiotis, in the SE. It is in this dist. that Homer places Phthia and Hellas proper, and the dominions of Achilles. Besides these there were 4 other dists., viz.: (5) Magnesia; (6) Dolopia, a small dist. bounded on the E. by Phthiotis, on the N. by Thessaliotis, on the W. by Athamania, and on the S. by Oetaea; (7) Oetaea, a dist in the upper valley of the Spercheus; and

(8) Malis. The Thessalians were a Thesprotian tribe, and invaded the W. part of the country, afterwards called Thessaliotis, whence they subsequently spread over the other parts of the country. The gov. in the separate cities became oligarchical, the power being chiefly in the hands of a few great families descended from the anc. kings. Of these, 2 of the most powerful were the Aleuadae and the Scopadae. The Thessalians never became of much importance in Gk. hist. In 344 BC Philip completely subjected T. to Macedonia. The victory of T. Flamininus at Cynoscephalae, in 197, again gave the Thessalians a semblance of independence under the Romans. The area of modern T. is given as 5200 sq. m. and its pop. 569,300. In recent years excavations have been made by the Brit. School of Archaeology in Athens. Mineral deposits exploited include iron-pyrites, copper, zinc, bitumen, and marble.

Thetford, mun. bor. and mrkt tn of Norfolk, England, situated on the borders of the great state forest of Thetford Chase and the Breckland. The Rs. Thet and Little Ouse unite just above the tn bridge. It was once the cap. of the kingdom of E. Anglia. The earthworks of Castle Hill are one of the largest and most interesting examples of early military fortifications in England. The site of the Saxon tn has been excavated by the Ministry of Works, and many interesting objects can be seen in the Ancient House Museum. The ruins of the Cluniac priory (founded c. 1103) stand on the banks of the Little Ouse. There are remains of the Benedictine Nunnery of St George and of the monastery of the Canons of the Holy Sepulchre. Pop. 4700.

Thetford Mines, city of Quebec, Canada, 64 m. N.E. of Sherbrooke, situated in the centre of the serpentine belt rich in long-fibred asbestos. The prin. industry is asbestos mining. Pop. 19,300.

Thetis, Gk. sea-goddess, daughter of Nereus and Doris, and mother of Achilles. Poseidon and Zeus sued for her hand; but when Themis declared that T.'s son would outshine his father, both gods withdrew. Others said T. rejected Zeus because she had been reared by Hera and that the god, in revenge, decreed that she should wed a mortal. At length she was wed against her will to Peleus.

'Thetis', Brit. submarine of the Trident class (1090-1575 tons), which on her trial run sank in Liverpool Bay on 1 June 1939 with the loss of 99 lives, only 4 men being saved. The submarine was beached on 3 Oct. on the Anglesey coast, recommissioned for war service as the *Thunderbolt*, and then finally lost through enemy action off the coast of Sicily on 13 March 1943 with the loss of all hands.

Theuriet, Claude André (1833-1907), Fr. novelist and poet, b. Marly-le-Roi. His first poems *Le chemin des bois*, 1867, were crowned by the Fr. Academy. He subsequently wrote a vast number of novels, among which were *Mademoiselle Guignon*, 1874, *Le Filleul du Marquis*, 1878, *Le fils Maugars*, 1880, *Flavie*, 1895, and *Dans les roses*, 1899. His work

shows a deep feeling for nature, but often insufficient characterisation. He was elected to the Academy in 1896.

Thibaud, Jacques (1880-1953), Fr. violinist, b. Bordeaux. He studied under Marsiek at the Paris Conservatoire, and his rise to fame as a virtuoso dates from 1898. In technique, he represented the wide and pure technique of the great classical school passed down to him through Marsiek and Ysaÿe. From 1905 he was especially associated in a trio with Cortot and Casals. He was killed in an aeroplane crash.

Thibaudet, Albert (1874-1936). Fr. literary historian b. Tournus, Saône-et-Loire. From 1925 he was prof. of literary hist. at Geneva. He was chiefly interested in the literature of the late 19th cent., and contributed regularly to the *Nouvelle Revue Française*. Among his works are *La poésie de Mallarmé*, 1912, *Flaubert*, 1922, *Intérieurs*, 1924, *La république des professeurs*, 1927, *Mistral*, 1930, *Physiologie de la critique*, 1930, *Stendhal*, 1931, *Histoire de la littérature française de 1789 à nos jours*, 1936. See life by G. Truc, 1935.

Thibault, Jacques Anatole, see FRANCE, ANATOLE.

Thibaut, Anton Friedrich Justus (1774-1840), Ger. jurist, b. Hameln. After studying at Göttingen, Königsberg, and Kiel, he was appointed prof. of civil law at the last-named univ. in 1798. In 1802 he removed to Jena, and 4 years later to Heidelberg, where he remained till his death. He published *Theorie der logischen Auslegung des Römischen Rechts*, 1799, etc.

Thibaw, or **Hispaw**, Shan state of Upper Burma, with an area of 5080 sq. in., traversed by the Namtu. Rice, cotton, and tea are the chief articles of produce. Pop. 130,000.

Thibet, see TIBET.

Thielt, see TIET.

Thiepval, vil. on the R. Ancrè, near Albert, France. It was the focal point of desperate fighting in the First World War, particularly during the Somme battles of July 1916, when it was taken by Brit. forces. In 1932 the Somme memorial was unveiled here by the then Prince of Wales.

Thierry, Jacques Nicolas Augustin (1795-1856), Fr. historian, b. Blois. On leaving school he became secretary to Saint-Simon, at whose suggestion he pub. his first work, *De la Réorganisation de la société européenne*, 1814. He became blind in 1826, but continued his historical studies. His *Histoire de la Conquête de l'Angleterre par les Normands* was pub. in 1825. His other pubs. include *Lettres sur l'histoire de France*, 1820, *Dix ans d'études historiques*, 1834, *Récits des temps mérovingiens*, and *Recueil des Monuments inédits de l'histoire du Tiers État*, 1850-70. T. belongs to the now discredited school of Romantic historians, but his accurate scholarship makes his work of lasting value in spite of its somewhat florid style.

Thiers, Louis Adolphe (1797-1877), Fr. statesman and historian, b. Marseilles of humble parentage, and studied law at Aix.

In 1821 he began writing for the *Constitutionnel*, and next collaborated with Félix Bodin in the production of *Histoire de la révolution française*, 1823-7, the greater part of which was the work of T. In 1830 his antipathy to the Bourbons prompted him to seek a more vigorous polemical field than that of the *Constitutionnel*, and, with Carrel, he founded the *National*, which helped to provoke the revolution later that year. After Louis Philippe became king T. was rewarded for his publicist services by being nominated a councillor of state and given a post in the Treasury. Later he became under-secretary of state to the treasury (1831), supporting the peace policy of Casimir Périer. T. was minister of the Interior in Soult's cabinet of 1832 during the Paris insurrection. Four years later he was placed at the head of the Cabinet, and carried out, among other liberal reforms, the suppression of lotteries and gaming-houses, and the reduction of tariff duties on inland trade. In 1840 he became president of the council and foreign secretary. He supported Mehemet Ali against Turkey with the object of assuring to the latter the retention of Egypt. Later, after the conclusion of peace between England, Russia, Turkey, Prussia, and Austria, he prepared for war as a demonstration against the exclusion of France from the European concert, but his policy resulted only in the prompt recalling of the Fr. fleet from Turkish waters and his own retirement. He then devoted himself to writing historical works, and pub. his huge work, the *Histoire du Consulat et de l'Empire*, 1845-69. After the *coup d'état* of 1851 T. was arrested and exiled. He returned to France the following year, but did not re-enter political life until 1860. In 1863 he was nominated deputy for one of the divs. of Paris. On the fall of the empire following upon the débâcle at Sedan, he was elected president of the assembly, and shortly after became president of the executive gov., his power being virtually those of a dictator. In 1873, however, wishing to avoid being made the instrument of monarchist intrigue, he voluntarily resigned. See R. Dreyfus, *Thiers contre l'Empire, la guerre, et la Commune 1869-71*, 1928; and lives by J. M. S. Allison, 1932, and M. Reclus, 1932.

Thiers, Fr. tn, cap. of an arron., in the dept of Puy-de-Dôme, on the Durole. It is very picturesquely situated above a ravine. Its cutlery manufs. are renowned. Pop. 15,400.

Thigh, the part of the lower limb between the pelvis and the knee. The T.-bone, or *femur*, is the longest bone in the human body, constituting about 0.275 of the height from sole to crown. It articulates with the *os inominatum* above, and with the *tibia* below.

Thionville (Ger. *Diedenhofen*), Fr. tn in the dept of Moselle, on the Moselle. It is the cap. of 2 arrons.—E. and W. An anct fort. tn, Imperial diets were held here in the 8th cent. It has large iron and steel works, and manufs. chemicals. Pop. 17,600.

Thiopentone, *see* BARBITURATES; ANAESTHESIA.

Thiophene, C_4H_4S , a colourless liquid (b.p. $84^\circ C.$) discovered in 1883 by Victor Meyer as an impurity in benzene obtained from coal tar. It gives a blue coloration with isatin dissolved in concentrated sulphuric acid, and in its general properties closely resembles benzene (q.v.). T. may be separated from benzene by prolonged shaking with cold concentrated sulphuric acid, which removes the T.

Thiosulphate of Soda, *see* HYPO.

Thiouraea, $(NH_4)_2CS_2$, derivative of urea, has been used in the treatment of exophthalmic goitre; it is now replaced by thiouracil and its derivatives. These drugs depress the activity of the thyroid gland so that its surgical removal can often be avoided.

Third, in music the interval comprising any three successive notes of a diatonic scale. T.s can be major, minor, or diminished, in the last case being equal to major seconds on the pianoforte, but written to look like T.s, e.g. C \sharp -E \flat . A diminished T. is the inversion of an augmented sixth. The T. of a diatonic scale is the most characteristic interval, determining the difference between major and minor.

Third Estate, that Fr. social class which was represented in the states-general, as well as the clergy and nobility.

Third International or Komintern, *see* COMINTERN.

Third Party Insurance, *see* INSURANCE, *Public Liability and Motor*.

Third Reich, term applied to the Ger. National Socialist régime, formally begun on 1 Feb. 1934. The empire of 1871 to 1918, and the succeeding Weimar rep., were the two anterior constitutions. *See* GERMANY, *History*.

Third Republic, in France, lasted from the fall of the Second Empire (q.v.) in 1870 to the surrender of the Fr. Gov. on June 17, 1940. *See* FRANCE, *History*.

Third Silesian War, *see* SEVEN YEARS' WAR.

Thirlage, term used in Scots Law for the obligation under which possessors of certain lands were bound to have their grain ground at a particular mill—to which mill the lands were said to be 'astricted' or 'thirled'.

Thirlmere, lake of the Lake District, Cumberland, England, $3\frac{1}{2}$ m. SSE. of Keswick. It is 3 m. in length and about $\frac{1}{2}$ m. in width, with a depth of nearly 100 ft. It is surrounded by lofty heights; on its E. shore rise Helvellyn and Whitherside, whose slopes are well wooded, while on its W. side are Armboth Fells and Raven Crag, whose slopes are cut by mountain torrents. T. affords part of the water supply of Manchester.

Thirlwall, Connop (1797–1875), divine and historian, b. London; educ. at the Charterhouse and Trinity College, Cambridge. In 1840 he was appointed by Lord Melbourne to the see of St David's. His prin. work is a *History of Greece* (8 vols.), 1835–44. *See* J. C. Thirlwall, *Connop Thirlwall*, 1936.

Thirsk, mkt tn and rural dist. of the N. Riding of Yorks, England, 22 m. from York. It has a beautiful par. church. Its fairs and mktts are noted, and a trade is carried on in livestock, corn, wool, timber, etc. With the par. of Sowerby, it forms one continuous built-up area. Pop. 2500.

Thirst, desire for drink, made known by sensations projected to the pharynx. The amount of water contained in the body is subject to great changes. It is always being lost by various organs, the amount lost varying greatly with the conditions of life. This loss directly affects the blood, but this is not lasting, as the blood draws upon the vast resources of the other body tissues for its supply of water: consequently the tissues require a new supply to restore them to their normal state. The sense of T. then comes into play; we become thirsty and take into our bodies water in varying quantities according to our needs. Little is known concerning the nervous mechanism controlling this sensation, but it is assumed that as the water content falls below a certain amount the nerves in the pharyngeal region are stimulated and so give rise to T.

Thirty-Nine Articles, The, of the Church of England are described in their heading as 'Articles agreed upon by the archbishops and bishops of both provs. and the whole clergy, in the Convocation holden at London in the year 1562, for the avoiding of diversities of opinions, and for the establishing of consent touching true religion.' Their hist., however, begins before this date. On the death of Henry VIII. the gov. of the country was left in the hands of a group of nobles, of whom almost all were in favour of the reformed doctrines, and the changes in the teaching and practice of the Church increased with great rapidity. The ant landmarks were being removed, and it was desirable that fresh ones should be set up. In 1549 Parliament empowered the king to appoint a commission for the drawing up of eccles. laws, and in accordance with this Act a commission was appointed in 1551 consisting of 8 bishops, 8 divines, 8 lawyers, and 8 other representatives of the laity. The commission, which included Crammer, Ridley, and Coverdale, began by drawing up a code of 42 articles which were pub. by royal authority in 1553. To these articles was prefixed Crammer's *Catechism*. In the same year Edward VI died, and the Convocation of the first year of Mary denied that the articles had received its consent, and entirely repudiated them. The tide of reformation was thus stemmed for a while, but on the accession of Elizabeth it was resumed. This period is marked by greater moderation. Parker occupied the see of Canterbury, and he submitted to Convocation a revised form of the original 42 articles. These underwent considerable further alterations, in course of which they were reduced in number to 39 and were finally promulgated in 1571. The first half of the twentieth article was omitted in some copies, and there con-

tinued to be some discussion as to which was the authorised form, until in 1604 they were finally settled in the form in which they are now used. The T. A. were adopted by the Convocation of the Irish Church in 1635, and by the Scottish Episcopal Church in 1804. There has been, especially during the last cent., much controversy as to the nature and meaning of the articles. Some have tried to interpret them as an orderly body of divinity, but they are plainly devised to meet a special need, and bear the marks of compromise in every line. *See also* ENGLAND, CHURCH OF. Commentaries are those of W. Beveridge, 1716, and Harold Browne, 1850. *See* E. J. Bicknell, *A Theological Introduction to the Thirty-Nine Articles*, 1919; W. H. G. Thomas, *The Principles of Theology, an Introduction to the Thirty-Nine Articles*, 1930.

Thirty Years' War, *The*. Practically it may be said that the T. Y. W. was the result of the Ger. Reformation and the Counter-Reformation. The war began in 1618 by the offer of the crown of Bohemia to the Lutheran prince, the elector of the Palatinate, son-in-law of James I of England and father of the Princes Rupert and Maurice. The troops of the Emperor immediately entered Bohemian ter. and drove out Frederick, depriving him also of his electorate of the Lower Palatinate, a task rendered more easy by the inactivity of James I of England. The ters. annexed by the Emperor Ferdinand were handed over to Maximilian of Bavaria and so became Catholic; an illustration of the 16th-cent. principle that the religion of the prince is also the religion of his subjects. The Hapsburgs now developed their policy on larger lines; Germany was to become an exclusive Hapsburg possession and the ter. lost to Catholicism by the Reformation was to be regained. The imperial gens., Tilly and Wallenstein, swept all before them; N. Germany and the Baltic ports seemed to lie at their mercy. Christian IV of Denmark came forward as the champion of Ger. Protestantism, but was defeated and forced to make peace in 1629 (Lübeck). Wallenstein had estab. the Hapsburg supremacy in the N., but had failed to take Stralsund. In the following year Gustavus Adolphus, aided by Fr. subsidies, came forward as the champion of Protestantism, and with his appearance began the turn of the tide. Wallenstein had been dismissed at the Diet of Ratisbon; the Ger. princes feared the man, whom they regarded as a mere mercenary upstart. Gustavus Adolphus marched from victory to victory. Tilly was defeated at Breitenfeld, and Gustavus marched to the S. In 1631 he again defeated, and killed, Tilly on the banks of the Lech, and then Wallenstein was recalled. Gustavus won the battle of Lützen (1632), but was killed, and much of his work was undone. From this point the religious motives of the war entirely disappear. France, anxious to break the power of the Hapsburgs, gave support to the Swedes and Ger. Protestant princes. Richelieu played his hand well; enemies

to the Hapsburgs were raised up in Germany, Italy, and Spain; the Dutch were given support in their struggle against Sp. power; and the power of the Hapsburgs, both Austrian and Sp., began to decline. The policy of Richelieu was continued after his death by Mazarin, and the Fr. gens. Condé and Turenne won brilliant victories over the imperialists. Finally, the end came in 1648, when the Emperor, suffering from defeats in Germany at the hands of the Swedes and the French, agreed to terms of peace. The treaty of Westphalia (q.v.) was signed in Oct. 1648. The territorial gains of France and Sweden, and the independence of the Ger. princes, were recognised. The attempted revival of the power of Catholicism by the sword had failed, and the imperial power became nominal except in Austria. The independence of Switzerland and the United Provinces (Holland) was also recognised by this treaty. The terrible devastation which the war caused in Germany had political and social consequences which were to last for sev. cents. *See* S. R. Gardiner, *The Thirty Years' War* (11th ed.), 1898; H. G. R. Rende, *Sidelights on the Thirty Years' War*, 1925; C. V. Wedgwood, *The Thirty Years' War*, 1944.

Thisbe, *see* PYRAMUS AND THISBE.

Thisted: 1. Amt. in N. Jutland, Denmark, on the N. Sea; it includes the is. of Mors in the Lim Fjord. Area 685 sq. m.; pop. 86,700.

2. Cap. of the above, on the Lim Fjord, 45 m. WSW. of Aalborg. Pop. 8935.

Thistle, name given to various composite plants, of which the best known are those that belong to the genera *Carduus* and *Cnicus*. Others are the Scotch T. (*Onopordon acanthium*); the Carline T. (*Carlina vulgaris*); the Globe T., which belongs to the genus *Echinops*; and the Hedgehog T. (*Echinocactus*). The Holy T. is *Silybum marianum*; its roots and young leaves are edible.

Thistle, Order of the, *see* ORDERS OF KNIGHTHOOD, GREAT BRITAIN AND IRELAND (2).

Thistle-finch, Black-headed, *see* SISKIN.

Thistleton-Dyer, Sir William Turner, *see* DYER.

Thistlewood, or **Thistlethwaite**, Arthur (1772-1820), conspirator, b. Topholme, Lincs. He served in the army, and having absorbed revolutionary ideas in America and France, became a reformer and sought to achieve his ends by the use of violence. His project in 1820 to assassinate the cabinet ministers when gathered together at dinner at Lord Harrowby's house in Grosvenor Square, failed owing to one of the body giving away the secret. T. and his associates were caught in a loft in Cato Street, London, and the attempt became known as the Cato Street Conspiracy (q.v.). T. was tried for high treason, and hanged.

Tholos (Gk.), in architecture, either: (i) the dome over a circular building; or (ii) the domed circular building itself, e.g. at Epidaurus in Greece.

Tholuck, Friedrich August Gottreu (1799-1877), Ger. theologian and preacher,

b. Breslau, studied in his native city and at Berlin. Here he came under Neander's influence, and in 1824 succeeded De Wette as prof. of oriental languages. In 1826 he went to Halle as prof. of theology, and here, except for one interval, he remained for the rest of his life. His works consist chiefly of Scriptural commentaries and sermons.

Thomaz, see TOMAR.

Thomas, St., one of the 12 apostles called also Didymus (John xi. 6), i.e. 'the twin.' All the information about him in Scripture is given in the Fourth Gospel. Later tradition says that he evangelised S. India and Parthia, dying at Edessa. His feast is on 21 Dec.

Thomas, Christians of St., see NESTORIUS.

Thomas, Albert (1878-1932), see INTERNATIONAL LABOUR ORGANISATION.

Thomas, Ambroise (1811-96), Fr. composer, b. Metz, son of a musician. He studied music at the Paris Conservatoire (1828-32), winning the Prix de Rome at 21. His first operatic success was *La Double Échelle*, 1837; but the opera by which he is chiefly remembered is *Mignon*, 1866. Other famous operas are: *Songes d'une Nuit d'Été*, 1850, *Raymond*, 1851, and *Hamlet*, 1868. T. also wrote numerous cantatas, part-songs, and choral pieces. He became a member of the Institute in 1851, prof. of composition in 1852, and director of the Conservatoire in 1871. See study by R. Brancour, 1914.

Thomas, Arthur Goring (1850-92), composer, b. Ratton Park, Sussex. Educ. at Haileybury College, he studied music in Paris and at the Royal Academy, London, under Froust and Sullivan. The success of his *The Light of the Harem* in 1879 led to the Carl Rosa Company's invitation to write the opera *Emeralda*, which was successfully produced at Drury Lane (1883). His best opera is *Nadeshda*, 1885, libretto by J. Sturgis. He also composed *The Sun Worshipers* (cantata), *The Swan*, *The Skylark*, and a number of songs.

Thomas, Augustus (1857-1934), Amer. dramatist, b. St. Louis, Missouri. He studied law, then became a journalist, and was for a time owner and editor of the *Kansas City Mirror*. He wrote over 60 plays, among the most important being *Alabama*, 1891, *In Mizouira*, 1893, *The Capitol*, 1895, and *Arizona*, 1899. From 1914 to 1916 he was president of the National Institute of Arts and Letters, which awarded him its gold medal.

Thomas, Bertram Sydney, explorer and orientalist (1892-). His crossing of the Rub' al Khali, the great desert of S. Arabia, one of the largest unknown regions in the world, in the winter of 1930-1, is one of the greatest feats of exploration of the present cent. T. went with a camel caravan. He was awarded the Founders' Medal of the Royal Geographical Society and the Burton Memorial Medal of the Royal Asiatic Society. Previously, in 1927-8, he had made a 600-m. journey through the S. borderlands from the toe of Arabia nearest

India to Dhufar, and in 1929-30 he explored the steppe for 200 m. to the northward of Dhufar, right to the edge of the sands. Pub. *Alarms and Excursions in Arabia*, 1931, and *Arabia Infelix*, 1932.

Thomas, Dylan Marlais (1914-53), poet, b. Swansea. He was educ. at the grammar school there, his father being senior Eng. master. T. was a reporter for a time on the *South Wales Evening Post*, and had a number of poems printed in the *Sunday Referee*. His first book, *Eighteen Poems*, 1934, containing some surrealist verse, was praised by Dame Edith Sitwell. In 1936 he pub. *Twenty-Five Poems*, and in 1938 won a prize offered by the Chicago magazine *Poetry*. *The Map of Love*, a collection of stories and verse, appeared in 1939. Rejected for service in the Second World War, T. worked for the B.B.C. In 1940 he pub. *Portrait of the Artist as a Young Dog*, a series of humorous autobiographical sketches. *Deaths and Entrances*, 1946, and *In Country Sleep*, 1951, are considered the finest vols. of his poetry, which has affinities with the works of Blake and Gerard Manley Hopkins; his *Collected Poems* appeared in 1952. Regarded by some as the outstanding poet of his generation, he died during a lecture tour of the U.S.A. *Under Milk Wood*, 'a play for voices,' was written for radio and first broadcast in Jan. 1954. The play was pub. in London and New York in the same year, and a stage version was produced at the Edinburgh Festival, 1956, and was later seen in London. Posthumously pub. prose works are *Quite Early One Morning*, 1954, *Adventures in the Skin Trade*, 1955, and *A Prospect of the Sea*, 1955. His *Letters to Vernon Watkins* were ed. by the latter in 1957. See E. Olsen, *The Poetry of Dylan Thomas*, 1954; D. Stanford, *Dylan Thomas*, 1954; J. M. Brinnin, *Dylan Thomas in America*, 1956.

Thomas, Edward, see THOMAS, P. E.

Thomas, Freeman Freeman, see WILKINGDON, first MARQUESS OF.

Thomas, George Henry (1816-70), Amer. gen., b. Southampton co., Virginia, and educ. at W. Point Military Academy. He served in the Seminole War and the Mexican War, and was instructor at W. Point from 1851 to 1854. At the outbreak of the Civil war though a Virginian by birth he adhered to the N. cause; and was appointed colonel, and later brigadier-gen. of volunteers. In 1862 he gained the victory of Mill Springs, and distinguished himself at Perryville, Murfreesboro, and Chickamauga. From the last of those actions he gained his sobriquet 'The Rock of Chickamauga.' He was made commander of the Army at Cumberland, and fought the battle of Chattanooga in 1863. In 1864 he defeated Hood at Nashville. See lives by T. B. van Horne, 1882; D. Platt, 1893; F. Cleaves, 1948; R. O'Connor, 1948.

Thomas, Hugh Owen (1834-91), manipulative surgeon, b. Bodedern, Anglesey. He came of a family famous for generations as bone-setters. His father was unqualified, but gave Hugh the benefit of

a medical training at Edinburgh and Univ. College, London. He qualified M.R.C.S. in 1857, and in the following year practised with his father and brother in Liverpool, but in 1859 set up on his own. He soon had an immense practice, gaining invaluable experience. He ordered himself to thousands of the Liverpool poor. The methods he introduced for the treatment of orthopaedic conditions make him the true founder of orthopaedic surgery in Britain. He wrote little, and it was left to his nephew and apprentice (Sir) Robert Jones, afterwards an eminent orthopaedic surgeon, to preach the principles of T. and make them, after many years, acceptable to the medical profession. T. was a small, frail man, an inveterate smoker, who always wore a peaked cap to protect an injured eye from the light. He wrote *Diseases of the Hip, Knee and Ankle Joints*, 1875, in which he described the Thomas splint, and *Contributions to Surgery and Medicine*, 1883-90. See lives by T. P. McMurray, 1935, and D. Le Vay, 1956.

Thomas, James Henry (1874-1949), Labour politician, b. Newport, Monmouthshire, son of a labourer. As an engine-driver he was elected to the Swindon tn council, and in 1904 became president of the Amalgamated Society of Railway Servants. T. was Labour M.P. for Derby 1910-36. In the First World War he was a member of Haldour's mission to the U.S.A., and in 1918 became general secretary to the National Union of Railwaymen; president of the Parl. Committee of Trades Union Congress (1920-3), and president of the International Federation of Trades Unions (1920-4). Vice-chairman of the Parl. Labour Party, 1921, T. was appointed secretary of state for the colonies in the first Labour Gov., 1924, and lord privy seal and minister of employment in the second Labour Gov. (1929-30). In June 1930 he became secretary of state for dominion affairs, being transferred to the Colonial Office in 1935. In 1936 he resigned both from office and from Parliament as a result of the report of a tribunal set up to consider unauthorised disclosures relating to the Budget. T. was author of *When Labour Rules*, 1920, *The Red Light on Railways*, 1921, and *My Story*, 1937.

Thomas, Philip Edward (1878-1917), poet and essayist, b. London of Welsh parents. His father was a civil servant, and T. was educ. at St Paul's and Lincoln College, Oxford, where he studied history. His first book, *The Woodland Life*, appeared in 1897, and 2 years later, while still an undergraduate, he married Helen Noble. They lived in poverty in various parts of Kent while he tried to make a living by his books and by hack journalism. On the outbreak of the First World War he enlisted as a private, but had received his commission as a second lieutenant when he was killed at Arras. An intense love of the country is shown in his works, which include *Oxford*, 1903, *Beautiful Wales*, 1905, *The Heart of England*, 1906, *The South Country*, 1909,

The Isle of Wight, 1911, *The Icknield Way*, 1913, *The Country*, 1913, and *A Literary Pilgrim in England*, 1917. T. wrote no poetry till 1912, when he used the pseudonym Edward Eastaway; his *Collected Poems*, 1920, in a style limpid and fastidious, were praised by Walter de la Mare. T. also pub. studies of Richard Jefferies, 1909, Maeterlinck, 1911, Swinburne, 1912, Borrow, 1912, Pater, 1913, the Duke of Marlborough, 1915, and Keats, 1916. *The Happy-Go-Lucky Morgans*, 1913, is a novel. See Helen Thomas, *As It Was*, 1926, and *World Without End*, 1931; also studies by J. J. Guthrie, 1937, and J. C. Moore, 1939.

Thomas, Sir (William) Miles (Webster) (1897-), industrialist and administrator, educ. at Bromsgrove School. He was trained as an engineer, and after serving in the First World War had a successful career in the motor industry. He was chairman of the colonial development corporation 1948-51. In 1949 he became chairman of B.O.A.C., his appointment being an outstanding success. Subsequently he returned to private industry. He was knighted in 1943.

Thomas à Kempis, see KEMPIS.

Thomas & Baldwins Ltd., Richard, iron, steel sheet, and tinplate manufacturers. In 1945 Richard Thomas & Co. (registered 1884) purchased the assets of Baldwins Ltd. (registered 1902) and was renamed R. T. & B. Ltd. Previously in 1938 Richard Thomas brought into operation at Ebbw Vale the first continuous wide strip mill outside the U.S.A. The company now has an ann. steel output of nearly 2,000,000 tons, and employs over 25,000 people. In addition to steel sheets and tinplates, the company manufactures alloy and stainless steels, and special-quality silicon sheets for the electrical industry.

Thomas Aquinas, or **Thomas of Aquino**, see AQUINAS, THOMAS.

Thomas Becket, see BECKET, THOMAS.

Thomas of Celano, see CELANO.

Thomas of Woodstock, see GLOUCESTER, DUKES AND EARLS OF.

Thomas the Rhymer, see ERCILDOUNE.

Thomas van Erpe, see ERPE.

Thomasius, Christian (1655-1728), Ger. jurist, b. Leipzig, where he began to lecture on law in 1684. In 1687 he took the daring step of lecturing in German instead of Latin, and in the following year sided with the Pietists in their controversy with the orthodox through the columns of a monthly periodical, *Comic and serious*, etc. *Thoughts on all manner of merry and useful Books*, 1688-9. He removed to Halle (1690), where he founded a university (1694). See works on T. and his life, by H. Dernburg, 1865; B. A. Wagner, 1872; E. Landsberg, 1894.

Thompson, Alice, see MEYNELL, ALICE.

Thompson, Sir Benjamin, Count Rumford (1753-1814), Anglo-Amer. scientist and administrator, b. Woburn, Mass., his family having settled in New England. Early made chemical and mechanical experiments and, by turns, studied

medicine and took up school teaching. At 19 he married the well-to-do widow of a Colonel Rolfe, and daughter of a minister who had settled at Rumford, now called Concord. This marriage was the foundation of his success, though within a few years he left his wife to settle in Europe. During the war of Amer. Independence his sympathies were opposed to the Amer. cause, and in 1776 he was therefore chosen by Governor Wentworth of New Hampshire to bear dispatches to London and later became an under-secretary of state. His official duties, however, did not preclude scientific pursuits, and in 1779 he was elected a fellow of the Royal Society. Among the subjects of which he made special study were ballistic experiments, a differential thermometer, and lighthouse improvements; but he is chiefly noted for his researches in heat, the caloric notion of which was rejected when he noticed that the metal chips from the boring of a cannon were very hot. A few years later he was introduced to Prince Maximilian, afterwards elector of Bavaria, and entered the service of that state as minister of war, grand chamberlain, and principal adviser to the elector. In 1791 he was created a count of the Holy Roman Empire, choosing his title of Rumford from his Amer. associations. In 1795 he again visited England and devoted himself to the problems of smoke abatement. In 1799 he co-operated with Sir Joseph Banks in projecting the estab. of the Royal Institution. T. himself elected Sir Humphry Davy as the first scientific lecturer there. He was the founder and first recipient of the Rumford Medal of the Society. His complete works were pub. by the Amer. Academy of Arts and Sciences at Boston in 1872.

Thompson, Dorothy (1894-), Amer. journalist, b. Lancaster, New York state. Educ. at Syracuse Univ. and Vienna, she became a journalist and from 1920 to 1928 was a foreign correspondent in Europe. Later she was political commentator on the New York *Herald Tribune*, and wrote a syndicated column entitled 'On the Record.' Her books include *The New Russia*, 1928, *I Saw Hitler*, 1937, *Refugees*, 1938, *Let the Record Speak*, 1939, and *Listen, Hans*, 1942. Her first 2 marriages, to Josef Bard, a Hungarian novelist, and to Sinclair Lewis (q.v.) ended in divorce, and in 1943 she married Maxim Kopt. She was given honorary degrees by 6 univs.

Thompson, Sir Edward Maunde (1840-1929), librarian and palaeographer, b. Jamaica; educ. at Rugby and Univ. College, Oxford. He was a co-founder of the Palaeographical Society (1873), of which he became president in 1903. T. was keeper of the MSS. and Egerton Librarian (1878), Director and Prin. Librarian of the Brit. Museum (1888-1909). His chief works are *Handbook of Greek and Latin Palaeography*, 1903, *An Introduction to Greek and Latin Palaeography*, 1912, and *Shakespeare's Handwriting*, 1916. He ed. and pub. a number of MSS. from the Brit. Museum, and was joint editor of pub. of the Palaeographical

Society, and of the *Facsimile of the Laurentian Sophocles*.

Thompson, Elizabeth, see BUTLER, ELIZABETH SOUTHERDEN, LADY.

Thompson, Flora (1877-1948), novelist, b. Juniper, Oxon. She became assistant in a post office, and her love of rural life is shown in her autobiographical novels *Lark Rise*, 1939, *Over to Candleford*, 1941, and *Candleford Green*, 1943, forming a trilogy later pub. as *Lark Rise to Candleford*, 1945. Other works are *Bog Myrtle and Peal*, 1921, a vol. of verse, and *Still Glides the Stream*, 1948.

Thompson, Francis (1860-1907), poet, b. Preston, Lancs. He was educ. at Ushaw College, near Durham, and afterwards studied medicine at Owens College, Manchester, but failing to take a degree, he sought his fortune in London. Here he spent some years in various occupations, until in 1893 he sent a poem to the magazine *Merric England*. This was recognised by Wilfrid Meynell as a work of merit; he rescued T. from destitution and helped him to publish his first vol. of *Poems*, which were praised by Coventry Patmore in the *Fortnightly Review*. This vol. was followed by *Sister Songs*, 1895,

Burns Oates & Washbourne
FRANCIS THOMPSON

and *New Poems*, 1897, both of which gave him a recognised place among poets. The most famous of his poems is 'The Hound of Heaven.' He also gained a reputation as a prose writer, and pub. *Health and Holiness*, 1905, a treatise dealing with the ascetic life; an *Essay on Shelley*, 1909; and *Lives of St Ignatius Loyola*, 1909, and John Baptiste de la Salle, 1911. *The Works of Francis Thompson* in 3 vols. were pub. in 1913; *Collected Poetry* in 1924. See J. Thompson, *Francis Thompson, Poet and Mystic*, 1923; E. Meynell, *The Life of Francis Thompson*, 1926; R. L. Mégroz, *Francis*

Thompson, Poet of Earth in Heaven, 1927; also lives and studies by F. Olivero, 1935 (Eng. trans. 1938), and T. L. Conolly, 1944.

Thompson, Sir Henry Francis Herbert (1859-1944), Egyptologist, son of Sir Henry T., educ. at Marlborough School and Trinity College, Cambridge. He studied law and biology, but at 40 found his true bent in Egyptology and became the leading Demotic scholar of his day. He founded the chair of Egyptology at Cambridge.

Thompson, Sylvia Elizabeth (1902-), novelist, b. Scotland. Educ. at Cheltenham and Somerville College, Oxford, she married Theodore D. P. Luling, an Amer. artist, in 1926. Her first novel, *Rough Crossing*, was pub. when she was 16, and *The Hounds of Syring*, started when she was an undergraduate, was a best-seller in 1925. Others of her novels are *The Battle of the Horizons*, 1928, *Chariot Wheels*, 1929, *Winter Comedy*, 1931, *Summer's Night*, 1932, *Helena*, 1933, *Golden Arrow*, 1935, *Recapture the Moon*, 1937, *The Gulls Fly Inland*, 1941, *The People Opposite*, 1948, and *The Candle's Glory*, 1953.

Thoms, William John (1803-85), antiquary and miscellaneous writer, b. Westminster, was for some years a clerk in the secretary's office of Chelsea Hospital, and was appointed Clerk in 1845, and subsequently deputy librarian to the House of Lords. He was founder in 1849 of *Notes and Queries*, which for some years he also edited. He also ed. Stow's *London*, 1842, and was secretary of the Camden Society. He introduced the word 'folklore' into the language.

Thomsen, Grimur (1820-96), Icelandic diplomatist, politician, and poet. For about 20 years he was in the service of the Dan. Foreign Office (London and Brussels), but after 1866 he permanently resided in Iceland. He stands in the front rank of Icelandic poets, and for the foreign student he is the easiest of them all to read. Many of his subjects are taken from Saga times, and his *Buarimur* is the greatest epic in the Icelandic language. His translations of the GK dramatists are unequalled in Icelandic.

Thomsen, Hans Peter Jørgen Julius (1826-1909), Dan. chemist, passed his life in Copenhagen, teaching chemistry at the Polytechnic (1847-56) and Military High School (1856-66), before he was appointed to the chair of chemistry in the Univ. (1866-91). He was awarded the Davy Medal in 1883 and became a member of the Royal Society in 1902. His name is famous for his work on thermochemistry. *Thermochemistry*, 1908, is an abstract of his *Thermochemische Untersuchungen*, 1882-6.

Thomson, Sir Charles Wyville (1830-82), zoologist, b. Bonnyside, W. Lothian; educ. at Edinburgh Univ., he became prof. of zoology at Cork, at Belfast, and, from 1870, at Edinburgh. He is chiefly remembered as director of the scientific staff in the *Challenger Expedition* (1872-6). This appointment he owed to his important studies of biological conditions

in the depths of the sea made in 2 expeditions in H.M.S. *Lightning* and *Porcupine* with Dr W. B. Carpenter in 1868-9. Knighted in 1876. He wrote *The Depths of the Sea*, 1872, and *The Voyage of the Challenger*, 1877.

Thomson, Elihu (1853-1937), Anglo-Amer. inventor, b. Manchester, and moved to the U.S.A. with his parents while a child. He was educated at the Central High School in Philadelphia. From 1875 to 1880 he was prof. of mechanics and chemistry at this institution. From 1880 he was chief electrician for the Thomson-Houston Co. and the General Electric Company, which under his inventions operate more than 600 patents. Besides numerous inventions in electric lighting and generator design, he was the discoverer of the method of electrical welding. He was the first to utilise a magnetic field to move an electric arc, made the first high-frequency alternator, invented a watt-hour meter, and was the first to make stereoscopic X-ray pictures. He was presented with medals by most of the great societies of the world.

Thomson, Sir George Paget (1892-), physicist, b. Cambridge, the son of Sir J. J. Thomson, who first identified the electron. Elected a fellow of Corpus Christi College, Cambridge, in 1914, he served in France 1914-15, and worked on aerodynamical problems from then until 1919, when he returned to Cambridge. From 1922 to 1930 he held the chair of Natural Philosophy at Aberdeen, and in 1930 was appointed prof. of physics at the Imperial College of Science and Technology, S. Kensington. He has been Master of Corpus Christi College, Cambridge, since 1952.

De Broglie's view that electrons possess not merely the properties of discrete particles but also have many of the attributes of wave motion was strongly supported by experiments performed by T., who in 1937 and 1939 respectively was awarded the Nobel Prize for physics, and the Hughes Medal of the Royal Society, of which he was elected a fellow in 1929. He was a member of the Acronautical Research Committee 1937-41, and in 1943-4 acted as scientific adviser to the Air Ministry. From 1946 to 1947 T. was scientific adviser to the Brit. delegation to the Atomic Energy Commission of the U.N. His pubs. include *Applied Aerodynamics*, 1919, *Wave Mechanics of the Free Electron*, 1930, *The Atom*, 1937, and *The Theory and Practice of Electron Diffraction*, 1939, with W. Cochran.

Thomson, Hugh (1860-1920), illustrator, b. N. Ireland. He made a special study of the 18th and early 19th cents., illustrating, with fidelity to modes and atmosphere, Goldsmith's *Vicar of Wakefield*, Elizabeth Gaskell's *Cranford*, J. M. Barrie's *Quality Street*, and all the works of Jane Austen, Thackeray, Austin Dobson, and others. In contemporary subjects 'Highways and Byways in London', 1902, shows him at his best. A delightful pen-and-ink draughtsman, he carried on the tradition of Randolph Caldecott.

Thomson, James (1700-48). Poet, *b.* Ednam in Roxburghshire. He was educ. at Edinburgh Univ. where he occupied his leisure in writing great quantities of verse, of which 3 poems appeared in the *Edinburgh Miscellany* of 1720. He had originally some intention of entering the ministry, but he abandoned all thought of this, and in 1725 went to London to pursue a literary career. He became a tutor to Thomas Hamilton (afterwards 7th Earl of Haddington), and made the acquaintance of many of the leading men of letters. He pub. in 1726 *Winter*, which was highly applauded, and this he followed in the next year with *Summer*. *Spring* appeared in 1728, and 2 years later he repub. these 3 poems, adding to them *Autumn*, under the title of *The Seasons*. He subsequently carefully revised this work, but it was not brought out in its amended form until 1744. T. in 1730 had his play *Sophonisba* produced at Drury Lane, but in spite of its many merits, it was not successful. In 1731 he accompanied the son of Lord Chancellor Talbot on the 'grand tour.' This inspired the poem *Liberty*, 1734. *Agamemnon*, 1738, was his next work, and in 1740, in collaboration with David Mallet, he wrote *The Masque of Alfred*, which is famous because in it first appeared the ode 'Rule Britannia.' It is virtually certain that T. was the author of 'Rule Britannia,' though Mallet's claims to it have been discussed. Since 1738 T. had been in receipt of a pension from Frederick, Prince of Wales, and in 1744 he was given by Lyttelton the sinecure office of surveyor-general of the Leeward Is. His later works include the plays *Edward and Eleonora*, 1739, *Tancred and Sigismunda*, 1745, in which Garrick played Tancred, and *Coriolanus*, 1748. *The Castle of Indolence*, 1748, an allegorical poem in the Spenserian stanza, is often reckoned his finest work. He was buried in Richmond church. When T. began to write, Eng. poetry was dominated by artificiality, and Pope was the prin. living poet; but T. employed a true, simple, romantic treatment of nature, and his influence on his contemporaries, as on his successors, was considerable. T.'s *Works* were first collected in 1763. The poetical works were ed. by J. L. Robertson, 1908. See lives by R. Shiels, 1753; S. Johnson, 1781; G. C. Macaulay, 1908.

Thomson, James (1822-92), physicist, *b.* Belfast, was also an engineer, inventor, and geologist. He was prof. of civil engineering at Belfast (1857-73) and Glasgow (1873-89), and was the first to demonstrate the possibility of lowering the freezing point of water, etc., by pressure.

Thomson, James (1834-82), poet, *b.* Port Glasgow. Educ. at the Royal Caledonian Asylum and the Military Asylum, Chelsea, he became a schoolmaster in Ireland and then an army teacher in Dublin, Aldershot, and Portsmouth, but was discharged in 1862 for a breach of discipline. Moving to London, he worked as clerk and journalist, writing under the initials B. V. for Bysshe

Vanolis, a combination of Shelley's middle name with an anagram of Novalis, the Ger. poet. In 1874 he contributed to the *National Reformer* his best-known poem, 'The City of Dreadful Night,' which made him famous as the poet of pessimism and despair. It was pub. along with some other pieces in 1880, and in 1881 a second vol. of verse and a collection of essays appeared. See study by I. Walker, 1950.

Thomson, Sir John Arthur (1861-1933), naturalist, *b.* E. Lothian. Educ. at the univs. of Edinburgh, Jena, and Berlin. Sometime lecturer in zoology and biology in the School of Medicine, Edinburgh, he was also Regius prof. of natural hist., Aberdeen, 1899-1920. Author of: *Study of Animal Life*, 1892 (rev. 1917). *Herbert Spencer*, 1906. *Darwinism and Human Life*, 1910 (rev. 1916). *Biology of Birds*, 1923. *Science and Religion*, 1925. *Outline of Biology*, 1930. *Biology for Everyman*, 1934. He was knighted in 1930.

Thomson, Sir Joseph John (1856-1940), physicist, *b.* near Manchester, eldest son of J. J. Thomson. Educ. at Owens College and Trinity College, Cambridge, where he was Second Wrangler and second Smith's Prizeman, 1880. Lecturer at Trinity College, 1883, and Master of Trinity College and Prof. of Physics, his association with Cambridge lasted throughout his life. In 1884 he succeeded Lord Rayleigh as Cavendish Prof. of Experimental Physics (1884-1918). To T. belongs, by general consent, the credit for the discovery of the electron. His book, *Application of Dynamics to Physics and Chemistry*, 1888, was to a great extent the foundation-stone on which the study of physical chemistry was built. This was followed by numerous papers on electrical theory and experiments on gases. After Röntgen had demonstrated the existence of X-rays produced by substances struck by cathode rays, T. (assisted by Rutherford, then a young research student from New Zealand) adapted the discovery to his own use and used the X-rays for producing more controllable ionised gas. Through his researches in this field he concluded that all matter is composed of electrically charged particles and that electricity is atomic in nature. His subsequent researches into the nature of electricity resulted in the development of the study of atomic physics, in which T. as a pioneer, gained international recognition from the scientific world and in 1906 he gained the Nobel Prize for Physics. In 1912 he was awarded the O.M. and was president of the Royal Society from 1916 to 1920. His pubs. include *On the Motion of Vortex Rings*, 1883. *Application of Dynamics to Physics and Chemistry*, 1888. *Elements of the Mathematical Theory of Electricity and Magnetism*, 1895. *The Discharge of Electricity through Gases*, 1898. *The Conduction of Electricity through Gases*, 1903. *Corpuscular Theory of Matter*, 1907. *Thermochemistry*, 1915, and *The Electron in Chemistry*, 1923. See life by Lord Rayleigh, 1942.

Thomson, William, see KELVIN, BARON.

Thomson Effect, or **Kelvin Effect**, see **THERMOELECTRICITY**.

Thonon (les-Bains), Fr. tn, cap. of an arron., in the dept of Haute-Savoie, on Lake Léman. It was the anct cap. of Chablais (q.v.). It is a popular spa, and manufs. cheese and other foodstuffs. Pop. 13,200.

Thor, god of thunder, see **MYTHOLOGY** (**Teutonic**).

Thoracic Duct, duct which conveys the greater part of the lymph and chyle into the blood. It is the common lymph trunk of the body except for the right upper extremity, right side of the head, neck, and thorax, right lung, right side of the heart, and convex side of the liver. It does not, as its name would seem to imply, lie wholly within the thoracic cavity, but begins in the abdomen, on the front of the body of the second lumbar vertebra, by a dilatation known as the *receptaculum chyli*. It reaches the thorax by passing through the aortic openings in the diaphragm, passes upwards to the root of the neck, and then takes a curved course outwards and downwards, emptying itself into the left subclavian vein at its junction with the left internal jugular vein. The duct measures, in the adult, between 15 and 20 in. in length.

Thorarensen, Bjarni (1786-1841), Icelandic poet of the Romantic school. Though with the exception of some 20 poems he is no longer widely read, these suffice to make him immortal.

Thorarensen, Jakob (1886-), Icelandic poet who has inherited some of the force of his older kinsman, B. Thorarensen. His themes are largely drawn from everyday life, and he is little affected by modern fashions.

Thorax, see **CHEST**.

Thórdarson, Thorbergur (1888-), Icelandic prose writer of the Rabelaisian type. He is entertaining, and his books are popular.

Thoreau, Henry David (1817-62), Amer. naturalist and author. b. Concord, Massachusetts, of mixed Scottish and Fr. descent. T. passed through school and Harvard Univ. without gaining any distinction. The 2 famous years of his life were those he spent as a recluse in his self-made shanty in the woods near Walden Pond (1845-7), and it is his *Walden*, or *Life in the Woods*, 1854, which reveals his curious and arresting originality. Here he lived happily on a bare pittance, indulging to the full his sympathies with bird and beast, and giving free rein to his fresh and noble but rather egoistic thoughts. Other writings are *A Week on the Concord*, 1849, *Excursions* (pub. posthumously, 1863), *The Maine Woods*, 1864 and *Cape Cod*, 1865. The standard ed. is the *Riverside*, 10 vols., 1894-5; there is also a collection (*Journal omitted*), *The Works of Thoreau*, ed. by H. S. Canby, 1947. See H. A. Page, *Thoreau, his Life and Atms*, 1878; also lives by F. B. Sanborn, 1882; H. S. Salt, 1890; F. H. Allen, 1908; J. B. Atkinson, 1929; W. White, 1939; J. W. Krutch, 1948.

Thorez, Maurice (1900-), Fr. politician, b. Noyelles Godault, Pas de Calais,

son of a coalminer. He joined the Communist party in 1920, and was its leader from 1936 to 1939. A military tribunal condemned him in absence for avoiding military service at the outbreak of the Second World War. He spent some time in Moscow, returning in 1944 to become a member of the consultative assembly and a minister of state under de Gaulle. He held various cabinet offices until 1947, when Auriol removed Communist ministers after they had opposed the gov. of which they were a part. Since that date T. has led Fr. Communist opposition to alliances, military or economic, with other W. European countries.

Thorium, metallic element, symbol Th, atomic weight 232.2, atomic number 90. T. was discovered by Berzelius in 1828, and is obtained commercially from the monazite sand of Brazil, Malay, Travancore, etc. Thorium oxide, ThO₂, is extracted from the sand, and is used in the preparation of incandescent gas-mantles. Metallic T. is difficult to isolate, owing to its chemical activity, but it has been prepared pure by strongly heating thorium chloride with sodium in a vacuum. It is a white metal, melting at over 1800° C. When heated in air or oxygen it burns brilliantly. T. is radioactive, thorium atoms gradually disintegrating to mesothorium, thorium-x, thorium emanation, and so on, a final product which is one of the isotopes of lead. Helium is also given off.

Thorkelsson, Jón (1859-1924), Icelandic scholar and poet. He organised the National Archives of Iceland, and specialised in the unpub. MSS. of the 15th-17th cents.

Thorláksson, Gudbrandur (1542-1627), Icelandic prelate and translator of the Bible, which he pub. in 1584, the first complete Icelandic ed. He was bishop of the N. see (Hólar) for 56 years and estab. the Lutheran reformation in Iceland on a secure basis. His is one of the great names in the hist. of Iceland. See F. E. Olason, *Menn og mentir*, vol. III, and his *Saga Íslendinga*, vol. v.

Thorkelsson, Jón (1744-1819), Icelandic clergyman and poet who holds a high place in the literature of his country. Among his numerous and able translations are Pope's *Essay on Man*, Milton's *Paradise Lost*, and Klopstock's *Messiah*. See Sir Wm Craigie in the *Oxford Book of Scandinavian Verse*, 1925.

Thorláksson, Þórður (1637-97), Bishop of the S. diocese of Iceland (Skálholt), a man of great and varied learning. He was the first to have any of the sagas printed in Iceland (*Landnámabók*, 1688). His own most important work is *Dissertatio chorographico-historica de Islandia*, Wittenberg, 1666. He was also a cartographer. See H. Hermannsson, *Islandica*, vol. xvii, 1926.

Thorn is the name of the O. E. letter, þ, pronounced th. Its form gradually became the same as γ, which appears in antique spelling of the definite article as 'ye,' often mistakenly pronounced like the plural of 'you' in pseudo-ancient phrases like 'Ye olde tea shoppe.'

Thorn, *see* **TORUN**.

Thorn Apple, *see* **DATURA**.

Thornaby-on-Tees, municipal bor. of Yorks (N. Riding), England, on the Tees, 3 m. W.S.W. of Middlesbrough. Stockton-on-Tees, co. Durham, is on the opposite bank of the riv. The bor.'s prin. industries are engineering, bridge-building, iron founding, flour milling, sugar refining, and wire rope manuf. Pop. 24,000.

Thorncliffe, Dame Sybil (Lady Lewis Thomas Casson) (1882-), actress, *b.* Gainsborough, Lincs, daughter of Arthur John Webster T., hon. canon of Rochester. Educ. at Rochester High School. With her brother, she joined Ben Greet's Academy, her first professional appearance being in 1904 at Cambridge. After touring in America for 4 years, she was with Miss Horniman's Manchester Co., 1908-9. Married in 1908, she joined the Chas. Frohmann repertory 1910, and made an Amer. tour with John Drew, 1910-11. From 1914 to 1918 she played leading rôles at the Old Vic, and at the Little Theatre from 1920 to 1922. Her creation of the title rôle in Shaw's *St Joan* in 1924 gained her wide recognition. Her range and quality have been shown in the classical parts of Lady Macbeth, Medea, and Lady Teazle, in *Peer Gynt* as Aase and in *The Linden Tree*. She is the leading tragedienne of the present-day Eng. theatre. D.B.E. 1931.

Thorne, market tn and rural dist. in the W. Riding of Yorks, England, on the R. Don, with barge-building, mining, engineering, and textile industries. Pop. of rural district 33,000; area, 38,419 ac. Pop. of tn about 15,000.

Thornycroft (George Edward) Peter (1909-), politician, educ. at Eton and the R.M.A., Woolwich. He resigned his commission in 1933 and was called to the Bar, 1935. From 1938 to 1945 he was Conservative M.P. for Stafford, and became Conservative M.P. for Monmouth in 1945. After the Conservative defeat in 1945, T. became a prominent Opposition speaker, his views being considered progressive within his own party. From 1951 to 1957 he was president of the Board of Trade, and in the Macmillan Gov. was appointed Chancellor of the Exchequer. T. resigned the chancellorship in Jan. 1958 after a disagreement with the rest of the Cabinet over the budget estimates, 1958-9. T. was not prepared to approve estimates any higher than the sum spent 1957-8. He was succeeded as chancellor by Derick Heathcoat Amory (q.v.), the then minister of agriculture.

Thornhill, Sir James (1676-1734) painter, *b.* Melcombe Regis, Dorset, and studied under Highmore. He was much employed by Queen Anne, who commissioned him to paint the interior of the dome of St Paul's, and the princesses' apartments at Hampton Court. T.'s other decorative works include the great hall at Greenwich Hospital, the hall at Blenheim, and paintings in Kensington Palace. He also painted altar-pieces for All Souls and Queen's College chapels, Oxford, and portraits of Sir Isaac Newton

and Steele. He founded a school of art in Covent Garden, attended by Hogarth, who became his son-in-law. T. (long undervalued) was a very able practitioner of the 'baroque' style of decorative painting.

Thornhill: 1. Suburb of Dewsbury (q.v.).

2. Picturesque vil. of Dumfriesshire, Scotland, 15 m. N. of Dumfries. Near it are Drumlanrig Castle, seat of the Duke of Buccleuch and Queensberry; and Maxwelltown House, bp. of Annie Laurie. There is trout and salmon fishing. Pop. 1200.

Thornton, vil. 4 m. S. of Fleetwood, on the Wyre, in Lancs, England. It is now joined with the seaside resort of Cleveleys to form the urban dist. of Thornton Cleveleys. Pop. 15,080.

Thornycroft, Sir John Isaac (1843-1928), naval architect, *b.* Rome, eldest son of Thomas and Mary T., sculptors. A draughtsman in Palmer's shipbuilding yard in Glasgow, he studied under Lord Kelvin and Macquorne Rankine at the univ. and later worked for John Elder, marine engineer. He estab. at Chiswick (1866) a yard for launches and torpedo-craft, and built the first torpedo-boat of the R.N. in 1877. In 1898 he began motor-building at Basingstoke; in 1906 he moved his boatyard to Woolston, Southampton. He supplied the Admiralty during the First World War; in 1893 he became a fellow of the Royal Society, and was knighted in 1902.

Thornycroft, Sir William Hamo (1850-1925), sculptor, *b.* London, son of the sculptor, Thomas T. (1815-85). He studied sculpture at the R. A. Schools and helped his father with the Park Lane Fountain (removed in 1948) 1872, contributing Comedy, Shakespeare, and Fame. He won R.A. gold medal, 1875. Other works include 'Teucer', 1881 (Tate Gallery); 'The Mower', 1884 (Walker Art Gallery, Liverpool); statue of Cromwell in front of the Houses of Parliament, and Gordon's statue in Trafalgar Sq. He was knighted in 1917.

Thoroddsen, Jón (1818-68), Icelandic poet, novelist, and administrator. He ranks as one of the country's greatest novelists. *Lad and Lass* has been trans. into Eng. (1890).

Thoroddsen, Thorvaldur (1855-1921), son of Jón T., Icelandic geologist and geographer. Among his works are *Island, Grundriss der Geographie und Geologie*, and *Geschichte der Isländischen Vulkane*. *See* H. Hermannson's *Catalogues*; also an autobiography in Icelandic, which the author did not live to complete.

Thorough-Bass (actually the old spelling of Through-B.), system of shorthand notation used by composers for keyboard instruments during the early part of the 17th cent. and persisting until about the middle of the 18th. Composers, instead of writing out the full harmony they required often contented themselves with setting out only the chief melodic parts over a single bass-line, under which they wrote figures indicating what the harmony above that bass was to be, but not how

it was to be spaced or distributed, much less giving any indication as to how it might be broken up into figuration or made more interesting by such devices as suspensions or passing-notes, all of which was left to the ingenuity of the player at the harpsichord or organ, who was expected to improvise an interesting part to amplify the music with a background of texture and harmony. T.-Bs. were not always completely figured, and sometimes not at all, which made the *continuo* player's task more difficult.

Thoroughbred, see HORSE.

Thorow-wax, see BUPLEURUM.

Thors, Thor (1803-). Icelandic lawyer, politician, and diplomatist, ambassador in Washington, and permanent representative to the U.N. since 1946.

Thorshavn, cap. of the Faeroe Is., situated on the S.E. coast of Stromø. To the E. of Eystaravag are the remains of an ancient fortress, parts of which serve as prison and lighthouse. The prin. buildings are the church, the Parliament building, the governor-general's house, the library (and museum), and the theatre. Pop. 4400.

Thorsteinsson, Steingrímur (1831-1913), Icelandic poet. Few poets have been so universally loved in Iceland in their lifetime as he was. He was a great translator. His masterly translation of the *Arabian Nights* shows both the wealth and the beauty of the Icelandic language. T.'s satirical epigrams in the Rom. style are matchless.

Thorwaldsen, Bertel (1770-1844), Dan. sculptor, b. Copenhagen, son of a poor wood-carver. He studied for a while in the school of art in his bp., and subsequently went to Italy, where he was influenced by Canova and where he remained for 23 years. On his return to Denmark in 1819 he was commissioned to execute a group of colossal figures of 'Christ and the 12 Apostles' for the Frueknirke in Copenhagen. Soon after his death a permanent exhibition of his work was formed at Copenhagen, while his statue of Hyron is now at Trinity College, Cambridge. The Lion of Luzern (see LUZERN) is also his work. Thorwaldsen estab. an international reputation during his life-time, and examples of his monumental sculpture may be seen on buildings and in churches all over Europe. His art was dominated by classical Gk and Rom. sculpture, and his artistic achievement is one of successful imitation and of skill rather than creative vision. See *lives* and *studies* by J. M. Thiele, 1852-6; A. Rosenberg (2nd ed.), 1901; E. E. Douglas, 1933.

Thoth, early Egyptian deity of knowledge and magic. He invented writing, and was the patron of scribes. T. was represented by a baboon or that persistent searcher, the ibis, and associated with the moon, whose phases were used for reckoning. Hermopolis (Ashmunein) was the centre of the cult. With Horus, T. was chief lustrator of Osiris. He accompanied the sun god in his boat, and recorded the result of the weighing of the heart of the dead.

Thothmes, Tuthmosis, or Tehutmes name of 4 kings of ancient Egypt, who belong to the 18th dynasty; *Thothmes I* (c. 1530 bc) finally subdued Cush or Nubia, fixed the boundary of his kingdom at the fifth cataract, and made successful campaigns as far as the Euphrates. He enlarged the Theban temple of Amen or Amen at Thebes (q.v.), which gradually became the largest temple in the world. He was the first king to be interred in the valley of the tombs of the kings at Thebes. *Thothmes II*, his son, reigned less than 3 years. *Thothmes III*, the son of Thothmes II, did little till the death of his aunt and wife, the despotic Queen Hatshepsut. He fought successful campaigns in revolted Syria and Mesopotamia, secured the Phoenician ports, and received ann. tribute from Nubia, Crete, Cyprus, and the Aegean Is. He built a large number of temples, his greatest work being the colonnade at Karnak, and set up sev. magnificent obelisks. His conquests enriched the country, and he proved an efficient administrator. He d. at a very advanced age. *Thothmes IV* was a grandson of Thothmes III; he married a Mitanni princess, and ruled till about 1405.

Thou (or Thuanus), Jacques Augusta de (1553-1617), Fr. historian, b. Paris. He gained the favour of Henry III and Henry IV and helped to draft the Edict of Nantes (1598). He wrote a *Historia sui temporis*, 1604-8, which has considerable historical value.

Thouars, Fr. tn in the dept of Deux-Sèvres, on the Thouet. It is a picturesque tn with many ancient buildings, including a fine château. It has an important agric. mrkt. Pop. 10,400.

Thought Reading, see PSYCHICAL RESEARCH; TELEPATHY.

Thousand and One Nights, see ARABIAN NIGHTS.

Thracia, or Thrace, was in earlier times the name of the vast tract of country bounded on the N. by the Danube, on the S. by the Propontis and the Aegean, on the E. by the Pontus Euxinus, and on the W. by the R. Strymon and the easternmost of the Illyrian tribes. It was divided into 2 parts by Mt Haemus (the Balkan), running from W. to E., and separating the plain of the lower Danube from the rivs. which fall into the Aegean. At a later time the name T. was applied to a more limited area. T. in its widest extent, was peopled at the time of Herodotus and Thucydides by different tribes. The earliest Gk poets and other cultural pioneers are represented as coming from T., which received Gk colonies at an early date. The first really historical fact respecting the Thracians is their subjugation by Megabazus, the gen. of Darius. After the Persians had been driven out of Europe by the Greeks, the Thracians recovered their independence; and at the beginning of the Peloponnesian war almost all the Thracian tribes were united under the dominion of Sitalces, King of the Odrysae, whose kingdom extended from Abdera to the Euxine and the mouth of the Danube. Sitalces fell in

battle against the Triballi in 424, and was succeeded by his nephew Seuthes, who raised his kingdom to a height of power and prosperity which it had never previously attained. Philip, the father of Alexander the Great, reduced the greater part of T.; and after the death of Alexander the country fell to the share of Lysimachus. It subsequently formed a part of the Macedonian dominions. T. was the centre of disturbances in more modern times. It was one of the theatres of war in the Balkan war of 1912, when the Bulgarians entered it and defeated the Turks. With the help of the Serbs Bulgaria took Adrianople, and nearly all T. was given to Bulgaria by the treaty of London signed in 1913. However, quarrels with her allies about the div. of the conquered territory led to the second Balkan war in 1913, when the Turks recaptured Adrianople and re-occupied Thrace. The treaty of 1913 gave Bulgaria her outlet to the Aegean Sea through Thrace. In 1919, after the First World War, the boundary was again changed, and the sea coast given to Greece, which obtained most of Thrace by 1920. In 1923 the treaty of Lausanne provided for the giving up to Turkey of E. Thrace as far as the Maritza, and W. Thrace, except Karagach, was given to Greece. Thrace in Greece has an area of 3315 sq. m., and is divided into 3 nomes—Havros, Rhodope, and Xantho, total pop. (1940) 360,000. Alexandroupolis, Komotin, and Xantho are the respective caps. E. Thrace, or Turkey-in-Europe, has an area of 9256 sq. m. and a pop. of 1,626,000. It includes the cities of Istanbul and Edirne. Gk Thrace was occupied by Germans and Bulgarians in 1941 and annexed to Bulgaria until the 1944 armistice. During this period attempts were made to give the area a Bulgar character, these activities contributing to much unrest during the period immediately following the Second World War. See A. J. Toynbee and others, *The Balkans*, 1915; F. Schevill, *The Balkan Peninsula*, 1922; *Treaty of Peace with Turkey, signed at Lausanne, July 24th, 1923*, 1923; S. Casson, *Macedonia, Thrace, and Illyria*, 1926; *Cambridge Ancient History*, vol. 8, 1930.

Thracian-Illyrian Languages, see INDO-EUROPEAN LANGUAGES.

Thrale, Henry (1728–81), Brit. brewer. He inherited his father's brewery in 1758 and in 1763 married Hester Lynch Salusbury, 'of good Welch extraction, a lady of lively talents, improved by education' (Boswell). T. and his wife were for long hosts of Dr Johnson at their home at Stroatham Park. Three years after T.'s death, Mrs T. married Gabriel Piozzi, a musician (see also Piozzi, **HESTER LYNCH**).

Thrale, Hester Lynch, see Piozzi.

Thrasea, Paetus P. (d. ad 66), Rom. senator and Stoic philosopher in the reign of Nero, a native of Patavium. He made the younger Cato his model of whose life he wrote an account. After incurring the hatred of Nero, he took his life by command of the emperor. See **ARRIA**.

Thrashing, or Threshing, separation of the grain from the straw, or the seed from the haulm. Formerly the operation was performed by the flail, and this laborious but effective implement is still occasionally used by seed growers and on small holdings. The first workable threshing machine was invented by Andrew Meikel about 1786; the modern machine, besides effectively sorting out the products of the sheaf, delivers the straw unbroken and ready for trussing. The machine was at first worked by hand, then by portable steam engines which were drawn from farm to farm by horses until they were superseded by self-propelled steam engines. These, in turn, were followed by tractors, those with Diesel engines appearing to be the most suitable. Water power and even horse gears are occasionally employed, more especially with fixed machines. The corn is passed by hand or self-feeder into the drum mouth and is threshed out by beaters. The straw is passed out, after the grain has been shaken away, by means of riddles, an air blast from a fan, and rotary screens which grade the corn. The most common of the threshing machine's auxiliaries are the chaff cutter, for cutting oats or barley straw into short lengths for cattle feed; the straw tier, which produces bundles or trusses of straw for thatching, etc.; the straw baler, which compresses the straw into wire-bound bales; and the huller, which is used for threshing very small seeds. The combine harvester cuts and threshes in one operation and has threshing mechanism similar to that of a stationary thresher. However, it is not always possible to produce clean grain, because of the quantities of green weeds cut close to the ground which tend to clog the sieves in the machinery, and thus small pieces become included in the threshed grain; for this reason it may be necessary to pass the grain through a separate dressing machine. Since the grain is cut and threshed at the same time, and has no opportunity to dry naturally in the traves and stack (see **REAPING**), the moisture content may remain high. Unless the grain is then dried artificially in plant installed in the farm buildings for that purpose it may heat or ferment when stored. The straw left by the combine tends to be much broken, but if wanted for litter or fodder it can be collected by a pick-up baler or swept up to a stationary baler or stack. Otherwise it is left to be ploughed in or burnt.

Thrasimene, see **TRASIMENE LAKE**.

Thrasylbulus, son of Lycus, an Athenian. He took an active part in overthrowing the Four Hundred in 411 BC, was banished by the Thirty Tyrants, but returned to expel the Ten and restore the Athenian democracy in 404. In 390 T. commanded the Athenian fleet in the Aegean, and was slain by the inhab. of Aspendus in Pamphylia.

Thread, fine cord made by twisting the fibres of such substances as cotton, wool, silk, and flax. The slightly twisted yarns used for weaving are strictly called T.s, but the term is more commonly applied to

the stronger and more highly finished cords used for sewing, etc. The cotton or other material is first twisted into yarn, which is doubled upon itself and twisted in the opposite direction to the original twist. The product is then 2-ply thread. To make a stronger thread, e.g. 6-cord T., a number of 2-ply yarns are twisted by the winding machine again in the opposite direction to the previous twist.

Thread (of screws), see SCREWS, BOLTS, AND NUTS.

Thread Cells, Stinging Cells, or Cnidoblasts, occur in Coelenterates as cells with bulb-shaped structures (nematocysts) containing fluid and having the narrower end prolonged into a fine tube folded inwards in the cavity of the bulb as a spiral coil. Externally the cell may bear a conical projection (cnidocil), and when a small animal comes in contact with this the fine tube turns inside out and is shot into the animal's body, becoming fixed by barbs at the base of the tube while poison passes through it. They are the stings of the jelly fish and are also well developed in the 'Portuguese Man-of-War' (Physalia) and 'sea wasps' (Cubomedusae). In Australian waters 'sea wasps' cause a number of deaths each year among bathers.

Thread-worms, see NEMATODES.

Threadneedle Street, famous thoroughfare in the city of London, running E. from the Bank of England (sometimes familiarly called the 'Old Lady of T. S.') to Bishopsgate. The name is sometimes considered to derive from a signboard with 3 needles on it, but it is more likely to have been connected with the children's game 'thread the needle,' once commonly played in some tns.

Threats. It is a felony either: (a) verbally to accuse or threaten to accuse another of any infamous crime (e.g. murder, rape) with a view to extorting from the person so accused or threatened or from any other person any property, money, or valuable security; or (b) to send a letter containing T. to accuse another person of crime with intent to extort something of value; and so gravely does the law regard this offence that a conviction may involve a sentence of imprisonment for life. The guilt or innocence of the recipient is material only in considering whether the intention of the prisoner was to extort money by his T. or merely to compound a felony (see COMPOUNDING). Similarly it is a felony punishable with imprisonment for any term up to life to send a letter demanding with T. and without reasonable cause any money or other property. Sending a letter containing T. to murder a person, or to burn or destroy his house, or to maim his cattle, are all felonies punishable with 10 years' imprisonment. See also BLACKMAIL.

Three Choirs Festival, music festival estab. in 1724. It is held annually, in Sept., alternately in the cathedrals of Hereford, Gloucester, and Worcester. New works from eminent contemporary composers have always been a feature of the T. C. F., the works of Parry, Elgar,

and Vaughan Williams having especially been promoted there. Standard oratorios like *Messiah* and *Elijah* are firmly entrenched.

Three-Colour Process, see PROCESS WORK.

Three Kings, Feast of, see EPIPHANY.

Three Mile Limit, see TERRITORIAL WATERS.

Three-phase System, electric a.c. supply system in which 3 lines are at voltage of equal peak value and frequency but differing in phase by $\frac{1}{3}$ cycle: $E \sin \omega t$, $E \sin (\omega t - 120^\circ)$, $E \sin (\omega t - 240^\circ)$ (see ELECTRIC MACHINES; TRANSMISSION). A fourth wire, at earth potential, is usually added in distribution networks. If the voltage between lines is 380 V, the voltage to the fourth wire (neutral) is $380/\sqrt{3} = 220$ V (see STAR/DELTA), the system is indicated as 380/220 V. In a distribution network it is important to keep a 'balanced load,' i.e. the phase circuits should be as near as possible equally loaded. The phases are named red, white, blue, and in connecting a 3-phase motor or transformer into the system, it is essential to observe the correct sequence. This can be tested by connecting 2 equal lamps and a reactor in 'star,' joining the 3 free ends to the 3 supply terminals; one lamp will be brighter than the other, the terminal to which it is connected is marked 'red,' the other lamp terminal 'blue,' the reactor terminal 'white.' The power may be measured by 2 wattmeters, with their current coils in 'red' and 'blue' lines, the volt coils connected to 'white.' The power is the sum of the 2 readings.

Three Rivers. In Quebec, see TRÔIS RIVIÈRES.

Threnody (Gk, *threnos*, wailing, and *ôde*, ode), song of lamentation, especially on a person's death. Gaelic literature supplies examples in the typical 'keens,' as e.g. the 'Keen on Art O'Leary,' originally pub. in Mrs Morgan J. O'Connell's *The Last Colonel of the Irish Brigade*, 1892. The true example of the spontaneous keen is in short, broken lines, containing in quick, natural succession, appeals, reminiscences, laments, and moves backwards and forwards as the irregular promptings of grief and affection dictate without form or premeditation. See also DIRGE; GAELIC LANGUAGE AND LITERATURE.

Thresher, see FOX-SHARK.

Threshing, see THRASHING.

Thrift, or Sea Pink (*Armeria maritima*), summer-flowering perennial plant of the family *Plumbaginaceae*. It has slender, stiff, grass-like leaves growing in bundles from the woody branches of the root-stock. The soft, funnel-shaped, rosy flower heads rise on slender hairy stems from the tufts of leaves. T. grows wild on cliffs and rocks in seaside places, and also in mt. dists. *A. plantaginea* is the Jersey Thrift.

Thring, Edward (1821-87), educationist, Somerset and educ. at Eton and King's College, Cambridge. Elected a fellow of that college, T. was, for a time, curate at Gloucester and other places, and

finally headmaster of Uppingham School. A most earnest, enlightened, and successful teacher, he built up an enduring reputation for his school, of which he was headmaster from 1853 till his death. See life by G. R. Parkin (2 vols.), 1898; and G. Heyland, *The Man Who Made a School*, 1946.

Throat, the front of the neck; or the upper part of the respiratory passages in the neck. See PHARYNX; LARYNX; TONSILS; etc.

Thrombin, enzyme (organic catalyst), which brings about the clotting of blood by catalysing (speeding up) the conversion of *fibrinogen*, present in the blood plasma, into *fibrin*. The latter substance, as its name implies, is deposited as a fibrous network in which the corpuscles of the blood become entangled, the whole mass constituting the clot, whereby further loss of blood is prevented. Since blood does not normally clot whilst still circulating in the vessels, it is thought that T. is not present as such but in the form of its precursor, *prothrombin*. The damaged tissues and blood platelets (See under BLOOD) at the site of a wound liberate *thromboplastin*, which, under the influence of calcium salts, combines with *prothrombin* to form T.

Damaged tissues
and platelets

The blood-sucking leeches are able to produce *hirudin*, which combines with *prothrombin* and hence prevents clotting. The clotting mechanism is disturbed in the conditions of (1) *thrombosis*, when it takes place in the vessels, and (2) *haemophilia* (q.v.), an inherited disease in which the blood continues to escape for a long period even from a small wound. A mucopolysaccharide known as *heparin*, which occurs in many tissues, but most abundantly in the liver, when injected into the blood stream prevents coagulation by stopping the conversion of prothrombin into thrombin. It is used therapeutically in cases of thrombosis, particularly coronary thrombosis (see HEART). See also under ENZYMES.

Thrombosis and Embolism formation of a plug by the coagulation of blood or by depositions from it, and results from injury to the endothelial cells lining the walls of the vascular system. The clots are deposited on the injured wall, and serve as nuclei for further deposits. They obstruct the circulation, and may even completely close the lumen of the blood-vessel. Since blood flows more slowly through the veins, venous thrombosis is more common than arterial thrombosis. The extent of the injury caused by thrombosis depends on the size, situation, and condition of the thrombus. In a main

vessel the blockage may be fatal; in smaller vessels it usually results in the necrosis of the surrounding tissues. Septic thrombi cause local abscesses, and may give rise to pyaemia. Frequently by the movement of the blood or by disturbing body movements the thrombus, or pieces of it, become detached, forming emboli and the carriage of these in the bloodstream is termed embolism. Embolism may also be due to the occlusion of air, usually resulting from the exposure of a wound. Emboli of fat may be formed by the escape of fat from bone marrow when bone is badly fractured. Emboli may block the circulation at a point far removed from the situation of the thrombus, and, when septic, cause abscesses and empyema. An embolus blocking the pulmonary artery will cause sudden death, but in arteries with numerous branches comparatively little interference with circulation is caused by the obstruction of one branch. Obstruction of vessels at some distance from the heart may result in gangrene (q.v.).

Thrush (*Turdidae*), family of passerine birds of very extensive distribution and of omnivorous diet. The typical genus *Turdus* includes sev. Brit. species, such as the blackbird, the ring ouzel, redwing, and fieldfare, to which the name T. is not commonly applied. The song T. (q.v.), thrush, or mavis, is one of the best-known Brit. song-birds. The missel T. or holm T. (*T. viscivorus*) is a larger bird with a slightly forked tail. It sings before and during storms.

Thrush, species of inflammation of the mouth due to a particular fungus known as *Oidium albicans* or *Saccharomyces albicans*, and characterised by diffuse white patches. It generally occurs in feeble children, but adults, prostrated by wasting diseases, may also be affected by it. It is also a disease which affects the frog of a horse's foot.

Thucydides (c. 464-c. 402 BC), Gk historian, the son of Olorus, or Orolus, and Hegesipyle, was a native of Attica. He is said to have been instructed in oratory by Antiphon, and in philosophy by Anaxagoras. He possessed gold mines in that part of Thrace which is opposite to the is. of Thasos, and here he was a person of the greatest influence. He commanded an Athenian squadron of 7 ships at Thasos (424), but failing in his attempt to save Amphipolis, he became an exile, probably to avoid a worse punishment. He spent 20 years in exile (v. 26), returning in 404 BC, when a general amnesty was granted on the restoration of the democracy by Thrasybulus. According to some accounts, he was assassinated at Athens or possibly in Thrace; according to others, he d. at Thasos, and his bones were carried to Athens. At all events, his death cannot be placed later than 401.

The Peloponnesian war forms the subject of the hist. of T. Though he was engaged in collecting materials during the whole of the war, he does not appear to have reduced them into the form of a hist. until after his return from exile, since he alludes in many parts of it to the con-

clusion of the war (l. 13; v. 26). He did not, however, live to complete it: the eighth book ends abruptly in the middle of the year 411 BC, 7 years before the termination of the war. The object of the hist. was to give such a faithful representation of the past as would serve as a guide for the future (l. 22). His observation of human character was profound, and his painstaking accuracy and careful attention to chronology are remarkable. His strict impartiality is another feature of his work. His style is marked by great strength and energy, but he is often obscure, particularly in the speeches. The Oxford text, *Thucydidis Historia* (2nd ed.) ed. by H. Stuart Jones and J. Powell, was pub. in 1942. See also C. F. Smith, *Thucydides* (2 vols. with trans.), 1945; A. W. Gomme, *A Historical Commentary on Thucydides*, 1945; G. B. Grundy, *Thucydides and the History of his Age* (2nd ed., 2 vols.), 1948; D. Grene, *Man in his Pride: a Study in the Political Philosophy of Plato and Thucydides*, 1950.

Thucydides, Athenian statesman who led the aristocratic party in opposition to Pericles (q.v.). He was ostracised in 443 BC.

Thugs, roving bands of fanatical murderers and robbers who used to infest parts of Central and N. India. Thuggery, as their system was called, had a religious basis, the murdered persons and a certain part of their belongings being regarded by the T. as sacrifices to the goddess Kali. The systematic suppression of the T. was begun about 1830 by Capt. W. H. Sleeman, Bengal Army (afterwards Maj.-Gen. Sir William Sleeman), and continued for many years afterwards; indeed, the dept for the suppression of Thagi and Dakaiti came to an end only in the present cent.

Thuja, family Pinaceae, a genus of conifers, pyramidal in habit, with scale-like leaves on flattened branchlets. *T. occidentalis* is Amer. Arbor-vitae; *T. orientalis*, Chinese Arbor-vitae; and *T. plicata*, W. Arbor-vitae; all very variable and hardy for Brit. gardens.

Thule: 1. Name given by the ancients to the most N. part of Europe known to them. Pliny said it was an is. in the N. ocean, discovered by the navigator Pytheas of Massilia, 6 days' sail from the Orades. Müllenhoff plausibly identifies it with the Shetlands. Procopius and others use it for Scandinavia. T. appears to be a Gk form of the Gothic *Þiel* or *Þiule*, 'remotest land.' The phrase 'ultima Thule' denotes any far-away unknown region.

2. A settlement in N. Greenland (Danish). The original Thule was at lat. 76° 34' N., long. 68° 49' W., where a U.S. air base was built during the Second World War. This led the Eskimos to move to a second Thule (lat. 77° 27' N., long. 69° 11' W.), in 1953. Official new place-names have been given to each, but confusion is avoided by reference to Thule air base and Thule village. See also RASMUSSEN. See K. Rasmussen, *Greenland by the Polar Sea* (trans.), 1921; A.

Gilberg, *Eskimo Doctor* (trans.), 1948; *Polar Record*, vol. 8, No. 53, 1956, pp. 176-7.

Thulium, metallic chemical element, symbol Tm, atomic weight 169.4, atomic number 69, belonging to the rare-earth group (q.v.). It was discovered in 1879 by Cleve, but was first prepared pure by James in 1911. Its salts are pale green in colour. T. is extracted from the minerals gadolinite, euxenite, etc.

Thulla, see ADULIS.

Thumbscrew, iron instrument of torture for compressing or breaking the thumbs. It was used by the Sp. Inquisition and in the persecutions of the Covenanters in Scotland, where its last recorded use was towards the end of the 17th cent.

Thun: 1. Lake in the canton of Bern, Switzerland, traversed by the R. Aar. Length 11 m.; average width, 2 m.; greatest depth, 700 ft; altitude 1840 ft.

2. Tn in the canton of Bern, on the R. Aar, 1 m. below its exit from the above lake. It is a trade centre, and has slate and brick works. Pop. (1955) 25,900, Ger.-speaking Protestants.

Thunder, see THUNDERSTORM.

Thunderbolt, or **Thunderstone**, common name for objects once erroneously thought to have been formed by thunder and lightning, the belief being that thunder somehow sent forth a destructive bolt or dart (cf. Zeus's levin bolts in Greek mythology). A so-called T. is really a discharge of lightning from one part of the sky to another, and especially one to earth which does damage. Lightning in certain cases does leave behind it a vitrified tube, called a fulgurite (see FULGURITES), which, however, is not flung or darted, but is created by vitrification or fusing on the spot where it is found. The term thunderstone is used especially for objects having more or less a dart or arrow shape, for belemnites, for meteorites (q.v.), and the pyritous nodules to be found in cretaceous rocks. The T. myth recurs in many lands; but the Sioux 'among their varied fancies about thunder-birds (an imaginary bird in the mythology of races of low culture, and personifying thunder) and the like, give unusually well a key to the myth.' They consider the lightning entering the ground to scatter there in all directions *thunder-bolt stones*, which are flints, etc., their reason for this notion being the very natural one, that these siliceous stones actually produce a flash when struck' (Tylor, *Primitive Culture*). In the traditions of the Finns concerning purification by fire, it became expedient to find a substitute, and hence the healing virtues of the T. were embodied in the *Keravania* or thunderstones. The 'holy stones' of the A.-S., or 'holed stones,' arrow heads, flint knives and the like worked by prehistoric men, were popularly believed to be stones which, falling down from heaven, possessed heavenly virtues, and were of use in all sorts of diseases.

Thunderer, *The*, see 'TIMES, THE.'

Thunderstorm, rain, snow, or hailstorm with thunder and lightning. Lightning is an electrical discharge which causes

rapid expansion and contraction of the air, producing the sound of thunder. The light from a stroke travels at 186,000 m. per sec., but thunder only at 1100 ft per sec., so that, although both occur simultaneously, thunder is heard some time later, 5 sec. for every mile away. Since different parts of the lightning flash are at different distances and heights, and the speed of sound decreases with height, the thunder is not normally heard as a single crack but as a succession of rolling sounds. As a rule thunder can be heard only at distances up to 10 m., but this varies with the conditions, and thunder has on occasion been heard up to 300 sec. after the lightning flash—from 60 m. away.

Observations in America by a close network of ground stations and specially equipped fighter aircraft have shown that a T. consists of several convective cells each up to 5 m. in diameter starting with an up current extending up to more than 20,000 ft often attaining more than 60 m.p.h. As this air rises its temp. soon falls to the dew point and below, and water droplets are condensed out, forming cloud and eventually raindrops in great quantities. The maximum raindrop size is 5.5 mm. diameter, with a maximum falling velocity through the air of 18 m.p.h.; after any further growth the raindrops are deformed and broken (see RAIN AND RAINFALL); so that they are carried up into the top parts of the cloud. From there and even lower levels if the up current is slanting, the rain can fall into surrounding, initially drier, air into which it begins to evaporate. This air then becomes colder and heavier than its surroundings and generates a down current which appears at the surface as a cold gust or squall. Although much of the rain is evaporated in maintaining saturation of the down current, most reaches the surface, and the heaviest rainfall is observed in this region of cold air. When the down current reaches the surface it must spread out and can extend as much as 12 m. in advance of the T. It acts as a cold wedge, and may give the initial upthrust to start new convection cells of the T. Eventually the up current in the older convection cell fades from the base upwards, and the whole cell then consists of a down current before dying away completely.

A thundercloud is essentially a gigantic electrical generator which works, like all generators, by separating positive and negative charges. It is now generally agreed that the vast majority of thunderclouds have a preponderance of positive charge at the top and of negative charge at the base, but the mechanism by which this distribution is brought about is still a matter of debate. It is clear, however, that the violent up-and-down air currents within the cloud supply the energy necessary to effect the separation of charge. There are 3 main contending theories, those of Frenkel, Simpson, and C. T. R. Wilson. Frenkel's explanation depends on the fact that a drop of water formed by condensation becomes negatively charged by attracting to itself negative

ions (q.v.) from the surrounding air, which is then left with an excess of positive ions. Simpson's theory is that ice particles become negatively charged by friction with their neighbours, leaving the surrounding air with an excess of positive charge. The heavier ice particles fall and melt, thus giving the required excess of negatively charged drops at the base of the cloud. Wilson's theory, which now commands most support, begins by supposing that an initial charge separation has been achieved either by the Frenkel or the Simpson process (or by both acting simultaneously) and that afterwards the drops acquire induced negative charges on their upper surfaces and positive charges on their lower surfaces. Because of this, a falling drop sweeps up a preponderance of negative ions and a rising drop an excess of positive ions, thus producing the observed field within the cloud.

Lightning. A lightning stroke is a huge electric spark, produced by the enormous potential difference, as much as 100,000,000 or 1,000,000,000 volts, between different parts of the cloud or between the cloud base and the ground. **Forked Lightning** begins with a faintly luminous 'leader' stroke, which branches and darts from side to side in an effort to find the easiest path, and is quickly followed by the intensely bright 'return' stroke. The return stroke carries most of the huge current, often as high as 20,000 amps. What appears to the eye as a single flash is usually made up of a number of strokes in quick succession, giving the characteristic flicker. Because of the very brief duration of the stroke, the amount of electricity involved is usually small, about 20 coulombs, and the length of a flash varies between $\frac{1}{4}$ and 3 m. **Sheet Lightning** is the diffuse illumination from a flash within a cloud or the reflection of a distant flash. **St Elmo's Fire** (q.v.) is a luminous glow seen at night at the top of a ship's mast or on aircraft in thundery weather. The existence of **Ball Lightning** is a matter of debate. There are many circumstantial accounts of the appearance of moving balls of fire during thunderstorms, but most meteorologists now attribute these to optical illusions or to St Elmo's Fire.

Lightning tends to strike tall objects, such as steeples, chimneys, masts of ships, and trees. There is no truth in the popular belief that L. never strikes twice in the same place, and the Empire State Building in New York has been struck over a thousand times. Protection against lightning damage is best afforded by the **lightning conductor**, a copper rod extending vertically above the highest point of a building and earthed by a thick copper strip kept well away from the outer face of the walls. The rod works by providing a path of low resistance for the electrical current in the stroke and not, as often stated, by neutralising the electric field in the vicinity of the building. The lightning conductor was invented by Benjamin Franklin and first used by him in 1752.

See also ELECTRICITY, ATMOSPHERIC. See W. J. Humphreys, *Physics of the Air*, 1920; B. F. J. Schonland, *Atmospheric Electricity*, 1932, and *The Flight of Thunderbolts*, 1950.

Thurber, James Grover (1894-), Amer. humorist, b. Columbus, Ohio. Educ. at Ohio Univ., he worked as journalist and artist, and in 1928 became a leading member of the staff of the *New Yorker*. In his first book, *Is Sex Necessary?*, 1929, he collaborated with E. B. White. His other works, illustrated with his own drawings, include *The Owl in the Attic*, 1931, *The Seal in the Bedroom*, 1932, *The Middle-Aged Man on the Flying Trapeze*, 1935, *Let Your Mind Alone*, 1937, *The Last Flower*, 1939, *Fables for Our Times*, 1940, *Men, Women, and Dogs*, 1943, *The Great Quillow*, 1944, *The Beast in Me and Other Animals*, 1948, *The Thirteen Clocks*, 1950, *The Thurber Album*, 1952, and *The Thurber Country*, 1953. *My Life and Hard Times*, 1933, is autobiographical. His work has been described as a mixture of absurdity, inconsequence, and irony.

Thurgau (Fr. Thurgovie), canton of NE. Switzerland, having Lake Constance and the Rhine to the N. and NE. Area 386 sq. m. It is watered by the Thur, Sitter, and Murg. The canton is a prosperous agricultural area. Embroidery, spinning, and weaving are the chief industries. Cap. Frauenfeld (q.v.). Pop. (1955) 155,800, Ger.-speaking, mainly Protestants.

Thurifer (Lat. *thus*, incense; *fero*, I bear), the server who bears the incense in Christian worship.

Thurii, more rarely Thurium (*Terra Nuova*), Gk city in Lucania, founded in 443 bc near the site of the anct Sybaris. It was built by the remains of the pop. of Sybaris, assisted by colonists from all parts of Greece. Among these colonists were the historian Herodotus and the orator Lysias. The new city rapidly became one of the most important Gk tns in the S. of Italy.

Thüringen, see THURINGIA.

Thüringerwald, see THURINGIAN FOREST.

Thuringia (Ger. Thüringen), name given to a region of central Germany which lay between Prussia, Hesse-Nassau, Saxony, and Prussia (q.v.). The region comprised mainly the duchies and principalities which derived from the country allotted to the Ernestine branch of the Wettin (q.v.) family at the division of the possessions of the house in 1485. The chief states referred to as T. were Saxe-Weimar, Saxe-Coburg-Gotha, Saxe-Meiningen, Saxe-Altenburg, Schwarzburg-Rudolstadt, Schwarzburg-Sondershausen, and the 2 Reuss principalities (qq.v.). In 1919 the Reuss principalities were merged into one People's State of Reuss, and Coburg elected to merge with Bavaria (q.v.). In the same year the 7 Thuringian states were amalgamated to form the prov. of T. In 1945 T. became a *Land* of E. Germany, but in 1952 it was divided into the *Bezirke* of Erfurt, Gera, and Suhl (qq.v.). The chief tn of T. was Weimar (q.v.). Area 6023 sq. m.

Thuringian Forest (Ger. Thüringerwald), range of wooded hills in central Germany, extending for about 80 m. SE.-NW. from the R. Werra near Eisenach (q.v.) to the (Thuringian) Saale (q.v.). It is known for its beauty. The highest point is the Grosse Beerberg (3218 ft), in the NW.

Thurles, mrkt tn of co. Tipperary, Rep. of Ireland, on the R. Suir. It is on the main Dublin-Cork road and rail routes. The Catholic Cathedral (1857) was built on the site of the Carmelite foundation (1300). St. Patrick's Diocesan College was estab. in 1837. There are turf-bogs and coal mines near by, and T. has sugar-beet and mineral-water factories. Pop. 6300.

Thurloe, John (1616-68), politician, son of an Essex clergyman. He was appointed secretary to the Council of State in 1652, in which capacity he revealed the remarkable adroitness in unmasking the intrigues of the enemies of the administration. He sat in Parliament (1654-6), and in Cromwell's second council (1657), and was appointed governor of the Charterhouse (1657), and chancellor of Glasgow Univ. (1658). He subsequently wrote sev. papers on foreign affairs for the information of Clarendon. The *Thurloe Papers* are one of the major original sources for the hist. of the Protectorate.

Thurlow, Edward, first Baron (1732-1806), lawyer, b. Bracon Ash, Norfolk, son of a clergyman. Educ. at Canterbury Grammar School and at Caius College, Cambridge, he was sent down for insubordination in 1751, without a degree. Called to the Bar, 1754, he distinguished himself at an early age in his legal career, taking silk in 1762. In 1768 he was returned to Parliament for Tavistock in the Tory interest, and his speech in the same year in the Douglas Peerage case greatly enhanced his reputation. As a zealous supporter of Lord North he became solicitor-general in 1770 and attorney-general the following year, supporting the gov.'s stand against the rights of juries in cases of libel and the liberty of the press. He won over George III by upholding his Amer. policy and sharing the king's hostility towards the N. Amer. colonies. In 1778 he became Lord Chancellor and Baron Thurlow, and while retaining office under the Rockingham Gov. he opposed all its measures in a spirit of violent factiousness. He was always in opposition for the king, who was virtually his own Prime Minister and foreign minister. Under Fox and North, however, he was forced to resign, but returned to the Woolsack under Pitt, when he once more began to undermine the influence of his colleagues. Eventually, when he openly attacked Pitt's National Debt Redemption Scheme, Pitt intimated to the king that either he or T. must go, and the king at length agreed to T.'s removal (1792). T. was a master of mordant wit, profane, vulgar, overbearing, and immoral, but 'no man,' said Fox, 'was so wise as Thurlow looked,' a gibe excited by T.'s physical appearance—harsh dignified features, piercing eyes under shaggy

eyebrows. He was the patron of Dr Johnson and of George Crabbe, and it is said that he was the first to discern the legal talent of Eldon. See J. C. Campbell, *Lives of the Chancellors*, 1845-69; E. Foss, *Judges of England*, 1848-84.

Thurmayer, Johann, see AVENTINUS.

Thurn and Taxis, Princes of, succession of princes who ruled over an immense stretch of land in Central Europe. The most famous of them, Count Matthias, commanded the Bohemian forces at the time of the dispute over the Bohemian succession, and later served Denmark and Sweden. The Princes of Thurn and Taxis claimed a hereditary right over the administration of postal affairs in Central Europe, having estab. posts as early as 1460. The last vestige of these rights disappeared in 1866 with their purchase by the N. Ger. Federation. See J. B. Mehler, *Das fürstliche Haus Thurn und Taxis*, 1899.

Thurnscoe, see DEARNE.

Thurrock, urban dist. of Essex, England, created in 1936 by the amalgamation of the former urban dists. of Grays, Thurrock, Tilbury, and Purfleet, and the rural dist. of Orsett, is one of the largest urban dists. in England. Industries include the manuf. of cement, soaps, detergents, and margarine, and oil refining. At Tilbury are extensive docks and ship-repairing workshops, and close by is Tilbury Fort, estab. by King Henry VIII. A portion of Rom. tessellated pavement and other antiquities have been found at Grays. In Hangman's Wood, Little Thurrock, are a celebrated group of dene holes. A passenger and car ferry connects Tilbury with Gravesend on the S. bank of the Thames. Pop. of urban dist. 91,140.

Thursday, fifth day of the week. It is named after Thor, the Scandinavian god of thunder. In the Rom. calendar the fifth day was Jupiter's Day, *dies Jovis*.

Thursday Island lies 30 m. off the N. tip of Cape York Peninsula, Queensland, Australia; it is H.Q. for the Torres Straits pearling industry. Area 1½ sq. m.; pop. 2066.

Thursley (from Thor's lea), village of Surrey, England, near Hindhead. It has a picturesque common and an old parish church which is partly Saxon. Iron was formerly worked in the vicinity. Pop. 700.

Thurso, seaport and mrkt tn of Caithness, Scotland, on Thurso Bay. It was formerly a trading centre with Scandinavia, and now exports Caithness flagstones. Harold's tower, over the grave of Earl Harold, once owner of Caithness and the Orkneys and Shetlands, is near T. Castle, home of a branch of the Sinclairs. T. was once the centre of Norse power on the mainland when at its zenith in the early 11th cent. and afterwards until the battle of Largs. The main industry is fishing, and it is also a holiday resort. Pop. 3200.

Thylacine, or Tasmanian Wolf (*Thylacinus cynocephalus*), a carnivorous marsupial of Tasmania, somewhat resembling a wolf. The fur, however, is

close and short, and the tail long and tapering; its fur is grey-brown and striped with black. The 4 young are carried in the pouch until they outgrow it.

Thyme, or *Thymus*, genus of small prostrate aromatic plants (family Labiatae), with rose-coloured, white, or heliotrope flowers. The 2 Brit. species are *T. pulegioides* (synonym *chamaedrys*) and the mt *T. (T. serpyllum)*, of which the lemon-scented T. of gardens is a variety. The T. used for seasoning and flavouring is *T. vulgaris*, a native of S. Europe.

Thymus Gland, temporary organ lodged partly in the anterior superior mediastinum, partly in the neck. It attains its full development at about the end of the second year of life, remains unaffected until puberty, after which it gradually atrophies and disappears. Its function is uncertain. A persistent T. G. in the adult has been considered (probably incorrectly) to be responsible for the condition of *status lymphaticus*, when death may follow any sudden exertion or shock. Recently the T. G. has been removed in the treatment of *myasthenia gravis*.

Thyratron, grid-controlled, hot-cathode valve with a trace of gas or mercury vapour, used as electronic switch or relay for timing current pulses. If a T. is connected across a capacitor being charged from a const.-voltage supply through a resistance, and the grid is kept negative, no current flows in the T. until the capacitor voltage reaches a value at which the anode potential is sufficient to make the electrons 'break through' the negative grid. The capacitor then discharges suddenly through the T. until the anode potential sinks below the critical value, whereupon the capacitor begins to charge again. The process is repeated automatically. The rate of charging depends on the time constant (q.v.) of the capacitor + resistance; the critical anode potential depends on the grid potential. Both can be adjusted so as to make the process repeat with a period between a few secs. and 0.0001 sec.

Thyroid Gland (Gk *thyreos* shield; *eidos* form), one of the ductless glands consisting of 2 lateral lobes, conical in shape, connected at about their lower thirds by an isthmus which passes transversely across the trachea. A third lobe called the pyramid sometimes arises from the upper part of the isthmus or from one of the lobes, generally on the left side, and ascends to the level of the hyoid bone. Occasionally this lobe is found to be detached. Structurally, it consists of follicles lined with epithelium, producing a peculiar yellowish, glue-like substance known as colloid. Its function is the production of the hormone thyroxine, which increases the rate of metabolism. In amphibia thyroxine causes metamorphosis, e.g. of the tadpole into the frog. Enlargement of the T. G., which may be due to hypertrophy of any of its constituent parts, is known as goitre (q.v.). When the hypertrophy is associated with increased secretory activity in the gland a toxic state results, known as thyrotoxicosis (q.v.), from an excess of thyroxine

in the blood. Of the symptoms of thyrotoxicosis the most noticeable is a protrusion of the eyes, and for this reason a toxic goitre is referred to as an exophthalmic goitre (q.v.). Deficiency of secretion in the T. G. causes a condition known as cretinism (q.v.), when the failure of function is congenital, and myxoedema (q.v.) when the gland fails in function in later life. Measurement of the basal metabolic rate (B.M.R.) is a long-established method of testing thyroid function. Essentially the test consists in recording the patient's oxygen consumption over a period of about 10 min. while the patient is at rest. By means of tables the amount of oxygen consumed is converted to its equivalent in heat production per unit of surface area (calories per sq. metre per hr) and then, by reference to further tables of age and sex, this is converted into a percentage of normal. The normal range of the B.M.R. is about ± 10 per cent. The usefulness of this test depends on ensuring that the patient really is fully resting when it is made, for the 'basal' state means as nearly as possible complete muscular, mental, and digestive rest. With a nervous patient, and those with thyrotoxicosis are nervous, this is difficult to achieve. A more modern test consists in assessing thyroid activity by measuring the speed of iodine metabolism by means of radioactive iodine. A 'tracer' dose of radioactive iodine is given to the patient, and by detecting, by means of special apparatus, its speed of movement throughout the body, and thus the speed of movement of iodine atoms in the body generally, the speed of iodine metabolism, which, in turn, depends on thyroid-gland function, may be measured. This is a reliable test, but its application is somewhat limited by the need for special apparatus. Also it cannot be used if the patient has had recent iodine medication of any kind. The function of the T. G. is largely controlled by the thyroid-stimulating hormone (T.S.H.) secreted by the anterior pituitary gland (q.v.). See also under HORMONES; DUCTLESS GLANDS.

Thyrototoxicosis, see HYPERTHYROIDISM.

Thyrsus, wand carried by Dionysus and the Bacchantes in his orgiastic rites.

Thysanura, or Bristle Tails, order of wingless insects, with long, many-jointed feelers and small paired limbs on several of the abdominal segments. They occur under stones or in damp earth, and often in human dwellings, one especially favouring bakers' ovens. One of the best known is the 'silver fish' (*Lepisma saccharina*) often found among papers in drawers and cupboards.

Thyssen, Fritz (1873-1951), Ger. industrialist, b. Mülheim, Ruhr, son of August T. (1842-1926), one of the founders of the Ger. steel industry. His father left him a 26 per cent interest in the vast Vereinigte Stahlwerke, or Ger. steel cartel, and he became its chairman of directors after 1926, with control of great iron and steel manufacturing plants. He had always been a nationalist and during the Fr. occupation of the Ruhr in 1923 he was court-martialled and imprisoned. He was

among the first Ger. industrialists to aid Hitler's rise to power, and after Hitler became chancellor T. was rewarded by the reorganisation of his virtually bankrupt company at the expense of the Reich, becoming, in effect, economic dictator of the Ruhr industrial region. From 1936, however, he began to disagree with Hitler's policies, and at the outbreak of war in Sept. 1939 he fled abroad. After the War a denazification tribunal deprived him of part of his property. T. d. in Buenos Aires. He wrote *I Paid Hitler*, 1941.

Tian Shan, see TIENSHAN.

Tiara: 1. Papal triple crown, symbol of sovereign power, not sacred like the mitre, a high cap of gold cloth, encircled by 3 coronets and surmounted by a gold cross.

2. Jewelled head ornament, usually of precious metal and diamonds, worn on the forehead of the head. It often begins in a foliage or scroll design at the sides of the head, rising to a higher central group. Diadem is an older word for the T. Diadems consisting of flat bands of gold links were found in the ruins of Troy and elaborate gold head-dresses of great magnificence, dating from 3500 BC, were found in the tombs of the Chaldean kings. The modern gem-set T., dates from a Napoleonic court fashion. It is worn on full-dress occasions.

Tiber (It. Tevere; Lat. Tiberis), third largest riv. of Italy, rising in the Apennines (q.v.) on the E. borders of Tuscany (q.v.), and flowing generally S. past Perugia (q.v.) and Rome (q.v.) to the Tyrrhenian Sea near Lido di Roma (see OSTIA). It is joined near Narni (q.v.) by the Nera, its most important trib.; other tribs. are the Aniene (q.v.), the Chiascio, and Paglia. The T. empties into the sea by 2 arms: the S. arm, or *Fiumara*, is silted up; the other, the *Fiumicino* is canalised. The morass between the arms was once known as the Sacred Is. or the Is. of Venus. Ships of small tonnage ascend the riv. to Rome. Length 245 m.

Tiberiacum, see BAGNACAVALLIO.

Tiberias, tn in Israel. The anc. city lay on the W. shore of the Sea of Galilee. Herod Antipas founded a new city c. AD 26, and called it T. in honour of the Emperor Tiberius, his benefactor. It later became the cap. of Galilee, a position held previously by Sepphois. It continued to be the seat of gov. under Agrippa I and under the Rom. procurators. After the destruction of Jerusalem (AD 70) it became a resort of the Jews. T. was the seat of a bishop under Constantine. It was taken by the Arabs in 657. Later, it was taken by Tancred, who erected a church in the city, but lost by the Crusaders in 1187. The modern tn stands at the NE. corner of the plain, some of the front walls actually rising out of the water. T., like tns in Syria and Trans-Jordan, is built of black basalt, which gives it a sombre aspect. It is partly surrounded by walls and bastions, restored by Omar al-Daher. A new residential quarter has grown up outside the walls on the slopes to the NW. of the

old tn. To the S. of the tn are the hot baths, famous for their curative properties in the Rom. occupation. The springs were known to the Romans as *Ammaus*, and extolled by Pliny. Herod Antipas built baths around the springs and placed his acropolis on the slope above. At present the main source of the springs is covered with a low dome, whence the hot water passes to the baths. The present baths were built by Ibrahim Pasha in 1833, during the Egyptian occupation, and additions were made in 1890 by the Turks. The therapeutic properties of the baths for rheumatism and skin diseases have long been recognised. The saline constituents of the water are chiefly sodium and calcium chloride and magnesium bromide, and the water is slightly radioactive. Below the baths is the tomb of the famous Talmudist Rabbi Meir, and to the N. of the tn those of Maimonides and Rabbi Ben Akiba. At the N. end of Lake T. is Cupernaum (Tel Hum), the synagogue of which has been excavated and re-erected. Pop. 17,000.

Tiberine Republic, see ITALY, *History*.

Tiberiopolis, see VARNIA.

Tiberius Claudius Nero (42 BC-AD 37), Rom. Emperor, the stepson of Augustus. He was the son of Ti. Claudius Nero and Livia, afterwards the wife of Augustus. He was carefully educated and became well acquainted with Gk and Lat. literature. At the age of 22 he was sent by Augustus to restore Tigranes to the throne of Armenia, and in 13 BC was consul with P. Quinctilius Varus. Three years before this T. and Drusus had been entrusted with the defence of the N. frontiers, and during the years from 12 to 9 BC he had conquered Pannonia. He remained in Germany until 6 BC, in which year he obtained the *tribunitia potestas* for 5 years, and retired with the emperor's permission to Rhodes. He returned to Rome at the end of 7 years, and in AD 4 was adopted by Augustus. In the same year he took command of the Rom. armies in N. Germany and here he remained during the next 7 years. On the death of Augustus, Tiberius hurried home, and the skilful management of Livia secured the throne to him without opposition. T. was suspicious in character, and he began his reign by putting to death Postumus Agrippa, the surviving grandson of Augustus. Then he proceeded to make himself absolute. Tacitus admits that from AD 14 to 23 Tiberius governed with justice and moderation (*Annals*, Books I-III), but ascribes his departure from Rome to a desire to give full vent to his sensual inclinations in private. T. had long hated Rome, and in AD 26 he left it, never to return. He first went to Campania on the pretext of dedicating temples there, but in the next year he moved to Capri, an is. off the Campanian coast. Meanwhile his minister Sejanus, in whose hands the real gov. of the state had long rested, was plotting to obtain for himself the imperial power. In AD 31 he was put to an ignominious death, to which many of his friends followed him. On 16 Mar. T. d. at the villa of

Lucullus at Misenum, having been smothered by the order of Macro, the prefect of the Praetorians. The character of Tiberius has been one of the most disputed points in hist. Tacitus and Suetonius unite in painting it in the blackest colours. He is defended by Dean Merivale in *History of the Romans under the Empire*, 1850-82, and by many subsequent writers. See F. B. March, *The Reign of Tiberius*, 1931; R. S. Rogers, *Studies in the Reign of Tiberius*, 1943.

Tibet, or **Thibet**, **Tubet**, or **Bod-pa**, Autonomous Region of the People's Rep. of China, formerly a dependency of China. It is bounded by the K'un-lun Mts on the N., separating it from the Chinese Sinkiang Autonomous Region; by the Chinghai and Szechwan provs. on the E.; by the Himalaya on the S., separating it from India, Bhutan, Nepal, etc.; and by Kashmir on the W. The boundaries are, in some cases, ill defined, as e.g. in Bhutan, where the bamboo forests appear to be accepted as the limit between the Tibetan rule as, too, was Darjeeling.

T. may be divided into 4 major physical regions: (a) the N. Plains (Chang Tang), a tangled mass of plains and valleys, averaging over 16,000 ft and rising sev. thousand ft higher in its mt peaks and ridges, the most important of which are the Nien-chen-tang-la and the Hlungpo-Gangri ranges. This region is bounded on the N. by Kunlun and the steppes of Tsaidam, and extends S. to the valley of the Tsangpo; (b) S. T. consists of the valleys of the Upper Indus and Sutlej in the W. and the great valley of the Tsangpo in the S. and E. The 3 great rivs. all have their source in the same region, near the sacred lake of Manasarovar; (c) E. T. comprises the mts and valleys lying between the Chang Tang and the Chinese frontier. On the E. slopes of the Chang Tang rise the great rivs. of SE. Asia, the Salween, Mekong, and Yangtse; somewhat to the N. the Hwang Ho; and (d) the great Tsaidam basin with the Tsaidam swamp and the Koko Nor basin to the NE. The N. Plains are treeless owing to the great elevation; vegetation is scanty grass, but sufficient to graze large numbers of yaks, asses, goats, sheep, and other animals. Few potatoes can be grown, so that food for herdsmen has to be brought from other parts of the country. Hence most of this great region is uninhabited and forms one of the main barriers of Central Asia. S. T. is proper, known to the Tibetans as Pö (in contrast to the Chang Tang of the N.) and here are found the chief tns, Lhasa, Shigatse, and Gyantse; it also includes the seat of the Dalai Lama and his gov. E. T. is a land of considerable natural resources; grazing is abundant, agriculture is possible on a large scale, and mineral wealth is known to be considerable.

Gold is found in T., and according to some explorers there are rich deposits in N. and E. T. which have been scarcely touched. Mining is carried on in only a few places, and though some gold is exported to China, it amounts to little.

Iron pyrites are found and lapis-lazuli and mercury in small quantities, also salt and borax among the lakes of the N. The climate varies considerably, though for the most part cold and dry. It is influenced by the SW. monsoon, and high winds are frequent. In certain dists, the rainfall is very high and in parts extremes of cold and heat are felt. Sheep and cattle are reared, also goats, pigs, and poultry; and horses, mules, and donkeys are used. There are innumerable species of wild animals, including the yak, leopard, deer, antelope, bear, wolf, etc., and rare kinds of pheasants and partridges are also found.

Trade is carried on principally with Szechwan, Sinkiang, Chinghai, Inner Mongolia, Nepal, India, and Indo-China. The Tibetans are keen traders, and the country is well supplied with trade routes. There is the Srinagar-Leh-Shigatse route, which is joined at Leh by the Hindustan-

for Chinese tea, which the Tibetans prefer to Indian. Motor cars and lorries are rapidly replacing the erstwhile caravans, and the price of industrial goods from other parts of China has been greatly reduced. An air service between Lhasa and Peking and Lhasa and India was inaugurated in 1956, and both the Dalai Lama and the Panchen Lama visited India in that year by flying over the Himalaya.

The chief imports are silk, carpets, gold lace, tea, porcelain, leather, cotton goods, horses, and sheep, and the chief exports are wool and woollen goods, salt, rugs, furs, drugs, borax, and some gold and silver.

The people of T. are of Mongoloid origin, as far as is known, and they speak Tibetan, which is allied to Burmese, and comprises a number of dialects. The religion of the country is Lamalism (q.v.). Polyandry is a custom of the people, all the brothers in a family having the same wife, but this custom is not widespread. The country is divided into 4 dists.: Chien Tsang (which includes Lhasa), Hou Tsang, Ali, and Chamdo Area. The real rulers of T. are the Lamas, whose authority is vested in the Dalai Lama at Lhasa, who is concurrently a Vice-Chairman of the National People's Congress in Peking. At Lhasa there is a national assembly, or *Tsongdu*, which settles all the important affairs of state, and is responsible for the country's relationship with the Peking gov.

The mysterious land of T. from very early days was the objective of explorers. Its inaccessibility and the exclusiveness of its inhab. merely operated as a spur to explorers, who knew that the rivs. which have their source within its mt fastnesses have become the sacred rivs. of Hinduism and that the country was also the site of many of the most sacred shrines of Buddhism. Up to the time of the Brit. expedition of 1904 no European had succeeded in penetrating to Lhasa. In 1894 foreigners were allowed to advance as far as Yatung to the N. of the Himalayan state of Sikkim for trade, but the trade with what, before 1947, was Brit. India always remained small, T. continuing to derive the bulk of the tea it consumed in the form of brick tea by difficult routes from W. Szechwan. T. and India were linked by telephone in 1922. A line also exists between Lhasa and Gyantze. The whole area of T., excluding the Chamdo Area, is 349,420 sq. m., with a pop. of 1,273,969 (1954), including Chinese and Mongolians, and Tibetans in the Chamdo Area. The majority live in the dists. between Lhasa and the Chinese border.

History. Of the early hist. of T. little is known. In 639 Srongtsan Gampo founded Lha-lan, which later became Lhasa, and also introduced Buddhism into the country. In 641 Srongtsan married Princess Wen Cheng of the T'ang Imperial House; her statue is still kept in the Potala in Lhasa. Tributes were paid to the Chinese court as late as 672; but from 676 onwards T. made successive raids on the NW. border of China. In 821 a peace treaty between China and T.

E.N.A.

TIBET: THE SHEKAR-DZONG, OR LAMASERY OF SHINING CRYSTAL

Tibet' road via Simla. But the most important route from India is from Kalimpong (Darjeeling dist.) across the Dzopel La via the Chumbi valley to Phari and thence by motor road to Lhasa. From Lhasa 2 motor roads were built in 1955: one strikes N., passing the Tsaidam basin to join the railway junction at Lanchow in Kansu; the other goes due E. via Chamdo and Tatsienlu (Kangting) to Chengtu, the railway centre in Szechwan. Tatsienlu is an important entrepôt of trade and lies on the ethnographic frontier between T. and China. Here the wool of Tibetan sheep is exchanged

was agreed, the terms of which were inscribed on a huge stone tablet. Chinese annals record that T. declined in 866, probably due to constant warfare with its W. neighbours. From the 5th to the 10th cents. T. was a monarchy, which eventually disintegrated owing to opposition among the nobles to the increase of temporal power among the priesthood. This period of disunion lasted from the 10th to the 13th cents. The greatest figure of this time was Atisha, the Indian Buddhist, who came to T. in 1026. In 1253 all the E. part of the country was conquered by Kublai Khan, and it was he who first placed the gov. in the hands of the lamas. The first priest-king was the abbot of the Sakya lamasey, but in the 17th cent. the Sakya line was overthrown by Nga-Wang Lob-sang, abbot of the Drepung lamasey, and he inaugurated the present line of rulers, the Dalai Lamas. In 1417 there was a. in Kansu the founder of the Yellow Church, Tsong-Kapa, who went to T. in 1431 and studied in the Sakya monastery of Tsashi Lhungpo. He reformed the old Red Cap Church and imposed a strict code of morals on the priesthood. His 2 great disciples, Ganden Truppa and Kuchi Nima, became the first Dalai Lama and the first Panchan Ngoerhtehni, whose successors have ever since been regarded as direct reincarnations of the 2 Lamas. It was not until 1720 that the country was finally brought under Chinese rule. In 1774 Warren Hastings made amicable contacts with the Tesho Lama, then regent of T. But these came to nothing of a permanent nature owing to Tibetan suspicion that the English had fomented a Nepalese invasion of T. in 1792, and throughout the 19th cent. it proved impossible to come to any sort of agreement at all. India had always been anxious to open up trade with T., and between 1872 and 1886 3 different missions were organised, but were abandoned. In 1888 the Chinese invaded Sikkim and a military expedition was sent to drive them out, which resulted in a treaty (1890-3). The lamas not having been consulted in the matter, they took offence, and revenged themselves by trying to bring about a treaty with Russia. Further inroads were made into Sikkim, and Lord Curzon, then viceroy of India, came to the conclusion that strong measures were necessary. Col. (afterwards Sir) F. E. Younghusband was sent with an escort to see if he could come to terms, but he was unable to do anything. It was then decided to send an armed expedition, and in Dec. 1903 Col. Younghusband, with Gen. Ronald Macdonald in command of the troops, set out, and after some severe fighting they reached Lhasa on 3 Aug. 1904, and the Dalai Lama fled. Peace was concluded in Sept. by a treaty which provided against further incursions into Sikkim and estab. Brit. trade marts, and also prevented any foreign power receiving concessions in the country; the Tibetans also had to pay an indemnity. A treaty with Russia was concluded in the following year, in which it was agreed that no concessions should

be sought by either power, and no expeditions dispatched without the consent of both countries, for a term of 3 years, and Chinese suzerainty over T. was recognised. In 1908 the Dalai Lama was reinstated in Lhasa by Chinese authority; but in 1910 he was deposed and fled to Brit. protection in India. After the Chinese revolution of 1911 the Chinese agreed (1912) to leave the country and the Dalai Lama returned. In July 1912 the Chinese Gov. sent out another expedition with the object of reconquering T., but in consequence of a memorandum sent to China by the Brit. Gov., drawing attention to the Anglo-Chinese treaty of 1906, it was withdrawn. A conference was held at Simla, 1913-14, between England, China, and T., but the convention which was then drawn up assuring autonomy to T. was not ratified by China. Further trouble arose between T. and China in 1917, and in 1920 Sir Charles Bell (Brit. representative in T.) was invited to negotiate a peace at Lhasa. No final settlement was reached.

In 1933 the thirteenth Dalai Lama d., and a regent assumed control. In 1939 a new and very youthful Dalai Lama was discovered and installed with all the customary ceremony. The Tibetan Gov. admitted to Lhasa a Chinese mission of condolence on the death of the thirteenth Dalai Lama, and since 1939 the Rep. of China has had a commissioner at Lhasa. The regent, who acts on behalf of the minor Dalai Lama, the temporal and spiritual head of the country, is assisted by a council (*Kashag*) of 4 ministers (*Shapes*). There is also a national assembly (*Tsongdu*), an advisory body containing most of the monastic and lay officials. In 1950 the Peking Gov. sent an army from Szechwan to T., but halted it at the border. The Panchan Lama pledged his loyalty to the new gov. and went to Peking via Chinghai. The Dalai Lama was urged to send his representatives to Peking for negotiation, and an agreement was reached in May 1951, in which, *inter alia*, the Peking Gov. granted the Tibetans the right of national regional autonomy within China. Peking, however, retains its right of defence and foreign affairs. In 1954 both Dalai Lama and Panchan Lama went to Peking as Tibetan representatives in the National People's Congress and were elected Vice-Chairmen of the Congress. In Dec. 1956 both toured India as a goodwill mission and returned to T. in Feb. 1957.

Archæology. An examination of the wooden pillars in the halls of the 2 famous temples of Lhasa, the Tsuglakhang and the Ramoche strengthens the supposition that both buildings are the work of Nepalese craftsmen of about the 13th cent. Only a few of the old frescoes are traceable, having been repainted in recent times. In Yerpa, on the road to Ganden, in a valley which opens a few m. E. of the capital on the R. Kichu are some very fine statues dating from the 12th cent. and believed to be either Indian or influenced by Indian art. The place is famous from the fact that a great Indian teacher, who played a prominent part in

introducing Buddhism into T. in the 13th cent., passed much of his lifetime in that wilderness. In Ganden is the tomb of the reformer, Tsong-kapa, founder of the Yellow Church. The Kichu, where it enters the Tsampo (Tibetan name for the Brahmaputra), passes a number of places of much historical interest, such as Ramagan, with 9th-cent. inscription; Usan, where the famous 9th cent. Sanskrit-Tibetan dictionary was written; Samye, built in the 8th cent., noted for its temple inscriptions and statues of Indian workmanship. In the valley of On are 2 notable lamaseries: that of Ngari Taktsang of the T'ang period, and that of Choding, famous as the habitat of Tsong-kapa. Some distance to the NE. is the lamasery of Zinchi, sacred to Tibetans for the image of Maitreya—the Buddha to come who now dwells in a heaven, awaiting his descent upon earth. Southward along the R. Chonghie, lies Changhie, where in the stronghold of the local 16th-cent. princes the fifth Dalai Lama was born, one of the leading personalities of T. According to tradition the tn is famous for the tombs of the Tibetan monarchs: they are natural hillocks eroded by the waters and then adapted by man. One of them is the tomb of Srongtsen Gampo, the real founder of the Tibetan power in the 7th cent. (see 'Hidden Treasures of Tibet,' by Prof. Giuseppe Tucci, in *The Times*, 19 July 1949).

Literature. Tibetan literature began with the introduction of Buddhism and the trans. of the Indian classics. A second period began in the 15th cent., mainly under Chinese influence, but Tibetan literature has never lost its religious character. Two of the most sacred books are the *Kangyur*, or the Canon of the Buddhist Law, trans. from the Sanskrit, and the *Tengyur*, a commentary upon the Canon in 225 vols. It is not known when printing or xylography was introduced into T. The text is printed from wood blocks on large sheets of paper, which are not bound, but placed between boards and wrapped in silk. A Tibetan book may weigh some 30 lb. Apart from the sacred writings, T. is rich in folk-lore, short stories, and fables, handed down orally from generation to generation. The love of theatrical performances among the Tibetans has produced a stock of religious, historical, and fairy plays.

Art. Tibetan painting is a sombre reflection of Lamaism, the earliest portrait being that of the goddess Tara, dating probably from the 10th cent. The demonic subjects of Tibetan paintings are generally luridly depicted, while later Lamaistic paintings of a lighter character lose even this distinction, and have been pronounced as merely 'provincial Chinese art.' Tibetan architecture from an early time assumed an imposing style. Whence it originated is not known. It is distinguished for its solidity and massive design. Of old buildings still standing, the Jo Khang, the Lhasa Cathedral, and the huge lamasery of Samye may be mentioned. In the applied arts great

skill and beauty were attained in the production of metal-ware, jewellery, and decorated swords. Most household utensils are of metal, chiefly copper, or wood, and the best worked metal-ware comes from the Derge dist. of Kham.

See Sven Hedin, *Central Asia and Tibet*, 1903, and *Trans-Himalaya*, 1909-13; F. Grenard, *Tibet: The Country and its Inhabitants* (Eng. trans.), 1904 (contains a long general account of the country); Sir F. E. Younghusband, *India and Tibet*, 1910; P. Shera, *A Tibetan on Tibet*, 1926; Sir Charles Bell, *Tibet, Past and Present*, 1927, and *The Religion of Tibet*, 1931; S. N. Wolfenden, *Outlines of Tibeto-Burman Linguistic Morphology*, 1929; H. Forman, *Through Forbidden Tibet*, 1936; M. Pallis, *Peaks and Lamas*, 1940; A. Ghibaut, *Tibetan Venture*, 1947; E. Wentz (ed.), *Book of the Dead*, 1950; articles in *China Reconstructs*: Fan Chih-lung, 'From Tibet to Peking' (Feb. 1955), Chang Po-chun, 'First Highways to Tibet' (May 1955); F. M. Bailey, *No Passport to Tibet*, 1957.

Tibetan Hound, anct breed of dog, used in Tibet as a watch-dog; it is a very powerful animal with a long coat. Mentioned in old Chinese literature and by Marco Polo, the T. H. is regarded as the ancestor of many present breeds.

Tibeto-Chinese Languages, see LINGUISTIC FAMILIES.

Tibia, the larger of the 2 bones in the lower part of the leg and popularly called the shinbone. It articulates with the femur above to form the knee joint, the fibula externally at its upper and lower ends, and with the astragalus below, forming the ankle joint.

Tibullus, Albius (c. 54-19 BC), Roman poet, was descended from an equestrian family, whose estate was at Pcdum, between Tibur and Praeneste. In the year 28 BC he followed his patron, Messala, into Aquitania and thence into the E., but was taken ill at Coreyra and had to return. His poetry, addressed to 2 mistresses under the names of Delia and Nemesis, has little ardour, but is marked by its air of gentle tenderness and self-abnegation; on the other hand, his bucolic elegies are some of the sweetest and best in the Lat. language. Horace was warmly attached to him. His tender elegiac love poems, by their limpid clearness and remarkable finish, seem to justify Quintilian in putting T. at the head of all elegiac poets. The text of the poems was ed. by J. P. Postgate in Oxford Classical Texts, 1905, and with a trans. by him in the Loeb Library, 1912. See W. Y. Sellar, *Horace and the Elegiac Poets*, 1892.

Tibur, see TIVOLI.

Tic Douloureux, see NEURALGIA.

Tichborne Case, one of the most celebrated trials in the annals of the Eng. criminal law. The prisoner, Thomas Castro, otherwise 'Bullocky Orton,' the big butcher of Wapping, was tried and convicted for perjury in putting forward in the civil courts a bogus claim to the Tichborne title and estates (1872). Not only did Orton, in posing as Sir Roger Tichborne, son of Sir J. F. Doughty

Tichborne (d. 1862), answer with astonishing skill every question put to him in the civil actions, but even the real Tichborne's mother at first identified him as her missing son. The whole proceedings cost the Tichborne family some £70,000 in legal expenses. In 1874 Castro was sentenced on 2 counts to 2 cumulative terms of 7 years' penal servitude each. See J. Brown, *The Tichborne Case Compared with Previous Impositions*, 1874; Lord Maugham, *The Tichborne Case*, 1936; M. Gilbert, *The Claimant*, 1957; D. Woodruff, *The Tichborne Claimant*, 1957.

Ticino (Ger. Tessin): 1. Canton of Switzerland, lying on the S. slopes of the Alps. Area 1088 sq m. In the S. it merges into the Lombard plain. It is watered by the Ticino and its tribs. Cereals, tobacco, fruit, chestnuts, vines, and silk are cultivated. It was taken by the Swiss from Italy in 1512 and joined the League in 1803. Cap. Bellinzona (q.v.). Pop. (1955) 179,600, It. speaking, mainly Rom. Catholics.

2. Riv. of Switzerland and N. Italy, which rises in the above canton, follows the St Gotthard road and railway, flows through Lake Maggiore and between Piedmont and Lombardy, and joins the Po 3½ m. SE. of Pavia. Length 150 m.

Ticinum, see PAVIA.

Tickell, Thomas (1686-1740), poet, b. Bridekirk, Cumberland. Educ. at Oxford, he was appointed prof. of poetry there in 1731. His complimentary verse *Rosamund* brought him into touch with Addison, who, on becoming secretary of state in 1717, made T. his under-secretary. He wrote much minor verse, his longest work being *Kensington Gardens*, 1722, his most popular *Lucy and Colin*, 1725, his finest, the elegy prefixed to his ed. of Addison's works, 1721. See R. E. Tickell, *Thomas Tickell and the Eighteenth-century Poets*, 1635-1740, 1931.

Tickhill, urban dist., tn and par. of the W. Riding of Yorks, England, 6 m. S. of Doncaster. There are ruins of a Norman castle, an Augustinian priory, a 13th-cent. hospital of St Leonard, and a 14th-cent. church. Pop. 2500.

Ticks, or Ixodidae, family of Acarina (Mites), with flat bodies protected by horny shields. During part of their existence they are blood-sucking parasites on animals and birds, for which they have developed a rostrum or beak composed of 2 barbed harpoons above and a dart below. Eggs are laid on rough herbage and hatch into white 6-legged larvae, which climb up the legs of passing animals and in some species complete their life hist. on the coat, but in others return to the grass for a period. T. cause irritation and anaemia, but their chief danger to their hosts is in the introduction of parasitic protozoa, causing such diseases as Texas fever and redwater.

Ticonderoga, vil. of New York, U.S.A., in Essex co., situated NW. of Lake George, with manufactures of paper and wood-pulp. Graphite is found near by. During the Fr. and Indian War T. was unsuccessfully attacked by Gen. Abercrombie, and Gen. Howe was killed here

in 1758. It was taken, however, by Amherst in 1759. In the War of Independence it was taken by Americans under Ethan Allen (q.v.) in 1777, retaken by Gen. Burgoyne, on whose surrender it was abandoned, and recaptured by the British in 1780. Pop. 3500.

Tiounas, Indians found in Brazil and Peru around the confluence of the Javari and Marañón.

Tidelands Oil. For years the ownership of off-shore resources along the U.S. coast-line has been a subject of controversy. The coastal states have maintained that the submerged lands and the resources which they contain, lying within the 3-mile limit controlled by the states under international law, are the property of the state concerned. The U.S. Supreme Court has taken the position that such lands and resources are Federal property. In 1945 the submerged lands and their resources were declared a naval petroleum reserve by President Truman. In 1953 President Eisenhower passed a bill which gave the coastal states title to all submerged lands which lay within their historic boundaries, with rights to develop whatever resources lay therein. There was much criticism of the bill by Democrats.

Tidemand, Adolf (1814-76), Norwegian genre painter, b. Mandal. From 1832 to 1837 he was a pupil at the Copenhagen Academy and later at Düsseldorf under Hildebrandt and Schadow. T. settled at Düsseldorf in 1846, where he contributed much to the fame of the Düsseldorf School, and was a friend of his compatriot Hans Gude. Together with him T. painted 'Night Fishing,' 1851, 'Funeral on Sogne Fjord,' 1852, and 'The Marquess of Lansdowne.'

Tides, regular disturbances of the fluids on the earth, produced by the action of the gravitational forces of the moon and sun. The earth, having a diameter of about 8000 m., is subject to a stress due to the different degrees of gravitational pull. Some evidence of tidal action in the atmosphere is barometrically shown, but even in the tropics, where it is greatest, the difference in pressure never reaches 0.1 millibars. The oceanic waters are markedly disturbed, and the predominating influence of the moon is shown by the usual interval of 24 hrs 51 min. between similar phases being identical with the average interval between 2 successive passages of that body across the meridian. The following elementary investigation shows some of the quantitative results of tidal forces.

The Tractive Force. Let E and M be the centres of the earth and the moon, respectively, and let a plane through E and M intersect the surfaces of the earth and moon in the circles NHZH' and QR, this plane lying in the plane of the paper (Fig. 1). Let r be the radius of the earth which will be assumed to be a sphere, and let ME, the distance between the centres of the moon and the earth, be R. Take any point P on the circle ZHNH' and join P to E and M. Draw a line PL parallel to EM and let the angle PEM be

average. The prin. tide here being that due to the moon, the sun raises the low at the expense of the high T. When the moon is in perigee spring T. are higher, and if this occurs about 1 Jan., when the earth is nearest the sun, the highest T. are produced; in each case low tide is correspondingly reduced. The relative heights of spring and neap T. are about 7:4.

Rise and Fall. Since the earth with its waters is rotating, every place as it comes under the influence of external attraction has its waters gradually lifted to a maximum, then gradually dropped to a minimum. The *flowing* or *flood tide* is the former, the *ebb-tide* the latter movement. Alternating high and low T. should occur, according to Fig. 3, twice each in 24 hrs; actually the average period is 24 hrs 51 min., since during the rotation the moon travels forward in its orbit, so that a place carried by the earth's rotation from high tide position completes

its antipodal crest in the S. A sublunar place is carried round by the earth's rotation in a plane inclined at an angle to the diameter forming the crests, so that its record high tide is not at the antipodal crest but to one side of it, the second high tide being thus less than the first; this is known as the diurnal inequality.

The *theory of tides* has been worked out very completely by Sir George Darwin, with very many interesting and important results. For example, Lord Kelvin concluded, from an analytical study of 33 years' observation, that the earth as a whole must be more rigid than steel, but perhaps not quite so rigid as glass. The friction due to T. involves a loss of energy obtained from the earth's energy of rotation, and tends to retard it, thus lengthening the day by about 1 sec. in 120,000 years according to Dr H. Jeffreys' theoretical investigations, confirmed by Dr J. K. Fotheringham's work on the

FIG. 2. OCEAN TIDES

a full rotation, but has to travel in addition another 12° or $\frac{1}{2}$ hr before coming again under the moon.

Priming and Lagging. The T. *prime*, or arrive early, at the time of spring tide, the average interval being about 24 hrs 38 min.; at neap tides the interval averages 25 hrs 6 min., and the T. *lag*. These differences are due to the conjunction of solar and lunar T. At new and full moon, when these T. coincide, the crest would be under the moon; at quadrature the solar wave crest and trough combining symmetrically with the lunar trough and crest respectively, produce merely a difference in height, not a displacement. In other positions displacement will occur owing to the combination of the lunar and solar crests. This gives high tide if the sun's influence is exerted to the W. of that of the moon, about $\frac{1}{2}$ hr ahead for the angle 45° , 3 days after full or new moon. The $\frac{1}{2}$ hr is gained from diminished intervals for the 3 preceding days. When the solar crest occurs to the E. of the lunar within a quadrant, the combined crest is found farther E. and is reached later by a similar interval, giving lag.

Diurnal Inequality. Twice a month the moon being at its farthest point N. (28°) of the celestial equator, the tidal wave crest is found in the N. hemisphere,

times of anet eclipses. This retardation of the earth's axial rotation implies less angular momentum in the earth-moon system, and to maintain the constance of this angular momentum the moon must recede from the earth, thus lengthening the month. This forms the basis of Sir George Darwin's *tidal evolution* theory, which thus accounts for planets having receded from the parent body after separation.

Actual Tides. The configuration of land and water, and the varying depth of the latter, are the chief elements in completely upsetting calculations from theory. High T. occur at all intervals before and after the meridian noon in different places. For any port the mean interval is known as the establishment of the port; at New York it is 8 hrs 13 min., with a variation of 22 min. either way during the month; at London Bridge it is 1 hr 58 min.; at Bristol, 7 hrs; at Yarmouth 9 hrs.

Height of Tides. In the open ocean no accurate determinations have been made, but 2-3 ft is the average height. Shallow seas, by diminishing the velocity, increase the height, which may be exaggerated again by entry into converging channels or estuaries. A hundred ft, it is said, has been recorded in the Bay of Fundy; at Bristol 50 ft is attained, yet the E. coast

of Ireland shows a range of only 2 ft. The effect of shallow water and projecting land, giving rise to reflection and interference, is to set up tidal currents, although the true tides give no displacement of water. Such currents entering riv. mouths give rise to the bore, eiger, or mascaret. It has been sometimes stated in text-books that these currents may give rise to double T., as at Southampton, the falling T. of the channel driving through Spithead and the rising tide of the Solent each giving high water. This erroneous explanation has been frequently exposed, but is still repeated. The correct explanation, which is too long to be dealt with in this article, is given in standard books mentioned at the end.

FIG. 3. SUCCESSIVE HIGH AND LOW TIDES

M1, first position of moon; M2, second position; X1, X2, tides.

Uses. Physiographically T. aid in the destruction of coast-line and help to carry debris to the sea; they prevent the formation of deltas, yet aid rivs. in building their lower flood plains. Biologically they have immense influence, the sea-shore 'between tides' having its peculiar life. Commercially they are useful in carrying vessels inland, and for the generation of electrical energy.

Absence of Tides. Though theoretically T. are produced in all bodies of water, they are often inappreciable; thus Lake Michigan has probably a tide of 2 in. Land-locked seas such as the Mediterranean and Baltic have usually very small T.

Tides in Relation to Practical Navigation. In navigating coasts where the tidal range is considerable, caution is always necessary; for there are in-draughts to all bays and bights, although the general run of the stream may be parallel to the shore. The turn of the tidal stream offshore is seldom coincident with the time of high and low water on the shore. In open channels the tidal stream ordinarily overruns the turn of the vertical movement of the tide by

about 3 hrs, forming what is known as tide and half-tide, the effect of which is that at high and low water by the shore the stream is running at its greatest velocity.

The tidal predictions given in Part I of the Admiralty's Tide Tables can generally be relied upon to give the times of high and low water within a few min. and the heights within a few tenths of a ft; times and heights at 'secondary' ports, found by means of the tidal differences given in Part II, are considerably less exact than those predicted in the tables for 'Standard' ports; times and heights found from the tidal constants may be considerably in error, and caution is advised, particularly in waters where diurnal inequality is great.

The data used on the charts of different nations vary considerably. That adopted for the Admiralty charts founded on surveys carried out by the surveying vessels of the R.N. is, in waters where the diurnal inequality is small, the level of mean low-water springs, and in waters where the diurnal T. are considerable the level of Indian spring low water. As, however, a very long series of tidal observations is required before either of these levels can be definitely determined and as the chart datum depends, in most cases, on a few weeks' observation only, the datum adopted must always be considered as approximate, and differs considerably in some cases from the theoretical datum. Where Admiralty charts are founded on the charts of other nations, the datum is that used by the original authority.

It has to be remembered by navigators that the tide may fall below datum, except in cases where the lowest possible low water has been used as datum. In waters where diurnal inequality is small the lowest tides usually occur when the moon is near perigee and near the equator at springs, or at about the equinoxes; where diurnal inequality is great the lowest tides usually occur when both the moon and sun are in high declination at springs or at about the solstices. Wind or a high barometer may also reduce the height of the tide and cause it to fall below datum. (*Admiralty Pilot.*)

See G. H. Darwin, *The Tides and Kindred Phenomena in the Solar System*, 1898; H. Lamb, *Hydrodynamics*, 1932; A. T. Doodson and H. J. Warburg, *Admiralty Manual of Tides* (H.M.S.O.), 1941; R. C. H. Russell and D. H. MacMillan, *Waves and Tides*, 1952. For tidal friction in shallow seas, see H. Jeffreys, *The Earth*, chapter xiv (2nd ed.), 1929; Martin Davidson, *From Atoms to Stars*, (3rd ed.), 1952, Appendix vi.

Tideswell, tn of Derbyshire, England, 6 m. E. of Buxton, in the Peak dist. It has a 14th-cent. church and an old grammar school. There are lead mines in the area. Pop. 2000.

Tidore, is. of the N. Moluccas, Indonesia; situated off the W. coast of Halmahera. The cap., Tidore, is on the E. coast. In the S. the is. is a symmetrical volcanic cone. It is fertile, producing cotton, maize,

fruits of various kinds, and spices. In the early 18th cent. the Portuguese captured the is., but in the next cent. it became a Dutch colony. Area, 45 sq. m.; pop. 19,000.

Tidworth, North, tn and par. of Wilts, England, 13 m. NNE. of Salisbury, a military centre. Pop. of par. c. 3000.

Tieck, Johann Ludwig (1773-1853), Ger. writer, b. Berlin; studied literature at Erlangen and Göttingen. After much travelling he became director of the Dresden theatre in 1819. T. was drawn to the Romantic school by the brothers Schlegel. He tried his hand in many fields: critical writings (*Dramatische Blätter*); poetry (*Romantische Dichtungen*, 2 vols., 1799-1800); drama (*Blaubart*, 1797, *Der gestiefelte Kater*, 1797, *Kaiser Oktavianus*, 1804); but he was especially successful as a writer of short stories. His *Phantasus*, 1812-17, is a collection of old tales and legends. In later years he freed himself from the romantic tendencies, and wrote many *Novellen*, which rank amongst his best work, as *Das Dichterleben*, *Der Tod des Dichters*. The novel *Der Aufruf in den Ewennen*, 1826, remained incomplete. He also trans. *Don Quixote*, and continued Schlegel's trans. of Shakespeare. See R. Minder, *Ludwig Tieck*, 1936.

Tiel, tn in the prov. of Gelderland, Netherlands, on the R. Waal. It is the centre of a fruit-growing dist. and has a large jam factory. In the Middle Ages T. was a member of the Hanseatic League (q.v.) and an important trade centre. The tn was heavily damaged in the Second World War and lost some of its anc. buildings. Pop. 16,870.

Tiele, Cornelis Petrus (1830-1902), Dutch theologian, and scholar, b. Leyden. He was prof. of the hist. of religions from 1877 to 1901. His best-known works are *On the Elements of the Science of Religion*, 1897-9, and *Outlines of the History of Religion*, 1876. See life by J. H. de Ridder, 1902.

Tielt, old tn in the prov. of W. Flanders, Belgium, 16 m. SSE. of Bruges. Its belfry dates from 1275. Chief manufs. are linen, woollen, and cotton goods. Pop. 13,100.

Tienen (Fr. Tirlemont), old tn of Brabant, Belgium, 26 m. E. of Brussels; situated on the R. Gette at the crossing place of the main road from Cologne to the N. Sea. T. is most probably of Rom. origin. It was a busy mkt in the early Middle Ages. At present it is the seat of the most important sugar-refinery of the country, producing yearly about 600,000,000 lb. of sugar. There are also tanneries, breweries, and engineering workshops. Pop. 22,600.

Tien-Shan, or **Tyan-Shan**, oblast (prov.) of the Kirgiz S.S.R., on the S. border, including part of the Tien-shan mts (q.v.). It is the most important livestock region of the Kirgiz S.S.R. Chief town is Naryn. Pop. 105,000.

Tienshan (*Thian-Shan*, celestial mts), mt system of Central Asia, forming part of the boundary between the U.S.S.R. and Sinkiang and extending NE. from

the Pamir to the W. fringe of the Gobi desert. The main range, including the ranges of Peter the Great, Trans-Alai, Kokshal-tau, and Sary-yassy, forms the border ridge of the High Plateau of E. Asia, to which they slope on the SE. In this chain, with a general elevation of 15,000-20,000 ft. are the chief peaks, Pobedy peak (24,406 ft.) and Khan-Tengri (23,620 ft.), and the largest glaciers, and it is crossed by passes at an elevation of 10,000-14,000 ft. On the NW. slope are a series of shorter fringing chains, running parallel to the main ridge. The general elevation of these minor chains is 10,000-19,000 ft. Forest rises to about 9500 ft.

Tientsin, municipality and port of the prov. of Hopei, China, at the junction of the Pailho with the Grand Canal, 76 m. SE. of Peking. It is the emporium for N. China, with an extensive trade. The exports consist chiefly of coal, skins, cotton, wools, ground-nuts, beans, peas, and dates. In the Chinese-Jap. conflict in July 1937 T. was bombed and occupied by the Japanese (22 July). Since 1950 it has become the chief centre of heavy and light industry in N. China. Area, 133 sq. m.; pop. (1954) 2,693,831.

Tiepolo, Giovanni Battista (1696-1770), It. painter, b. Venice. His earliest master was Lazzarini, a noted painter in his day, but it was the work of Paul Veronese and of Titian that chiefly influenced him. His earliest known pieces are those in the chapel of Sta Teresa in the church of the Scalzi at Venice. These pieces, in conception after the style of Piazzetta, have been criticised for affectation and wanton fantasy, but they have force and brilliance. His individual special gift was that of creating a luminous and aerial atmosphere in which he rivals Veronese. T. did a great deal of work on the huge ceilings and walls of the villas and palaces of Venice and its environs, and later, at Würzburg and at Aranjuez and San Sebastian in Spain. In 1737 he also did a number of notable works for the interiors of the Villa S. Sebastiano at Malmara, near Vicenza, the chief being 'Scenes from the Iliad', 'Orlando Furioso', and 'Gerusalemme Liberata', in which he was assisted by his son, Giovanni Domenico (1727-1802). His best ceilings and frescoes in Venice are 'The Institution of the Rosary' (1739), 'The Triumph of Antony and Cleopatra' (Palazzo Labea). For sheer virtuosity T., last of the great Venetian fresco-painters, is unsurpassed. He d. in Madrid. See lives by H. W. Hegemann, 1940, and A. Morassi, 1943.

Tierra del Fuego (Land of Fire), group of is. separated from the S. extremity of S. America by the strait of Magellan. It consists of sev. large is., the prin. ones being called Tierra del Fuego or Isla Grande (area 18,500 sq. m.), Navarin, Hoste, Clarence, Santa Inez, besides a number of much smaller size, the most important of which contains Cape Horn at the extreme S. The highest peak is Mt Sarmiento (7500 ft.). T. is inhabited by savages of low type, who now number less than 1000. T. was discovered by

Magellan in 1520. Half of Tierra del Fuego Is., and the isles W. of it, belong to Chile, the rest forms an Argentine ter. (cap. Ushuaia) with an area of 8000 sq. m. and a pop. of 5050. Punta Arenas is cap. of the Chilean portion, Magellanes Ter. Large tracts of the Chilean Is. are devoted to sheep-farming, largely by Brit. subjects, and there are important fisheries. See H. Mielche, *Journey to World's End* (trans.), 1945; E. Lucas Bridges, *Uttermost Part of the Earth*, 1948.

Tiers Etat, see THIRD ESTATE.

Tiffin, city, co. seat of Seneca co., Ohio, U.S.A., on the Sandusky R., 40 m. SSE. of Toledo. It is the seat of Heidelberg Univ. Pop. 19,000.

Tiflis (Georgian Tbilisi), cap. of the Georgian Rep. in Transcaucasia, a major industrial and cultural centre of the U.S.S.R., situated on both banks of the R. Kura. It has diverse engineering (machine tools, equipment for food and textile industries, radio and telegraph equipment, etc.), food, and light industries, and is an important transportation centre (4 railway lines, airport, Georgian Military Road to Ordzhonikidze in N. Caucasus). It is the seat of the Georgian Academy of Sciences (founded 1935 as the Georgian branch of the U.S.S.R. Academy of Sciences, transformed 1941), a univ. (founded 1918), a conservatoire (founded 1917), an arts academy (founded 1875 as a school of painting, transformed 1922), and other higher educational estab.; it also has a public library (1850), a Georgian (former Caucasian) museum (1867), and an opera and ballet theatre (1851). There are many treasures of Georgian architecture, including 5th-7th-cent. churches (St David's and Anchiskhat churches, and Zion cathedral), Lurdzhi monastery church (12th cent.), Metekhi Castle (1278-93), and Anchiskhat bell-tower (1675); there are also sev. interesting 19th- and 20th-cent. buildings. Known since the 4th cent. AD, since the 6th cent. it has been cap. of Georgia or E. Georgia. It became Russian in 1801, and was the seat of the Viceroy of Caucasus till 1882. It was cap. of the anti-Bolshevik Transcaucasian Federation (q.v.), 1917-18, of independent Georgia, 1918-20, of the Transcaucasian Federal Rep. within the U.S.S.R., 1922-36, and of T. Oblast within the Georgian Rep., 1951-3. T. is an old centre of Georgian culture (printing press in 1709, philosophic seminary in 1755, theatre in the 1790s, first newspaper in 1819); in the 19th-early 20th cents. it was the cultural centre of the whole of Transcaucasia (first Russian paper in 1828, Russian theatre in 1845, Armenian theatre in the 1860s). Politically it was one of the strongholds of Social Democracy in Russia. Pop. (1956) 635,000 (1st in Transcaucasia, 10th in the U.S.S.R.; 1897, 160,000; 1917, 264,000; 1926, 294,000; 1939, 519,000), Georgians, Armenians, Russians.

Tigellinus, son of a native of Agrigento, the minister to Nero's worst passions, and of all his favourites the most obnoxious to the Rom. people. On the

accession of Otho, T. was compelled to put an end to his own life. See Tacitus, *Annals* xiv, xv; *Histories* 1.

Tiger (*Panthera tigris*), huge and powerful carnivore, peculiar to Asia, though absent from Ceylon, Afghanistan, Baluchistan, and Tibet. The Indian T. rarely exceeds 10 ft in length, and the female averages about 8 ft 6 in. Fine males weigh from 400 to 500 lb. Young animals, which are characterised by their canine teeth being hollow throughout, are handsomer than older ones, the tawny orange colour being richer and the stripes

Camera Press

TIGER CUB

darker and closer together. T.s are monogamous, though there is no reason to suppose that they pair for life. The period of gestation is 14 or 15 weeks, and from 1 to 6 cubs are born, though more than 2 are seldom reared. T.s will eat carrion, but generally kill for themselves. Their food consists principally of deer, antelopes, and smaller animals, but occasionally powerful ones are attacked, and they sometimes kill the wild boar. Man-eaters are not, as in the case with lions, old and worn out, and many are in splendid coat when killed after a meal on human flesh. The taste is generally acquired during a hunt from which the animal escapes after having mauled a man, but even man-eaters are known to hunt for other food. The T. has been crossed experimentally with the lion; the resulting hybrid, the *tigon*, is faintly striped; it is sterile. See R. G. Burton, *The Book of the Tiger*, 1933; R. I. Pocock, *Fauna of British India, Mammalia*, Vol. 1, 1939.

Tiger Beetle, see CICINDELIDAE.

Tiger-cat, see OCELOT.

Tiger Flower, see TIGRIDA.

Tiger Lily, see LILY.

Tighina, see BENDERY.

Tighnabruaich, tn of Argyll, Scotland, popular holiday resort, situated on the Kyles of Bute. Pop. 1000.

Tightrope Walker, see ACROBAT.

Tiglath-pileser, name of sev. ant Assyrian kings (see ASSYRIA). T. I (c. 1115-1103 BC) restored the declining Assyrian power by a series of campaigns which re-established control as far west as

the Mediterranean. T. III (745-727 bc), whose native name was Pulu, in extensive wars to keep open trade routes into Assyria, initiated a system of provinces owing allegiance direct to his court and enforced by the deportation of recalcitrant populations. T. recorded his actions on behalf of (Jeho)ahaz of Judah, and against Israel and Damascus. He also mentions Azariah, Pekah, Hoshea, Menahem, and Hiram (see O.T.). Sculpture from his palace at Nimrud (Calah) is in the Brit. Museum.

Tigranes, or **Dikran**, name of sev. kings of anc. Armenia, one of whom flourished as early as 550 bc, and was a friend of Cyrus the Great, helping to overthrow the Median empire. The best-known bearer of the name (c. 121-55 bc) was the son-in-law of Mithradates the Great. He was King of Armenia (c. 96-55 bc), and master of the Syrian monarchy from the Euphrates to the sea (83), founding the city of Tigranocerta. T. at first supported Mithradates against the Romans (76), but was defeated by Lucullus (69-68) and by Pompey (66).

Tigre, one of the 3 most important provs. in Ethiopia, bounded on the N. by Eritrea. It is a prin. source of hides and skins for export and also an important producer of grain, beeswax, and wool. Potash and sulphur exist in payable quantities. The tns of Axum, Adowa, and Adigrat are historically famous. Estimated pop. of prov. 1,000,000. The Tigreans are a Semitic race.

Tigridia, or **Tiger Flower**, genus of bulbous plants (family Iridaceae), natives of tropical America. They are grown in the cool greenhouse and also in warm borders, with winter protection. *T. pavonia*, Flower of Tigris, and its varieties are particularly beautiful.

Tigris, one of the 2 large rvs. of Iraq, the other being the Euphrates (q.v.). It rises in Turkey on the S. slopes of the Taurus range, and flows E. across Turkey through Diyarbakir, entering Iraq E. of Nusaybin. Thence it flows SE to Mosul and Samarra and then S. through Bagdad. It is joined by the Euphrates 50 m. NW. of Basra to form the Shatt-al-Arab, which flows into the Persian Gulf. Length 1150 m. Navigable as far as Bagdad.

Tihwa, **Tihwafu**, see URUMCHI.

Tikopia, a small is. in Melanesia, but whose inhabitants have a Polynesian culture. They have sacred chiefs and, although under 1500 in number, a highly complex social organisation based on patrilineal clans. See Lt. Firth, *We, the Tikopia*, 1936.

Tiksi, port in the T. Bay of the Laptev Sea, near the Lena delta, on the N. Sea Route (q.v.); it is a supply base of N. Yakutia, founded in 1934.

Tilburg, tn in the prov. of N. Brabant, Netherlands, 15 m. SW. of s'Hertogenbosch. It is a great industrial centre, manufacturing cloth, woollens, soap, leather, etc. There is a Catholic economic univ. (estab. 1927). Pop. 129,985.

Tilbury Fort and Docks, fortification in Essex, England, on the Thames opposite Gravesend, enclosed by a moat. Origin-

nally built by Henry VIII, it was enlarged by Charles II. The troops raised in anticipation of a Sp. invasion were reviewed here (1588). The docks (507 ac.), which lie 1200 ft above Tilbury Ness, opposite Gravesend, 26 m. below London Bridge and about the same distance from the Nore, were opened in 1886, and formerly belonged to the London and India Dock Company, but are now under the control of the Port of London Authority. The great development of trade since 1886 has rendered frequent changes necessary. The latest extensions were begun in 1917, when the Port of London Authority extended the main dock 1450 ft. These extensions, which were completed in 1928-9 at a cost of £2,500,000, enable London to compete for the large ocean-liner traffic. They comprise a new entrance dock, 1000 ft by 110 ft with a depth of 45½ ft below T. H. W. at centre of sill, a floating structure, a dry dock 750 ft by 110 ft, and a passenger landing stage 1142 ft in length, at which vessels can be dealt with at any state of the tide, day and night. The dry dock is so constructed that it can be extended when necessary, without interference with its use, to a total length of 1000 ft. There are over 35 m. of railways in the Tilbury Docks. See also THURROCK.

Tilden, Samuel Jones (1814-86), Amer. lawyer and statesman, b. New Lebanon, New York. He was a famous Democratic leader, and in 1874 became governor of New York. He endowed a free library in New York. He was Democratic candidate for President, and was believed to be elected, but a special commission decided that the disputed votes of Florida, S. Carolina, and Louisiana should go to R. B. Hayes, his Republican opponent, who was thereupon declared president. See TAMMANY HALL and SOCIETY.

Tilden, Sir William Augustus (1842-1926), chemist who, after teaching chemistry at Clifton College for 8 years was made prof. of chemistry at Birmingham in 1880. He was later called to the Royal College of Science, London, and was elected a fellow of the Royal Society. His chemical work dealt mainly with the constitution of the terpenes (q.v.) and with various problems of physical chemistry.

Tilden, William Tatem, junior (1893-1953), Amer. tennis champion and author, b. Germantown, Pa. Educ. at Germantown Academy and the univ. of Pennsylvania he was world's champion of lawn tennis in 1920, 1921, and again in 1930, and with F. T. Hunter won the men's doubles at Wimbledon in 1927. He was for 10 years a member of the U.S. Davis Cup team. He wore the Amer. singles laurel for 8 years (1920-6 and 1929); he was clay court singles champion from 1922 through to 1927, and shared the national men's doubles title in 1923 and 1927. In 1930 he became a professional, and led the professional singles field in 1931 and 1935, and in 1945, at the age of 52, he and Vincent Richards won the professional men's doubles trophy.

Tile, thin plate of various materials, earthenware, porcelain, marble, glass, etc., used for roofing, flooring, walls, fireplaces, etc. Roofing T.s of marble-coloured clay were used in ancient Greece and Rome, coloured glazed roofing T.s were known in ancient China and Japan, and unglazed red earthenware roofing T.s were used in medieval Europe. Floor T.s of medieval Europe, as much a branch of brick-making as of ceramics, were made of red earthenware often with a lead-glaze and slip decoration (see **SLIPWARE**). Large pavements of these T.s were mosaic in form. The use of earthenware T.s for wall decoration is of Near-Eastern origin, as early as Darius I, c. 500 bc. Painted specimens from Samarra (Mesopotamia) are of 9th-cent. origin, and dated examples from Persia go back to the 13th cent. The mosaic type of T. work, cutting to shape from slabs of tinged earthenware, spread from N. Africa to Spain under the Moors. Sp. T.s with coloured glazes, lustrated, stamped in relief, and painted, were made at Seville, Valencia, and in Catalonia, etc. The imported Sp. T.s led the Italians to imitate them and to create Maiolica (q.v.) T.s for flooring. But in the Netherlands, the maiolica technique was extended to pictorial representations extending over many T.s for wall and fire-place decoration and the great Dutch T. manuf. of the 17th cent. sprang up, favouring blue-and-white designs. These were copied in N. France, Germany, and England, where about 1756 at Liverpool transfer-printed decoration was used. Porcelain T.s were made at Meissen and Fürstenberg.

Till, see **BOULDER CLAY**.

Tillage, see **CULTIVATION**.

Tillamook Language, see **NORTH AMERICAN NATIVE LANGUAGES, Pacific Areas**.

Tillandsia (named in honour of E. Tillands, Swedish prof.), family Bromeliaceae, genus of 400 species of stemless herbaceous plants, natives of tropical and sub-tropical America, usually epiphytic. *T. usneoides* is Sp. Moss or Old Man's Beard, which hangs from trees in the tropics, sometimes used in stuffing birds. *T. utriculata*, wild pine of Jamaica, has leaves with expanded bases, retaining water as if in a bottle. Sev. 'T.' are cultivated as pot plants or epiphytes in a warm greenhouse.

Tillett, Benjamin (1860-1943), Labour leader and politician; b. Bristol and began his career in a brickworks, later joining the R.N. Subsequently he organised the Dockers' Union, of which he became general secretary. T. largely organised the dock strike of 1889. He shared responsibility for the developments which placed the general labour unions in an equal position with the organisations of skilled craftsmen inside the Trade Union Congress. He was M.P. (Lab.) for N. Salford (1917-24) and president of the T.U.C. (1929). T. pub. a short hist. of the Dockers' Union in 1910, and his *Memories and Reflections* in 1931.

Tillcultry, police burgh in Clackmannanshire, Scotland, 4 m. from Alloa,

situated on the R. Devon at the foot of Ochil Hills. Industries are mining, paper coatings, stationery, and textiles. Pop. 3818.

Tillotson, John Robert (1630-94), Archbishop of Canterbury, b. Halifax, of a Calvinist family; educ. at Cambridge. He was at first a Presbyterian, but was ordained in 1660 or 1661, accepted the Act of Uniformity, and became chaplain to Charles II (1666). In 1672 he became dean of Canterbury, in 1675 canon of St Paul's, in 1689 dean of St Paul's, and in 1691 archbishop of Canterbury. He was strongly anti-Catholic, and pub. *Rule of Faith*, 1666, and 4 lectures on the Socinian controversy, 1693. His sermons are famous for their prose style, and are among the best examples of the pulpit oratory of his times. See selections ed. by G. W. Weldon, 1886, J. Moffat, 1926.

Tilly, Johann Tzerclaes, Count von (1559-1632), Ger. soldier, b. Tilly in Brabant and brought up by Jesuits. He served in the Sp. army in the Netherlands. Later, he left the Sp. service for Austria, and in 1607 became gen. of the Bavarian army and Catholic League, greatly distinguishing himself during the Thirty Years' War. He won the great battle of the White Mt. near Prague, in 1620, and was also victorious at Wimpfen, Stadtlohn, Wiesloch, and Kocust. In 1630 T. was appointed commander-in-chief of the imperial forces, and besieged and took Magdeburg, after a fierce struggle. Four months later, however, he was defeated by Gustavus Adolphus at Breitenfeld, and, shortly afterwards, on the banks of the Lech, where he was mortally wounded, and d. at Ingolstadt the following day. See Count Villermont, *Tilly ou la guerre de trente ans*, 1859; O. Klopp, *Tilly im 30-jährigen Kriege*, 1861, 1891-6; Keym Marcour, *Johan Tzerclaes Graf von Tilly*, 1884; life by G. Gilardone, 1932.

Tilman, Harold William (1898-), mountaineer, advocate of the small mobile Himalayan party, and leader of the 1938 Everest expedition. He had a distinguished record in the First and Second World Wars, has explored many mt. dists. in Africa and Asia, and led the first ascent of Nanda Devi in 1936. He has written *Ascent of Nanda Devi*, 1937, *Snow on the Equator*, 1938, *Mount Everest*, 1938, *When Men and Mountains Meet*, 1947, *Two Mountains and a River*, 1949, *China to Chitral*, 1951, and *'Mischief' in Patagonia*, 1957.

Tilsit (since 1946 Sovetsk), tn in the Kaliningrad Oblast of the Russian Federal Rep. (former E. Prussia), on the Niemen 65 m. NE. of Königsberg. It has a timber and paper industry. It was founded in 1288 by Teutonic Knights as a castle, and has been a tn since 1552. Here Napoleon I concluded treaties with Russia and Prussia in July 1807, by which Prussia lost her possessions W. of the Elbe, and Westphalia was formed out of W. Prussia and Hanover. Prussian Poland was assigned to Russia and Saxony, and the Tsar Alexander I was to join an alliance with Napoleon against England. Pop. (1939) 59,000.

Timaeus (c. 346–c. 250 BC), Gk historian, was the son of Andromachus, tyrant of Tauromenium in Sicily. He was banished from Sicily by Agathocles, and passed his exile at Athens, where he had lived 50 years at the time when he wrote the thirty-fourth book of his *History*. This, his greatest work, was a hist. of Sicily from the earliest times to 264 BC. See F. Jacoby, *Fragmente der griechischen Historiker*, vol. iii B, 1950.

Timaeus of Locri, Gk philosopher of the Pythagorean school, contemporary with Plato. To him is usually ascribed the work *Concerning the Soul of the Universe*, written in the Doric dialect. It deals with the same subjects as Plato's dialogue *Timaeus*.

Timaru, seaport and city of S. Is., New Zealand, on the E. coast between Christchurch and Dunedin, chief tn of S. Canterbury dist. The climate is equable, with little rain, and there are some 400 ac. of scenic and recreational reserves. It was the first N. Zealand tn to operate a tn-planning scheme. Industries include the manuf. of woollen goods, footwear, pottery, furniture, flour, and allied products, agric. implements, and engineering products and the frozen-meat industry is carried on near by. There is an airport, and a good harbour, the area of which was doubled during the Second World War. It became a city in Nov. 1948. Pop. 24,700.

Timber from dicotyledons or broad-leaved trees is known commercially as 'hardwood.' T. from Gymnosperm or coniferous, 'needle-leaved' trees is known as 'softwood.' These terms are long estab. and widely used and accepted. Not all hardwoods, however, are hard; some indeed, such as Balsa (*Ochroma lagopus*) from S. America, are extremely soft, much softer in fact than any softwood. Conversely, some softwoods are quite hard, Yew (*Taxus baccata*), for instance, being almost as hard as oak. There are many thousands of different hardwood species, and hardwoods are found in forested areas throughout the world. Softwood species, on the other hand, are numbered in hundreds, and although softwoods are found in many parts of the world, it is in the N. parts of the N. Temperate Zone that the great softwood forests are found—in Russia and Siberia, Finland, Sweden, and the lands round the Baltic, in SE. Europe and over the Atlantic, in Canada and the N. U.S.A. Softwoods are also well represented in mountainous regions S. of the 'Conifer Belt'—in the Himalaya, the Atlas Mountains, and the Mexican Highlands.

Hardwoods vary widely in all their properties. They vary most obviously in colour, from the white of holly to the black of ebony, with every shade of red, brown, and yellow in between. They vary in weight, from the 7 lb. per cub. ft of balsa to the 80 lb. per cub. ft of lignum vitae (*Gustacum officinale*) from the W. Indies. Most hardwoods weigh between 35 and 80 lb. per cub. ft, the well-known T.s oak, mahogany, and teak weighing about

45 lb. per cub. ft or rather less. Hardwoods vary also in their durability, their hardness, their working properties, their taste and smell, their stability, their resistance to abrasion or indentation. Their properties largely determine the use to which they are put. Unlike the hardwoods, softwoods vary comparatively little. They all weigh approximately 30 lb. per cub. ft and are similar for the most part in colour. They are characterised by the difference in colour—marked in some species, less marked in others—between the spring-wood and the summer-wood. Their cellular structure is simpler than that of the hardwoods, and illustrates their more primitive origin and development. It also makes it more difficult for the expert to identify the species of softwood, and he will usually have to use a microscope. Hardwoods, with their more distinctive features and cell structure, are easier to identify, and a hand lens with a $\times 10$ magnification is usually all the expert requires.

Whereas over 200 species of hardwood are in use in Britain, mostly imported from many countries, 20 species of softwood at the most are in use. Indeed 6 or 7 softwood species account for the bulk of the wood we use. These are European Redwood and Whitewood, Douglas Fir, Western Hemlock, Canadian Spruce, Western Red Cedar, Litch Pine, and a few other species of pine and spruce. The prin. uses for T. are house building and other construction work, boxes and packing-cases, pit-props, railway sleepers, telegraph and transmission poles, joinery, flooring, ship and boat building, road and rail transport, furniture, civil engineering, small household articles, tool handles, beer barrels, chemical vats, cooling towers, shop-fittings, and a variety of other industrial, agric., and domestic uses. Hardwood is sold by the cub. ft and softwood by the Standard of 165 cub. ft. In 1955 the U.K. imported 38,500,000 cub. ft of hardwood and 1,269,000 Standards of softwood.

See also FORESTRY; TREE; and articles on individual trees. See W. S. Jones, *Timbers: Their Structure and Identification*, 1924; S. Recond and R. Hess, *Timbers of the World*, 1943; H. T. Eyres, *Introducing Wood: Facts for all who handle it*, 1950.

Timber (in Law). In real property T. means oak, ash, and elm by general custom, and various other trees by local custom. It becomes important to consider what T. denotes when construing the powers of a tenant-for-life under a settlement (q.v.). A tenant-for-life, unless expressly authorised, is liable for *Waste*, and felling T. is an act of *Voluntary Waste*. Neither T. nor *germins* (i.e. T. trees under 20 years) may be cut by a tenant-for-life, except that he may cut *germins* for necessary thinning of overgrown plantations and, on recognised 'T. estates,' he may periodically cut so much T. as by local usage is regarded as annual fruits of the land so cultivated. By the Settled Land Act, 1925, the tenant-for-life, even

though impeccable for waste, may with the consent of the court, cut and sell T. ripe and fit for cutting, most of the proceeds of which must go to 'capital money' for the benefit of the inheritance, and the residue as rents and profits to himself; if not impeccable, he takes all the proceeds. A tenant-for-life, impeccable for waste, is entitled to the proceeds of sale of ornamental T., properly cut to preserve adjacent T.

Timbrel, or **Ta-obret**, Heb. musical instrument, like the modern tambourine.

Timbuktu, in of the colony of Fr. Sudan, near the Sahara, 9 m. N. of the main stream of the Niger. Its position makes it a focus of caravan routes between Algeria, Morocco, and Tuab, and of traffic on the Niger, and it thus has considerable importance as a trade centre. It exports ostrich feathers, gums, salt (from Taudeni), and kola-nuts to Senegal, the Guinea Coast, and Morocco. Most of the houses are of straw and earth, but there are a few brick buildings, some mosques and schools, including a Muslim superior school, called a *medersa* (official), and a citadel and forts. René Caillé (q.v.) in 1824 approached the Niger at T., where his life was in constant danger. He was, however, not the first white man to discover T.; an Englishman, Maj. Laing, setting out from Tripoli, had reached this mysterious city of caravans and had been murdered there. In 1863 Faidherbe (q.v.), having routed his formidable adversary, El Hadj-Omar, lord of a vast region, concluded an agreement with the masters of T. But it was not until 1893 that Commandant Joffre (q.v.) seized the city and built a string of forts around it which have since then secured Fr. domination of this region. In 1904 it combined with Zinder-Chad to form the military ter. of the Niger. In 1920 it was formed into a military ter. incorporated in Upper Senegal-Niger, but in 1923 was converted into a civilian ter., under a lieutenant-governor. Pop. 6500. See P. Marty, *La région de Tombouctou*, 1920.

Timby, Theodore Ruggles (1822-1909). Amer. inventor; b. Dover, New York and passed his youth on a farm. In 1841 he exhibited, at Washington, a model of a revolving battery; in 1843 he made a model of a marine turret, but received little encouragement—either from the U.S. Gov. or from Napoleon III, whom he approached. He patented a turbine water-wheel, 1844, and, devised a method of firing heavy guns by electricity, 1861. In 1862 his idea of a marine battery was embodied in the ship *Monitor*.

'Time', Amer. magazine, correctly described by its subtitle as a 'weekly newsmagazine', founded at New York in 1923 by Henry R. Luce and Briton Hadden (d. 1929). It achieved as early as 1942 a circulation in excess of 1,000,000. In 1957 it had its own news-gathering bureaux in 15 cities of the U.S.A. and Canada, and 14 cities abroad, and issued not only Amer. and Canadian editions but 3 others, circulated overseas.

'Time and Tide', independent, non-party weekly review, founded in 1920 by

Viscountess Rhonda. Regular features include editorial comment and background articles on current politics, book reviews, financial notes, and criticism of theatre, films, music, and art. In the weekly *Notes on the Way*, to which well-known personalities of the day are invited to contribute, writers are allowed a free pen to discuss any subject they choose. Strongly anti-totalitarian, both in home affairs and foreign policy, *Time and Tide* has been banned in most Communist-ruled countries.

Time and Time Measurement may be determined by reference to some regular occurrence of any natural phenomenon. Thus the day is determined by the rotation of the earth on its axis, and the year by the periodic revolution of the earth round the sun. *Sidereal T.* is employed only in astronomical work, for definition of the *sidereal day*, which, unlike the solar day, is of constant length (see below). *Apparent T.* is taken from the apparent revolution of the sun, the mean solar day being the interval between 2 consecutive southings of the mean sun. The mean solar T. in any instant is the mean sun's hr angle, which can be converted into time by taking 15° as 1 hr, 15' as 1 min., and 15" as 1 sec. T. can be easily determined by travellers by observing the transits of known stars across known vertical circles. At sea different methods can be used. A simple method is to observe the altitude of the sun or a well-known star whose spherical co-ordinates are given in the *Nautical Almanac*. Then, the lat. of the place being known and also the Greenwich Mean Time (given by a chronometer or time signals), the local time can be computed. Local T. varies with the long. being 1 hr in advance of or behind the true Greenwich T. for every 15° to the E. or W. of Greenwich respectively. Owing to the confusion from the various local T.s, a standard T. has been introduced, the Greenwich T. being taken as the standard. This is known as *Greenwich Mean Time*, *Greenwich Civil Time*, or often as *Universal Time*.

Time Measurement. The ultimate standard to which all systems of T. M. are referred is *sidereal T.* The *sidereal day* is defined as the duration of a complete rotation of the earth on its axis relative to the stars. The *sidereal day* begins at a given place when the *First Point of Aries* (q.v.) is on the meridian. One of the duties of the Astronomer-Royal is to provide the nation, and, as we shall see, the civilised world, with a T. scale. A very accurate clock, known as the *sidereal clock*, is checked daily by astronomical observation of the instants when certain stars, known as clock stars, cross the meridian. In actual practice, T. is measured by the length of the *mean solar day*. A solar day is the duration of a complete rotation of the earth on its axis relative to the sun. The length of a solar day varies because the earth's orbit round the sun is elliptical and because the earth's axis is not perpendicular to the ecliptic (q.v.) or the plane of its orbit. For T. M. clocks are referred to the *mean solar day*,

which is divided into 24 mean solar hrs. The length of the mean solar day is constant, and it refers to the duration of 1 complete rotation of the earth on its axis relative to an imaginary body, the mean sun. The zero of this T. M. is the instant when the mean sun crosses the meridian at a given place. In England this place is chosen as Greenwich, and whereas the zero of T. M. was formerly referred to the instant at which the mean sun crossed the meridian in the cap. of a given country, it is now the practice for astronomers to refer all T. Ms to Greenwich. What is known as Greenwich Mean T. (G.M.T.) or Universal Time (U. T.) is T. measured from the zero of the Greenwich mean solar day. Formerly this day began at noon, but from 1 Jan. 1925, astronomers adopted a day of 24 hrs beginning at midnight.

The checking of G.M.T. from sidereal T. is a matter of astronomical computation (see *Whitaker's Almanack*). The advent of radio has simplified the regulation of clocks by means of the Greenwich standard clocks, since T. signals are broadcast.

Standard Times. Since 1883 the system of Standard T. by zones has been gradually accepted, and now almost throughout the world a Standard T. which differs from that of Greenwich by an integral number of hrs, either fast or slow, is used. A list of times in various regions of the world at 12 noon Greenwich Mean T. is given in the *Nautical Almanac* (ann.), and displayed in diagrammatic form in most good atlases. It is to be noted, however, that changes in standard T.s are often made without long previous notice, also that in the *Nautical Almanac* no account is taken of Summer T. in any country. Zone T.s have been adopted in various large countries. In Canada and the U.S.A. 5 standard T.s are used, the zones being bounded by meridians of long. 15°—the equivalent of 1 hr apart. Within each zone the mean T. for the meridian midway between each of the meridians 15° apart is kept. In the U.S.S.R. hourly zones from 3 hrs to 13 hrs fast on Greenwich time are used.

See also EQUATION OF TIME; HOROLOGY; METEOROLOGY. For Summer Time see DAYLIGHT SAVING; INTERNATIONAL DATE LINE; SUNDIALS. For T. in relation to space see RELATIVITY; SPACE.

Time Base, device for generating a voltage of saw-tooth waveform applied to the deflecting plates of a cathode-ray oscillograph (q.v.) producing an adjustable horizontal deflection of the spot with a quick fly-back at the end. It usually consists of a capacitor whose charge and discharge is controlled by a thyatron (q.v.) or hard-valve relay.

Time Constant. When electric d.c. supply of voltage E is switched-on to an inductive circuit of resistance R , inductance L , the magnetic field builds up gradually, the current rises exponentially according to the relation $i = \frac{E}{R} (1 - e^{-Rt/L})$,

where e is the base of natural logarithms. The ratio L/R is the T. C. of the circuit, the time in which the final value E/R would be attained if the current continued

to rise at the initial rate. Actually the current reaches 10 per cent of full value in time $t = 0.1 L/R$, 50 per cent in $0.7 L/R$, 63 per cent in L/R , 95 per cent in $3 L/R$. Theoretically, final value is reached only after an infinite time, $e^{-Rt/L} = 0$ when $Rt/L = \infty$. When the supply is switched off the current decays according to the equation $i = \frac{E}{R} e^{-Rt/L}$, a curve sym-

metrical to the curve of growth with resp. to the t -axis, but starting at E/R . When the supply is switched-on to a capacitor C through a resistance R , the capacitor voltage rises according to the relation $e = E(1 - e^{-t/RC})$, the T. C. is RC .

The charging current is $\frac{E}{R} e^{-t/RC}$, starting

abruptly at E/R . A high resistance gives a large capacitive T. C. and makes the capacitor voltage rise slowly, but a low inductive T. C., making the magnetic field grow faster. Low resistance makes the current in an inductive circuit rise slowly. Inductance coils (chokes) are used for smoothing current variations. Field windings in generators are more quickly responsive to changes in voltage if the resistance is high.

Time of Troubles, see TROUBLES.

Time Series, see STATISTICS.

Timenel, Eleonora, see FONSECA.

Time, see CHRONOGRAPH.

'Times, The,' daily newspaper, founded in 1785 under the title of the *Daily Universal Register*. John Walter I, the publisher, hoped only to establish himself as a book publisher by the promotion of a more economic method of type-setting, i.e. with units of words or groups of letters as well as single letters. The 'logographic' invention was a failure, but the news-sheet printed as an advertisement was a success. On 1 Jan. 1788 it was re-titled *The T.* In 1803 the management, and in 1812 the proprietorship, passed to his second son, John Walter II, under whom, assisted by the Napoleonic wars, the paper maintained its independence and secured a paramount position. In 1817 Thomas Barnes was appointed editor. He became the outstanding journalist of the century, and, as the champion of middle-class opinion, won for *The T.* the nickname of '*The Thunderer*.' John Walter III succeeded his father as proprietor in 1847. His editor, John Delane, claimed for the press a responsibility in national affairs that was conspicuously demonstrated by the newspaper's successful agitation for the proper equipment and care of troops in the Crimea. The competition of cheaper journals, after the repeal of the Stamp Act of 1855 was severe, but John Walter III refused to imperil the independence or inclusiveness of the paper. During the editorship of G. E. Buckle, *The T.* suffered a catastrophic reverse when it indicted Parnell on the basis of a letter secured in good faith, but found by the Parnell Commission (1889) to be forged. The reputation of the paper was damaged and its resources crippled. Arthur Fraser Walter, chief proprietor 1894-1908 and chairman 1908-10, appointed as acting

manager C. F. Moberly Bell, who laboured to retrieve solvency. Nevertheless, family disputes made necessary the public sale of *The T.* in 1908. Though the Walter interest was retained, the paper came under the control of Lord Northcliffe, and through his efforts flourished without loss of independence. His first editor, Geoffrey Dawson (1912-19) directed the paper's demands for a vigorous prosecution of the War, and under H. Wickham Steed (1919-22) *The T.* contributed, in particular, to the success of the Washington Conference and the Irish settlement. On Northcliffe's death in 1922 the control was acquired by Maj. the Hon. J. J. Astor (now Lord Astor of Hever), in association with John Walter IV. Dawson returned to conduct the paper until 1941, to be followed until 1948 by R. M. Barrington-Ward. His successor, W. F. Casey, retired in 1952, when Sir Wm Haley became editor. Since 1785 *The T.* has been edited and printed on the same site, Printing House Square. The Koenig and Bauer steam press (1814), the Applegarth-Cowper 4-cylinder press (1828), and the rotary, reel-fed Walter press (1866) were all designed for and first used by *The T.* In 1932 the Times New Roman type was designed in the office specifically for the newspaper. The Mobile Printing Unit, a miniature printing office for use should aerial bombardment, for instance, threaten pub., was also designed in the office, and was exhibited at the British Industries Fair in 1953. The financial control of *The T.* is governed by a trust deed which prevents the sale of shares except with the assent of a body of trustees consisting of the Lord Chief Justice, The President of the Royal Society, the Governor of the Bank of England, the President of the Institute of Chartered Accountants, and the Warden of All Souls College, Oxford. See *The History of the Times*: vol. 1, *The Thunderer in the Making*, 1935; vol. 2, *The Tradition Established*, 1939; vol. 3, *The Twentieth Century Test*, 1947.

'Times Literary Supplement,' London weekly review, founded in 1902 and pub. by The Times Publishing Company Ltd. It owes its present position to the completeness of its coverage of the field of publishing and the scholarly nature of its criticism. It offers, besides book reviews, articles of interest to authors, publishers, and above all readers, on literary and allied subjects. Reviews and general articles are anonymous.

Timgad, anct Rom. city of Algeria in the dept. of Constantine, founded by Trajan about AD 100. Since the visit of James Bruce in 1765, T. has proved to be of great archaeological interest and importance. Extensive excavations have been carried out.

Timisoara, or **Temesvá**, city of Rumania, on the Bega. It was the cap. of the Banat, and is now cap. of the prov. of Timisoara. It was an important defence against the Turks, who captured it in 1552 and held it till 1716. In 1920, by the treaty of Trianon, it passed from Hungary to Rumania. It is strongly

fortified, and is the see of a Rom. Catholic bishop and of a Rumanian Orthodox bishop, with a fine cathedral and castle. It is now an industrial and railway centre. The industries include textiles, brewing and distilling, chemicals, leather, and shoes. Its univ. was founded in 1845. Pop. (1948) 112,000.

Timmins, tn of Ontario, Canada, 268 m. N. of North Bay on the Temiskaming and N. Ontario Railway, and about 460 m. N. of Toronto. It is the centre of the Porcupine gold-mining area of N. Ontario. About 20 years ago it was only a rough frontier mining vil., but to-day it is a flourishing tn with all the facilities and amenities of a long-settled city. It has an additional source of future prosperity in the adjoining great clay belt of fertile agric. land estimated at 23,000 sq. m., where settlement has only begun. A feature of the tn is its large public park created in an area formerly occupied by unsightly mine-dumpings. Besides the large gold mines, there are sash and door factories, saw mills, and planing mills. Pop. 26,716.

Timoleon (4th cent. bc), Gk democrat, b. of the noblest families of Corinth. His whole life was spent in a ceaseless struggle for liberty, and in his youth this led him to the murder of his own brother Timophanes, who was trying to make himself tyrant of Corinth. In 345 bc the Gk cities of Sicily applied to Corinth for aid against the Carthaginians, and T. was sent with a small force. He took possession of Syracuse, and set about the estab. of democratic gov. in all the Sicilian colonies. Meanwhile the Carthaginians landed at Lilybaeum (339). T. was not able to collect more than 12,000 men, but with these he marched against the Carthaginian troops and totally defeated them. A treaty was concluded in the next year, and T. continued his work. The flourishing state of Sicily at the time of his death shows how beneficial was his influence. See Holden's ed. of Plutarch's *Life of Timoleon*, 1889.

Timon the Misanthrope, Athenian who lived in the time of the Peloponnesian war. On account of ingratitude and disappointments which he believed himself to have suffered, he secluded himself from the society of all but his friend Alcibiades. He is the central figure of Shakespeare's *Timon of Athens*.

Timor, or **Timur**, is. of the Malay Archipelago, largest and most easterly of the Lesser Sunda group, Indonesia. In 1859 a treaty divided the is. between Portugal and Holland, the boundaries being finally arranged by arbitration in 1914. Portuguese T. includes the NE. of the is. with the Ocuasi enclave, and the is. of Atauro and Jaco, Dili being the cap. and chief port. Area 7386 sq. m.; pop. 438,000. Dutch T. (now Indonesian) comprises most of the SW., including the is. of Roti, Peman, Savu, Sumba, Alor, and E. Flores, with Kupang as the cap. Area 5765 sq. m.; pop. 450,000. The soil is dry and not very fertile, and the country mountainous. Mt Atlas (12,000 ft) and Mt Kabalaki (10,000 ft) being the

culminating peaks. Among the chief exports are coffee, cocoa, copra, sandalwood, bêche-de-mer, and cattle. A noted breed of ponies is reared here. Pearls have been found off the SW. coast. The staple article of food is sago. See H.M. Stationery Office, *Peace Handbook*, No. 80, *Portuguese Timor*, and No. 86, *Dutch Timor*, 1920. T. was occupied by the Japanese during Second World War. Dutch T. became part of Indonesia in 1950.

Timor-Laut, or **Tanimbar**, is. group in S. Moluccas, Indonesia, 265 m. ENE. of Timor (q.v.). The chief is. are Yamdena, Selaru, and Larat. Chief industries are agriculture, cattle-raising, and trepang. Area of group 2172 sq. m.; pop. 31,800.

Timoshenko, **Semjon Konstantinovich**, (1895-), Russian marshal b. of peasant stock in the vil. of Furmanka, on the old Russo-Rumanian frontier. Called up for military service in 1915, he fought in the First World War. Early in 1918 he was with the Black Sea Partisan detachment, a cavalry force, fighting in the Crimea and against Kaledin's Don Cossacks. He later joined Budyenny's First Cavalry Army and became a skilful leader of night attacks, and rose in this army to the rank of gen. In 1920 he was in the Russo-Polish campaign, and after the defeat near Warsaw he returned to the Crimea, where, at Perekop, he was defeated by Gen. Wrangel's troops and severely wounded for the fourth time. He now entered on his real career as a military leader, for at the Frunze Military Academy, which he entered in 1922, he qualified for high command after long and intensive study both there and at the Military and Political Academy for commanders and commissars, which he joined in 1930. T. became military representative at Kiev and Kharkov, stages in his career which had an important bearing on his achievements in the Second World War. It was T. who retrieved the Russian military position in the Russo-Finnish war of 1939-40. When the Germans invaded Russia, T., who, as Defence Commissar, had reorganised the Red Army and introduced reforms without which successful resistance to the Ger. armies would have been impossible, was entrusted by Stalin with the defence of Moscow. After he had repulsed the Germans, Stalin sent him to stem the enemy's advance in the Ukraine in Nov. 1941. The re-conquest of Rostov on 26 Nov. of that year was due to his masterly tactics and strategy. From 1939 to 1952 he was a member of the Central Committee of the Communist Party and was subsequently a candidate member. See W. Mehring, *Timoshenko Soviet Marshal*, 1942.

Timotheus of Miletus (c. 450-c. 360 BC), Gk lyric poet. He added an eleventh string to the lyre (or cithara) and thus incurred the displeasure of Athens and Sparta. Euripides wrote a prologue to his *Persians*. See E. Diehl, *Anthologia Lyrica Graeca*, 1949.

Timothy, St (d. 97), young friend and fellow-labourer of St Paul. He was a native of Lystra, his mother Eunice being

a Jewess and his father a Greek. He accompanied St Paul on the second missionary journey, and the lives of the two are henceforward closely connected. He was left as the apostle's representative at Ephesus, where he received 2 epistles from him. Eusebius says that he met his death there in a popular riot, after denouncing the worship of Artemis. His feast is on 24 Jan.

Timothy, Epistles to, form with the Epistle to Titus the group known as the Pastoral Epistles, which give detailed instructions for the appointment of officers and the pastoral care of the Christian churches. They show many points of contact with one another and with the other Pauline epistles, but there are numerous departures from the latter both in diction and subject-matter. They are private letters of an official nature. In spite of many attempts to disprove the Pauline authorship, the balance of probability still rests decidedly with the traditional view that they are by St Paul. The First Epistle was probably written on a journey up the coast of Macedonia c. AD 56 after Paul's release from his first captivity. The second epistle is placed during the second imprisonment of Paul, of which no record is given in Acts. The pastorals are strongly doctrinal. The Christian life must show no incongruity between creed and practice, and Christianity must be translated into ethical and spiritual terms. The Christian is to fight a good fight and expect suffering, and his swan song will be a song of victory. Other points are the unity of God; the inspiration of Scripture; and the danger of riches. The modern critical study of the Pastorals began in the early years of the 19th cent. with Schleiermacher, who denied Pauline authorship to 1 Tim. See B.S. Easton, *The Pastoral Epistles*, 1948.

Timothy Grass, common name of *Phleum pratense*, perennial grass, native of Britain, often grown for hay.

Timrod, Henry (1828-67), Amer. poet, b. Charleston, S. Carolina. Educ. at Franklin College, he studied law, but gave that up and became a schoolmaster. In 1860 he pub. a vol. of verse, and some of his war poems, such as 'A Cry to Arms' and 'Carolina,' were such an inspiration to the South in the Civil war that he was termed 'the laureate of the Confederacy.' The war ruined him in both fortunes and health. See G. A. Wauchope, *Henry Timrod, Man and Poet*, 1915; V. P. Clare, *Harp of the South*, 1936.

Timûr Beg, or **Tamerlane** (1335-1405), sultan of Samarkand, b. Kesk, of Mongol origin, a direct descendant of Genghis Khan. He assisted and then attacked Husein, Khan of N. Khorasan and Jagatai, finally supplanting him in 1369. He made Samarkand his cap. and rapidly made himself master of the whole of Turkestan and part of Siberia. He next attacked NE. Persia. After a series of bloody and cruel conflicts, the whole of Persia, Georgia, Armenia, and the neighbouring states accepted him as suzerain. Timûr then turned his arms towards the N. and overran Kiptshak. He then

declared war against India, and in 1398 defeated the Indian army near Delhi. He later came into conflict with Europeans, when he attacked and took Smyrna, the property of the Knights of St John. He died at Otranto on the Jaxartes as he was marching to attack China. His name Tamerlane is a European corruption of Timur-lenk (Timur the Lame). He figures as the hero of Marlowe's (q.v.) great drama, *Tamburlaine*.

Tin, symbol Sn, atomic number 50, atomic weight 118.7, one of the 7 metals of the ancients, occurs as the oxide—tinstone or cassiterite (SnO_2)—and is found in Cornwall and New S. Wales, Australia, but the prin. deposits are in Malaya, the Dutch E. Indies, Bolivia, and Mexico. The metal is prepared from the ore (see **CASSITERITE**) by roasting to remove arsenic and sulphur, followed by heating in a reverberatory furnace with anthracite. The T. so formed is remelted and poles of green wood stirred in it. By this means impurities are carried to the surface in the form of a scum. T. is white and lustrous (sp. gr. 7.2), and melts at 232°C . It is crystalline in structure and when bent emits a curious crackling sound called the 'cry of tin.' T. is not acted upon by the air, and is therefore used for tinning iron (see **TIN-PLATE**). T. readily dissolves in hydrochloric acid with evolution of hydrogen and the formation of stannous chloride (SnCl_2). It is not acted upon by dilute sulphuric acid but dissolves in the concentrated acid. Stannic oxide is formed in the hydrated condition (as in stannic acid ($\text{SnO}_2 \cdot \text{H}_2\text{O}$)) by the action of nitric acid on the metal, while aqua regia acting on the metal forms the tetrachloride (SnCl_4). T. forms 2 series of salts, the stannous, in which it is bivalent, and the stannic salts, in which it is quadrivalent. The stannic salts correspond with similar compounds of carbon and silicon, the oxide (SnO_2) is acidic, and the chloride is a fuming liquid. The stannous salts are strong reducing agents. The oxide (SnO) is basic but also acts as an acid-forming oxide towards strong bases. The alloys of T. are of great value, comprising gunmetal (Cu 88, Sn 10, Zn 2 per cent), bronze (copper and tin), phosphor bronze (0.5 per cent phosphorus), pewter (Sn 80, Pb 20 per cent), modern pewter (Sn, Sb, Cu with a little Bi), solder, bell metal, as well as a large number of alloys with other metals such as gold, iron, bismuth, etc. One of the best-known compounds of T. is pink salt, $\text{SnCl}_2 \cdot 2\text{NH}_4\text{Cl}$, which is used as a mordant in dyeing, and the trisilicate of T. which is used in 'slilk-weighting' to replace the sericin in silk when it is degummed.

Tin Can Island, see **NIUAFOOU**.

Tin-plate and Sheet, basis of low-carbon unalloyed mild-steel coated by hot-dipping or electro-deposition with pure tin. It is used chiefly for the manuf. of cans and boxes. See **IRON AND STEEL**; **METALLURGY**.

Tin Tut (d. 1948), Burmese politician, was appointed Vice-Chancellor of Rangoon Univ., 1940, and became adviser for

reconstruction to the Burma Gov. in Exile, 1942-5. He was Member for Finance and Revenue in the Governor's Council. Minister for Foreign Affairs, 1948, he resigned from the Cabinet to become Inspector-General of Auxiliary Forces (Brigadier). He owned and ed. the *New Times* of Burma. He was assassinated in Dec. 1948.

Tinamou, any individual of the Tinamidae, a family of game birds inhabiting the forests of tropical and S. America and placed in a separate order, Tinamiformes. They resemble partridges in appearance, but have little or no tail. However, this resemblance is only superficial, for the T.s have a number of anatomical features in common with the flightless Ratite birds. Although their wings are short, they are able to fly with great speed.

Tinchebray, Fr. tn in the dept of Orne. Here Henry I of England vanquished his brother Robert of Normandy in 1106, after which Normandy was annexed to the Brit. crown. There are hardware and furniture manufs. Pop. 3000.

Tincture, see **HERALDRY**, *Tinctures*.

Tindal, Matthew (c. 1656-1733), deist. b. Bere Ferrers, Devon, and educ. at Lincoln College, Oxford, becoming fellow of All Souls (1678). After having been received into the Catholic Church (1685), he returned to the Church of England (1688), and later wrote controversial pamphlets, which all met with vehement opposition from the High Church party. He aroused very fierce controversy with the pub. of *The Rights of the Christian Church Against all Romish and Other Priests*, 1706. But his famous work was his *Christianity as Old as the Creation*, 1730, popularly known as 'The Deist's Bible,' which had for its purpose the 'stripping of religion of the additions which policy, mistakes and the circumstances of the times, have made to it.' See E. Curll's *Memoirs*, 1734; J. Hunt, *Religious Thought in England*, II, 431 1896.

Tindale, William, see **TYNDALE**.

Tinfoil, see **FOIL**.

Tinned Meat, see **CANNING**.

Tinnevely, or **Tirunelveli**, tn of Madras State, India, near the S. tip of the sub-continent. It is stated that it was here that St Francis Xavier began his preaching in India. T. has for many years been a particular centre of Christian missions.

Tintagel, coastal vil. and par. of Cornwall, England. The correct name of the vil. proper is Trevena, which merges with Bossiney. T. is a celebrated holiday resort with good bathing beaches. On T. Head, a promontory 300 ft high on the Atlantic coast, are the ruins of a castle, famous in the Arthurian romances. Some affirm that King Arthur was born here and held his court at T. In other versions T. is the impregnable retreat of King Mark. In 1685 a bor. charter was granted to T., Trevena, and Bossiney. Pop. of par., including Trevena and Bossiney, 1552.

Tintern Abbey, famous ruins of Tintern vil. in the co. of Monmouthshire, England, beautifully situated on the Wye, 5 m. N.

of Chepstow. They date from 1131, when Walter de Clare founded a Cistercian house which became one of the wealthiest foundations in England. The building was mainly erected between 1269 and 1287 by Roger Bigod, Earl of Norfolk. The chief remains are the ruins of the magnificent cruciform church, the chapter house, and refectory, which were purchased by the Crown in 1901.

Tinto, Río, see **RIO TINTO**.

Tintoretto, Jacopo Robusti (1518-94), chief painter of the later Venetian school, b. Venice. He studied under Titian, and was considerably influenced by Michel-

also lives and studies by F. P. Stearns, 1901; E. M. Phillips, 1911; L. Coletti, 1944; H. Tietze, 1949.

Tipperary: 1. Inland co. of the Rep. of Ireland, bounded by Galway and Offaly in the N., Cork and Waterford to the S., Laoighis and Kilkenny to the E., and Clare and Limerick to the W. The co. is one of those supposed to have been made by King John in 1210. It was granted to the Earls of Ormonde in 1328, and was the last of the Irish palatine cos. In 1848 it was the scene of the Young Ireland rising, an abortive rebellion. To the N. and W. lies a mountainous region with Keeper

TINTAGEL CASTLE

Youghlons

angelo, writing on the wall of his studio the precept 'Michelangelo's drawing, Titian's colour.' His paintings show never-failing imagination, broad and dramatic composition, fine draughtsmanship, and a superb use of colour. Where he is most individual is in his rendering of movement in space. His industrious life was spent almost entirely in Venice, and there he painted his great 'Miracle of St Mark, 1548, his decorations for the Scuola di San Iacopo (including the vast 'Christ before Pilate' and 'Last Supper') and the 'Paradise' for the Doge's Palace, 1540. The 'St George and the Dragon' (National Gallery) has all his sense of rushing movement, and 'The Origin of the Milky Way' (National Gallery) is one of the most beautiful of painted allegories. Perhaps no writer has shown better appreciation of T. than Ruskin, who rescued him from obscurity (*Stones of Venice*, etc.). See

Hill (2278 ft), and in the S. are the Galtee Mts. with Galtymore (3018 ft), the Knockmaldown Mts. and, farther E., the Slievecardagh Hills. The Bog of Allen adjoins Kilkenny, while in the SW. lies the Golden Vale, one of the most fertile regions in all Ireland. The prin. rivs. are the Shannon in the NW., Little Brosna and Nenagh, and the Suir in the centre, and S. is Lough Derg on the NW. boundary, the only lake of any size. Agriculture is the chief industry; barley and oats are the main crops, and potatoes and turnips are also grown; a considerable area is under pasture, and cattle are reared in large numbers. Dairy farming flourishes, and there are a number of butter factories. There are also flour and meal mills. Coal, copper, lead, and zinc are found, also slate and limestone, and peat and coal mining is being extended. There are many interesting castles and eccles. buildings in

various parts of the co., notably at Cashel, where there is a round tower, at Ardinnan, at Athassel (an Augustinian priory), at Holyroos (Cistercian abbey), and at Fethard and Roscrea (abbeys). Moor Abbey stands at the head of the Glen of Aherlow. The co. is divided into a N. and S. riding, and returns 7 members to the Dail Eireann, 3 representing the N. and 4 the S. The co. tn is Clonmel, and other tns are Tipperary, Carrick-on-Suir, Nenagh, Thurles, Cashel, and Templemore. Area 1659 sq. m.; pop. 137,000, decreased through emigration.

2. Mrkt tn of co. Tipperary, Rep. of Ireland, at the foot of the Slievenamuck Hills. In the fertile plain known as the Golden Vale, it is famous for its butter making, and there are also condensed- and powdered-milk factories, and lino and glove manufs. 4 m. from the tn is the Glen of Aherlow, and just outside the tn is New T., the vil. built by Wm O'Brien in 1890 for the Smith-Barry tenants who had to give up their holdings on account of the boycott. Charles Kieckham, the patriot poet and novelist, was b. in T. Pop. 5200.

Tippett, Michael (1905-), composer, b. London, studied at the Royal College of Music and in 1934 came forward with a Symphony in B flat major, now superseded by two others, Nos. 1-2, 1945 and 1958. A choral work of 1937, *A Song of Liberty* (Blake), expressed his humanitarian views, and even more so did the indignant war-time oratorio, *A Child of our Time*, 1941. T. is a very deliberate composer and also highly self-critical, so that further works appeared in slow succession, but always showed closely concentrated craftsmanship and great originality. He owes nothing to current systems, much less to fashions, but his work is distinctly modern in a very personal way. It includes a Concerto for double string orchestra, a Fantasy on a Theme by Handel, and a Concerto for piano and orchestra, 3 string quartets, a Fantasy Sonata for piano, and 2 sets of songs, *Boyhood's End* (W. H. Hudson) and *The Heart's Assurance*. An opera with a libretto of his own, *The Midsummer Marriage*, was produced in London, at Covent Garden, in 1955.

Tippoo Sultan, see **Tipu**.

Tipstaff, officer of the High Court whose function it is to arrest within the precincts of the Court and take to prison any person committed by the Court. The name is often extended to any constable, sheriff's officer, and court crier or usher, and is connected with the staff tipped with metal or a small crown which was formerly his badge of office.

Tipton, tn of Staffordshire, England, engaged in light and heavy engineering, iron founding, and the manuf. of motor-car parts, grates, furniture, glassware, hollow-ware, clothing, light metal goods, electrical equipment, machine tools, etc. Its par. registers, beginning in 1513, are the oldest in England. Pop. 39,300.

Tiptree, vil. in Essex, England, 46 m. from London on a light railway running from Kelvedon. It is noted for fruit and seed growing, and for its jam factory. Pop. 2453.

Tipu, or Tippoo Sultan (1749-89), son of Hyder Ali, succeeded his father as Sultan of Mysore in 1782. He had previously distinguished himself in the Mahratta war, 1775-9, and in the first Mysore war had defeated Braithwaite in 1782. As sultan he concluded a treaty with the British in 1784, but in spite of this invaded (1789) the protected state of Travancore. War followed, and in 1792 he was obliged to resign half of his dominions. But nothing daunted, he continued his intrigues, urging the French to stir up war with England, the result of which was the storming of his cap., Seringapatam, by the English, during which T. himself was killed. See L. B. Bowring, *Haidar Ali and Tipu Sultan*, 1893.

Tipulidae, see **CRANE FLY**.

Tiraboschi, Girolamo (1731-94), It. scholar, b. Bergamo. He was a Jesuit and prof. of rhetoric in the univ. of Milan, 1755. Here he wrote *Venera Humiliatorum Monumenta*, 1766. In 1770 he was appointed librarian to the Duke of Modena, and completed his masterpiece, *Storia della Letteratura Italiana* (13 vols.), 1772-82.

Tirana, cap. of Albania, 20 m. inland above the Rrushka valley. It dates from the 17th cent., when Albania was part of the Turkish dominions, and is noted for its mosques. The tn was much damaged during the Second World War, but was afterwards rebuilt and greatly expanded to become the administrative, educational and industrial centre of the new Communist-controlled Albania. Pop. (1955) 110,300.

Tiree, is. of the Inner Hebrides, off Argyll, Scotland. Hynish in the S. has a watch tower built for signalling to men on duty at Skerryvore lighthouse. The surface is flat, and has been used as a landing-ground for aircraft. Pop. 1200.

Tiresias, blind Theban seer, said to have been deprived of his sight by Athena, whom he saw bathing, but afterwards endowed by her, in pity, with gifts of prophecy. He counselled Oedipus and Creon, and Odysseus descended into Hades to consult him.

Tirgoviste, or Tergoviste, tn in the prov. of Ploesti, Rumania, 44 m. NW. of Bucharest. There is a 16th-cent. Gk Orthodox church and ruins of a 14th-cent. castle. It is a garrison tn, with a cavalry school and an arsenal. From 1383 to 1698 T. was cap. of Wallachia. Pop. (1930) 22,300.

Tirgu Mures (formerly Mures-Osorheiu, Hungarian, Maros-Vásárhely, Ger., Neudorf), cap. of the Magyar Autonómous Region, 50 m. ESE. of Cluj, Transylvania, Rumania, on the l. b. of the Mures. There is an old fortress with a Gothic church, and a palace with a library of 70,000 vols. Sugar, textiles, leather, spirits, and furniture are made, and there is a trade in grain and wool. Pop. (1948) 47,000.

Tiridates, name of a dynasty of Parthian or Armenian kings, 5 of whom are remembered. The 2 most important are Tiridates I and II. *Tiridates I* conquered Armenia with the assistance of his

brother, Vologeses I of Parthia. In AD 63 he was obliged by the victories of Corbulo to abdicate and accept his crown anew at the hands of Nero. *Tiridates II*, who had been educ. at Rome, was placed on the throne of Armenia by Diocletian in 286. He was constantly at war with the Persians, and d. a Christian in 314.

Tirlemont, see TIENEN.

Tiro, Marcus Tullius, freedman of Cicero, and his amanuensis and assistant in literary labours. He was himself an author of no mean reputation, and notices of his works have been preserved by anc. writers. He was the first recorded person to invent a system of Lat. shorthand.

Tirol, or Tyrol: 1. Former crown land of Austria-Hungary, in the Alps. In Rom. times it was inhabited by the Rhaetians (see RHAETIA). It was later ruled by the Bishops of Brixen and Trent (q.v.), and came into the possession of the house of Hapsburg (q.v.) in 1363. It was ceded to Bavaria (q.v.) in 1805 (see also HOFER, ANDREAS), but was returned to Austria by the Congress of Vienna (q.v.) in 1814. By the treaty of St Germain-en-Laye (q.v.) in 1919, T. was divided, the part N. of the Brenner Pass (q.v.) becoming a prov. of the new Austrian rep. (see 2, below), and the part S. of the Pass being ceded to Italy. It, T.—the Trentino (q.v.) and the upper Adige (q.v.)—was the subject of bitter contention between Austria and Italy, 1919–39. (For the hist. of this question, see under AUSTRIA.) After the Second World War the Council of Foreign Ministers, meeting in Paris, decided, despite Austrian demands to the contrary, that S. T. should remain It. Italy and Austria were encouraged to make a separate agreement relating to the region, and this was incorporated into the It. Peace Treaty of 1947. Under the agreement, Ger.- and It.-speaking people have equal rights, the region has a degree of legislative and administrative autonomy, and steps are to be taken to facilitate intercourse between Austrian and It. T. See M. Steinitzer, *Das Land Tirol*, Vienna, 1923; Foreign Office Historical Section, *The Trentino and Alto Adige*, 1920.

2. Prov. of W. Austria, the N. half of the former crown land of T. (see 1, above). It is bounded on the N. by Bavaria, and on the S. by Italy. E. T., the part S. of the Hohe Tauern, is detached from the rest of the prov. The main part of the prov. contains the great valley of the Inn, and the valley of the Lech—both running NE.–SW. The Alpine chains separating these valleys are broken up by many tribes, running N.–S. Grossglockner (12,460 ft), the highest peak in Austria, is at the junction of the borders of E. T., Salzburg, and Styria. The valley of the Drau crosses E. T. E.–W. The prov. is heavily forested. The chief occupations are dairy-farming, stock-raising, and forestry. Lignite, nickel, lead, and other minerals are found, there are textile and chemical manufs., and there are sev. hydro-electric installations. The cap. is Innsbruck (q.v.). Area 4884 sq. m.; pop. 427,450.

Tirpitz, Alfred Peter Friedrich von (1849–1930), Ger. grand-adm.; b. Küstrin, son of one 'Gross-Justiz-Rat' T., of a Prussian landowning family. Attended the Realschule at Frankfurt-on-the-Main. Passed into the Prussian Navy in 1865, and for 30 years was almost continuously at sea. In the 1870s T., a lieutenant-commander, prepared memoranda on torpedoes, which led to the estab. of a torpedo-section in 1885. In 1892 he was appointed to the naval staff at Berlin. Rear-adm., 1895, in 1896, he was appointed to command the Asiatic Cruiser Squadron; under his direction Tsingtao became a Ger. naval base. On returning home in 1897 he became secretary of state for the Navy. In 1898 he presented to the Reichstag his first Navy Bill, the beginning of the serious growth of the Ger. Navy. Vice-adm., 1899. His second Bill was brought in in 1900; it definitely started the naval armament 'race'. Adm., 1903. Grand-adm., 1911. At the beginning of the First World War he was still secretary of state for the Navy; but he was on bad terms with his 2 naval colleagues, and did not succeed in his purpose of making full use of the Navy from the beginning. He resigned 15 Mar. 1916, and was Nationalist member of the Reichstag from 1924 to 1928, and then retired to private life. He wrote *My Memoirs*, 1919, also *Der Aufbau der deutschen Weltmacht*, 1924.

'Tirpitz,' Ger. battleship, see NAVAL OPERATIONS IN SECOND WORLD WAR.

Tirso de Molina (pseudonym of Gabriel Tellez) (c. 1584–1648), Sp. dramatist, b. Madrid, educ. at the univ. of Alcalá. When he had taken his degree he left for Madrid, in order to take up the life of a dramatist. He was a very prolific writer, and wrote 300 comedies till 1625 when he ceased to write plays. He is perhaps the most forceful of Sp. dramatists, and his characters, portrayed in action, are often extreme and unusual. His best-known play is *El Burlador de Sevilla*, introducing the figure of Don Juan. He also excelled in historical plays, as *La Prudencia en la Mujer*, and biblical dramas, as *La Venganza de Tamar*. Tellez ended his life as a member of a religious order, and became prior of the monastery of Sorrea, where he d. See life by A. H. Bushee, 1939; I. L. McClelland, *Tirso de Molina. Studies in Dramatic Realism*, 1948.

Tiryns, anct city of Argolis, traditionally founded by Proetus, who was said to have built the walls with the aid of the Cyclopes. T. existed in the 3rd millennium BC; its earliest fortifications were erected about 1000 years later, and were rebuilt at least twice. The city was finally destroyed by the people of Argos in 468 BC. Excavations made between 1884 and 1927 have revealed many interesting structures, including the remains of 2 palaces dating from about 1600 BC. See AEGEAN CIVILISATION.

Tisa, see TISZA.

Tischendorf, Lobegott Friedrich Konstantin von (1815–74), Ger. biblical scholar, b. Legenfeld in Saxony. He made a special study of N.T. criticism at

the univ. of Leipzig, and in 1845 became prof. there. He discovered the 4th-cent. Sinaitic Codex (see SINAITICUS, CODEX), at the monastery on Mt Sinai. His works include eds. of the Sinaitic Codex, 1862-3, *Editio VIII* of the New Testament, 1864-72, the *Monumenta Sacra Inedita*, 1846-71, and *Reise in den Orient*, 1846, and *Aus dem Heiligen Lande*, 1862, which describe his journeys.

Tiselius, Arne Wilhelm Kaurin, (b. 1902). Swedish biochemist, b. Stockholm. In 1931 he took a D.Phil. at Uppsala, where he worked on chemistry, electrophoretic work, and absorption analysis and made discoveries on the nature of serum proteins. He was elected in 1943 to the New York academy of sciences, and received the Nobel prize for chemistry in 1948.

Tisio da Garofalo, see GAROFALO.

Tisiphone, see KUMENIDES.

Tisri, seventh month of the anct Biblical (the name T. is post-biblical) calendar, and first month of the Jewish post-exilic calendar, corresponding to Sept.-Oct. On the first day is the feast of the New Year (Rosh Hashanah, q.v.); on the tenth the Day of Atonement (Yom ha-Kippurim, q.v.); on the fifteenth the harvest festival or feast of Tabernacles.

Tissa, see TISZA.

Tissaphernes, Persian soldier and statesman, the son of Hydarnes. He was satrap of Lower Asia in 414 BC, and during the Peloponnesian War espoused the cause of Sparta, though without giving any assistance. His plans being thwarted by Cyrus, who helped the Spartans, he repaid to the King, Artaxerxes II, warning him against his brother and took part in the battle of Cunaxa. At that battle he was one of the 4 gens. who commanded the army of Artaxerxes, and his troops were the only portion of the left wing that was not put to flight by the Greeks. When the Ten Thousand had begun their retreat, T. promised to conduct them home in safety; but during the march he treacherously arrested Clearchus and 4 of the other gens. As a reward for his services, he was invested by the king, in addition to his own satrapy (Lydia and Caria), with all the authority which Cyrus had enjoyed in Asia. This led to a war with Sparta, T. being defeated by Agesilaus near Sardis, on which account, as well as by the influence of Parysatis, the mother of Cyrus, he was put to death (395) by order of the king.

Tisserand, François-Félix (1845-96), Fr. astronomer, b. Nuits-Saint-Georges, Côte-d'Or, was appointed as *astronome adjoint* to the Paris Observatory in 1863 and as director in 1892. In *Bulletin Astronomique*, 1899, he dealt with the theory of the capture of comets by the larger planets and pub. his well-known *Criterion* for establishing the identity of a periodic comet, in spite of its perturbations by the planets. This also appeared in his chief work, *Traité de Mécanique céleste*, and is expressed as follows: $\frac{1}{a} + 2\sqrt{a(1-e)} \cos i$ is constant, where a is the semi-major axis of the ellipse in which the

comet moves, e its eccentricity, and i the inclination of its orbit to the plane of the ecliptic.

Tissington, vil. and par. of Derbyshire, England, 8 m. WSW. of Wirksworth, noted for the well-dressing ceremonies carried out on Ascension Day, when 5 wells, which were of benefit to the inhab. during the Black Death, are decorated with pictures made from flower petals, leaves, and mosses set in damp clay, and visited in procession as a thanksgiving. Pop. 250.

Tissot, James Joseph Jacques (1836-1902), Fr. painter, b. Nantes. He settled in England after 1870, and did illustrations for London journals. He also illustrated the life of Christ, but is better known by charming and detailed pictures of late-Victorian life, an example being 'The Picnic' (Tate Gallery).

Tissue and Tissue Culture. T. (Lat. *texere*, to weave) in general usage denotes either an interwoven fabric, or a connected series of statements, circumstances, or events. Biologically, a T. consists of associated cells having in common either form, function, both form and function, or other characteristics. In animals there is frequently dead, non-cellular matrix deposited between the cells, as for instance in bone and cartilage. The study of T.s is *histology*. T.s may be named severally according to the types of cells composing them, e.g. muscular and nervous T.s of animals, and parenchymatous, prosenchymatous, and sclerenchymatous T.s of plants; or according to their function, e.g. connective T.s of animals, vascular and storage T.s of plants; or according to their position, e.g. epithelial tissue of animals and dermal T.s, such as cork and bark, of plants. See also AMOEBA; CELL; EMBRYOLOGY; EPITHELIUM; EXPERIMENTAL EMBRYOLOGY; HISTOLOGY; LYMPH AND LYMPHATICS. See G. R. de Beer, *Experimental Embryology* (2nd ed.), 1943; T. S. R. Strangeways, *Tissue Culture in Relation to Growth and Differentiation*, and *The Technique of Tissue Culture 'in Vitro'*.

Tissue Paper, see PAPER.

Tisza (Ger. *Theiss*; Russian *Tissa*; Serbo-Croat. *Tisa*), riv. of the Ukraine, Hungary, and Yugoslavia. It rises in 2 head streams in the Carpathians (q.v.), in Ruthenia (q.v.), and flows W.-SW.-S. across the Alfold (q.v.), generally parallel with the Danube (q.v.), which it joins at Novi Sad (q.v.). In its lower reaches in Yugoslavia it is also connected with the Danube by canal. At Tiszalök, S. of Tokaj (q.v.), there is an important hydroelectric station (1953) and a scheme for irrigating part of the Hortobágy puszta (q.v.). The prin. tribs. are the Körös and the Mures (qq.v.). Length 840 m.

Tisza of Boros-Jenő and Szeged, Istyvan (Stephan) Emmerich Ludwig Paul, Count (1861-1918), Hungarian statesman, b. Budapest, son of Kálmán Tisza, a former liberal Prime Minister of Hungary. He was Prime Minister from 1903 to 1905 and again from 1913. He was adamant in his attitude to minority peoples within

the ters. of the Dual Monarchy, so that he hopelessly estranged Rumanian feeling. On the death of the Emperor Francis-Joseph, 1916, T.'s influence began to wane. The Emperor Charles favoured a thorough review of the problem of the Slav. pops., and also a democratisation of the franchise. T. objected to both these reforms, resigned May 1917, and was assassinated in the following year.

Tiszalök, see TISZA.

Tit, or **Titmouse**, names given to members of the passerine family Paridae. Five species, all great insect-eaters, are common in Britain, and 2 occur in a few dists.: one of these is the bearded T. or reed pheasant (*Panurus biarmicus*), which is found only in Norfolk and Yorks; the male is about 6 in. long, and has a thin tuft of black feathers on each side of the chin; the general colour is light red. The crested T. (*Parus cristatus*) occurs only in parts of Scotland, though it sometimes visits England. The blue T. (*P. caeruleus*) is the commonest of these birds; its prevailing colour is blue, with green above, and a black throat. The coal T. (*P. ater*) has a black head, with a white patch on the nape. The great T. (*P. major*) is about 6 in. long and is yellow on the back, breast and sides, with grey wings and tail, and black head and throat. The marsh T. (*Pensthes palustris*) resembles the coal T. except for the latter's white nape and white spots on the wings. The long-tailed T. (*Aegithalos caudatus*) is about 5½ in. long, and has the black tail feathers prolonged and graduated. The black-cap T. or chickadee (q.v.) (*P. atricapillus*), is a N. Amer. native.

Tit-lark, see PIPIT.

Titan, satellite of Saturn (q.v.). Mean distance from primary 759,500 m., periodic time, 15 days, 22 hrs, 4 min. Stellar magnitude 8.3.

Titania, see MAB, QUEEN.

Titania, satellite of Uranus (q.v.). Mean distance from primary 272,500 m., period of revolution 8 days, 16 hrs, 56 min, stellar magnitude 13.7.

'**Titanic**' Disaster was caused by the White Star liner *Titanic* colliding with an iceberg on the night of 14 April 1912. In all, some 1500 persons were drowned, among them being Colonel J. J. Astor, Jacques Futrelle, the Amer. novelist and dramatist, F. D. Millet, the artist, William T. Stead, editor and journalist, and Harry Widener, millionaire book-collector. Out of 2206 passengers, only 703 were saved, being picked up by the *Carpathia* after a wireless message from the *T.* The *T.*, then the largest vessel afloat (tonnage about 45,000), was on her maiden voyage to New York, and at 11.46 p.m. ship's time (10.13 p.m. New York time) of the fifth day of the trip, when in lat. 41° 46' N., and long. 50° 14' W., struck an enormous iceberg a glancing blow, stripping off her bludge practically from end to end. Less than 3 hrs from the impact the liner sank. After an inquiry the Mersey Report was issued, as a result of which improvements were introduced in life-saving equipment, and boat-drill for passengers became a necessary

routine. See L. H. Beesley, *The Sinking of the Titanic*, 1912; W. Lord, *A Night to Remember*, 1956.

Titanium, metallic chemical element, symbol Ti, atomic weight 47.9, atomic number 22. It is a white, lustrous metal of low density (sp. gr. 4.5) and high strength, which is resistant to atmospheric corrosion. It has only recently become commercially useful, and because of its high cost it is used almost exclusively in aircraft manufacture. T. ranks ninth in abundance amongst the elements in the earth's crust, but owing to its reactivity at high temperatures its extraction from its ores, anatase, ilmenite, rutile, brookite, and aegirine, is particularly difficult. The element was first discovered in England by Gregor in 1790, but did not receive its name until Klaproth found it in Hungary in 1795 and named it after the mythological first sons of the earth, the Titans. Neither Gregor nor Klaproth succeeded in isolating elemental T., but isolated its oxide. It was in 1910 that Hunter succeeded in preparing the metal by the reduction of T. tetrachloride with sodium in a sealed steel vessel. It was not until 1946, however, that Kroll first produced the metal on a pilot-plant scale by reducing the tetrachloride with magnesium; this method is now being generally used commercially, although sodium is sometimes used instead of magnesium. The E. I. du Pont de Nemours and Company became the first producers of metallic T. for general sale in 1948. Since the molten metal (melting point 1690° C.) reacts with every known refractory sufficiently to produce serious contamination, special methods have had to be devised to melt and cast the pure metal. To overcome contamination a water-cooled metal crucible, usually copper, is used. The charge of T. sponge obtained by the magnesium reduction of the tetrachloride is melted by a direct current arc in an inert atmosphere of argon or helium. Additional sponge or T. scrap is added and an ingot is built up layer by layer. The electrode assembly of tungsten is also water cooled. The metal does not wet or react with the water-cooled metal crucible. Continuous operation is maintained by slowly lowering the base of the crucible. Round ingots weighing 4000 lb. have been produced by this method.

Titanotheres, extinct perissodactyl mammals which lived in Eocene and early Oligocene times. They were of considerable size, and had large horn-like processes on the front of the skull. The teeth were primitive, and they probably lived on soft vegetation.

Titans, the 6 sons and 6 daughters of Uranus and Gaea, who overthrew their father, at their mother's instigation, and made the youngest of them, Cronus (q.v.), king in his place. He was in turn overthrown by his youngest son, Zeus (q.v.). He obtained from Thetis an emetic that made Cronus vomit up his brothers. The better Titans now fought for the Olympians against the rest. At Hera's advice the Cyclopes and the Hecatoncheires

(hundred-handed monsters) were released from Tartarus, and helped to hurl the rebels to Tartarus, where the Hecatoncheires kept guard over them.

Titchener, Edward Bradford (1867-1927), experimental psychologist, *b.* Chichester. He graduated at Oxford (1890) and studied at Leipzig (Ph.D., 1892), where he became an ardent admirer of W. Wundt (q.v.). Proceeding to Cornell Univ., U.S.A., where one of the first experimental psychological laboratories had been founded, he remained there for the rest of his life and became recognised as a world authority on his subject. His *Experimental Psychology, a Manual of Laboratory Practice* (2 vols.), 1927, is the masterpiece on the subject so far as Eng.-speaking people are concerned; in this exhaustive treatise he considered both qualitative and quantitative experimental work. He also wrote *Psychology of Feeling and Attention*, 1908, and *Experimental Psychology of the Thought Processes*, 1909. The *Titchener Commemorative Volume*, 1917, includes a bibliography of his writings; biography by C. S. Myers in *Brit. Journal of Psychology*, vol. 18, 1928.

Tite, Sir William, M.P., F.R.S. (1798-1873), architect, *b.* London. In 1824 he won competitions for the Presbyterian Church, Regent Square, and for the new buildings of Mill Hill School; and in 1840 for the Royal Exchange, London. He also built many railway stations in England and France, and had a large practice. As M.P. for Bath he took a prominent part in debates about the projected Gov. Offices in Whitehall, 1855-72. He was President R.I.B.A. 1861-3 and 1867-70; and was awarded the R.I.B.A. Royal Gold Medal in 1856.

Tithe. T.s were 'tenth part of the increase yearly arising from the profits of lands, stocks upon lands, and the industry of the parishioners, payable for the maintenance of the par. priest, by everyone who has things titheable, if he cannot show a special exemption' (Thomas Wood's *Institute of the Laws of England*). T.s were payable before the Christian era (see Gen. xiv. 20), but in the Christian Church T.s were first given by the faithful as spontaneous offerings given in kind, e.g. wool, corn, or other agric. or farm produce. Canon law (q.v.) later enjoined payment as a legal obligation in accordance with the divine law of the O.T. (see TEINDS). T.s were either *praedial*, *personal*, or *mixed*: *praedial* being the produce of the soil (e.g. corn, wood); *personal*, the produce of labour and industry; and *mixed*, the produce of animals, also including eggs. Before the Lateran Council (1215), it was a common practice to pay T. to monasteries, but the Council restricted T. payment to the parsons of pars. In consequence most T.s belonged as of common right to the par. incumbents, though sometimes laymen could show a right to a portion of T.s based upon a prior voluntary grant to some spiritual corporation. Again, rectorial T.s, after the dissolution of the monasteries, frequently found their way into lay hands

(see IMPROPRIATION). The only lands exempt from T.s were barren heath, waste forest or glebe, old monastic lands held prior to the dissolution exempt from T.s, crown lands or lands held by a spiritual corporation, which had never been known to pay T.s, and lands in respect of which was payable a modus or composition real, an agreement between parson ordinary and landowners and patron, whereby the landowners agreed to pay a perpetual sum in lieu of T. The Tithe Commutation Act, 1836, and amending Acts commuted all the T.s of England and Wales into T. rentcharge and fixed the total amount of the rentcharge for which the T.s of each par. were to be commuted.

Provision was made by the Tithe Act, 1918, for the compulsory redemption of rent charges exceeding 20s., the consideration money for redemption being the amount agreed between the owners of the land and of the rentcharge. Provision for apportionment of annuities created by the redemption of T. rentcharge was made by an Act passed in 1921. The Tithe Act, 1925, still further amended the law on T. rentcharges, rents, etc., in lieu of T., and the payment of rates on rentcharge, etc. By this Act any T. rentcharge which before 31 Mar. 1927 was attached to a benefice or to an eccles. corporation was transferred to be vested in the Governors of Queen Anne's Bounty and held in trust for the incumbent or corporation.

Notwithstanding much legislation, rentcharge gave rise to agitation and remained a vexed question which was settled only by another Act, the T. Act of 1936, which at last ended a system containing ineradicable difficulties. This Act extinguishes both rentcharge and extraordinary rentcharge, and makes provision through a Tithe Redemption Commission for compulsory redemption and for the compensation of persons interested, by the issue of 'redemption stock' charged on the Consolidated Fund. In other words, the rentcharge, previously payable to the Church, the Eccles. Commissioners, Queen Anne's Bounty, and some lay owners, is replaced by 'redemption annuities' payable to the Crown, and the Crown issued gov. stock to the tithe-owners. Thus for the first time in its long hist. T. was divorced from the Church. The annuities will be payable until 1996, when they should cease and all T. (with a few minor exceptions, such as corn rent) will be abolished. A capital loss estimated at £17,750,000 resulted to the Church of England from the Act of 1936, a situation which called for every possible adjustment by the Eccles. Commissioners and Queen Anne's Bounty (now amalgamated as the Church Commissioners). See P. W. Millard, *Tithes and Variable Rentcharges: Some Aspects of their History and Development*, 1934, and *Law Relating to Tithes and Payments in lieu of Tithe* (3rd ed.), 1938.

Tithing: 1. A tithe (q.v.).

2. An association of 10 men in the arrangement known as frankpledge (q.v.); now still sometimes found applied to a div. of an Eng. co., one-tenth of a hundred (q.v.).

3. A tenth part.

Tithonus, in Gk mythology, son of Laomedon, brother of Priam, loved for his beauty by Eos, who secured from Zeus for him the gift of immortality. Not, however, having eternal youth, he grew hideously old, and Eos turned him into a grasshopper.

Titian, or **Tiziano Vecelli** (c. 1477-1576), It. painter of the Venetian school, *b. Pieve*, in Cadore, a mountainous dist. of the Venetian Alps. Having shown a taste for art, he was sent to Venice to learn painting, and first studied under Zuocati, a mosaicist, afterwards becoming the pupil of Giovanni Bellini and working with Giorgione (q.v.). He seems first to have been employed in the decoration of houses, but he also produced works on canvas, notably the allegorical picture 'Sacred and Profane Love' (Borghese Gallery), 'Doge Marcello' (at the Vatican), and 'Christ and the Tribute Money,' of the Dresden Gallery, spoken of by Vasari as something stupendous and miraculous. In 1516 he was made official painter to the council in Venice. In the same year he went to Ferrara, and executed amongst other works the glorious masterpiece 'Bacchus and Ariadne,' now in the National Gallery. In 1533 he became acquainted with the Emperor Charles V, who sat to T. for his portrait, rewarding him by making him a Count Palatine and a Knight of the Golden Spur. He was now of European eminence. Returning from Bologna to Venice (1537), he executed his magnificent 'Battle of Cadore,' which unfortunately perished by fire in 1577, but he was again with the emperor at Milan in 1541, and in 1545 accepted the Pope's invitation to Rome, where he painted portraits, as well as 'Danaë,' now in the Naples Museum. In 1548 he undertook a journey across the Alps to join Charles V at Augsburg, and painted the well-known portraits of Philip of Spain. From this time he was chiefly occupied in working at Venice, until in 1576 he died of the plague. T.'s works are remarkable for their magnificent colouring and technical skill. He painted religious pictures as well as mythological, poetical, and allegorical subjects, and as a portrait painter he occupies the first rank. See J. A. Crowe and G. B. Cavalcaselle, *Life and Times of Titian*, 1887; C. Phillips, *Titian: a Study of his Life and Work*, 1898; C. Ricketts, *Titian*, 1910; D. von Hadeln, *The Drawings of Titian*, 1927; R. F. Heath, *Titian*, 1930; H. Tietze, *Titian*, 1936; D. Cecchi, *Titian* (trans. N. Wydenbruck), 1957.

Titicaca, **Lake**, mt lake in the Andes, on the frontier of Bolivia and Peru, in S. America, between the main Andean range and the Cordillera Real. It is 110 m. long, has an average width of 30 m., and lies 12,507 ft above the sea. It consists of the 2 lakes Chucuito and Uinamarca, connected by the Strait of Tiquina. An important steamer service connects Puno in Peru with Guaquil in Bolivia. Its area is 3200 sq. m., and its maximum depth is about 700 ft. The water is fresh though unpleasant for drinking, and provides valuable fisheries.

Title Deeds, documents showing a person's right to interests in land (e.g. conveyance, lease, mortgage).

Titles, additions to a person's name, indicative of some honour, office, or dignity, e.g. emperor, prince, chancellor, primate, duke, mayor. Some T. are held *virtute officii*, as for instance 'king'; others, like the T. of the 5 orders of nobility, and baronets in Britain, are hereditary, and some, like that of knight, are conferred for life. See also ADDRESS, FORMS OF; NAMES; NOBILITY; ORDERS OF KNIGHTHOOD.

Titmouse, see BLACK-CAPPED TOMTIT.

Titu, Josip Broz (1890-), Yugoslav soldier and statesman, *b. Kumrovec* near Zagreb. He came of peasant stock, and worked as a farm-labourer for a time. After the First World War he became a Communist, paying frequent visits to Moscow for training periods there and adjustment to the ever-changing Party line. In the winter of 1928-9 he was arrested in Zagreb. After a short time

Yugoslav Embassy
PRESIDENT TITO

in the Zagreb prison T. returned to Moscow and attended the Lenin school for 2 years. In 1934 he became a member of the Yugoslav Politburo, and here he began his secret struggle to oust Stalin's satellite, Milan Gorkić, who had been sent to Belgrade in 1928 to bind the Yugoslav Party to the Soviet general secretariat. After 3 years of conspiracy T. achieved his first success; Gorkić paid the usual price of failure, was called to Moscow in 1937, and executed. Installed with unlimited power, as the general secretary of

the Yugoslav Party, T. dissolved it and ordered a re-registration. Surrounded by loyal adherents, T. now began to aspire to higher things. Unlike most of the other Communist leaders of Europe, who remained safely in Moscow during the War, T. was in his own country organising resistance to the Nazis. His fight was fraught with the greatest difficulties, for his antagonists included, besides the Nazis, the Mihailovich (q.v.) partisans and the N.K.V.D. observers in his own Politburo. By wolding the peasants into a victorious guerilla partisan army he felt he had contributed not only a new Communist experience but something novel in Stalinist doctrine. In mid-1948 the Cominform expelled T. and urged the Yugoslav people to turn him out of office if he did not change his policy. Yet a year later T. was still in power in spite of all that the Cominform had been able to do, though there can be no doubt that the quarrel with Soviet Russia had by that time made serious political and economic difficulties for Yugoslavia; but equally there seems to be no doubt that T. was still genuinely popular with supporters from all classes of the people and all parts of the country; for the idea that Moscow should try to control Yugoslav internal affairs, or limit her industrial expansion, roused their national pride and rallied many Yugoslavs hitherto hostile to his gov. round T. As a consequence of this quarrel the Cominform countries decided to impose economic sanctions, and therefore stopped sending to Yugoslavia any cap. equipment, hoping that unemployment and food shortage would eventually bring about wholesale collapse of Yugoslav economy; but T., adhering to his five-year-plan, made trade treaties with over a score of countries, many of them in W. Europe and received economic aid from Britain, France, and the U.S.A. In 1953 T. paid a State visit to Britain. After Stalin's death he resumed relations with U.S.S.R., though maintaining his country's independence of the Soviet bloc. In 1956 T. visited Moscow, and it seemed that the Yugoslav connection with Russia might be about to become much closer. But after the events of autumn 1956 in Poland and Hungary this possibility appeared less likely. When the Yugoslav constitution was revised in 1953 T. became President, being re-elected in 1954. He is also supreme commander of the Yugoslav armed forces. See also under EASTERN FRONT in SECOND WORLD WAR. See G. Blainkin, *Tito*, 1949; F. Maclean, *Eastern Approaches*, 1949; H. F. Armstrong, *Tito and Goliath*, 1951; V. Dedijer, *Tito Speaks*, 1953; F. Maclean, *Disputed Barricade*, 1957; E. Halperin, *The Triumphant Heretic*, 1957.

Titograd (formerly Podgorica, or Podgoriza; anet Ribnica), tn in Yugoslavia, the cap. of the rep. of Montenegro. It is at the confluence of the Ribnica and Morača. It was seriously damaged in the Second World War, but has been rebuilt as a fine, modern city, and its commercial and industrial importance is

growing. Diocletian (q.v.) was b. at Dioclea, near by. Pop. 16,350.

Titration, method in quantitative chemical analysis. The weight of a substance in a definite volume of solution is determined by causing it to react with a solution of another reagent of known strength. This reagent is contained in a burette and run out into the other solution till reaction is complete, as shown by change of colour of an indicator such as litmus, methyl-orange, phenolphthalein, or by cessation of effervescence, etc. The volume used is noted, and the weight of reagent contained is thus known. From the chemical equation and the atomic weights, the weight of the other solute can then be calculated. T. methods are quick and, under suitable conditions, are susceptible of great accuracy; they have therefore largely displaced the older gravimetric methods, though these are still employed when even greater accuracy is required. T. was introduced by Gay-Lussac (q.v.) early in the 19th cent.

Titulescu, Nicolas (1883-1941). Rumanian lawyer and statesman, became prof. of law at Jassy Univ. (1905) and at Bucharest Univ. (1909). He entered Parliament in 1913 as a supporter of Také Ionescu (q.v.) and a recognised authority on finance. In the First World War he was finance minister from 1917 until the treaty of Bucharest, when he resigned. In his term of office he supported the scheme of land reform involving div. of the large estates, whereby he probably saved his country from Bolshevism. He took a prominent part in negotiating the agreements with Czechoslovakia and Yugoslavia which constituted the Little Entente (q.v.). He was twice ambassador in London. As delegate to the League of Nations, he was president of the Assembly in 1930-1. His policy of a Balkan bloc led to the signing of the Balkan Pact of Feb. 1934. His foreign policy envisaged friendship with France, accommodation with Russia, and regional pacts in the Balkans, the objective always being the integrity of Greater Rumania. In 1936 he was ousted from the gov., left Rumania, and lived in London and Monaco.

Titus, St. friend and companion of St Paul who consecrated him Bishop of Crete. All we know of him is learned from the canonical epistle addressed to him by St Paul. Eusebius says that T. remained unmarried and d. in old age. His feast is on 4 Jan. See B. S. Easlon, *The Pastoral Epistles*, 1948.

Titus (T. Flavius Sabinus Vespasianus) (AD 39-81), Rom. emperor, son of Vespasian. He served when a young man as military tribune in Britain and Germany, and helped to crush a Jewish insurrection (67), besieging and storming Jerusalem (69-70). T. was associated with Vespasian in the gov. (71), and succeeded him (79), proving a wise and kind ruler. Under T. began the campaigns of Agricola in Britain. Two heavy calamities fell upon Italy during his reign: the eruption of Vesuvius, burying Pompeii, Herculaneum, and Stabiae (24 Aug. 79), and,

a few months later a great fire in Rome. T. completed the Colosseum and erected the baths which were called after him. See Suetonius, *Titus*; Tacitus, *Historiae*; Josephus, *History of the Jewish War*; C. E. Beulé, *Titus et sa Dynastie*, 1872.

Tityus, giant of Euboea, son of Gaea, or of Zeus and Elara. For offering violence to Artemis (or to Leto) he was killed by Zeus (or Apollo) and cast into Tartarus, where 2 vultures perpetually devoured his liver while he lay prone on the ground.

Tiumen, see TYUMEN'.

Tiv, or **Munshi**, an important pagan tribe, numbering 800,000, of Central Nigeria. They are cultivators, with a complex clan system devoid of any centralised political authority. Formerly they practised marriage by sister-exchange. Their religion is based upon the belief in fetiches (*akombo*). See L. and P. Bohannan, *The Tiv of Central Nigeria*, 1953.

Tiverton, municipal bor. of Devon, England, on the Eke. 14 m. NNE. of Exeter. The chief building of interest is the church of St Peter. Textile manuf. is the chief industry. Here is Blundell's School (q.v.). Pop. 11,200.

Tivoli (anc. Tibur), It. tn, in Lazio (q.v.), 15 m. ENE. of Rome (q.v.). It stands 800 ft above sea-level, on the Aniene (q.v.), at the point where the riv. forms a series of falls down to the Campagna di Roma (q.v.); these cascades have been celebrated for their beauty since classical times, and in modern times they have produced electric power for Rome. In Horace's day T. was the resort of wealthy Romans; the ruins still exist of fine Rom. villas, in particular a magnificent villa built by Hadrian (q.v.), and of mausolea, aqueducts, and a temple of Vesta. The modern tn has a cathedral, interesting churches, and villas, the gardens of which (notably those of the 16th-cent. Villa d'Este) are extremely beautiful. Much damage was done to the tn during the Second World War. The wine of T. has long been known, iron is worked, and there is a trade in oil. Pop. 24,600.

Tizard, Sir Henry Thomas (b. 1885), Brit. scientist, educ. at Westminster School and at Magdalen College, Oxford. Fellow of Oriel College, Oxford, and, from 1911 to 1921, lecturer in natural science. He was assistant controller of experiments and research in the R.A.F., 1918-19; permanent secretary of the dept of scientific and industrial research (q.v.), 1927-9; Rector of the Imperial College of Science and Technology, 1929-42; and Chairman of the Aeronautical Research Committee, 1933-43. He was president of Magdalen College, 1942-6, being the first scientist to hold such a position at Oxford, and was Member of the Brit. Air Council, and chief scientific adviser to the Ministry of Aircraft Production. From 1934 to 1945 he was a development commissioner; and Chairman of the Advisory Council on Scientific Policy and Defence Research Policy Committee, 1946-52.

Tlaxcala, agric. inland state of Mexico and its cap. The state, which has an area of 1555 sq. m., lies on the Mexican plateau, average height 7000 ft, rising in Malinche volcano to 13,454 ft. In the days of the great Aztec empire, T. maintained a sturdy independence within her mt fastnesses till, in 1519, she became the ally of the Spaniards under Cortés. The cap. lies 60 m. SE. of Mexico City, and has the oldest church in the country, dedicated to San Francisco (1521). Pop. (state) 284,600; (tn) 3250.

Tlemcen, tn in the dept of Oran, Algeria. The Rom. *Pomaria*, it was later the Moorish cap. It fell to the French in 1842. It has synagogues, mosques, and a museum of antiquities. It exports blankets, olive oil, and alfa, and manufs. leather work and native carpets. Rashgun, which has a lighthouse, is its port. Pop. 54,300.

Tmesis (Gk *temnein*, to cut) is the separation of parts of a word by insertion of one or more words. It is very rare in English, though it appears in jocular expressions like 'abso-bally-lutely.' In Kipling we find 'If there be trouble to herward,' and Gerard Manley Hopkins writes 'brim in a flash full' in one of his poems. See also FIGURE OF SPEECH.

Toad, the name usually applied to members of the family Bufonidae which number more than 100 species. They differ from frogs chiefly by the total absence of teeth, and in certain anatomical features, such as the shoulder girdle and the sacral vertebra. In Brit. T.s a large gland, called the *parotid*, occurs, but this is absent from the frogs. It appears to be necessary for the secretion to come into contact with the blood through an abrasion or other means to be noxious. The skin of the T. is drier and more warty than that of the frog. The 2 Brit. T.s are the natterjack (*Bufo calamita*) and the common T. (*Bufo vulgaris*), which is generally distributed over Great Britain, though absent from Ireland. It has longer hind limbs than the other and is able to hop. Its eyes are more lateral and the irises reddish-copper colour. The females are usually larger than the males. The natterjack, which is local in England, cannot hop, as the hind limbs are too short, but it is able to run and is often called the running T. Its eyes are more prominent and the irises greenish-yellow; a thin yellow line runs along the middle of the back. During the breeding season the males croak very loudly and the eggs are laid in strings. The value of T.s to the farmer and gardener cannot be exaggerated, as they feed entirely on insects, millipedes, woodlice, slugs, and snails. They are quite harmless to man.

Toadflax, or *Linaria*, genus of plants and sub-shrubs (family Scrophulariaceae), with a spurred corolla. Of the natives of Britain *L. vulgaris*, the T., with yellow flowers, and *L. repens*, pale T., are perennial; *L. pelisseriana* is an ann. *L. cymbalaria*, Mother of Thousands, Pennyleaf, or Pennywort, is a perennial from S. Europe, naturalised in Britain; as is *L.*

purpurea, the Purple T. Many species are grown in gardens.

Toadstool, common name for the fruit-body of an *Agaric fungus*, not a mushroom or a bolete. See FUNGI.

Tobacco, plant of the genus *Nicotiana* (family *Solanaceae*) from which is manufactured smoking and chewing T., cigarettes, cigars, and snuff. There are over 50 varieties of the plant, many of which are cultivated in gardens, but only a few varieties are used for smoking purposes. The varieties of most importance to smokers are *Nicotiana Tabacum* and *Nicotiana Rustica*. The former, a native of the W. Indies, bears pink or rose-coloured flowers and grows from 2 to 9 ft high. The bulk of T. used in the trade of most countries of the world is

potash. Sowing takes place in the early spring. The seed is minute, 1 oz containing 300,000-400,000 seeds, and a tablespoonful being sufficient to sow a bed covering 100 sq. yds. The seed is usually mixed with ash or flour which are white, so that the sower can see where it falls and thus ensure even distribution. After sowing, the bed is covered with cheese cloth or grass to protect the plant in the early stages of growth. When the plants are 5-6 in. high they are transplanted by hand into fields which have been thoroughly broken up by repeated harrowings. In land that does not drain easily they are usually set in ridges. About 4200 plants are set to the ac. Very careful cultivation is essential. 'Top-ping,' the cutting away of the stalk carrying the top leaves and the flower bud, is necessary to prevent seeding and to put more strength in the remaining leaves, usually 10-16 in number. Harvesting takes place in the hottest part of the year. Leaves may be picked individually as they ripen (known as 'priming'), or by the whole-plant method, after which they are conveyed to barns for curing.

Curing. Curing is an operation requiring skill and experience. There are 4 methods: flue-curing; firing; air-curing; and sun-curing. Flue-curing barns are heated by iron flues and the leaves are hung above the flues. No smoke comes into contact with the T. Flue-curing is done in 3 stages: yellowing the leaf; fixing the colour; and drying out the stem; and the whole operation takes 4-5 days. In fire-curing the T. is hung in the barns over wood fires in trenches in the floors and the smoke comes into direct contact with the T. The length of the process varies from a week or 10 days to 6 weeks. Generally speaking, the longer and more gradual the process, the better the result. For air-curing the T. is hung in the barns, protected from the rain, but exposed to the passage of air, and the curing is a natural process extending over about 2 months. Sun-curing is a similar process except that in the early stages the leaf is exposed in the open to the sun's rays.

Production and Types of Tobacco. The production of T. is world-wide, extending as far N. as Sweden and as far S. as New Zealand. In some countries, China for example, the production is almost entirely for domestic use, and in others, England for example, the production is almost entirely for domestic use, because of unsuitable climatic conditions, only tobacco of low yield and poor smoking quality can be produced commercially. The prin. types of T. and the main exporting countries are as follows: (1) *Flue-cured tobaccos*, *Brights* and *Semi-brights*. U.S.A. (N. and S. Carolina, Georgia, Virginia); E. Canada; Nyasaland; Rhodesia; some parts of India; and Brazil. This is the type of T. most used in the U.K., where most cigarettes are made from it, and it is also extensively used in pipe T. It is grown on light, sandy soil and obtains its nourishment from applications of chemical fertilisers. It has a characteristic bright colour. (2) *Burley Tobacco* and other

The Imperial Tobacco Co. (of Great Britain and Ireland) Ltd., Bristol

HARVESTING TOBACCO IN THE U.S.A.

produced from this variety. The latter, a native of Mexico, bears greenish yellow flowers, and is a much smaller plant than *Nicotiana Tabacum*. *Nicotiana Rustica* was cultivated by the anc. Mexicans and by the N. Amer. Indians, but early in the 17th cent. it was largely superseded by *Nicotiana Tabacum*.

Growth and Cultivation. T. seedlings are grown in sheltered level ground containing loamy, mellow soil, which is burnt to a depth of 3 in. to kill all weeds, insects, etc., and deposit the essential

Air-cured tobaccos. U.S.A. (Kentucky; Tennessee; Maryland); E. Canada; parts of India; and Nyassaland. This type is used in very large quantities in the U.S.A. both for cigarettes and pipe T's. It is used to a lesser extent in the U.K. for pipe T's only. It is grown from distinctive kinds of seeds, and its reddish-brown colour is obtained by air-curing. (3) *Dark Fired Tobacco.* U.S.A. (Kentucky, Tennessee, Virginia); E. Canada; Nyassaland; and S. Rhodesia. This type of T. is used for the manuf. of roll and shag T. and produces a strong smoke. It is a large heavy type of leaf grown on richer soil than the flue-cured variety. (4) *Latakia and Latakia type tobacco.* Syria (dist. of Latakia) and Cyprus. Latakia T.,

PACKING LEAF TOBACCO INTO CASKS,
SOUTHERN RHODESIA

has a flavour peculiar to itself and is used in the U.K. entirely in pipe-smoking mixtures. It is the smallest of all the tobacco plants, and its leaves are barely 2 in. in length. The whole plant is cured by heavy firing, which gives the characteristic black appearance and distinctive flavour. (5) *Oriental Tobacco.* Turkey; Greece; Bulgaria; and the borders of the Black Sea. Oriental has a highly distinctive aromatic flavour. It is used in Oriental and 'blended' brands of cigarettes. The Oriental T. plant is of small growth, producing a delicate type of leaf. (6) *Cigar Tobaccos, see CIGAR.*

History. The use of T. dates from remote antiquity amongst the natives of

the Amer. Continent. It is mentioned in the observations (1497) of Romano Pane, a friar who accompanied Columbus on his second voyage, as being used medicinally and in religious ceremonies by the tribes of the Antilles. Gonzalo Fernandez de Oviedo in 1526 described the plant and the native custom of inhaling smoke from the burning leaf through a hollow forked cane held to the nostrils. This cane was called tobacco by the natives, and the name was applied by the Spaniards to the primitive cigar and to the plant itself. T. was introduced into Europe in 1559 by Francisco Hernandez de Toledo, a physician who had been sent by Philip II of Spain to investigate the products of Mexico. Jean Nicot, the Fr. ambas. to Portugal, learned of T. in Lisbon and introduced it to the Fr. court in 1560. His association with the plant is commemorated by the botanical name *Nicotiana* and the word nicotine. On its first introduction to Europe T. was valued for its medicinal properties, and it was considered 'a panacea for all the ills that the flesh is heir to.' Sailors returning from the Americas first introduced smoking to England about 1565. Sir Walter Raleigh brought the practice to Court circles. By the end of the 17th cent., despite attempts to exterminate the practice by means of stringent laws, heavy punishment, and even excommunication from the church, T. was in general use in most parts of the world. The introduction of cigarettes and the two World Wars popularised smoking among women, although women smoked in earlier times, particularly in some E. countries, where it was and still is customary. Smoking by children and the sale of tobacco to them is now forbidden by law in many countries, including Great Britain.

Tobacco in Great Britain. T. was introduced into England in about 1565 by sea captains and sailors returning from America. Famous men associated with its introduction are Sir John Hawkins, Sir Francis Drake, Capt. Ralph Lane (Governor of Virginia), and Sir Walter Raleigh, who popularised smoking in Court circles. By the end of Elizabeth's reign smoking was general among all classes and both sexes. Despite vigorous opposition by James I, who pub. 'A Counterblaste to Tobacco' and imposed heavy T. duties, the popularity of T. continued. The prosperity of the Colony of Virginia was built up on T. exports. The heavy duty imposed on imported T. led to considerable quantities being grown in Britain in the 17th cent., but under the Protectorate and in Charles II's reign, in order to safeguard the gov. revenue and to protect the Virginia industry, its cultivation in Britain was prohibited. During the Great Plague (1665) T. was widely used as a prophylactic and even children were encouraged to smoke. Smoking by women and children was common for many years afterwards. In the Georgian Period, snuff-taking displaced smoking in fashionable circles. Cigar smoking became fashionable in Britain at the beginning of the 19th cent.

Cigarettes were introduced into the country in the middle of the 19th cent. by soldiers returning from the Crimean War. T. manuf. came under strict gov. supervision in the first half of the 19th cent. and the Pure Tobacco Act of 1842 still remains in force. At the beginning of the 20th cent. about two-thirds of the T. smoked in Great Britain was in pipe T. form and only about one-third in cigarettes. By the beginning of the First World War, cigarettes had nearly gained equality in sales with pipe T.s. The war accelerated the change in trend, and also popularised smoking amongst women. The swing to cigarettes and increased

with private individuals growing T. for their own personal consumption.

Bibliography. A. E. Tanner, *Tobacco*, 1912, 1945; G. L. Apperson, *The Social History of Smoking*, 1914; C. M. MacInnes, *The Early English Tobacco Trade*, 1926; Count Corti, *A History of Smoking*, 1931; W. W. Garner, *The Production of Tobacco*, 1946.

Tobago, Is. of the Brit. W. Indies, in lat. 11° 9' N. and long. 60° 40' W., about 75 m. SE. of Grenada and 19 m. NE. of Trinidad. The Is. is 26 m. long and 7½ m. wide and has an area of 116 sq. m. T. is mountainous in the centre and at the NE. end, and undulating and flat in the

W. D. & H. O. Wills, Bristol

CIGARETTE-MAKING MACHINE

smoking by women have continued, and the Second World War has accentuated the trend.

The rate of tobacco duty in the U.K. increased from 3s. per lb. in 1900 to 3s. 8d. in 1914, to 9s. 6d. at the beginning of 1939, to 58s. 2d. per lb. in 1948, and to 61s. 2d. in 1956. From 1900 to 1949 the U.K. Gov.'s revenue from the T. duties increased from nearly £11m. a year to £602m. a year, and now, except for Income Tax, the T. duties are the gov.'s largest single source of revenue. A committee appointed by the Treasury in 1923 recommended against gov. financial support of T. growing in England, on the grounds of unsuitable climatic conditions. The growing of T. in the U.K. is subject to Excise regulations and the payment of duty, but in 1948 the gov. announced that although not prepared to repeal the Excise duty on home-grown T., they would not for the time being interfere

S. and W. The highest peak is 2100 ft. Deep fertile valleys run down from either side of the main ridge. The prin. riv. is the Courland, named after the Norse duke who in the 17th cent. ruled the Is. almost as a sovereign. Scarborough (pop. 1250) on the S. coast, formerly called Port Louis, is the cap. Its new deep-water harbour was opened in 1953. The only other tn is Roxborough (pop. 1000). Sugar was once the staple industry, but it was ruined by the foreign sugar bounties. Cacao, coconuts, and limes have taken its place. The climate is most agreeable; the mean temp. is 80° F., but owing to the long seaboard the heat is generally tempered by a cool sea breeze. In the central and Windward dists. the rainfall varies from 85 to 95 in. and in the N. may exceed 100 in. There is a civil airfield at Crown Point, the SW. tip of T.; also a gov. wireless station and telephone system. At a distance of 1½ m. from the

NE. end of T., off the vil. of Speyside (25 m. from Scarborough), is the is. of Little T. or Bird of Paradise Is., the only place in the W. hemisphere where these birds are found in their wild state. The rocks between it and T. are known collectively as Goat Is.

T. is known to many people by its nickname, Robinson Crusoe's Island. For though the actual story of Crusoe's life on his is. was based largely on Alexander Selkirk's adventure on Juan Fernández, there can be no doubt that Defoe, in describing his mythical is., had T. in mind, and it may safely be assumed that 'Robinson Crusoe Cave,' near Scarborough, is well named. The hist. of T. shows that it changed hands a dozen times during a period of less than 2 cents., the reason being that it was an attractive fertile is. lying near enough to the Guiana coast to be a jumping-off ground for those anxious to explore the Orinoco, and also because its sheltered bays gave a safe anchorage with deep soundings.

Columbus discovered T. in 1498 and named it 'Tabago,' from a notion that it resembled in shape the Carib tobacco pipe. Sir Robert Dudley, natural son of the Earl of Leicester, is believed to have visited T. and hoisted the Eng. flag in 1580. Nearly 36 years later Eng. colonists from Barbados effected the first settlement, but no successful settlement was made for nearly a cent. and a half after the discovery of the is. For the ensuing 40 years the is.'s hist. was a ding-dong struggle between Dutch colonists and some Baltic settlers from Courland, varied by Fr. and Eng. invasions. After that and for the next 20 years the is. was declared neutral but, nonetheless, alternated between Fr. and Eng. possession until, in 1814, it was finally ceded to England. T.'s first constitutional gov. was set up about 1763 in the letters patent for the governor of Grenada, which dependency at that period comprised also Dominica, St Vincent, and Trinidad. In 1783 the is. was ceded to France, but was recaptured in 1793, when it was erected into a separate gov. under a capt.-gen. and governor-in-chief, with a council appointed by the Crown and a House of Representatives. By an Act of 1855 T. was given an executive committee or Privy Council, that being its nearest approach to self-gov. In 1877 T. became a Crown colony, and in 1888 was amalgamated with Trinidad. Ten years later it became a ward of the United Colony of Trinidad (q.v.) and Tobago. T. is a member of the Caribbean Federation (q.v.). See also WEST INDIES, *West Indian Federation*. Pop. 27,000. See H. I. Woodcock, *History of Tobago*, 1867; E. C. Digby, *Guide to Trinidad and Tobago* (2nd ed.), 1936-7; C. Reis, *The Government of Trinidad and Tobago* (3rd ed.), 1948; C. E. R. Alford, *The Island of Tobago* (revised ed.), 1953.

Tobermory, seaport and burgh of Argyll, Scotland, on a bay of the same name, 30 m. from Oban. It has a good harbour. In 1588, following the scattering of the Sp. Armada, a Sp. galleon sank in T. bay

with, it was believed, a large cargo of treasure. In 1912 Col. Foss recovered some coins and silver goblets, and the search is being continued. Pop. 700.

Tobit, Book of, a deuterocanonical book, placed by the Church of England in the Apocrypha (see BIBLE). It is a Haggadic version of an old tradition, embodying in the form of a delightful adventure and love story a series of moral and religious lessons. Its date is given by Ewald as about 350 bc, but Hitzig places it in the reign of Trajan.

Tobogganing (from an Indian word, *tobaakan*, meaning sledge), practice of sliding down natural or artificial slopes of snow or ice. The Canadian toboggan consists of a flat surface curled up in front. It is about 5 ft long by 2 ft broad. T. in its advanced form takes place really only on the Cresta, a valley behind St Moritz, Switzerland. The sport was started in 1855 by Eng. visitors and took the form of an ann. race between those at St Moritz and those at Davos, the race being fought out alternately at Davos on a course from Klosters and at St Moritz on the Cresta. The former is now closed, but the Cresta continues. From being a snow run it is now an enclosed track of solid ice 1 m. long dropping at an average slope of 1 : 7. There are sev. well-known corners, known as banks, such as the Battledore and Shuttlecock. Down this run, a steel chassis is employed with 2 steel runners rounded in the front, about 3 ft long and about 13 in. apart. On this chassis is a sliding seat. The back parts of the runners are grooved. The method of riding is to lie prone with the body on the sliding seat forward, and on coming to a corner the rider pushes his body back upon the seat so that the weight is on the back part of the runners where are the grooves. Steering is effected by pushing the nose of the toboggan round, mechanical forms of steering not being allowed. Great skill and judgment are required for fast riding. Racing is done against time, taken by the breaking of 2 electric contacts, at the start and the finish. A running start from 10 ft behind the line is allowed; this requires much skill and agility. Finishing speeds are over 85 m.p.h.

Hiding the Cresta is recognised as an Olympic event. The great ann. race of the Cresta Run is the Grand National, which is usually held about the middle of Feb. The next most important race is the Curzon Cup, which is run from the auxiliary starting-point of Junction, and is about two-thirds of the length of the course.

Bobsleighting is to be distinguished from T. The bobsleigh is formed of a frame carried on 2 sleighs fitted with steel runners. Steering is effected by swinging the front runners; this is done by cords or a steering-wheel. Under rules at present in force, riders sit facing the direction they are going. At one time the position was prone with heads first, but this practice has now been banned. There are many famous places where this sport is popular, notably at St Moritz in Switzerland, Garmisch in Bavaria, Cortina d'Ampezzo

in the Dolomites, and at Lake Placid in America. 'Bobs' vary in size, there being races for those carrying 2 people and a bigger type carrying 4 people. The track is usually of ice and beaten-down snow, and the banks are heavily iced. International races take place, and 'bobbing' has been included among the Olympic Winter Sports sections.

Tobol, navigable left trib. of the R. Irtysh in SW. Siberia. It rises in the Turgay plateau and flows NE. through a fertile region with rich mineral resources now being rapidly cultivated and industrialised (see KUSTANAY). Length 1000 m.

Tobol'sk, tn in the Tyumen' Oblast of W. Siberia, on R. Irtysh, centre of a lumbering and dairy-farming area, and supply point for the N. part of the Tyumen' Oblast. There is some industry, and an old bone-carving craft is still carried on. It is an important local cultural centre (theatre founded 1705). Pop. (1939) 32,000. T. was founded by Russian Cossacks in 1587 near the old cap. of the Siberian Khanate; it was cap. of Siberia 1596-1824, prov. cap. till 1923. It has been a place of banishment, including that of Nicholas II (1917-18).

Tobruk, or Mersa-Tobruk, port in the prov. of Cyrenaica, Libya. It has an excellent harbour, and was occupied by Italy in 1912. It was the scene of much fighting in the Libyan campaign of the Second World War. In Gen. Wavell's advance against Graziani's It. army the Brit. force entered the stronghold on 22 Jan. 1941, some 25,000 It. prisoners of war being taken at a cost of less than 500 Brit. casualties. With the arrival of Rommel's Ger. forces the Brit. force withdrew to the E. T. being by-passed and isolated. For 8 months the garrison defied land attacks and air bombardment, striking back with much success at the enemy lines of communication, whilst local command of the sea made it possible in that period to land 34,000 tons of supplies and 29,000 troops in T. and to bring off 33,000 men to Egypt. T. became a pivotal point in the tank battles of the late autumn of 1941, Rommel's object being to prevent Gen. Auchinleck's Brit. forces near Rezegh from effecting a junction with the isolated garrison at T. At the end of Nov., after 7 months' siege by Rommel, the garrison carried out a strong sortie, and Rezegh being captured by co-operating forces, these and the T. garrison at length joined hands. But the position was precarious, and the Germans broke the T. corridor again on 2 Dec. Once more it was relieved by the Brit. forces. In the spring of the following year it was again the key point in the campaign. The British had consolidated a line from El Gazala to Bir Hacheim; behind this line in the area before T. was a force of 100,000 to meet the 40,000 Italians and 50,000 Ger. troops now at Rommel's disposal. In June 1942 the main Allied outpost at Bir Hacheim was lost to Rommel, who then concentrated his whole weight against the main positions covering the T. area. The results were

disastrous, the Brit. forces under Gen. Ritchie being drawn into an ambush (13 June). This marked the turning-point of the campaign. On 18 June El Adem and Rezegh were abandoned and the Brit. army retired to the Egyptian frontier, leaving a strong garrison in T. in the vain hope that it might repeat the previous triumph as a strong point hampering the enemy's whole plan. On 20 June T. with most of its stores and its garrison of nearly 2 divs., largely S. African forces, fell to Rommel after a single day's massed attacks. This gave him the best harbour between Alexandria and Tripoli, and so helped to relieve his land lines of communications. Later in the year the reinforcement of the Eighth Army (q.v.) under Gens. Alexander and Montgomery reversed the fortunes of war and T. was recaptured on 13 Nov. 1942. See also AFRICA, NORTH, SECOND WORLD WAR, CAMPAIGNS IN.

Toc H, a movement to bring together into interdenominational Christian fellowship men and women of every class and opinion for the purpose of social service of all kinds, with groups and branches throughout the world. The name, Toc H, comes from the army signallers' designation of the initials, T. H., which stood for Talbot House, opened in Dec. 1915 at Poperinghe in Flanders as a chapel and club for soldiers. It was a memorial to Gilbert Talbot, who was killed in July 1915, and was founded by his brother, Neville Talbot, later Bishop of Pretoria, and the Rev. P. B. ('Tubby') Clayton. In 1920 Clayton formed a small Toc H group in London, and in 1922 Toc H was incorporated by royal charter. Toc H. church, All Hallows by the Tower, largely destroyed in the Second World War, has now been rebuilt. The *Toc H Journal* is pub. monthly.

Tocantins, riv. of N. Central Brazil, rising in the state of Goiás and flowing N. into the Atlantic Ocean through the Rio Pará. Its largest trib. is the Araguaia. Its course, which is much interrupted by rapids, is navigable only in some parts. Its economic value rests in the babaçu palms watered by its upper reaches. Length 1600 m.

Toccata (from It. *toccare* = lit. to touch, figuratively to play). Originally, in the 17th cent., simply 'a thing to play,' as distinct from *cantata*, 'a thing to sing.' But it soon acquired a sense of touching a keyboard instrument, for the purpose of trying or testing it, which meant that it usually contained scales, shakes, and other brilliant figuration, often interspersed with slow chordal passages. Modern T.s usually lay stress on brilliance and rapid execution alone, and are often more or less uniform in figuration throughout; there is in fact little or nothing to distinguish them from concert studies. Well-known examples are found in the works of Bach, Schumann, Debussy, and Ravel.

Tocopilla, tn and port of Antofagasta prov., Chile, 120 m. N. of Antofagasta and 110 m. S. of Iquique. Exports include nitrate, iodine, sulphate, and copper ore.

T. supplies electric power to the important copper mine of Chuquicamata. Pop. 15,500.

Tocqueville, Alexis Charles Henri Maurice Clérel de (1805-59), Fr. historian, b. Verneuil, Seine-et-Oise, accompanied Gustave de Beaumont to America to study prisons in 1831, and took the opportunity to collect materials for his *De la Démocratie en Amérique*, 1835, a work of peculiar interest as the first reasoned and more or less unbiased exposition of popular gov. in that country. A moderate Liberal in politics, he was elected vice-president of the Assembly in 1849, was dismissed when Louis Napoleon became emperor, and met with an enthusiastic reception from John Stuart Mill and other prominent Whigs when he visited England. He pub. *Ancien Régime et la Révolution*, 1856. His *Souvenirs* were written in 1850-1, first pub. in 1893, and ed. and trans. with an introduction, by J. P. Mayer in 1948. See studies by E. d'Eichthel, 1897; R. P. Marcol, 1910; H. Göring, 1928. See also R. Sottan, *French Political Thought in the Nineteenth Century*, 1931.

Todas, aboriginal people living in the Nilgiri Hills of S. India. They devote their labour almost exclusively to their herds of buffalo, and exchange dairy produce for grain and other goods with neighbouring tribes. The ordinary herds are tended by men and boys without any special ritual; but the sacred herds of buffalo are the object of elaborate rituals performed by official herdsmen at sacred dairies. The T. practise an interesting system of polyandry (q.v.). See W. H. R. Rivers, *The Todas*, 1906.

Todd, Ruthven (1914-), poet, essayist, and novelist, b. Edinburgh. He was educ. at Fettes College and the College of Art, Edinburgh. A leading authority on William Blake, he produced a modern ed. of *Gilchrist's Life of Blake*. A collection of essays entitled *Tracks in the Snow*, 1946, deals with the mythology of the 18th cent. in its effects upon Blake, John Martin, and Henry Fuseli, and with the influence of science upon the artists and writers of the period. He pub. 4 books of poems, including *The Planet in My Hand*, 1947, and *In Other Worlds*, 1950. His first novel, *Over the Mountain*, 1939, an allegorical fantasy, was followed by *The Lost Traveller*, 1942, and *The Ruins of Time*, 1950.

Toddy, in the N. usually a drink of spirits, sugar, and hot water with a slice of lemon; in tropical countries beverages fermented from the sap of various palms.

Todhunter, Isaac (1820-84), mathematician, graduate of London and Cambridge, b. Eves. At St John's College at Cambridge he was a scholar, fellow, and lecturer in turn, heading the degree list as senior wrangler, and gaining the mathematical blue ribbon, Smith's Prize. He was a member of the council of the Royal Society, of which he was elected a Fellow in 1862. His text-books on algebra, Euclid, trigonometry, and calculus attained a world-wide circulation, and he made original contributions to the cal-

culus of variations and the theory of probability. Amongst his more important works may be noticed *History of the Theories of Attraction*, 1873, *Elementary Treatise on Laplace's, Lamé's and Bessel's Functions*, 1875, and with Pearson, *History of Theories of Elasticity*, 1886-93. **Todi**, **Jacopone da**, see **JACOPONE DA TODI**.

Todi (anc. **Tuder**), It. tn, in Umbria (q.v.), on a hill overlooking the Tiber valley, 24 m. S. of Perugia (q.v.). It has a cathedral, and Etruscan and Rom. remains. Pop. (tn) 3900; (com.) 21,000.

Todmorden, municipal bor. in the W. Riding of Yorks, England, 19 m. NNE. of Manchester. It has cotton weaving and spinning factories, foundries, and machine shops; and there are coal mines in the area. Pop. 19,074.

Todt, Fritz (1891-1942), Ger. engineer, b. Baden, famous as the constructor of the Ger. W. Wall (q.v.), and the *Autobahnen* (motor roads) in Germany. He became Inspector-General of Reich Roads in 1933 and visited Britain in 1937 to study Brit. traffic problems. He was made maj.-gen. in 1939 in recognition of his work in the W. anti-aircraft defensive zone, and was appointed Reich Minister of Arms and Munitions in Mar. 1940.

The construction of the Ger. W. Wall had to be carried out at great speed because of the tense political situation, and for this purpose T. created his 'Todt Organisation', by the aid of which the task was completed with almost incredible speed. T. was also largely responsible for the very efficient construction of road-transport supplies, upon which the Nazi 'Blitzkrieg' mainly depended.

Tofua, volcanic is. in the Tongan Group. **Toga**, the formal dress of a Rom. citizen in tn, and obligatory on public occasions. It was made of white wool. Laid flat, it resembled a semicircle with the straight side bent outwards to form an obtuse angle. The T. measured lengthwise about 3 times, in width about twice, the wearer's height. The method of donning a T. was as follows. It was formed into thick folds lengthwise and cast over the left shoulder so that one-third of the total length hung down in front; the remainder was passed behind, under the left arm, and thence over the left shoulder. The left arm being now almost covered, the part lying across the back was spread to cover the right shoulder, and the front was arranged in a series of folds, forming a pocket (*sinus*). Curule magistrates and boys wore the T. *prætexta*, i.e. with a purple border; on attaining manhood the T. *virilis*, without the border, was assumed. The T. *picta* (embroidered) was worn by gens. at their triumph; the T. *pulla* (of dark stuff) by mourners and persons impeached. After Augustus, the emperors commonly wore a purple T. See L. Wilson, *The Roman Toga*, 1924.

Toggenburg, upper valley of the R. Thur, canton of St Gallen, Switzerland. It extends for about 30 m. The chief vils. are Lichtensteig, Wattwil, and Nesslau. Dairy-farming, fruit-growing, and agriculture are carried on.

Togliatti, Palmiro (1893-), It. Communist politician, formerly a journalist. Lived in exile in Russia during the Mussolini régime, and became a prominent member of the Comintern. He returned to Italy in 1944 and became vice-premier (1944-5), and minister of justice (1945-6). An unsuccessful attempt was made on his life in 1948. He has consistently attacked Italy's alliance with the W. and has supported Moscow unquestioningly through every post-war phase of Soviet policy.

Togo, Heihachiro, Count (1847-1934), Jap. adm., b. Kagoshima. He studied in England at the Thames Naval College, Greenwich, and on the *Worcester*, 1871-3. He had already entered the Jap. Navy. Made adm. in 1904, he acted during the Russo-Jap. War as commander-in-chief of the Combined Fleet. His exploits during this war were numerous, the chief being the bombardment of Port Arthur.

Togoland, formerly (1884-1914) a Ger. colony, and now (a) part of the state of Ghana; (b) an autonomous rep. within the Fr. Union. In Aug. 1914 the Germans surrendered their colony unconditionally to Brit. and Fr. forces. Britain administered the W. portion, 13,041 sq. m., as a part of the Gold Coast (now Ghana, q.v.), later under mandate by the League of Nations. The pop. in 1954 was 423,000 Africans and a mere handful of Europeans. Terms of the trusteeship for Brit. T. under the U.N. Charter were approved in 1946 (Cmd. 6963, H.M.S.O.). In 1948 an Anglo-Fr. standing consultative commission was formed, which agreed on co-ordination of medical and educational services, on economic exchanges, and on freedom of movement across the boundaries. In May 1956 a plebiscite was held under the auspices of the U.N. to estab. the wishes of the people in respect of integration with Ghana. Of the total registered electorate of 192,432, 66,529 were in favour of Brit. administration under U.N. control. In the event, T. was incorporated with Ghana, but there was evidence of serious dissension.

France administered 20,404 sq. m. (which included all the coast-line) between the Gold Coast (Ghana) on the W. and Fr. Dahomey on the E., as part of the Federation of W. Africa. Later it became a trustee ter. of the French under the U.N. In Aug. 1957 the Territorial Assembly of Fr. T. conferred self-gov. on the ter. within the Fr. Union, which granted home rule except regarding foreign relations, defence, currency, and internal security, which remained the responsibility of France. The new rep. granted equal rights for all inhab., created a Legislative Assembly, and a cabinet was formed in Sept. 1957 with M. Grunitzky as Prime Minister. A referendum in Oct. confirmed—by 62 to 80 per cent., according to the dist.—the new status of the ter. It continues to be represented in the Fr. National Assembly, the Council of the Rep., and Assembly of the Fr. Union. The pop. is 738,000 Africans and 1100 Europeans, and the cap. is Lomé.

Considering the 2 ters. as a whole, T. is bounded on the N. by the Upper Volta and on the S. by the Gulf of Guinea. A chain of highlands runs from SW. to NE., the highest point being Mt. Atakpessé (3248 ft.). The chief rvs. are the Volta, which formerly separated T. from Ghana, its trib. the Oti, the Mono, and the Zio and Haho, which empty into Togo Lagoon. The climate is unhealthy. Coffee, rice, and cocoa are grown, but the last is the only crop of commercial value. The dist. is rich in iron, which is smelted by the Africans. Some cattle are reared. The chief port, Lomé (pop. 280,500 Africans and 760 Europeans), is connected by rail with Aného, the second port, and Palime for Misahöhe and Atakpame, all in Fr. ter. A trade school has been estab. at Yendi. Straw-plaiting, weaving, wood-carving, smith-work, and the making of earthenware are the chief industrial occupations of the natives, who, in the S., are of Bantu stock. They speak 30 different languages, of which Ewe is the chief. The inhab. of the N. are of Hamitic descent and speak 16 languages. See General Maroix, *Le Togo*, 1938; Report on the Administration of Togoland, H.M.S.O., 1955.

Tojo, Hideki (1884-1948), Jap. statesman and gen., b. Tokyo, came into office with the expansionist elements in the Army and Navy and, in 1940, when Prince Konoe founded his new National Party, T., as war minister, was one of the 2 leading figures in the Cabinet formed by Konoe, whom he succeeded as Prime Minister. It was T. who ordered soon afterwards the attack on Pearl Harbour. During the easily won victories in 1941-2, before the Allies could deploy their strength, T. assured his position at home in 1942 by dissolving the Diet and appointing a National Service Political Council to control the Diet in the interests of the gov. But in 1944 T. began to realise that the War was closing in on the heart of Japan, and he therefore reorganised the High Command by combining, and himself taking, the posts of war minister and army chief of staff and combining the posts of navy minister, and navy chief of staff. He also speeded up shipbuilding and gave priority to aircraft production. But despite these measures the tide of allied victory rolled on, and when Salpan fell, T. resigned and was succeeded by Gen. Koiso. After the Jap. collapse T. was tried in Tokyo (1947-8) and hanged on 23 Dec. 1948.

Tokaj (anglicized Tokay), tn of Hungary, in Borsod-Abaúj-Zemplén co., near the junction of the Tisza (q.v.) and the Bodrog, 28 m. E. of Miskolc (q.v.). The tn is at the E. ft of Mt T. (1690 ft.), which gives its name to the celebrated wine produced on its slopes and in the surrounding hilly dist. of Hegyalja. Pop. 5900.

Tokat, (ancient Dazimon), tn and il of Asiatic Turkey, 52 m. NNW. of Sivas. It manufs. copper-ware and leather, and there are coal and iron deposits in the vicinity. Pop. (ii) 388,724; (tn) 21,700 (1950).

Tokay, see TOKAJ.

Tokelau (or Union) Group of Pacific is., lies about 270 m. due N. of Apia, W. Samoa. It consists of 3 atolls, Atafu (or Duke of York Group), Nukunono (or Duke of Clarence Group), and Fakaofo (sometimes called Bowditch). Attached to W. Samoan administration from 1926 to 1948, when the Group became part of New Zealand. Total land area 2500 ac. Copra is the chief product, and excellent hats and mats are made from pandanus leaves. The Polynesian pop. was estimated in 1954 at 1750.

Token (Money), coin of higher nominal than intrinsic value; or a stamped piece of metal issued as a limited medium of exchange, as for bus fares, and at a nominal value much greater than its commodity value; or anything of only nominal value similarly used, as a piece of paper currency.

Tokharian Language, see INDO-EUROPEAN LANGUAGES.

Tokitaro, Ando, see HIROSHIGE.

Tokyo (formerly Yedo), cap. of Japan, situated on the SE. side of the is. of Honshu or Honshu in the Bay of Tokyo, on the delta of the Sumida R., which separates the city proper on the W. from the Kōto on the E. It was founded in 1457 by Ota Dokan, who built his castle here, and received its present name when the court moved thither from Kyōtō in 1868. The tn was opened to foreigners in 1869. The magnificent palace, in a blend of Jap. and European styles, stands in the Fukiage park, not far from the anc. castle. To the E. of the palace lies the commercial and industrial part of the city, while the N. part is mainly educational, and contains the Imperial Univ., the Law School, First Higher Middle School, and numerous beautiful temples. In the W. and SW. are the foreign embassies and legations. The port of entry, Yokohama (q.v.), is 17 m. away and Haneda airport 10 m. S. of central T.

T. has suffered frequently from fire (many of the houses were, and still are, built of wood), and from storms, earthquakes, and epidemics. The gov. buildings had to be rebuilt after the fire of 1891. In Sept. 1923 great portions of the city were destroyed by a disastrous earthquake and the ensuing fire. Nearly 70,000 people were killed, and nearly a million migrated after the disaster. Reconstruction work was begun at once and completed by Mar. 1930. The important buildings were made both earthquake- and fire-proof; 3 large and 51 smaller parks were laid out to serve as refuges; and wherever possible improvements in planning were carried out.

T. was frequently and heavily bombed by Amer. aircraft, especially by Super Fortresses in 1945. According to the official estimates, more than 80 per cent of the houses in T. were completely destroyed. The present metropolitan area includes the whole of the former Tokyofu, and consists of 23 wards and 8 satellite cities, with a pop. of 8,224,000 (1956). It has 10 univs. and more than a hundred

colleges and technical schools; 378 high schools, 618 middle schools, and 908 primary schools; 44 museums, 58 libraries, and 28 public halls; 4 radio and 3 television stations (one of each is national). The daily circulation of newspapers is 5,500,000, and there are more than 1000 cinemas and theatres. The city and suburbs are well served by buses, trams, and underground railway. As well as being the political, educational, and artistic centre of Japan, T. is also a great industrial city; although traditionally noted for the production of toys, its largest industries are foodstuffs, printing, electrical apparatus, metal goods, machine tools, optical instruments, plastics, and textiles.

Tokyo Trials, see JAPANESE (WAR CRIMINALS) TRIALS.

Toland, John (1670-1722), theologian, b. near Londonderry, of Rom. Catholic parentage. Educ. at the univs. of Glasgow, Edinburgh, and Leyden, he became a protestant, then a rationalist. His work, *Christianity Not Mysterious*, 1696, was condemned by the House of Commons to be burnt. Later T. wrote *An Account of the Courts of Prussia and Hanover*, 1705. See studies by G. Berthold, 1876, and A. Lantoinc, 1927.

Tolbooth, term originally used in Scotland for a booth at a fair in which dues or tolls were collected and offenders against fair regulations were detained—whence it came to mean a prison. The most famous T. was the one in Edinburgh mentioned in *The Heart of Midlothian*. It stood near St Giles cathedral, and was pulled down in 1817.

Tolbukhin, Fyodor Ivanovich (1884—), see EASTERN FRONT IN SECOND WORLD WAR.

Tolbukhin (formerly Bazarjic, Bazargic, Dobrich), city of Bulgaria, in Varna prov., 26 m. N. of Varna (q.v.). It belonged to Turkey until 1878, and was in Rumania 1913-40. It has textile, metal, and food-stuff industries, and has a trade in agric. produce. Pop. 30,000.

Toledo: 1. Sp. prov., in Castilla la Nueva (q.v.), lying in the Tagus (q.v.) basin S. of Madrid (q.v.). In the N. is a rocky plateau, and in the S. are the Montes de T. (4350 ft). The valleys are fertile. Live-stock, including fighting bulls, is raised, and there are silk, cutlery, wine, oil, and pottery manufs. Area 5,926 sq. m.; pop 540,100.

2. (Anc. Toletum), Sp. city, cap. of the prov. of T., built on a rock above the Tagus. Important under the Romans, it became the cap. of the Visigoths (see GOTHS) in 418. In 711 it was taken by the Moors (q.v.), and in 1085 it became a cap. of Castile (q.v.), and, later, of Spain. In 1561 Madrid became sole cap. The tn centre is the Plaza de Zocodover, once the scene of *autos-da-fé*, masquerades, and bull-fights. To the S. is the ruined alcázar, and to the W. the great 5-aisled Gothic cathedral (13th-17th cents.) of the primate of Spain. There are many curious old streets and mansions. Sev. churches preserve paintings by El Greco (q.v.), once a resident of T. T. sword

blades were long famous, and fine knives are still manuf., as well as silks and objects of church art. Pop. 41,800. See I. Marin, *Recuerdos de Toledo*, 1893; A. F. Calvert, *Toledo*, 1907; H. Lynch *Toledo* (Medieval Towns Series); M. Gonzalez Simancas, *Toledo*, 1929.

3. City, cap of Lucas co., Ohio, U.S.A., on Maumee Bay of Lake Erie 95 m. W. of Cleveland. It is a railway centre, airport, and oil pipeline terminus, and a prin. Great Lakes port, ranking high among world ports for the shipment of soft coal, and receiving much iron ore. Important in shipbuilding and oil refining, it manufs. glass, automobiles, electrical equipment, and steel. T. has the city manager plan of government with proportional representation, and maintains a large public library, a noted Museum of Art, and the univ. of T. St Francis de Sales Cathedral is here. Pop. 303,600.

Toleration, doctrine that a citizen may adopt or discard any religion without state interference. T. became practically universal during the 19th cent.; but the rise of Fascism and Communism tended to restrict it in many countries, though most govts. still claim to support it. T. is not a direct offspring of the Reformation, which accepted the principle 'Cuius regio, eius religio,' i.e. a man should follow the religion of his king. But in effect this principle implied a theoretical equality of religions, and so paved the way for T. Modern indifference to religion also contributed to the development of T. Where it exists, it extends only to matters of doctrine; the State still exercises certain rights as a guardian of morality. See W. K. Jordan, *Development of Religious Toleration*, 1932-38; T. Lyon, *Theory of Religious Liberty*, 1603-39, 1937.

Toleration, Act of, see under ACT.

Toletum, see TOLEDO.

Tolima, dept of Colombia, lying between the Central and E. Cordilleras. The volcano T. rises to 18,425 ft, the highest peak in Colombia. In contrast, the transshipment point for vitally important riv. traffic is located in the same dept, at Honda, on the Magdalena. Silver, gold, lead, copper, and sulphur are found, and there is agriculture and stock-raising. Cap. Ibagué. Area 8874 sq. m.; pop. 772,970 (1955).

Toller, Ernst (1893-1939), Ger. poet and playwright; b. Samotschin (Posen), son of a Jewish merchant. He fought in the First World War as a volunteer, and, being a Socialist, he was prominent in the struggle for power in Bavaria, 1919, and suffered imprisonment. A refugee from the National Socialists, he committed suicide in New York. His expressionist drama has communistic and pacifist tendencies. His plays, many of which were trans. into English, include *Masse Mensch*, 1921, *Maschinenstürmer*, 1922, *Hinkemann*, 1924, *Tag des Proletariats*, 1926, *Hoppla, wir leben*, 1927; autobiography, *Eine Jugend in Deutschland*, 1933; verse, *Gedichte der Gefangenen*, 1921, and *Das Schwalbenbuch*, 1924. See W. A. Willbrand, *Ernst Toller and his Ideology*, 1945.

Tolls, tax imposed in consideration of some privilege. In the feudal system it meant the right to tollage one's vassals. Later it became the distinguishing mark of a turnpike road, i.e. a road having toll-gates or bars on it, called 'turns.' These 'turns' appear to have been first constructed about the middle of the 18th cent., when certain interested persons subscribed among themselves for the repair of various roads, and exacted a T. for the privilege of using the roads so repaired. The popular resistance to these exactions led to the passing of Acts to regulate T. These turnpike roads are now extinct. Where a claim to demand T. is made, there is a distinction between a *toll thorough* (through) and a *toll traverse* (across); the former being granted in consideration of the performance of a continuing beneficial service, such as the repair of a road or the maintenance of a bridge or ferry; the latter, of permitting the general public to pass over the land of the grantee of the toll. Military vehicles are exempt from payment. Other kinds of T. are *port-tolls*, or charges on goods carried into a port, *turn-tolls*, or charges on cattle driven to market and returned unsold, and T. levied by railway companies, as a statutory authority, upon merchandise carried on their lines. In recent years many fine roads in the U.S.A. have been financed by tolls, and it has been suggested that Brit. roads might be financed by the same method. For the Ferries Committee's proposals (*Ferries in Great Britain*, H.M.S.O., 1948), see FERRY. See also ROAD FUND.

Tolly, M. A. Barclay de, see BARCLAY.

Tolna County, see SZÉKESZÁRD.

Tolosa, see TOULOUSE.

Tolpuddle Martyrs, 6 farm labourers of Tolpuddle, 7 m. from Dorchester, who in 1834 were transported to Australia for forming a trade union, which at that time was held to be a conspiracy in restraint of trade. Following a nation-wide agitation, they were pardoned 2 years later. The centenary of the Tolpuddle episode was marked by the pub. of *The Book of the Martyrs of Tolpuddle, 1834-1934*, by the general council of the T.U.C. and of *The Tolpuddle Martyrs*, by M. M. Firth and A. W. Hopkinson; and also by a gift to the public of a plot of land including a memorial to the T. M.

Tolstoy, Count Aleksey Nikolayevich (1833-1945), Russian novelist and playwright, an outstanding representative of National Bolshevism (q.v.). He estab. a name as a Neo-Realist before the 1917 revolution, was with the Whites during the Civil war, emigrated, but then joined the Change of Landmarks movement and in 1923 returned to Russia. At first he was treated by Communists with suspicion as a Fellow Traveller (q.v.), but from the middle 1930s he enjoyed a privileged position as a pillar of Stalinism and directly contributed to the Stalin cult (*Bread*, 1937). His best works are the trilogy *The Road to Calvary*, 1921-41 (trans. 1946) on the life of the Russian intelligentsia in 1914-21, and the historical novel *Peter I*, 1929-45 (incomplete trans. 1936).

Tolstoy, Count Lev Nikolayevich, (1828-1910), great Russian novelist and social reformer, of an old aristocratic family, b. on the family estate Yasnaya Polyana in the Tula prov., where he spent most of his life. He became an orphan at 9 and was brought up by a distant cousin, studied at Kazan' Univ., but left it before graduating and gave himself up to pleasure for some years. In 1851 he joined the Russian forces in the Caucasus engaged in the struggle against Shamil' (q.v.), and on the outbreak of the Crimea War was at his request transferred to the Danube army and then to Sevastopol', taking part as an artillery officer in its heroic defence.

TOLSTOY IN 1857

When, after the fall of Sevastopol' in 1855, he came to St Petersburg, he was received with admiration in the literary circles of the capital—by Turgenev, Nekrasov, Goncharov, Ostrovsky, Chernyshevsky, etc.—as a new star of Russian letters. While in the Caucasus he had written autobiographical stories, *Childhood* and *Boyhood* (pub. 1852 and 1854), and a number of war stories which had already revealed what were to be the main features of T.'s literary work, and his main contributions to the art—the minute psychological analysis and the clarity of moral sense. These first works were followed by the *Tales of Sevastopol'*, 1855, *Poeth*, the third part of the autobiographical trilogy, 1857, etc. In 1857 and 1860 he travelled widely in W. Europe, bringing back a disgust with its materialism. The second journey was largely devoted to the study of educational methods. In the 1860s and seventies T. devoted much of his time and energy to educational activities, running

a school on his estate, publishing a special magazine, writing textbooks, etc., as one of the pioneers of 'free education.' The sixties and seventies were also the period of most intensive literary work. For over 6 years (1863-9) T. worked on *War and Peace*, often called the greatest novel in world literature, a panorama of Russian society on the eve of and during the Patriotic war of 1812 against Napoleon. Equally forceful and encyclopaedic is the picture of Russia after the emancipation of the serfs (see GREAT REFORMS) in *Anna Karenina*, 1873-7. By the time he finished *Anna Karenina* T. had approached a spiritual crisis, which in the following years was resolved in his working out a new religious and social teaching known as Tolstoyism and based on the conviction that the whole message of Christ was contained in the words 'that ye resist not evil.' Renunciation of violence and wealth, inner self-improvement, and love to all living things are the main tenets of Tolstoyism (*What I Believe In*, 1883, *A Confession*, 1884, *What Are We To Do?*, 1886, *A Short Exposition of the Gospels*). In *What is Art*, 1896, T. argued that art is a means of 'infecting' other people with the feelings the artist has experienced, and rejected the 'superfluous detail' of his great realistic creations. The imaginative works of T.'s later years (long stories *The Death of Ivan Ilich*, 1884, *Kreutzer Sonata*, 1889, *Master and Man*, 1895, *Hadji-Murad*, 1896-1904; the novel *Resurrection*, 1899-99; the plays *The Power of Darkness*, 1886, *Fruits of Enlightenment*, 1890, and *The Living Corpse*, 1900; and many popular stories all to a greater or lesser extent serve to illustrate and propagate his new philosophy. His rejection of the Church and State brought him excommunication and government hostility. The fame of his teaching soon crossed the frontiers of Russia, and during the last 15 or 20 years of his life T. was probably the most venerated man in the world. While Yasnaya Polyana became a place of pilgrimage, T. himself felt increasingly estranged from it and from his family, who did not share his views. Unable to reconcile his ideal of simple life with the atmosphere of his family estate, he secretly left Yasnaya Polyana and 10 days later d. of pneumonia at a small railway station. T. the artist has had much influence on subsequent literature. T. the thinker has proved much less influential, and his only great disciple was Gandhi (q.v.). His collected works are being pub. in Russia in 90 vols. (60 have appeared 1928-56). There are many trans. The standard Eng. version is by L. and A. Maude (21 vols.), 1928-37. See also M. Gorky, *Tolstoy, Chekhov, and Andreyev*, 1923; life by A. Maude (2 vols.), 1928; and studies by D. S. Merezhkovsky, 1902; R. Rolland, Eng. trans. 1911; J. Lavrin, 1924-45; E. J. Simmons, 1946.

Toltecs, semi-legendary people of Mexico and Central America, to whom the Aztecs and Mayas ascribed many cities, monuments, and arts. Though their certain origin is not known, they were the

reputed conquerors of the Mayas. They are said to have migrated southward along the Mexican plateau from the N. In the basin of Mexico they subdued the tribes already settled on the land and founded their own cap., calling the land Anáhuac, 'edge of the water,' on account of its many lakes. It is thought their main centre was at Tula (Tollán). They reached the zenith of their power between AD 700 and 1100, conquering many neighbouring tribes, and in time the confines of their empire extended as far N. as the Tropic of Cancer and as far S. as the S. border of Guatemala. Their name means 'builder,' and they are famous for the great pyramids of Teotihuacán, etc. The legendary Toltec leader, Quetzalcoatl or Kukulkán ('Feathered Serpent'), who is said to have died in AD 895, forced the Maya city states to cease their internecine warfare and accept his rule, but when the power of the T. declined the Mayas resumed their mutual strife, which resulted in their abandonment of the tns of NW. Yucatán. The legendary hist. of Quetzalcoatl is found in *Historia de Colhuacín y de México* (see Scler's Commentary (Eng. trans. by A. H. Keane), 1901-02). See also P. James, *Latin America*, 1942.

Tolu, see BALSAM.

Toluca, tn of Mexico, cap. of the state of Mexico, 45 m. SW. of the city of Mexico. It is a summer resort and the centre of an agric. and stock-farming region. The Nevado de Toluca, an extinct volcano (14,950 ft), lies SW. of the tn. To reach T. from Mexico City, a distance of only 40 m. by road, it is necessary to climb above 10,000 ft over the intervening mt range. The centre of the region, known as the basin of T., is swampy; maize, wheat, beans, and alfalfa are grown. Included in this dist. of concentrated settlement is the old mining community of El Oro. There are flour and textile mills and a power plant. Pop. 43,500.

Toluene, **Methyl Benzene**, or **Phenylmethane** ($C_6H_5CH_3$), mobile liquid (boiling-point $110^\circ C.$) which resembles benzene in most respects. It is prepared from the 90 per cent benzol obtained from coal-tar and from the cracking of petroleum (q.v.), and is used in the preparation of aniline dyes, explosives, and many other compounds.

Toluidine. The T.s or amino-toluenes ($C_6H_4(CH_3)NH_2$) are prepared from the corresponding *ortho*-, *meta*-, and *para*-nitrotoluenes by reduction. *ortho*- and *meta*-T.s are oils boiling at 197° and $203^\circ C.$ respectively. *para*-T. is crystalline, melts at 45° and boils at $200^\circ C.$ The T.s resemble aniline in their reactions, and they are employed in the manuf. of aniline dyes.

Tom Thumb, see DWARF.

Tomahawk, war-batchet of the N. Amer. Indians. Originally it was composed of a stone head tied to a wooden handle by leather thongs. One end of the stone was sharpened and the other hollowed into a pipe bowl, to which the hollow handle acted as stem. Subsequently steel and iron heads were introduced by Europeans.

VOL. XII.

Tomar, tn of Portugal, in Santarém dist., 29 m. NNE. of Santarém (q.v.). It was the seat of the Order of Christ, 14th-16th cents., and it was here that Philip II (q.v.) of Spain was proclaimed King of Portugal. The tn has 2 fine churches and a splendid convent-castle of the Knights Templars (q.v.). Textiles and paper are manuf. Pop. 5400.

Tomaso de Vio, see CAJETAN, JACOPO.

Tomaszów Mazowiecki, tn of Poland, in Łódź prov., on the Pilica, 29 m. SE. of Łódź (q.v.). It has iron and textile industries. Pop. 32,000.

Tomato, or *Lycopersicon esculentum*, ann. plant (family Solanaceae), bearing globose red or yellow fruit, formerly known as 'love apples,' was introduced into England in 1596, but only since 1900 has it come into immense popularity in Britain, its production, chiefly under glass, now being a large and important industry. Its production is world-wide. Except in sheltered and especially favoured situations, and when the season is sunny, the culture of the fruit out of doors is unsatisfactory. The plants are raised from seed early in the year in warmth. They are confined to a single stem, shoots at the axils of the leaves being regularly pinched out. Liberal watering and manuring are necessary while the fruit is setting. Late fruit may be ripened in the dark in a temp. of $50^\circ F.$

Tomb (Gk *tumbos*), properly signifies a mass of masonry raised over a grave or vault used for interment; but it is applied, in a wider sense, to any sepulchral structure. Of primitive sepulchres there are 2 classes, one subterraneous, the other of raised mounds or tumuli. Monuments of the first kind are numerous in Egypt; the Pyramids had no doubt a common origin with the tumulus. At some places in Etruria the T.s are hewn out on the sides of rocks and hills, and their entrances present an architectural façade. Sepulchral edifices are numerous throughout Latium and Magna Graecia, many being remarkable for the architectural decoration bestowed on them. The T.s of the Middle Ages within buildings (churches, chantries, cloisters, etc.) exhibit a variety of form and enrichment, from the primitive stone coffin to the lavishly decorated canopied monuments. Another class consists of *Altar* or *Table Tombs*. The next in order is the *Effigy Tomb*, first introduced in the 13th cent., with a recumbent figure of the deceased upon it, extended, with the hands slightly raised and joined in the attitude of prayer. Altar and effigy T.s were usually placed between the piers of an arch, or within a recess in a wall, and the whole T. was frequently covered by an arch forming a sort of canopy over it; of which kind is that of Aymer de Valence in Westminster Abbey. See also BURIAL CUSTOMS; MASTABA; MAUSOLEUM; PYRAMID; SARCOPHAGUS.

Tombigbee, riv. of U.S.A. rising in Prentiss co., Mississippi, and flowing S. to unite with the Alabama R. to form the Mobile R. Length 400 m.

Tombolo, sandbank or bar connecting an is. to the mainland. A T. is formed

F

when deposits of sand formed by wave-action around the is. link with shore deposits of the coast.

Tomis, often but inaccurately called **Tomli** (later **Tomiswar**, or **Jegni Pangola**: modern **Kustendje**, or **Constanza**), tn of Thrace on W. shore of the Euxine. Once cap. of Scythia Minor, it was colonised by Greeks from Miletus (c. 600 BC), and is famous as the place to which Ovid was banished.

Tomlinson, Henry Major (1873-1958), novelist and travel writer, b. London. At the age of 12 he became clerk in a shipping company, but disliked the work, and turned to writing. In 1904 he joined the staff of the *Morning Leader*, and in 1912 made a voyage up the Amazon, of which he wrote in *The Sea and the Jungle*. During the First World War he was a war correspondent, then was literary editor of the *Nation* from 1917 to 1923. After travelling in the East Indies he wrote *Tidemarks*, 1924. His novel *Gallions Reach*, 1927, was awarded the Femina-Vie Heureuse Prize; others are *All Our Yesterdays*, 1930, *The Snows on Helicon*, 1933, *All Hands*, 1937, and *Morning Light*, 1946. But he is best known for his travel books, *Old Junk*, 1918, *London River*, 1921, *Under the Red Ensign*, 1926, *Out of Soundings*, 1931, *The Wind is Rising*, 1941, *Turn of the Tide*, 1945, and *Malay Waters*, 1950. *A Mingled Yarn*, 1953, is a book of autobiographical essays.

Tommaso di Stefano, see **GIOTTINO**.

Tommy Atkins, slang name for the Brit. private soldier; more shortly 'Tommy', as in the opening poem of Kipling's *Barrack Room Ballads*, 1892. Originally the supposititious name used in a specimen form in an official handbook issued by the War Office after the Napoleonic wars and afterwards generally applied to describe the Brit. regular soldier. The vogue of the name, which is used in a friendly rather than in any derogatory sense, was due largely to Kipling. There seems to be no convincing evidence that the name was that of an identifiable individual, though the theory has been advanced that a soldier of that name was mortally wounded under Wellington when a subaltern in Holland, and that many years later the Duke, when secretary of state, adopted the name in the army form. The Scots equivalent is 'Jock'.

'Tommy Gun', see **SUBMACHINE GUN**.

Tompson, Thomas (1638-1713), watchmaker, b. Northill, Beds. Throughout his career he was closely associated with some of the leading mathematicians and philosophers of the time. The theories of Robert Hooke (q.v.) and Edward Barlow (see **CLOCK**) would, in all probability, never have been put into practice but for Tompson's skilful execution of them. Early in his career he became the leading watchmaker to the court of King Charles II, and was everywhere welcomed as a craftsman of exceptional ability. T. was closely associated with the Worshipful Company of Clockmakers, being elected a brother in 1671, a Freeman in 1674, and Master in 1704. He is buried in Westminster Abbey. See **WATCH**.

Tomsk: 1. Oblast in W. Siberia, traversed by R. Ob', largely covered by swampy coniferous forests. Area 121,400 sq. m.; pop. (1956) 751,000, mostly Russians, some Tatars and Khanty. There are lumbering and wood-processing, metalworking and food industries, fur trapping, grain and flax growing, and dairy farming. Area of banishment and labour camps (see **NARYN**).

2. Cap. and econ. centre of the above, and a major cultural centre of Siberia. There are engineering, chemical, and woodworking industries. It has a univ. (oldest in Siberia, founded 1888) and a polytechnical institute (founded 1900). Pop. (1956) 224,000 (c. 1914, 112,000; 1926, 92,000; 1939, 141,000). T. was founded in 1604 as a fort. tn, and played an important part in further Russian advance in Siberia as a trade and transportation centre on the crossing of water and overland ways; it was a prov. cap. 1782-1925, and the admin. centre of a gold-mining area from the 1830s; industrial development has taken place since the 1930s, and particularly since the Second World War.

Tomtit, see **TIT**.

Ton, or **Tun**, see **METROLOGY**.

Tonalite, type of quartz diorite found in the Adamello Alps. Plagioclase quartz, hornblende, and biotite are dominant minerals, with magnetite, zircon, etc., as accessories. The granite-diorites of the U.S.A. are of this type, which is also found among the Scottish plutonic rocks.

Tonality, synonym for **key**, in music, but also meaning, more specifically, the feeling of a definite key suggested by a composition or passage. In modern musical terminology 2 antithetical derivatives of the word have appeared, **atonality** (q.v.), and **polytonality** (q.v.).

Tonawanda, tn of New York, U.S.A., in Erie co., on the Erie Canal. It has canal and lake shipping, and is also a commercial and railroad centre. It manufs. chemicals, hardware, paper and metal products, furniture, office equipment, lenses, and paints, and there is oil refining. T. Indian reservation is E. Pop. (1950) 14,617.

Tonbridge, tn of Kent, England, on the R. Medway, 27 m. SE. of London, an agric. mkt. and educational centre. Printing, manuf. of cricket balls, bricks, plastic goods and flints, tanning, and t. distilling are the chief industries. Remains of T. Castle, founded soon after the Norman Conquest, are to be seen. T. School was founded in 1553 by Sir Andrew Judd, who placed it in the care of the Skinners' Company. Little of the 16th-cent. building remains; new additions were completed in 1894. Jane Austen's father, the Rev. George Austen, was a master here. See D. C. Somervell, *A History of Tonbridge School*, 1947. Pop. 20,000.

Tønder: 1. Amt in S.W. Jutland, Denmark. The soil is mainly marshy, but there is some agriculture. From 1864 until the plebiscite of 1920 the dist. was part of Germany. Area 535 sq. m.; pop. 42,840.

2. Cap. of the above, near the Ger. border. Pop. 7260.

Tone, Theobald Wolfe (1763-98), Irish patriot, b. Dublin, and educ. at Trinity College there. He was called to the Irish Bar in 1789, but devoted himself to politics, and printed articles attacking the gov. In 1791 he founded the society of United Irishmen (q.v.), and in the same year was elected secretary to the Catholic Committee. He went to the U.S.A. in 1795, and in the following year went to Paris, where he persuaded the Directory to organise a Fr. invasion of Ireland. T. was given a command under Hoche (q.v.) in the resultant expedition, but the French failed to effect a landing. In 1798 T. was captured (by the forces of Sir John Warren) on board a Fr. ship which was part of a force intended to support the Irish risings of that year. He was tried by court martial and sentenced to death for treason; he committed suicide in prison. His *Autobiography* was pub. in 1826. See lives by A. de Blacam, 1935, and G. F. MacDonnet, 1939.

Tone, term used in English for pure musical notes not charged with harmonics, each harmonic being itself a T.; also for the quality of a musical sound, especially with reference to performance. The word T. does not imply pitch; but in America it is often used confusingly as synonymous with 'note,' doubtless under the influence of the Ger. *Ton*.

Tones, Partial, see HARMONICS.

Tonga, or Friendly Islands, kingdom under Brit. protection situated in the W. Pacific to the ESE. of Fiji between 15° and 23° S. lat., with an area of 259 sq. m. The group consists of about 200, mostly small is., 38 of which are inhabited. They were discovered by Tasman in 1643, and visited in 1777 by Cook, who, on account of the disposition of the natives, called them the Friendly Is. Most of the is. are of coral formation, though some (Tofua, Kao, and Niuafoou) are volcanic. There are 2 volcanoes, and the is. are subject to frequent hurricanes. The Tongans are Polynesians, closely allied to the Maoris and Samoans. Tonga is a constitutional monarchy under the protection of Great Britain, estab. by a treaty of friendship and protection signed in 1900. The is. are ruled by Queen Salote Tupou, G.C.V.O., G.B.E., who succeeded her father, King George Tupou II in 1918. The kingdom consists of 3 main groups of is., Tongatabu, Ha'apai, and Vava'u. The inhab. are converted to Christianity, the first Wesleyan missionaries having landed in Tonga in 1826. Free Wesleyan Church 28,500; Free Church of Tonga 9000; Rom. Catholic 7500; other Protestants 7000. There are both gov. and mission primary schools, education being compulsory between the ages of 6 and 14. Schools are divided into 3 types, primary, middle, and high. There are 3 public hospitals, the main one being at Nuku'alofa (the cap.). The soil is very fertile, and the chief exports are copra and bananas; other exports are sweet potatoes, pineapples, melons, and candle-nuts. All copra is now shipped to

the U.K. and bananas to New Zealand. The imports include drapery, flour, sugar, timber, and hardware. Exports were valued at £1,202,162 in 1953 and imports at £918,319. There is no public debt, and the amount of accumulated balances (30 June 1953) was £699,508. The main source of revenue is customs duties. There is a monthly steamship service from New Zealand via Fiji, and vessels call at frequent intervals to load copra for the U.K. New Zealand National Airways ceased operating to Tongatabu in 1950, as T. felt that the heavy cost of maintaining airfield facilities was unwarranted.

TONGAN BOY

E.N.A.

In 1953 Tonga made arrangements with Tasman Empire Airways Ltd., which replaced New Zealand National Airways Corporation's land-plane service with a Solent flying-boat service, to fly charter-trips from Suva and return. Since 1954, flights have been made at alternate 2-weekly and 6-weekly intervals. There are 5 wireless stations in the group and a telephone service in Nuku'alofa and in Vava'u. The constitution provides for a gov. consisting of the sovereign, a privy council and cabinet, a legislative assembly, and the judiciary. The sovereign presides over the privy council, which consists of the premier, the ministers (at present 3 Tongans and 1 European, who are also heads of gov. depts) and the governors of Vava'u and Ha'apai. The constitution of the cabinet is similar, except that the premier presides. The legislative assembly consists of the premier, and ministers of the Crown (including the 2 governors), 7 representatives of the nobles elected by the nobles themselves, and 7 representatives of the people elected triennially by popular franchise.

The courts consist of a supreme court, a magistrate's court, and a land court. Pop. (1953) 51,402 Tongans, 230 Europeans, and 545 others.

History. The first Europeans to visit any part of the group were the Dutchmen Cornelis Schouten and Jacob le Maire in 1616. After Tasman, the next arrival was the first Englishman to land in T., Capt. Wallis, who, in 1767, gave the name of Keppel to the N. Is. of Niuatobutabu and exchanged some iron nails with the natives for food. A few years later these

the kingdom, given the people a land system, a constitution, and the beginnings of parl. gov. in a modern Christian state. The result of Brit. protection, however, has been to sustain and strengthen the Tongan's independence and national characteristics. The Tongans have their own currency notes and postage stamps, and the language of the gov. or the depts is Tongan. Foreign affairs are transacted through the Brit. agent and consul, who is appointed by the gov. of Fiji and acts as adviser to the queen and gov. His

A TONGAN DANCE

nails were shown by the natives to Cook, who paid sev. visits to the group between 1773 and 1777 and gave a full account of the is. and people on his return home. After Cook's time Tonga began to be torn by civil wars between sev. contemporary dynasties, from which it was rescued, after long and heavy fighting, by a member of the 19th Tui Kanokubolu (or third dynasty), Taufa'ahau Tupou, an able warrior and administrator who had been converted to Christianity in 1831, when he and his wife, at their baptism, took the names of George and Salote (Polynesian for Charlotte) in honour of George III and his consort, and these names have persisted in the Tupou dynasty to this day. By 1845 King George Tupou I had brought the whole of Tonga under his rule and when he d. in 1893, at the age of 96, he had united

consent is necessary for the appointment of Europeans to the Tongan gov. service. In other respects the country is completely autonomous. See Sir H. Luke, *Britain and the South Seas*, 1945.

Tongaland, see AMATONGALAND.

Tongareva, see PENRHYN.

Tongariro, volcanic mts in the N. part of the N. Is. of New Zealand, Wellington prov., 20 m. SSW. of Lake Taupo. The N. plateau, to which the name is confined, has 8 craters. To the S. is Ngauruhoe (7515 ft), which was in eruption in Mar. 1909. The Red Crater and Te Mari are also still active.

Tongatabu, prin. is. of Tonga.

Tongerén (Fr. Tongres), tn in the prov. of Limbourg, Belgium, 12 m. SE. of Hasselt, generally considered to be the oldest tn of Belgium. It was called Civitas Tongrorum under the Romans.

Part of the defensive wall, built in this last period, has been laid bare recently. Among its numerous historical monuments are the 15th-cent. basilican church of Notre-Dame, the cloister of the 12th cent., the beguinage and the Moerepoort, an interesting remnant of the fortifications of the 14th cent. T. has an important cattle mkt. Pop. 15,000.

Tongres, see TONGEREN.

Tongue, vil. on the N. coast of Sutherland, Scotland, on the E. shore of the Kyle of T. The House of T. first erected 1678, is a seat of the Duke of Sutherland. To the W. of the Kyle are the impressive cliffs of Kennageall or Whiten Head. Pop. 827.

Tongue, movable muscular organ attached to the floor of the mouth, and concerned in the operations of mastication, deglutition, speaking, and tasting. The T. consists of a mass of muscle symmetrically arranged about a middle line from tip to roof. The base is attached to the hyoid bone; the upper surface, or dorsum, is free; the edges and the anterior portion of the lower surface are free. A fold of the investing mucous membrane is situated in the middle line of the under surface; this is the *frænum lingue*, or 'bridle' of the T. The substance of the T. is striped muscle. It is supplied by branches of the lingual artery, whose origin is the external carotid. The nerves of the T. are the gustatory, for touch and taste sensations, the glossopharyngeal, supplying the posterior third, and the hypoglossal, which conveys motor stimuli. The surface of the T. is covered with squamous epithelium and is supplied with numerous papillæ (see TASTE). The T. is liable to morbid changes. The easily-recognised phenomena of furring may indicate dyspepsia or inflammatory conditions of the upper respiratory tract. Acute inflammation, known as glossitis, may occur from bacterial infection or contact with strong irritants. Chronic inflammation is due to prolonged irritation, as by a broken tooth or excessive smoking, and may also occur in secondary syphilis (q.v.). It may be followed by excessive growth of the surface cells leading to the formation of a cancer (q.v.).

Tonic, in medicine, an agent which tends to re-establish the proper performance of the functions of the body in general, or of some particular organ. T.s. differ from stimulants in that the latter produce a transient effect rapidly, while the former gradually build up a permanent effect. Among general T.s. are vegetable bitters, cold baths, exercise, etc.; iron and arsenic are blood T.s.; dilute acids are gastric T.s.; digitalis and strophanthus are cardiac T.s.

Tonic, in music, the fundamental keynote of a scale. See MUSIC.

Tonio Sol-fa, see under SOLMISATION.

Tonio Sol-fa College, see under CURWEN, JOHN.

Tonks, or **Tonquin Bean**, see DUTTERYX.

Tonking: 1. Northernmost of the 3 administrative divs. into which France split Viet Nam during the 19th cent., and now forming part of the Democratic Rep.

of Viet Nam (see VIETNAM, DEMOCRATIC REPUBLIC OF). It is bounded N. by the Chinese provs. Kwangtung, Kwangsi, and Yunnan; E. by the Gulf of T.; W. by Laos; and S. by Annam. The prin. riv. is the Red R. (q.v.) which flows from NW. to SE. The mountainous plateau and forest land lies chiefly N. and W., and there is flat, low-lying, fertile land to the SE. Area 40,530 sq. m. There are a number of small is. off the coast. Gold, silver (at Ngan-son), antimony, tin, and coal (Quang-yen prov.) are found, and there are rich limestone quarries and calomine mines. Teak, ebony, and sandalwood are the most valuable woods produced. In the low-lying delta areas of the SE. rice is grown very extensively and is the main crop. In other parts are plantations of coffee, tobacco, maize, arrowroot, tea, cotton, jute, sugar-cane, as well as mulberry and some other fruits. The litchi (litchi, or leeches) tree is a native of T. Vegetables, betel palms, areca nuts, bamboo, hemp, indigo, gambodge, pepper, and cinnamon are also grown. High-quality silk is produced and woven for home consumption. Sea-fishing is practised, and a fish-canning factory was recently opened. Handicrafts include the weaving of reed mats and baskets, lacquer-work, and inlaying with mother-of-pearl. There is, at present, little export trade, since all European and almost all Vietnamese and Chinese commercial companies have ceased to operate in T. since the Communist gov. assumed control in 1955 (see VIET NAM). No new trade pattern has yet emerged, and all importing and exporting is in the hands of the gov. Hanoi (q.v.) is the cap. of T., and Haiphong (q.v.) the main port. There are large cotton mills in Nam-dinh (q.v.) which have now resumed production. Much of the railway system was destroyed during the 1945-54 war, but some lines are again in operation. Hanoi and Haiphong are now connected by rail to one another as well as to S. China. T. formed part of the kingdom of Viet Nam until the Fr. protectorate was estab. in 1884. During the Second World War it was occupied by Japan, and in 1945 experienced a severe famine which caused over 1,000,000 deaths, owing to the bad harvest and the excessive requisitioning of rice by the Japanese. Occupied by Chinese troops after the Jap. surrender, T. became the scene of political battles between the returning French and the Viet Minh (q.v.). Full-scale war broke out in 1946 at Hanoi, and T. continued to be the scene of the heaviest fighting throughout. The final, and most destructive, battle was fought at Dien-bien-phu (q.v.) in western T. In 1955 the Viet Minh assumed control of all T. and N. Annam (q.v.), which they estab. as the Democratic Rep. of Viet Nam. See C. Madrolle, 'Le Tonkin Ancien,' *Bulletin de l'Ecole Française d'Extrême Orient*, vol. xxxviii, 1937, and *Indochine du Nord*, 1925; P. Gourou, *Les Paysans du Delta Tonkinois*, 1936; E. Hammer, *The Struggle for Indo-China*, 1954, with

supplement *The Struggle for Indo-China Continues*, 1955; G. Taboulet, *La Geste Française en Indochine* (2 vols.), 1955-6; Lê Thanh Khol, *Histoire du Viet Nam*, 1955.

2. Gulf of, an arm of the China Sea, of average breadth 150 m. receiving the Red R. (q.v.). It is bounded by T., Kwangtung, and Hainan.

Tonks, Henry (1862-1937), artist, b. Solihull, Warwickshire. Educ. at Clifton, he studied for the medical profession at London Hospital, becoming F.R.C.S. He abandoned medicine, however, and devoted himself to painting and teaching art. In 1917 he became Slade Professor of Fine Art in the Univ. of London, and he exercised strong influence on teaching at the Slade School. 'An Evening in the Vale,' 1929 (Tate Gallery) is his best-known work. See life by J. Hone, 1939.

Tonlé-Sap, large tidal lake in NW. Cambodia (q.v.) fed by R. Mekong (q.v.). It is the centre of Cambodia's fishing industry and the source of irrigation for a large part of NW. Cambodia.

Tonnage of a ship is the measure of its cubical or carrying capacity expressed in tons. There are now in use 4 methods of expressing the T. of a ship, known respectively as the gross T., the net register T., the dead-weight T., and displacement T. Before 1836 (1812 for warships) there was in use a much rougher and more inadequate measure, the 'builders old measurement' (B.O.M.), which, however, is still sometimes referred to. In calculating the gross T., the whole interior capacity of the ship below the T. deck is found, together with that of all covered-in spaces on deck used for stowage, and the result in cub. ft is divided by 100. T. deck is the upper deck in all ships which have fewer than 3 complete decks; and is the second deck from below in all other ships. A 'register' ton is a measurement of space calculated from the average bulk of light freight. The net register T. is the gross T. minus all those spaces used for the working parts of the ship or for the accommodation of crew or instruments. It is on this T. that dues are almost invariably paid. The dead-weight T. is the measure of the exact amount of cargo, bunkers, stores, etc., that a ship can carry when floating at her load draught. The displacement T. is that in use since 1872 for all ships of war throughout Europe. The amount of water displaced by a ship is, of course, equal in weight to the ship and all that it contains. Since 35 cub. ft of water weigh 1 ton, the displacement T. is found by dividing by 35 the number of cub. ft of water displaced when the ship is immersed to its draught- or load-line.

Tonnage and Poundage. Tonnage, a tax from 1s. 6d. to 3s. levied on each tun of wine or liquor imported into or exported from the U.K., and poundage, a similar tax of 6d. to 1s. on every lb. of dry goods, were first levied in 1371. James I. asserted his right to alter the rates of levy as he chose by means of additions called *Impositions*, and secured a decision in his

favour on the legality of such additions against the merchant Bate. Parliament never ceased to protest against this denial of its claim to control taxation, and the resistance of Hampden to the collection of the tax expressed the widespread discontent over the question which contributed much to the outbreak of the Civil war. In 1660 it was granted to Charles II, made perpetual under Anne, and abolished, on the reorganisation of customs and excise in 1787.

Tonnage Dues, rates levied on the tonnage of ships entering ports or navigable public waters. Such rates are imposed by local Acts; and the mode of computing tonnage for the purposes of the dues may be that set out in the particular local Act, or may, with the consent of the Ministry of Transport, be on the registered tonnage as ascertained according to the rules made under the Merchant Shipping Act, 1894. The dues are devoted to the upkeep of harbours, wharves, etc., and the maintenance of buoys, lighthouses, and light vessels. Pilotage dues are often paid on tonnage, and all ships passing through the Suez, Panama, and other canals pay tonnage dues. By the constitution of the U.S.A. no state may impose T. D. without the consent of Congress; but a municipal corporation may levy a wharfage rate on the owners of unused steamboats mooring at a wharf.

Tonnarre, Fr. tn in the dept of Yonne, on the Armançon. A picturesque tn, it has a wine trade. Pop. 4200.

Tonquin Bean, see DIPYERYX.

Tönsberg, fort. seaport of Jarisberg-Laurvik amt, Norway, near the Christiania Fjord. It is one of the oldest tns in Norway (AD 871), and is the H.Q. of the sealing and whaling fleet. Near here are the ruins of an ancient fortress and royal residence. Pop. 11,900.

Tonsils, pair of almond-shaped bodies situated in the fossa between the pillars of the fauces in the pharyngeal cavity. Each consists of a mass of lymphoid tissue plentifully supplied with blood vessels, and is covered with mucous membrane which dips into depressions called crypts. The T. secrete a viscous fluid which acts as a lubricant to the respiratory passages, but their main function is to filter off pathogenic bacteria from the lymph flow which drains into them from the mouth and pharynx. Thus it is that the T. are a frequent site of inflammation from septic infection. Tonsillitis, as this inflammation is called, may be acute or chronic. Acute tonsillitis is most often due to infection with the streptococcus, and may be the starting point of generalised streptococcal infections such as rheumatic fever (q.v.) and scarlet fever (q.v.). Bovine tuberculosis infection (see TUBERCULOSIS) may also gain access to the system through the T. The treatment of acute tonsillitis consists in the administration of the appropriate sulphonamide or antibiotic, but mild cases dissolve in a few days without specific treatment. Chronic tonsillitis, as its name implies, is a state of chronic inflammation resulting from one

or more attacks of acute tonsillitis. It is invariably accompanied by overgrowth of the adenoidal tissue in the nasal pharynx. The treatment is usually surgical removal of the tonsils and adenoids. *Quinsy* is the term given to an acute suppurative tonsillitis with abscess formation in and around the T.

Tonson, Jacob (c. 1656-1736), publisher. He was apprenticed to a stationer and having been admitted a freeman of the Stationers' Company in 1677, began business on his own account. T. purchased Dryden's *Troilus and Cressida* in 1679, and in 1681 acquired the valuable property of a half-share in the rights of *Paradise Lost*, of which he bought the other half in 1690. He was secretary of the Kit-Kat club, and became associated as publisher with the prin. men of letters of his day, including Steele, Pope, Addison, Congreve, and Wycherley. He was printer of parl. votes. He retired from the business about 1720, and his descendants carried on the business. See BOOKSELLING.

Tonsure, the cutting of the hair in a certain form as a symbol of self-dedication to the monastic life. The custom first appears at the end of the 4th or beginning of the 5th cent. In the anct Celtic Church all the front of the head was shaved in front of a line drawn from ear to ear. In the Oriental churches the whole head is shaved. In the Rom. Church the 'coronal of St Peter' has always been used. In this T. the crown of the head is shaved to leave a fringe of hair all round.

Tontine, form of mutual life insurance in which a number of people invest a sum of money in the purchase of a property. They share the income, and as each dies the shares become proportionately larger per survivor, until all the property eventually devolves on one. It owes its name to an It. banker, Lorenzo Tonti, whose idea it was. In France and in Great Britain, in the 18th cent., the State raised money by this means.

Tooke, John Horne (1736-1812), politician and philologist, b. London and educ. at Westminster, Eton, and St John's College, Cambridge. He was ordained in 1759, but resigned his living in 1773. He at first supported Wilkes, but quarrelled with him in 1771. His support for the Amer. colonists and for the Fr. Revolution brought him political notoriety; in 1801 he was elected to Parliament, but immediately after this an Act excluding the Anglican clergy from membership was passed (this Act is still in force), which disqualified him. He wrote an important work on philology: *Epea Pterocna*, or the *Diversions of Parley*, 1786-1805. See life by M. C. Yarborough, 1927.

Toole, John Lawrence (1832-1906), actor, b. London, educ. at the City of London School. In 1879 he took a lease of the Folly Theatre, changing its name to 'Toole's Theatre'. Characterised often as 'the last great low comedian of the old school,' T. excelled, nevertheless, in serio-comic parts. See his *Reminiscences*, chronicled by Joseph Hatton, 1888.

Tools, Machine. The most important machine for producing finished work with T.s is the *lathe* (q.v.). Since the invention of the slide-rest during the last cent. it has been possible to turn out very accurate work, since this affords a rigid support for the T. being used and can traverse it parallel to the piece that is being worked. The *planing machine*, invented by Clement about 1825, is used for producing a truly level surface. The work moves under stationary T.s on a rolling bed. In the case of very heavy objects, such as armour for battleships, the machines have a fixed bed and movable T.s. Planing is being gradually superseded by *milling* (see MILLING MACHINES). *Drilling Machines* sometimes have sev. spindles worked at once, if it is necessary to drill a great many holes in a plate, such as a boiler firebox. Adaptors are also made for fitting taps into small drilling machines so that it is possible to tap small holes by this machine. *Shaping machines* are planers on a small scale with moving T.s; the T. is moved by means of a crank and connecting-rod; it is used on light work. *Boring mills* may be either horizontal or vertical; they are largely used for cylinders and guns, etc. Cylinders 12 ft in diameter may be bored on these machines, while holes 15 or 16 in. in diameter can be bored for some 60 ft in length. See E. Pull and F. J. Taylor, *Workshop Practice*, 1935; W. H. Atherton *Workshop Practice*, 1942; P. Gates, *Jigs, Tools, and Fixtures*, 1944.

Toombs, Robert (1810-85), Amer. statesman, b. Georgia and educ. at the univs. of Georgia and Virginia. After a number of terms in the House of Representatives of his state he was a Congressman from Georgia from 1845 to 1853, and U.S. Senator from Georgia from 1853 to 1861. When the S. Confederacy was formed and Jefferson Davis was named President, the latter appointed a Cabinet whose only strong men were T. as secretary of state and Judah P. Benjamin as attorney-general. When the grave question of attacking Fort Sumter, at the entrance to the harbour of Charleston, S. Carolina, was discussed, T. counselled caution, but was overruled. Later he quarrelled with Davis and left the Cabinet to become inspector-general of the Georgia troops. When the war was lost he remained in exile in Europe until 1867. He then returned to his native state, where he practised law until his death.

Toothwort (*Lathraea*), genus of plants (family Orobanchaceae), partly parasitic and partly saprophytic. *L. squamaria*, the only Brit. species, has a fleshy branched rhizome clothed with tooth-like scales and bearing a raceme of drooping dull red flowers, parasitic on hazel, beech, and woody plants. *L. clandestina*, introduced from W. Europe, is parasitic on willows and poplars.

Tooting, dist. of the bor. of Wandsworth, SW. London, largely residential. Dr Johnson used to visit his friend Mrs Thrale at Thrale Place, the site of which

is now covered by Streatham Park. T. was once famed for its inns. Pop. 38,200.

Toowoomba, second largest city in Queensland, Australia, in the centre of the rich Darling Downs, 101 m. W. of Brisbane. It serves vast farming and dairying areas, where meat and wool are produced extensively. Pop. 44,000.

Toparé, see POLONNARUWA.

Topaz, mineral crystallising in the orthorhombic system, with cleavage parallel to basal face, a fluosilicate of aluminium of $Al_2(F,OH)_2SiO_4$. The colour range includes colourless, yellow (pale to brown), blue, pale green. Hardness 8, sp. gr. 3.5. The pink T. seen in jewellery is produced by heating brownish-yellow stones which change colour on cooling. On heating or rubbing, T. becomes electrified (pyro-electric). T. is abundantly found in Brazil, Siberia, Ceylon, Mexico, Japan, and Tasmania; in the Brit. Is., in the Cairngorm Mts in Scotland, Mourne Mts in Ireland, and in Cornwall. The true T. should not be confused with the yellow quartz known as citrine (hardness 7, sp. gr. 2.65). There is also the yellow sapphires, sometimes sold as Oriental T.

Topé (Hind. *ṭōp*, prob. from Pall *thūpa*, Sanskrit *stūpa*, a mound), common name for a kind of Buddhist monument erected by monks to enshrine relics of Buddha or his disciples. Most T.s take the form of a tumulus of masonry, shaped like a dome or tower, and often surrounded by an elaborately carved stone railing with lofty gates far higher than the railings. When the purpose of the T.s is for the preservation of relics, it is called a *dagoba* (see PAGODA), and when its purpose is merely to commemorate some event, the usual name is *stupa*, the word T. only connoting the external shape. There are numerous specimens in India, and SE. Asia, and it is assumed by archaeologists that they were all constructed between 200 BC and AD 400. The most ancient dome-shaped and are built on a cylindrical or polygonal base which rises in terraces. The most noteworthy is at Sānci in Bhopal, but the ruins in the vil. of Amravati in the Kistna dist. of Madras are those of the finest Buddhist monument in India. One of the largest of those which are raised on terraces is that at Manikyalā near Rawal Pindi in the Punjab, and all T.s in the Punjab are, as this one, plain hemispheres in form. A peculiar feature of the T. is the structure at the cone or apex, which is shaped like an open umbrella and called the *tee*, but generally there is now only a flat space at the apex where once the *tee* stood.

Topeka, cap. of Kansas, U.S.A., and co. seat of Shawnee co., on the Kansas R., 55 m. W. of Kansas City. It is a large manufacturing centre, and has railway workshops, publishing, printing, and wholesale houses, and insurance firms. It also has flour milling, meat packing, and dairying, and manufs. foundry products, tyres, tents, awnings, clothing, and medicine. It is the third largest city in the state. Pop. 78,790.

Topellius, Zachris (1818-98), Finnish novelist and poet, b. Kuusnaes. He entered journalism and for 20 years ed. a newspaper in Helsingfors. In 1854 he was appointed Prof. Extraordinary of the Finnish Language at the Univ. in Helsingfors and 7 years later Prof. in Ordinary of Finnish, Russian, and N. Hist. He was the author of sev. vols. of descriptive and lyrical poems, but his fame rests on a series of historical novels, grouped under the title of *Fällekskröns berättelser* (The Surgeon's Stories), 1859-67, describing Finnish life over 3 cents. The first cycle, *Gustave Adolf and the Thirty Years War*, was trans. into Eng. and pub. in New York in 1872, and in London in 1901 with the title of *The King's Ring*. The remaining 5 cycles were pub. in Eng. trans. in Chicago in 1883-4. Following the manner of Scott, their historical background is well described and the stories finely imagined. T. also compiled a notable collection of children's stories. *Läsning för Barn*, (Eng. trans. *Fairy Tales from Finland*) (4 vols.), 1865-96, which made him the Hans Andersen of Finland. T. wrote in Swedish. See lives by E. Spjut, 1919, and S. Lagerlöf, 1921; and V. Vasenius, *Topellius Hans Lif och Skaldegärning*, 1912.

Tophane, see ISTANBUL.

Tophet(h), 'fire-place,' S. of Jerusalem, at the junction of the valley of the Sons of Hinnom (Ge-bene-Hinnom, Jer. xix. 2, shortened to Ge-Hinnom, 2 Kings xxiii. 10), the modern Wady er-Itababi, and the Kidron valley. Child sacrifices were offered there to Moloch (Milkom) god of the Ammonites, whose worship Solomon introduced (1 Kings xi. 7). Ahaz offered up his son there (2 Kings xvi. 3), and the practice was common later (Jer. vii. 31). The evil place was later defiled and made the refuse dump of the city, providing, with its smouldering rubbish and maggots, the symbolism for Gehenna, or Hell (Mark ix. 45 f.).

Topiary, training and clipping of trees and shrubs into ornamental shapes. The art was most greatly developed in Tudor times, and was a definite feature of old-world gardens: some of the more ambitious examples still exist at Elvaston Castle, Derby, and Leven's Hall, Westmorland. Evergreens are most popular for T. work, though hawthorn stands up to clipping well and is often used. The 2 best species, being long-lived and able to withstand severe, and constant clipping, are yew (*Taxus baccata*) and box (*Buxus sempervirens*). Holly (*Ilex aquifolium* and its variegated varieties) and evergreen oak (*Quercus ilex*) are often used, and the larger-leaved sweet bay (*Laurus nobilis*) and Portugal laurel (*Prunus lusitanica*) may be trained in simple, formal shapes.

Toplady, Augustus Montague (1740-78), Anglican divine and hymn-writer, b. Farnham, Surrey, and educ. at Westminster and Trinity College, Dublin. He entered the Church in 1762, and became vicar of Harpford (1766) and Broad Hembury (1768). In 1775 he became minister at the Fr. Calvinist Chapel in

London. He is remembered for his hymn, 'Rock of Ages.' See life by T. Wright, 1911.

Topographic Surveying. see AZIMUTH; LATITUDE AND LONGITUDE; THEODOLITE; TRANSIT INSTRUMENT. See also SURVEYING AND LEVELLING.

Topography. see MAPS; MAP READING.

Topolia, see COPAIS.

Topsail, see SAILS AND RIGGING.

Tor Bay, on the S. of Devon, England, was the landing place of William of Orange (1688). On its shores are the towns of Torquay, Paignton, and Brixham.

Torbanite, see BOGHEAD COAL.

Torch-thistle, see CERUEUS.

Tordesillas y Herrera, Antonio de, see HERRERA Y TORDESILLAS, ANTONIO DE.

Tore, see PYGMIES.

Torfaeson, Thormóður (1636-1719), Icelandic scholar, better known under his Latinised name *Torfaeus*. In 1660 he entered the service of the King of Denmark, Frederik III, and became *antiquarius regius*. In 1666 he married a Norwegian lady of property, thenceforth residing on his estate in Norway (then a Dan. province), and wrote on Scandinavian medieval hist., basing his writings on Old Icelandic sources. His works are still valuable because the original sources no longer exist, e.g. *Historia rerum Norvegiarum* (4 vols. fol.), 1711, and *Orcaedes* (i.e. Hist. Orcadum), 1697.

Torga, Miguel (1907-), pseudonym of the Portuguese poet, novelist, dramatist, and short-story writer Adolfo Rocha, an independent and staunch individualist among literary circles. He pursues a long-drawn speculation on the relationship between the material and the spiritual, mingling a deep sensuousness with an all-embracing love for every living form in the universe. His works include *Crição do Mundo* (3 vols.), 1937-8, *Bichos*, 1940, *Diário*, 1941-9, *Mar*, 1941, and *Sinfonia*, 1947.

Torgau, Ger. tn in the dist. of Leipzig, on the Elbe (q.v.), 30 m. NE. of Leipzig (q.v.). In 1526 the T. League (of Protestant princes) was formed here, and in 1631, during the Thirty Years' War (q.v.), a council of war of Protestant commanders was held here under Gustavus Adolphus. Frederick the Great defeated the Austrians near by in 1760. During the Second World War it was the scene of the first allied link-up, when Amer. patrols met units of the 58th Russian Guards' Div., on 25 April 1945. There is a Gothic church containing the grave of Luther's (q.v.) wife. Chemicals and machinery are manufactured. Pop. 20,000.

Torhout (Fr. Thourhout), tn in the prov. of W. Flanders, Belgium, 12 m. S.W. of Bruges. 2 m. NW. of T. lies the beautiful castle of Wijnendale, built in the 11th cent. In 1940 King Leopold III had his H.Q. and capitulated here on 28 May. T. is considered to be the oldest place in Flanders and was once the most important cloth-mkt. of the country. Manufs. include linen, drainage pipes, and weighing-machines. It is an important horse-mkt. Pop. 12,800.

Torino, see TURIN.

Tormentil (*Potentilla erecta*), perennial herb (family Rosaceae), found in the Azores, W. Siberia, and Europe. The leaves are divided into 3, sometimes 5, leaflets; the flowers, which are yellow have 4, sometimes 5, petals. The root-stock is used in tanning, having an astringent quality.

Tornado, cyclonic disturbance of the atmosphere, most common in the U.S.A. E. of 100° W. long., but particularly in Kansas and Illinois. Usually it arises suddenly on a sultry summer afternoon in the transition zone, between tropical maritime air from the Gulf of Mexico and polar air that has become hot and dry over deserts. It is of small diameter, a few hundred yds, but of relatively great vertical height. The upper portion is marked by a swirling funnel-shaped cloud which sways and rises and falls and may reach the ground in the centre of the T. Local surface conditions give rise to rapid heating of a column of moist air by the sun, and sudden expansion takes place; it rises, and condensing moisture adds to its temp. As it spreads out rain falls, which evaporates into surrounding dry air, cooling it and increasing the instability of the transition zone, causing, in its turn, more intense convection—a self-generating process.

The pressure in the centre falls and as the air is sucked in, it is whirled vortex-like in a cyclonic (anti-clockwise) rotation with stronger and stronger winds, sometimes reaching 300 m.p.h. The force developed cuts a clean path through trees or country; trees are uprooted and whirled outside the track; houses are 'burst' by their own internal pressure as the low pressure passes; the damage to houses often leads to escape of gas and disastrous fires. The track extends usually for a few miles, and the energy is dissipated in about an hr, although sev. have been observed at the same time. They also occur in India, where they are sometimes known as 'Nor'westers,' and in Australia, where the name is 'Willy-willy.' A very destructive T. visited S. Wales in Oct. 1913, springing up near Merthyr-Tydfil and dissipating in Cheshire. A T. in Oklahoma on 9 April 1947 killed 167 people and caused damage to property of nearly \$10m. From 1916 to 1947 the average yearly number of Amer. T.s was 141, the average loss of life 235, and the average loss to property \$12,300,000. The water-spout (q.v.) at sea is a similar phenomenon. In W. Africa the name is applied to the squall that accompanies a thunderstorm (q.v.). See CYCLONE; HURRICANE; TYPHOON.

Toro (anc. Arbocala), Sp. tn in the prov. of Zamora, on the Duero. It has many anc. buildings of interest, and is famous for its wines. Pop. 8300.

Toronto, cap. of the prov. of Ontario, Canada, in York Co., 1800 m. W. of the Atlantic Ocean on a bay on the N. shore of Lake Ontario, 330 m. NW. of New York City, 333 m. SW. of Montreal, and 238 m. E. of Detroit. The cross-roads of trade since Indian times, T.'s strategic

position was fought for by French, Americans, and English. Its well-sheltered harbour, the finest on the Great Lakes, handled 4,310,900 short tons of water-borne trade in 1948. Co-ordinated water, rail, highway, and air transit services include 2 of the world's greatest railway systems, Canadian National and Canadian Pacific, buses, steamships, and Trans Canada and Amer. Airways air service to all parts of the world. A great commercial centre, it has the largest live-stock market in Canada, over 4000 manufacturing establs. with gross value of products of more than \$1,686,000,000,

Maple Leaf Gardens, in winter the T. home of Canada's national sport, hockey. The Canadian National Exhibition, largest ann. exposition in world, occupies in Aug. and Sept. a 350-ac., municipally owned park on the shore of Lake Ontario, where the Royal Agric. Winter Fair, one of the 3 major live-stock shows on the continent, is also held annually. A new rapid transit system to provide increased, speedy transportation in the form of modern subways, began in 1949 with the building of Yonge Street subway, which was opened in 1954.

The univ. of T., founded in 1827, had

TORONTO: A VIEW FROM CENTER ISLAND

including meat-packing, electrical equipment, agric. implements, bakery products, clothing, furniture, automobile supplies, pianos, foundries, brewing, and distilling works. T. is the leading Canadian city in wages and salary payroll, bank clearings, postal revenue, telephone installations, and car loadings. Imports cleared through the Customs Ports of Toronto in 1953 amounted to \$650m.; exports, \$27m. (*Trade of Canada*, Dominion Bureau of Statistics). In volume of trading T. Stock Exchange is the second largest in the world.

T. is served by municipally owned water works, hydro-electric power supplied by Niagara Falls, gas works, electric street railways, trolley buses, and motor coaches, and has an airport. One of the world's great sports cities, it has 4 race tracks, a large baseball stadium, and one of the world's largest indoor sports arenas,

a registration of 11,400 in the year 1955-6 in Faculties of Arts, Science, Medicine, Music, etc., the chief colleges being Univ., Victoria (United Church), Trinity (Anglican), St Michael's (Rom. Catholic), with federated theological colleges, Knox (Presbyterian), Wycliffe (Anglican), Emmanuel (United Church), and St Michael's, with which is affiliated St Michael's Pontifical Institute of Medieval Studies, the only Institute in N. America empowered to grant Pontifical Degrees. T.'s School of Medicine has developed the Connaught Laboratories, and the Banting and Best Institute, named after the late Sir Frederick Banting and Dr Charles H. Best, who discovered insulin in one of the most accurately planned scientific developments ever known, at the physiology laboratories at the univ. of T. in 1921. T. hospitals include T. General, Sick Chil-

dren's, and Sunnybrook, largest and most modern Canadian military hospital. T. is also the centre of Dominion Meteorological services. The Royal Ontario Museum, largest in the Brit. Commonwealth outside London, is famous for its Chinese collection. The Conservatory of Music, incorporated in 1886, passed under the trusteeship of the univ. in 1921 and was granted the title of Royal T. Conservatory of Music in 1946 on the occasion of its diamond jubilee. It is the

tion, High, Riverdale, Queen's, Sunnybrook, Sunnyside, and T.'s island parks.

The site of the present city of T. was chosen by Lord Dorchester, governor of Canada, as the seat of gov. for the newly created prov. of Upper Canada in May, 1793. Sir John Graves Simcoe, first Lieutenant-governor, named the new York. It was occupied by U.S. forces in 1813, when legislative buildings and archives were burned and the mace carried away, to be returned by President

Ontario Dept. Travel and Publicity

UNIVERSITY AVENUE, TORONTO, ONTARIO

dominant force in musical education in Canada. T. had its first full-size symphony orchestra in 1894, and now supports 2 symphony organisations, the T. Symphony Orchestra and the T. Philharmonic Orchestra. T. Art Gallery contains the second largest collection of Canadian paintings in the world. Other interesting buildings include the Prov. Legislative buildings, City Hall, Casa Loma, Bank of Commerce Building (tallest in the Commonwealth), T. Public Library, with 17 branches and total circulation of 4,724,332 vols. (1957); St James (Anglican) and St Michael's (Rom. Catholic) cathedrals, Metropolitan (United) Church with its famous 52-bell carillon, the first tuned to the chromatic scale. 105 parks and playgrounds cover 2035 ac. of land and 159 ac. of water, including Exhibi-

Roosevelt at the centennial celebrations in 1934. Self-gov. was granted to the tn of York in 1817, and it was incorporated as a city under the name of T. in 1834, with William Lyon Mackenzie as its first mayor. Its name, of Huron Indian origin, means 'a place of meeting.' Pop. 675,754; Greater T. 1,230,000. See J. C. Dent, *Toronto: Past and Present*, 1884; *University of Toronto History*, 1925; *Toronto Municipal Handbook*, 1957.

'Toronto Daily Star,' Canadian daily newspaper, estab. 1892, circulates throughout the prov. of Ontario and has full coverage of world and home news. Associated with it is the *Star Weekly*, the largest single periodical in Canada, estab. 1910, also pub. in Toronto with a national circulation.

'Toronto Globe and Mail,' Canadian morning newspaper, estab. 1844. It gives extensive coverage to foreign and national affairs and enjoys wide circulation throughout Canada. It is independent in politics.

Torpedo. In the days before the advent of the locomotive T., all submarine explosive devices, whether stationary or mobile, were referred to as T.s. These early T.s were of many different forms: one type was towed across the bows of enemy vessels by small torpedo-boats (q.v.); another was the 'spar' T., which was carried on the end of a spar at the bows of a launch. The spar was arranged to lower the T. below the water-line just before striking, later models being fired electrically. As the result of equipping battleships with additional small guns and the installation of searchlights, the use of the above kinds of T. became a practical impossibility, and efforts were concentrated upon the development of a type which could drive itself. Whitehead's T. was constructed to ideas of Capt. Luppis of the Austrian Navy, but was first practically evolved in 1866 by Whitehead, whose practical mechanical skill completely altered the original idea. The first type was too uncertain in vertical direction but the introduction of the 'balance chamber' in 1868 obviated the troubles of skimming and diving. The secret was purchased by the Brit. Gov. after successful trials, and in 1876 the servo-motor was added by Whitehead. Improvement continued, and to-day every navy uses the Whitehead T. in a highly developed form, though there are many patterns.

The shape of the modern T. resembles a cigar with a rounded or blunt nose, upwards of 20 ft long by as many in. in diameter and constructed of special steel. It is divided into a number of compartments: the explosive head, compressed-air chamber, balance chamber, engine room, and buoyancy chamber. In war-time about 500 lb. of high explosive are stored in the head and are fired on contact with the target by means of an arrangement called a pistol, located in the extreme nose. The blow need not be directly head-on to detonate the charge, there being other side-projections capable of causing the explosion in the event of an oblique strike. To render the T. safe whilst being handled and until it is clear of the ship, there are 3 safety devices fitted, viz. a safety-pin, which is first withdrawn; small vanes, so set that the rush of the T. through the water causes them to rotate and unscrew until they fall off; and lastly, the force of impact against the target must be sufficient to shear through another pin before finally the point of the striker fires the charge. For peace-time practice, special heads are fitted containing water and cork. The head is bolted on to the compressed-air chamber, which is forged from high-tensile steel and contains air at a pressure of over 1 ton per sq. in. supplied from air compressors on board the warship. Next follows the balance chamber containing the mechanism

for controlling the depth the T. will run at, as well as, in the later types, vessels containing fuel, water, and a special heater apparatus. Depth control is effected by a swinging weight or pendulum which, being affected by any alteration in tilt, sets in motion a servo-motor, contained in the engine-room, which provides the necessary power to actuate the horizontal rudders which correct the vertical deflection of the T. from its proper depth. A hydrostatic valve is fitted to ensure that the T. attains the correct depth. The engines, placed abaft the balance chamber, are of the 4-cylinder, single-acting, Brotherhood type, and are marvels of ingenuity. Normally they are driven by compressed air, though in the latest types fuel and air are burnt in a special generator and form steam, which is led to the engines. The exhaust is allowed to escape and rises to the surface in the form of bubbles, making a track which can be clearly seen from the bridge of the ship attacked. Next comes the buoyancy chamber, whose primary purpose is to give the necessary buoyancy to the T. Herein is situated the gyroscope, which rotates at high speed, is delicately suspended in gimbals, and is connected to the vertical rudders. The gyroscope tends always to maintain the direction of its spinning axis, and this is used in conjunction with a servo-motor to actuate the vertical rudders and correct any deflection as soon as it occurs. At the tail are situated the vertical and horizontal rudders which keep the T. on its course and prevent it from sinking or jumping out of the water. Behind the rudders are situated 2 4-bladed propellers, driven by the engines, which rotate in opposite directions, thus preventing the T. from any heeling due to the torque reaction which would occur if only one screw were fitted. Exact details of the latest types are secret, but figures which have been pub. show that ranges exceeding 15,000 yds and speeds of over 45 knots have been obtained. Efforts are being made to control them by radio. Acoustic T.s were developed by the Germans during the Second World War. These T.s are attracted by sound waves emanating from their target.

T. tubes from which T.s are ejected are either submerged, as in submarines, or above water, as fitted in light cruisers and destroyers, and the firing impulse is given by compressed air or explosive. Another method of discharging them is by means of special dropping-gear from aircraft. The submerged tube has the advantages that the T. cannot be damaged by shell-fire when within the tube prior to discharge and that the moment of release cannot be detected by the enemy. In this type of tube the orifice can be closed by a watertight door, when a rear door may be opened to allow the T. to be placed in position. To fire, the rear door is closed, the outer door opened, and a blast of compressed air blows the T. out of the tube.

Human T.s or 'chariots' were successfully used in the Second World War, first by the Italians and later by the British. Human T.s are about the same size as the

ordinary T., and are driven by electric batteries. They are manned by a crew of 2, who wear diving-suits and sit astride the weapon. A charge similar to the warhead of the ordinary T. is attached to the nose. The Human T. is manoeuvred at slow speed towards its target and dives under it. The charge is then detached and fixed to the bottom of the enemy ship; the fuse is set and the human T. is driven away to be clear of the target area before the charge detonates.

Torpedo, or **Electric Ray**, a member of the elasmobranch family Torpedinidae. T.s are characterised by the possession of electric organs which are present between the head and the pectoral fins. The shock which they are capable of producing is from 20 to 30 volts in *T. marmorata*.

Torpedo Boat and **Torpedo Gunboat**. Both these types of craft are obsolete in modern navies, having been replaced by the destroyer (q.v.), and motor T. B., now classified, together with motor gunboats, as fast patrol boats. The earliest type of T. B. was merely a launch fitted with spar torpedoes; later the method adopted was to tow the torpedo across the bows of the enemy vessel. The first T. B. was built by Messrs. Thornycroft for the Norwegian Gov. in 1873, for the 'towing' type of torpedo. In 1879 the Brit. Admiralty had built the T. B. *Lightning*, of 27 tons, 19 knots speed, and fitted with a bow torpedo tube for launching a locomotive torpedo of the Whitehead type. As time went on this class of vessel grew in size, speed, and armament and became a grave source of danger to battleships, necessitating other means of countering them than quickfiring guns and torpedo nets, particularly as torpedoes were fitted with net cutters. A special class of vessels, termed 'torpedo gunboats' or 'torpedo catchers,' was introduced to destroy the T. B.s. They were armed with 4-in. and 3-pounder quick-firing guns and, later, torpedo tubes, but were never successful, owing primarily to their lack of speed, and were entirely superseded by the T. B. destroyer, which was able to combine effectively the functions of T. B. and catcher.

Torpedo Boat Destroyer, see DESTROYER, TORPEDO BOAT.

Torpedo Ejector, or **Torpedo Tube**, see TORPEDO.

Torquatus, name of a patrician family of the gens Manlia. *Titus Manlius Imperator* fought against the Gauls (361 BC), winning his name T. by taking the necklace (*torques*) from the body of a mighty Gaul slain by him in single combat. He was dictator 353 and 349, and consul 347, 344, and 340. With P. Decius Mus he defeated the Latins at the foot of Vesuvius. (See LIVY, iv. 5, viii. 3-12; Cicero, *De Officiis*, iii. 31.) *Titus Manlius*, conqueror of the Sardinians, was consul 236 and 224, and censor 231 BC. With hereditary sternness he opposed the ransom of the Rom. prisoners of Cannae in the Senate (216). He was dictator in 210. *Lucius Manlius* was consul with L. Aurelius Cotta (65 BC). He helped to suppress Catiline's conspiracy (63), and

supported Cicero in his exile (58). *Lucius Manlius*, his son, was praetor 49 BC, and opposed Caesar on the outbreak of civil war. Obligated to surrender Oricum, he was taken prisoner (48), but released. He fought again in Africa, but was captured and slain (46), on the defeat of the Pompeians. *A. Manlius*, friend of Cicero, presided at the trial of Milo for bribery as praetor (52 BC). He sided with Pompey in the Civil war, and was an exile at Athens (45).

Torquay, municipal bor., seaport, and holiday resort of S. Devon, England, on Tor Bay, 26 m. S. of Exeter and 199½ m. by rail from Paddington (London). Its picturesque scenery and mild climate make it a favourite health resort. Terra cotta, clay, and marble are found in the neighbourhood of the tn. The Domesday survey identifies part of the site of T. with the Norman period, recording that William I gave the manor of *Cockington* (now Cockington) to a follower, Hostiarius. But by far the earliest link with the past is Kent's Cavern, in the Isham valley. A large and fine collection of the remains of extinct animals which once frequented the cave, and of the implements made by the men of the Old Stone Age, forms part of the exhibits at the Museum of the T. Natural Hist. Society. In 1196 the Premonstratensian canons regular founded Torre Abbey, the ruins of which, together with the restored Monastic Barn and the Mansion House dating in some parts from about the 15th cent., are a conspicuous feature to-day on the seashore. The development of T. as a modern seaside resort dates back to the end of the 18th cent., when 'Tor Kay' or 'Tor Key' was no more than a cluster of fishermen's huts on the shore with the vil. of Tor (or Torre) about a m. inland. To deal with the threat of invasion by Napoleon, ships of the Fleet constantly used Torbay as an anchorage, and houses were built on the shores of the bay for the accommodation of the wives and families of the officers. Of T.'s total acreage (6244) over 1000 ac. are occupied by parks, pleasure grounds and public gardens, with tennis courts, bowling greens, etc. Torbay, which is notable for its regattas, provides one of the best yachting courses in Great Britain and has been the scene of America's Cup trials; the yachting events of the 1948 Olympic Games were contested in the bay. In the tn hall there is a tablet in honour of Prof. Oliver Heaviside (q.v.), who lived here for a period of his life. Babacombe (q.v.), 2 m. N. of central T., on Babacombe Bay, is now part of the bor. of T. Cockington, an old-world thatched vil. ½ m. from T. railway station, has for long been part of the bor. Its little church in its present form is of the Norman period. In the neighbourhood of T. are traces of both Rom. and Saxon occupation. Pop. (estimated) 50,000.

Torque Amplifier and **Torque Converter**. It is often necessary for an operator to be able to rotate massive pieces of mechanism such as a rudder of a liner or the guns

of a ship. The operator can only exert a feeble twist or torque on the controlling device fixed in his observation post, so that some intermediate mechanism is required to magnify or amplify this torque in order to perform the required operations. This intermediate mechanism is called a *torque amplifier*, and the principle of its action is as follows. The operator applies a feeble torque to a control-shaft that causes friction bands to engage with 2 drums rotating in opposite directions. The bands also engage with a shaft connected to the mechanism to be rotated, and the magnitude of the torque applied to this shaft depends on the friction between the bands and the rotating drums. Hence the feeble torque provided by the operator controls the extent to which the bands are brought into contact with the drum, while the final torque applied to the mechanism depends on the speed of rotation of the drums.

The *torque converter* acts as an infinitely variable gear, usually with varying efficiency.

Torquemada, Tomás de (1420-98), Dominican friar, *b.* Valladolid, who, in 1483 was entrusted by Queen Isabella with the estab. of the Sp. Inquisition. Ascetic in his private life, he was severe to the point of cruelty towards suspected or convicted heretics. Of 100,000 said to have been accused, 1000 were put to death, others fined and penanced. He was one of the leading instigators of the conquest of Granada and of the expulsion of the Jews. *See* W. T. Walsh, *Isabella of Spain*, 1937; E. Lucke, *Torquemada und die spanische Inquisition*, 1926; life by H. G. de Saint Amand, 1910.

Torre, Duque de la, *see* SERRANO Y DOMÍNGUEZ.

Torre, Víctor Raúl Haya de la (1895-), Lat.-Amer. political leader, member of a prominent family in Peru; educ. in Lima and at Oxford. His party, 'A.P.R.A.', advocates that the Amer. Indians, who are very numerous in some of the reps., should have an equal voice in the political and educational affairs of their countries. T. is the author of *Adónde va Indoamérica?*, 1935. *See also* International Court of Justice, *Haya de la Torre Case, Judgment of June 13th 1951*.

Torre Annunziata, It. seaport, in Campania (q.v.), on the bay of Naples (q.v.), 10 m. SE. of Naples. It manufs. macaroni, and has ironworks and fisheries. Pop. 50,600.

Torre del Greco, It. resort and fishing tn. in Campania (q.v.), on the Bay of Naples (q.v.), 6 m. SE. of Naples. It stands near the SW. foot of Vesuvius (q.v.), which has frequently damaged the tn by eruptions. It has boatbuilding yards, and produces cameos, and worked coral and lava. Pop. (com.) 62,300.

Torrence, Frederic Ridgely (1875-1950), Amer. poet and playwright, *b.* Xenia, Ohio. He was educ. at Miami Univ., for 6 years was a librarian in New York, then held various editorial posts, from 1920 to 1933 being literary editor of the *New Republic*. After making a tour of Europe with his friend Wm Vaughn Moody he

began writing verse plays and composed *El Dorado*, 1903, and *Abelard and Heloise*, 1907. These were followed by his plays for a Negro theatre, *Granny Maumee*, *The Rider of Dreams*, and *Simon the Cyrenian*, all produced in 1917. A pioneer in this type of production, he opened the way for others such as O'Neill's *Emperor Jones* and Connelly's *The Green Pastures*. Of his vols. of verse *Hesperides* appeared in 1925, *Poems*, which received the Shelley Memorial Prize, in 1941, and *Last Poems* in 1944.

Torrens, Lake, large salt lake of S. Australia, discovered in 1840 by Eyre, 35 m. N. of Port Augusta. It is 40 m. N. of Spencer Gulf, in the N. part of the Great Valley and 80 ft above sea-level. Its average breadth is 20 m., length 130 m. It becomes a marsh in dry weather.

Torreón, tn of Mexico, in the state of Coahuila, and standing 3500 ft above sea-level, 500 m. NW. of Mexico City. It is an important railway junction, lines radiating to Chihuahua, Durango, Zacatecas, Fresnillo, and Monterrey. Its industries include cotton mills, smelting works, and flour mills, and there are coal and other mines in the dist., which is also an important wheat production area. Pop. 75,800.

Torres, Niceto Alcalá Zamora y, see ZAMORA Y TORRES.

Torres Strait, in the S. Pacific Ocean, between New Guinea and Australia, from 80 to 90 m. broad. It contains sev. is., the chief of which are Banks and Prince of Wales Is. Its reefs and shoals abound, rendering navigation difficult.

Torres Vedras, tn of Portugal, in Lisboa dist., 27 m. N. of Lisbon (q.v.). It was here that Wellington (q.v.) constructed the famous field-works called the 'Lines of Torres Vedras' during the Peninsular War (q.v.), when he withdrew his forces, in face of Masséna's invasion of Portugal, for the winter of 1810. The triple line of fortifications, stretching to the Tugus (q.v.), consisted of 100 forts joined together by entrenchments and inundations, and Wellington successfully defended it until he was able to advance and drive the French back into Spain. T. V. is the centre of a wine-producing region, and has manufs. of ceramics and gunpowder. Pop. 5000.

Torricelli, Evangelista (1608-47), It. physicist, *b.* Faenza. He acted as Galileo's secretary, and, prompted to many of his discoveries by the study of that scientist's works, he succeeded Galileo as prof. of mathematics at Florence. Besides making a barometer—an invention commemorated in the names of Torricellian tube and Torricellian vacuum—he solved the problem of the quadrature of the cycloid. *Opera Geometrica*, 1644, is his prin. work.

Torrige, riv. of Devon, England, rising 4 m. SE. of Hartland Point, and joining the Taw estuary at Barnstaple Bay.

Torridon, hamlet at the head of Loch T. (salt-water), on the W. coast of Scotland, in Ross and Cromarty, set amid magnificent mt scenery. Lathach, 3455 ft).

Torridonian, name applied to a series of Pre-Cambrian sediments, chiefly sandstones and arkoses, which are exposed along the seaboard of NW. Scotland and which have been named after the village of Torridon (q.v.).

The T. rests unconformably upon the Lewisian (q.v.), and in turn is unconformably covered by Cambrian sediments. No fossils have as yet been found in the T., which has been divided into 3 stratigraphical divs.; the Diabaig Group; the Applecross Group; and the Aultbea Group at the top. Shales occur at the base of the Diabaig group, but in general the series is arenaceous and shows clear signs, such as slump beds, of subaqueous deposition. However, the T. lies upon an old landscape of marked relief carved out of the Lewisian gneiss, and the exact conditions under which the T. were deposited are not yet known.

Torrignano (or Torrigiani), Pietro (1470-1522). Florentine sculptor, said to have broken Michelangelo's nose in a quarrel. T. worked in Rome for Pope Alexander VI: was a hired soldier for a while in various states; was then invited to England to execute the tomb for Henry VII and his queen in Westminster Abbey, which he completed in 1519—a splendid work in the mature Renaissance style. A tomb for Henry VIII at Windsor was left unfinished and its bronze melted during the Commonwealth. T. d. in Spain, where he was imprisoned by the Inquisition.

Torrington, Viscount, see BYNG, GEORGE.

Torrington: 1. Industrial city on Naugatuck R. in Litchfield co., Connecticut, U.S.A. Textiles, engines, hardware, tools, machinery, needles, electrical equipment, lumber, and brushes are produced. The site of John Brown's bp. is marked, and a state forest is nearby. T. suffered heavy damage in a flood in 1955, but is rebuilding rapidly. Pop. 27,820.

2. or Great T., a mkt tn and mun. bor., on the Torridge, in Devon, England. Its Saxon name was Toritone. The bluecoat school was estab. in 1671. There is a milk-canning factory, and gloves are made. Pop. 2875.

Torsion, strain produced by a twisting motion, for example, by a couple acting in a plane at right angles to the axis of a prism, cylinder, or other body. The distortion produced is a type of shearing stress. Resistance to T. determines the rigidity of the bar, and resistance to permanent distortion depends upon its elasticity. The amount of 'torque' or twist required to produce T. in cylindrical bars of the same material varies as the fourth power of their diameters. In bars of section other than circular the rigidity is lessened, so that in practical application cylindrical bars are best adapted to resist a twisting strain. See ELASTICITY; MODULUS; STRAIN AND STRESS.

Torsion Balance, Coulomb's, see ELECTROSTATICS.

Torstenson, Lennart (1603-1651). Swedish soldier, b. Torstena. After serving under Gustavus Adolphus, he became a

leader in the Thirty Years War, becoming commander-in-chief in 1641. His greatest victory was at Breitenfeld in 1642, over the Imperialists. In 1643 he defeated the Danes, the Imperialists again in 1644, and returned Vienna in 1645.

Tort (Lat. *torlus*, twisted), is the breach, by act or omission, of a duty imposed by law and not by contract, which gives the injured party a right to damages, e.g. trespass (q.v.), slander, libel, detinue (q.v.), negligence and nuisance (q.v.), and assault. A T. has some of the characteristics of a criminal offence, but is to be distinguished therefrom, though many crimes necessarily include a T. (e.g. a public nuisance causing special damage to an individual; rape), but every T. does not amount to a crime (e.g. slander and seduction are merely T.s), nor does every crime amount to a T. (e.g. blasphemy and treason). Where the T. is punishable summarily and the magistrates dismiss the case, no further proceedings, criminal or civil, can be taken. A cause of action in contract may co-exist with a T., i.e. the same facts may give A a remedy in contract against B and also a remedy in T. against C, e.g. where A is injured in alighting on a defective wharf belonging to B shipping company, from a ship belonging to C shipping company, which enjoys unloading rights of B's wharf (see Sir F. Pollock, *Law of Torts*, 1887); conversely there may be 2 causes of action, one in T. and one in contract with a common defendant; and generally, when a contract inevitably gives rise to duties independently of the contract itself, the breach of them often amounts to a T., e.g. where A purchases goods on credit from B, and B resells before A makes default in payment, A can sue B for conversion. See Sir F. Pollock, *Law of Torts* (15th ed.), 1951; Sir J. W. Salmond, *Law of Torts* (11th ed.), 1953; G. F. Clerk and W. H. Lindsell, *Law of Torts* (11th ed.), 1954; P. H. Winfield, *A Textbook on the Law of Tort* (6th ed.), 1954.

Torticollis, contracture of the sternomastoid muscle in the neck, usually on one side, causing an abnormal posture of the head, or 'wryneck'. T. may be present in infants from birth injury, and usually needs surgical intervention for its cure. In adults it may be caused by some irritant to the muscle or the nerve supplying it or, quite simply, by some passing inflammation due to a draught playing on the muscle—i.e. a stiff neck.

Tortoise, name for all the land Chelonians, and often applied to all members of the family Chelonina with the exception of the marine Chelonians or turtles. All members of the order are cold-blooded, 4-footed reptiles, without teeth, and are protected by a shell, or leathery case. All lay eggs, but otherwise there is wide diversity in their habits. They are of great geological age, and their tenacity of life has enabled them to survive where more recent animals of higher types have become extinct. The most familiar example of the land T.s (*Testudines*) is the common or Gk T. (*Testudo graeca*), which occurs around the Mediterranean and is

much kept as a pet. It is entirely vegetarian in its diet, though frequently sold as an insect killer. Another T. which is sometimes offered for sale is the riv. T. (*Emys orbicularis*); this is a type of the riv. and marsh T.s (*Emydes*), and is distinguished by its small yellow spots; this eats insects, worms, etc. Among the mud or soft T.s (*Trionyx chioidea*) are various Amer. and Indian species which are frequently killed for food, the flesh being well flavoured. The most important of the turtles (*Chelonidae*) are the edible green turtle (*Chelonia mydas*) and the hawksbill turtle (*C. imbricata*), from which tortoise-shell is derived. Among the most interesting kinds of T. are the Gigantic T.s formerly found in great numbers in the Galapagos and Mascarene Is. When discovered these were uninhabited; the T.s therefore enjoyed perfect security, and this, as well as their ordinary longevity, accounts for their great sizes (as much as 5 ft in length) and numbers.

Tortoise Plant, see ELEPHANT'S FOOT.

Tortoise-shell, in commerce, is the horny plates of the hawksbill turtle (*Chelonia imbricata*). The largest of these plates are about 18 in. long by 6 in. broad, and rarely exceed $\frac{1}{2}$ in. in thickness. T. is semi-transparent, and mottled with various shades of yellow and brownish-red. Its value depends on the brightness and form of the markings, and, if taken from the animal after death and decomposition, the colour of the shell becomes clouded and milky. Hence great cruelty has been exercised in removing the plates from living turtles, but the finest T. is derived from shells immersed in boiling water immediately after the death of the animal. Numerous imitations and substitutes are made. T. is used for making combs, snuff-boxes, and a number of fancy articles, as a material for inlaying ornamental furniture, as a veneer, and as a ground substance in which the precious metals and mother-of-pearl are inlaid.

Tortola, see VIRGIN ISLANDS.

Tortosa (ancient **Dertosa**), Sp. tn in the prov. of Tarragona, on the Ebro (q.v.). It is a granite tn, with a Gothic and Baroque cathedral, old walls, and some fine ancient houses. It manufactures porcelain, leather, and glass, and has a trade in oil, wine, and rice. Pop. 48,200.

Torture. The application of bodily pain (i) as a prelude to or accompaniment of capital execution, (ii) as an act of vengeance upon defeated enemies, and (iii) as a means of extracting confessions or other evidence from accused persons, is of great antiquity alike among barbarians and otherwise highly cultured peoples. It has taken a large variety of more or less atrocious forms; and methods employed in medieval England included the boot and the *peine forte et dure* (piling weights on the prostrate body of the victim). T. was often part of the penalty for treason. Pope Innocent IV (q.v.) authorised T. for use by the Inquisition (q.v.), which generally had recourse to flogging, the rack, the strappado, or the ordeal by burning coals.

In England T. virtually ended in 1640.

It was abolished in France at the Revolution (1789); in Scotland by an Act passed in 1709. It was unknown in the Ger. municipalities until the end of the 14th cent., but once introduced it remained lawful (though only intermittently resorted to after 1750) in Hanover, Bavaria, and some of the smaller Ger. states until the first decade of the 19th cent., while in Austria, Prussia, and Saxony it virtually ceased in 1750, and in Russia was finally abolished in 1801. T. was used by the Nazi regime in Germany (1933-45) to extort information from political prisoners and as a form of punishment in concentration camps, and by the Japanese also during the Second World War. The govts. of the Soviet Union and the Communist countries in E. Europe have used T. as a means of extracting confessions from political prisoners prior to their trial by Peoples Courts. Cardinal Mindszenty, the Primate of Hungary, confessed at his trial to treasonable activities; in Nov. 1956, following the Hungarian people's revolt against Russian domination, he explained that he had been beaten and subjected to continuous questioning for days on end without sleep. The mental and moral resistance of political prisoners in Communist countries has been broken by such cruel treatment as being forced to stand for hrs in the same position under the glare of blinding light, having lighted matches placed under their finger-nails, being exposed to extremes of heat and cold, and deprivation of food.

Toru Dutt, see DUTT, TORU.

Torula, old generic name for a group of yeast-like organisms now classified under the genus *Torulopsis*.

Torún (Ger. **Thorn**), tn of Poland, in Bydgoszcz prov., on the Vistula (q.v.), 26 m. ESE. of Bydgoszcz. It was part of Germany (Pomerania, q.v.) 1793-1807, 1815-1918, and 1939-45. Treaties concluded here in 1411 and 1466 made the Teutonic Knights (q.v.) vassals of the Polish kings. Copernicus (q.v.) was a native. There are engineering, chemical, and textile industries. Pop. 80,000.

Tory, synonym, though historically inappropriate, for a Conservative. The word T. is Irish, and signified, during the time of the wars in Ireland in the reign of Elizabeth I, a kind of robber who, being attached to neither army, preyed generally upon the country without distinction of English or Spaniard. They were especially prominent in the Protestant massacres of 1641. From this the term came to be applied to a body of men who, in 1680, appear to have ridiculed the Popish Plot and yet encouraged the Papists to revive it. Their political object was to banish the Duke of Monmouth and recall the Duke of York, and to further their end they endeavoured to thwart the Bill of Exclusion (from their abhorrence to which they were called 'abhorrrers' and their opponents the 'petitioners'). Ultimately the 'abhorrrers' and 'petitioners' became identified with the terms Tories and Whigs respectively.

Toscana, see TUSCANY.

Toscanini, Arturo (1867-1957), It. conductor, b. Parma. He studied at the Parma Conservatory, where he gained his diploma in cello and composition in 1885, and began his career as a conductor in 1886 at Rio de Janeiro. His reputation rapidly gained ground. After sev. years at Turin he was appointed to La Scala, Milan, in 1898 and in 1907 he was nominated conductor to the Metropolitan, New York. He was conductor of the Philharmonic Symphony Society of New York. 1926-36. His chief centres of activity were the opera-houses and concert halls of Milan and New York, but he was also guest conductor at Bayreuth, Vienna, Salzburg, Paris, and elsewhere.

Press Portrait Bureau

ARTURO TOSCANINI

He conducted at Covent Garden during the Coronation celebrations of George VI, 1937. The concerts conducted by him in the Augusteo in Rome became memorable. Many new It. operas were presented by T. See lives by G. M. Ciampelli, 1923; T. Nicotra, 1929; P. Stefan, 1936; A. Della Corte, 1946; F. Sacchi, 1951.

Tosk, see ALBANIA, *Language*.

Tostal, the Irish tourist festival, was launched at Easter 1953 with the primary aim of extending the Irish tourist season. The Gaelic word *Tostal* means a festive gathering, and *An Bórd Fáille*, the Irish State-directed Tourist Board, who are in charge of the festival, have endeavoured to make it live up to its title. It has been held for 3 weeks each year since 1953, and has featured, in cities, towns, and resorts all over the Rep., pageantry, exhibitions of every kind, drama festivals, athletic events, and such distinctive Irish features as currach racing, mumming, and open-air displays of step-dancing and traditional music and songs. In 1955 the festival was advanced so as to be held during May, as this is generally the sunniest and driest month of the year in Ireland.

Tosti, Sir Paolo (1846-1918), It. composer, b. in the Abruzzi. He came to London when about 30 years old, and held the position of singing teacher at the Royal Academy of Music. He was knighted in 1908. He was the singing-master to the Queen of Italy and later to the Brit. Royal Family, and settled permanently in London. He composed hundreds of light drawing-room songs, *Goodbye* being probably the favourite in a mass of very popular work.

Tostig (d. 1066), Earl of Northumbria, son of Earl Godwin (q.v.). In 1065 he was banished from his realm because of his cruel, repressive measures and replaced by Morcar. The following year he returned with Hardrada, King of Norway, and was slain at Stamford Bridge by his brother, King Harold.

Totalisator, machine, or apparatus, set up on race-courses for recording bets and payment of winnings on the principle that all money staked is pooled and shared (subject to a percentage deduction) by those who have backed winners. This system, known as the *pari-mutuel*, was invented in France by M. Oller in 1872. The first machine used to operate this system was set up at Christchurch, N.Z., in 1880, and the first T. in Europe was operated at Longchamps, near Paris, in 1929. T.s were introduced into Britain in the same year, and by the end of 1930 92 race-courses were provided with T. facilities. They were also in the same year installed at many greyhound tracks. A mechanized *pari-mutuel* system was operated in Maryland, U.S.A., in 1930.

In Great Britain T.s are operated on horse-racing courses by the Racecourse Betting Control Board, constituted under the Racecourse Betting Act, 1928, with a view to benefiting, by the legislation and estab. of T.s on race-courses in Great Britain, the horse-breeding industry, the sport of horse-racing, and charities. Under the Betting and Lotteries Act, 1934, veterinary science also benefits. The Board's normal statutory deduction is 15 per cent from losing stakes, the only exceptions being double and treble event pools and pools at point-to-point meetings (deduction, 10 per cent from pools).

On a fully mechanised installation, at the time of the issue of the tickets, each 2s. unit is automatically added and recorded on a miniature indicator in the control room and simultaneously indicated to the public on the main indicators. The prices of tickets on a race-course are 4s., 10s., £1, £5, and on a few occasions, £10 and £50. Facilities also exist for 'off-the-course' betting. T. betting represents only a small proportion of off-course betting on horse-racing, whereas it represents a larger proportion of on-course betting. The amount staked with the T. on horse-racing 1929-57 inclusive was £369,574,383, the average ann. turnover 1948-57 being £25,500,000, the peak year being 1957 with £27,052,028. Two representatives each of the secretary of state for the Home Dept and the National Hunt Committee, 3 from the Jockey Club and 1

representative each of the secretary of state for Scotland, the chancellor of the Exchequer, Tattersalls' Committee, the minister of agriculture and fisheries, and the Race-course Association, Ltd. form the Race-course Betting Control Board. In greyhound racing all the 65 tracks under the control of the National Greyhound Racing Club are equipped with totalisators which were legalised on greyhound race-tracks by the Betting and Lotteries Act of 1934. The deduction authorised by this Act was 6 per cent, but in 1948 a betting tax of 10 per cent was imposed by the Government, bringing the total deductions from the pools to 16 per cent. In 1957 the turnover on the tote was approximately £60 million compared to the peak year of 1946 when the total was £199 million. For discussion of T. and *pari-mutuel* systems, see BETTING.

Totalitarian Government, see GOVERNMENT; INDIVIDUALISM.

Totemism (Algonquin Indian *totem*, my 'otem' or guardian spirit, pronounced *lodaim*), belief prevailing among primitive peoples of kinship with or descent from an animal or plant. T. accounts for such mythological phenomena as the animal-headed gods of Egypt, anthropomorphic totems in a state of high evolution. T. certainly existed among many European and Asiatic peoples, and still does among, notably, the N. Amer. Indians and Australian aborigines. In sev. Indian 'nations' each individual of a tribe possesses a personal totem which he receives in a dream induced by drugs or hunger at the age of puberty. In Australia and Africa there are clan totems, and it is thought particularly wrong to hunt, kill, or eat one's totemic animal. See F. B. Tylor, *Primitive Culture*, 1871; A. Lang, *Secret of the Totem*, 1905; Sir J. G. Frazer, *Totemism and Exogamy*, 1910; S. Freud, *Totem and Tabu*, 1913; E. Durkheim, *The Elementary Forms of the Religious Life* (Eng. ed.), 1915; W. Schmidt, *Origin and Growth of Religion*, 1930; A. R. Radcliffe-Brown, 'The Sociological Theory of Totemism' in *Structure and Function in Primitive Society*, 1952.

Totila (d. 552), king of the Ostrogoths in Italy, was proclaimed in 541. He at once began the restoration of the Ostrogoth kingdom of Italy and gained a victory over the Romans near Faenza. He captured Rome in 546. In 547 Belisarius (q.v.) recovered possession and repulsed 3 assaults of T., who did not succeed in retaking the city till 549. Owing to T.'s continued successes the Emperor Justinian sent a large army against him led by the eunuch Narses (q.v.), who encountered T. at Tagina and killed him.

Totnes (the *Totenais* of Saxon times), anct mrkt tn of Devon, England, on the R. Dart, with cider breweries, a milk factory, sawmills, and timber-yards. The grammar school was founded in 1553. There is a Norman castle, and the Guildhall also dates from 1553. Pop. 5534.

Tottenham, municipal bor. of Middx, England, near the borders of London and Essex, on the road from London to Waltham Cross. It was a royal manor in

the Middle Ages; was much developed at the end of the 19th cent. by working-class overflow, especially from Stoke Newington, and is now an industrial and residential dist. Bruce Castle, near the par. church, is a fine late Elizabethan manor-house, now a museum of postal history (Rowland Hill (q.v.) and his brothers once owned the house). T. returns 1 member to parliament. Pop. 125,200.

Tottington, urb. dist. of Lancs, England, 2½ m. NW. of Bury. Its industries are cotton-spinning and weaving, and production of rayon silk. Pop. 6000.

Toucans, popular name of any bird of the genus *Ramphastos*, often applied to the whole family *Ramphastidae*. They are all natives of tropical America and are characterised by their enormous bill and by their habit of bringing up their food after swallowing it in order to masticate it. In confinement they are almost omnivorous, but in a wild state they live chiefly on fruit, seeds, and insects. In the true T. the ground colour of the plumage is generally black; the throat, breast, and rump adorned with yellow, red, and white; the body is short and thick; tail rounded or even and capable of being turned up over the back when the bird goes to roost.

Touch, sensation due to the stimuli of pressure and contact acting on the body. There are 2 components of this sensation, one of simple pressure, and the other of the locality or region of application of the pressure. Sensitivity to pressure may be estimated by the ability to perceive the pressure due to small weights, from 2 to 15 milligrams, on various parts of the body. Results show that the sensitivity of these parts varies considerably, parts of the face being most sensitive. Ability to perceive locality is measured by the minimum distance separating the 2 slightly blunt points of dividers when they can be felt as 2 separate points. In parts of the back, forearm, and thigh the 2 points are felt as one, even when they are 2 in. apart. The tip of the tongue is most sensitive to locality, points 1 mm. apart being distinguished separately. The peripheral nerves supplying the skin terminate either on or between epithelial cells, or in special corpuscles. Certain of these have long been regarded as tactile organs, but there is conflicting evidence with regard to this view. Although careful experiment has failed definitely to establish the connection between the corpuscles and the sensation of T., results seem to indicate that T. must be due to special nerve endings probably associated with the corpuscles. Like all other sensations, that of T. is perceived by the brain, and is conveyed to it by afferent nerves or fibres which travel in special tracts of the spinal cord distinct from those conveying impulses of pain. Consequently in *syringo-melia*, when the sensation of pain is lost, that of T. is unimpaired. See NERVOUS SYSTEM.

Touch-Me-Not, see IMPATIENS.

Touchstone, mineral (schist or Jasper), also known as basanite, hydian stone, and

Flinty slate, is a siliceous stone, black or very dark coloured, used for testing the purity of gold, gold alloys, and other precious metals, which leave characteristic streaks when rubbed over it. The test is probably over 2000 years old and is still used.

'Tough School,' see HEMINGWAY.

Toul, Fr. tn, cap. of an arron., in the dept of Meurthe-et-Moselle, on the Moselle and the Marne-Rhine canal. It is an anct fort. tn, and was long a bishopric. Taken by the French from the Germans in 1552, it was finally ceded to France in 1648 (see WESTPHALIA, TREATY OF). The fine church of St-Étienne, built between 965 and 1496, was damaged in the Second World War. Pottery is manuf. Pop. 9000.

Toulon (anct Telo Martius), Fr. seaport in the dept of Var, on the Mediterranean, 29 m. ESE. of Marseilles. It became the seat of a bishopric in the 6th cent. In 1793, at the beginning of the Fr. Revolution, it was surrendered to the English by the royalists, but was retaken by the republicans in Dec. of the same year; during this memorable siege the young Bonaparte (see NAPOLEON I) first distinguished himself. In modern times T. has been an important naval station and arsenal. In 1911 the battleship *Liberté* caught fire and blew up in the harbour; many ships near by were damaged and some 200 persons perished. During the Second World War, in 1942, the bulk of the Fr. fleet was scuttled in T. harbour to prevent it falling into Ger. hands. Subsequent Allied bombing almost completely destroyed the harbour (by then a Ger. submarine base) and its installations. The tn was taken by Fr. troops in Aug. 1945. The fine roadstead of T. (with inner and outer bays separated by a breakwater) is backed by fortified limestone heights. There are marine engineering, armament, chemical, oil, and textile industries. Pop. 141,150. See G. Lambert, *Histoire de Toulon*, 1886-92; J. H. Rose, *Lord Hood and the Defence of Toulon*, 1922.

Toulouse, Count of, see RAYMOND.

Toulouse (Rom. Tolosa), Fr. tn, cap. of the dept of Haute-Garonne, on the Garonne. It was the anct cap. of Langue-doo (q.v.). A Celto-Ligurian (see CELTS, LIGURIA) settlement, it was colonised by the Romans in 106 bc. In 419 it became the cap. of the Visigoths (see under GOTHs), and in 506 became cap. of Aquitaine (q.v.). Simon IV de Montfort (see under MONTFORT) was killed in 1218 while besieging the tn during the campaign against the Albigenses (q.v.). The last action of the Peninsular War (q.v.) was fought here in 1814. T. is the fourth city of France, a centre of communications, and the seat of an archbishopric and of a university. The anct abbey church of St-Sernin is probably the finest Romanesque church in France. There are sev. other remarkable churches, including the cathedral of St-Étienne which is partly 12th cent. There are museums, art galleries, and libraries, and the tn is a publishing and banking centre. A 16th-17th-cent. bridge joins it to the

W. suburb of St-Cyprien. T. has armament, chemical, footwear, metallurgical, textile, and flour industries, and a large trade in agric. produce. Pop. 268,900. See J. de Lahondès, *Les Monuments de Toulouse*, 1924.

Toulouse-Lautrec-Monfa, Count Henri Marie Raymond de (1864-1901), Fr. painter, b. Albi. An accident in early life (1878) broke his legs and prevented their normal growth. He turned, in compensation, from aristocratic country life to painting and the contemplation of the amusements and vices of Paris. His prolific period was between 1885 and 1899. 2 famous studies of the Moulin Rouge and its denizens belonging to 1892. He visited England in 1895. Strongly influenced by Degas, he is more of a social commentator than that master. He painted with verve, but perhaps his best work is graphic, notably in the brilliant posters he himself lithographed in colour for various Parisian resorts and in his series of drawings *Au Cirque*. See studies by G. Coquilhot, 1921; M. Joyant (2 vols.), 1926, 1927; J. Lassaigne, 1939.

Touquet-Paris-Plage, Le, Fr. seaside resort in the dept of Pas-de-Calais, on the Eng. Channel. It has excellent bathing, and is a fashionable sporting centre with a racecourse and polo ground. Pop. 3200.

Touraco, or Touraeco, beautiful African bird of the genus *Turacus* of the family *Musophariidae* or plaitain-eaters. The T. has a small high bill, notched and serrated mandibles, short rounded wings, and a long rounded tail. It has an erectile crest on the head. The plumage is green, with purple on the wings and tail. The Ts comprise over 20 species, including the *Turacus persa*, with purple wing coverts, found on the Guinea Coast, and *T. albicrestatus* or white-crested T. of Cape Colony.

Touraine, anct prov. of France, now the dept of Indre-et-Loire and a part of Vienne. Its cap. was Tours (q.v.), and it was named from the local Gallic tribe of the Turones. With Anjou and Orléanais (qq.v.), it was a source of dispute between France and England. It came to England with Henry II in 1154, and was regained for France by Joan of Arc (q.v.). See A. Macdonnell, *Touraine and its Story*, 1906; A. H. Brodrick (ed.), *Touraine, with Anjou and Maine*, 1948.

Tourcoing, Fr. tn in the dept of Nord, 8 m. NE. of Lille. It was the scene of a Fr. victory over the Austrians in 1794. It has an important textile industry (dating from the 12th cent.), and forms part of the T.-Lille-Roubaix industrial complex. Pop. 83,500.

Tourguenieff or Tourgueniev, see TURGENEV.

Tourmaline, mineral of variable composition, containing silica, aluminium, sodium, iron, magnesium, boron, etc. It crystallises in the hexagonal system, and has a rhombohedral cleavage. It also occurs massive and compact and in radiate fibrous masses. In colour it is generally black, more rarely green, blue, and red, and, still more rarely, colourless. The

black variety is termed schorl (q.v.). The mineral is dioroid, brittle, and pyroelectric. On account of its hardness (7.5; sp. gr. 3) it is sometimes cut as a gem. Varieties of T. are rubellite (red or pink), indicolite (indigo blue), Brazilian sapphire (Berlin blue and transparent), Brazilian emerald (green), and peridot of Ceylon (yellow). T. occurs in granite, gneiss, mica, and chlorite slates and granular limestones; it is found in Cornwall and Devon, Bavaria, and Switzerland. The rubellite variety, used as gems, is found in Ceylon, Siberia, and Ava. The transparent varieties are used for making polariscopes and polarimeters, e.g. the 'T. pincette.'

Tournai (Flem. Doornik), tn in the prov. of Hainaut, Belgium, situated on the R. Scheldt, 27 m. WNW. of Mons. It is an important railway junction. Of all the Belgian tns T. suffered most during the Second World War. Many houses, medieval churches, and municipal buildings, and the valuable library were destroyed. The fine Romanesque and Gothic cathedral, built from the 11th to the 14th cents., however, and the Belfry, the oldest in the country, were hardly damaged. There are quarries of freestone and limestone, and the chief manufs. are Brussels carpets, pottery, and woollen and cotton goods. Pop. (1955) 33,100.

Tournament, **Tourney**, or **Joust**, form of martial sport very popular in the Middle Ages. Combats took place on horseback between men of noble rank, and a prize was given by the lady of the T. to the knight who had displayed the greatest prowess. The custom was introduced into England from France during the 11th cent. T.s were regulated by definite rules and by very strict etiquette. The weapons used, spears, lances, swords, or daggers, had to be blunted. Each joust was attended by his squire, who acted as his second and could alone touch him if he fell. In spite of precautions, however, accidents and rough dealings were not infrequent. In its earlier form the T. often took the form of a private war; it was more than once banned (though ineffectively) by the Church, e.g. at the Councils of Clermont (1130) and the Lateran (1179). See F. H. Cripps-Day, *History of the Tournament*, 1918.

Tournefort, Joseph Pitton de (1666-1708), Fr. botanist, b. Aix, Provence, prof. of botany at the Jardin des Plantes. In 1683. His *Éléments de Botanique*, 1694, embodies a systematic arrangement of some 8000 species of plants, classified, mainly, according to the corolla, a system for long adopted on the Continent. His chief work was his *Institutiones Rei Herbariae* (3 vols.), 1700, which prepared the way for Linnæus, whose system of classification eventually superseded that of T.

Tourneur or **Turner**, Cyril (c. 1575-1626), Brit. poet and dramatist. Very little is known of his life. He was a soldier much of the time, served in the Low Countries, accompanied Sir Edward Cecil's expedition to Cadiz, and d. on his return at Kinsale, Ireland. In the 6 years which he devoted to litera-

ture T. was a prolific writer. He wrote the *Atheist's Tragedy*, 1611, *Transformed Metamorphosis*, which was discovered only in 1872, and a lost play, *The Nobleman*. T.'s masterpiece is the *Revenger's Tragedy*, 1607. If it is true that T., unlike Shakespeare, was concerned rather with the technique of horror, physical and mental, than with psychological issues, it must be emphasised that, like Shakespeare, he sought to 'hold the mirror up to nature'; and he was perhaps the first Eng. writer to display the 'indifference' exemplified by Tchekov and his view that 'Man will become better only when you make him see what he is like.' Eng. drama owes much to T. for the admirable construction of his work, free from mannerism and bombast. His works were ed. by J. C. Collins in 1878; his 2 chief plays are reprinted in the Mermaid series and the *Revenger's Tragedy* in the Temple Dramatists. There is an ed. of his complete works by A. Nicholl, 1930. See A. C. Swinburne in *The Age of Shakespeare*, 1908; T. S. Eliot in *Elizabethan Essays*, 1934; U. M. Ellis-Fermor, *The Jacobean Drama*, 1936.

Tourniquet, instrument for preventing severe arterial hæmorrhage by compressing the main artery of a limb. The usual form consists of 2 metallic plates, united by a thumbscrew, and a strap provided with a pad. The instrument is applied so that the pad is opposite the artery to be compressed, while the strap encircles the limb. By turning the thumbscrew the 2 metallic plates are gradually separated, so that the strap is drawn more tightly round the limb. A simple form of T. for first-aid purposes may be contrived by tying a triangular bandage about the part, introducing a stick between limb and bandage, and twisting until the required compression is obtained. A T. should not be left in position for more than $\frac{1}{2}$ hr at a time, otherwise severe devitalisation of the tissues from lack of blood may occur and lead to gangrene. If it is necessary for a T. to remain in position for a long period it should be loosened for a few sec. every 30 min. and then re-applied. It is always advisable to tie a label of some kind to the patient and write on it the exact time at which the T. was first applied. This enables the hospital, or surgeon, or whoever it is into whose care the patient is delivered to see at a glance whether or not it is time for the T. to be loosened. This simple measure has saved many a limb from amputation as a result of gangrene.

Tournon, Fr. tn, cap. of an arron., in the dept of Ardèche, on the Rhône. It has a textile industry, and a trade in wines. Pop. 5800.

Tours, Fr. city, cap. of the dept of Indre-et-Loire, lying between the Loire and the Cher (q.v.), 125 m. SW. of Paris. It was formerly the cap. of Touraine (q.v.). Known to the Romans as Caesarodunum, the tn passed to the Visigoths in the 5th cent. It developed in importance after the time of St Martin (q.v.) and it was here that St Gregory (q.v.) founded the abbey which was later

associated with the name of Alouin (q.v.) and which became one of the great centres of learning in the Middle Ages. Near T. in 732 Charles Martel (q.v.) stopped the advance of the Saracens. A silk industry was estab. by Louis XI, but it declined after the revocation of the Edict of Nantes (q.v.), since most of the craftsmen were Huguenots. During the siege of Paris in 1870, T. was the seat of the Fr. Gov., and it was again the seat of the gov. for 4 days in 1940 during the Second World War; it suffered much damage during the War. The archiepiscopal cathedral (13th-16th cents.) has fine glass and cloisters. There is an archiepiscopal palace (17th-18th cents.), now a museum, and there are some notable anc. houses. Machinery, textiles, and chemicals are manuf., there is a publishing industry, and there is a trade in agric. produce, fruit, wines, and spirits. Clouet, Jean Fouquet, and Balzac were natives. Pop. 83,700.

Tours, Battle of, see under CHARLES MARTEL.

Tourville, Anne Hilarion de Contetin, Comte de (1642-1701), Fr. adm. and marshal of France, b. Normandy, distinguished himself in the battle of Palermo against the combined fleets of the Dutch and Spaniards (1676). But his most famous victory was won in 1690 off Beachy Head against the Dutch and English. The enemy, however, retrieved this disaster in 1692, when T. suffered defeat at La Hogue.

Toussaint, Anna Louisa Geertruida, see BOSBOOM.

Toussaint L'Ouverture, Pierre Dominiq (1744-1803). Negro liberator of Haiti (q.v.), b. Haiti, son of a chieftain of Gulaou-Guinou, W. Africa, whom slave-traders captured and brought to Haiti. He was baptised and learned to read. He read and was markedly influenced by the Abbé Raynal's *Philosophical and Political History of the European Establishments and Commerce in the Two Indies*, where it was emphasised that the slaves were treated worse than dogs. Having joined the rebels, he soon acquired a magnetic hold over the negroes; his literacy lent him prestige, his knowledge of plants the reputation of a witch doctor, his dignity of bearing commanded their respect, and by 1791 he was their leader. T. and his army, then 6000 strong, allied themselves with Spain and carried out a lightning campaign.

In France, with the progress of the revolution of equality, came a change of heart towards Haiti, and 3 delegates from the ls. now took their seats in the Fr. National Assembly (1793), while slavery was declared abolished. Thus T. was now able to lead his fellow negroes under the banner of the Fr. Rep. against both the Spanish and the English, the latter having intervened on behalf of the white planters. Though without military allies, and alone, he fought the English, who sustained their worst defeat for many years and soon had to yield all the positions they had won. T. entered Port-au-Prince in triumph.

In France reaction now set in. Van-blanc, in the Convention, demanded that help be given to the whites against the aggression of the negroes, but T. defeated both the mulattoes under Rigaud and the Spanish. During 1801-2 T. was the ruler of the whole is., and began to reorganise the administration in the Sp. colony as he had done in Haiti.

At this point, however, Napoleon intervened in an attempt to recover the slaves to their former bondage, and T. then took up arms against his former Fr. allies. T. refused to negotiate with Napoleon's commissioner, and stipulated that he himself should be made governor of Haiti for life. Napoleon retorted by making extensive preparations for war. Following the Peace of Amiens (1802), Napoleon openly announced an expedition against Haiti, whose slaves had 'flouted France's authority.' In the end T. could not rely on his general staff, and had no choice but to accept peace. He was inveigled into pourparlers with the Fr. leaders and at once put on board a frigate for France. There he was confined in the castle of Joux, a cold, elevated spot near the Swiss frontier. Through the studied neglect of his jailers he died there in less than a year.

See P. Sannon, *Histoire de Toussaint L'Ouverture*, 1920; C. L. R. James, *The Black Jacobin*, 1938; R. Koringold, *Citizen Toussaint*, 1944; S. Alexis, *Black Liberator: The Life of Toussaint L'Ouverture*, 1949.

Tout, Thomas Frederiek (1855-1929), historian, b. London. Educ. St Olave's School, Southwark, and Balliol College, Oxford, he became prof. of hist. at St David's College, Lampeter, 1881-90, and at Manchester Univ., 1890-1925. He was president of the Royal Historical Society, 1925. His works include booklets on mediæval subjects, and many articles in the *Dictionary of National Biography*. See also his *Collected Papers*, 1932-4. See memoir by Sir F. M. Powicke, 1931.

Tovey, Sir Donald Francis (1875-1940), composer, pianist, and scholar, b. Eton. From early childhood he was associated with Joachim (q.v.), who took a great interest in his musical education. T. entered Balliol College, Oxford, in 1894, and studied composition under Sir Walter Parratt and Sir Hubert Parry. From 1900-2 he gave concerts in London, Berlin, and Vienna, and from 1914 was Reid Prof. of Music at Edinburgh Univ. He conducted the Reid Orchestra, Edinburgh, founded in 1924. T.'s music is distinguished by high and serious aims, with marked regard for classic form and style, and as a pianist he was for some time in the front rank with his interpretations of Bach, Beethoven, and Brahms. As a teacher of music he was regarded with the greatest esteem. He wrote 40 articles for the 11th ed. of the *Ency. Brit.*, and others, on Brahms and Haydn, in *Cobbett's Cyclopedic Survey of Chamber Music*, *A Companion to Beethoven's piano sonatas*, 1931, and *A Companion to Bach's Art of Fugue*, 1931, and studies of Schubert, 1927, and Gluck, 1934, in H. Foss's *Heritage of Music*. His *Essays in Musical*

Analysis (6 vols.), 1935-8, were notes for performances by the Reid orchestra. See also his *Essays and Lectures on Music* (ed. by H. Foss), 1950.

Towcester, tn of Northants, England, 8 m. SSW. of Northampton, on Watling Street and known to the Romans as *Lactodorum*. T. has an anct par. church at which Archdeacon Wm Sponne (d. 1449) was rector for 28 years, during which time he founded the grammar school. The chief industry is light engineering, and there is an agric. trade. Some 4 m. SW. is Silverstone, with a notable motor-race track. Pop. 2441.

Tower and Extending Ladders. A ladder is a set of steps or rungs between supports, usually made of wood, but sometimes of metal (aluminium alloy and steel) or rope. Ladders were originally used in the anct world, e.g. for embarking or disembarking from the stern of a ship, or, fixed to a wheeled platform, as an *escalade* for siege work. A simple form of E. L. is the scaling-ladder (q.v.), which consists of 2 or more loose sections, each of which fits into the other. Other types of ladder are the wheeled tower ladder for (e.g.) inspection of street lamps, and the self-supporting steelback ladder for use when the surface of a building is not to be touched. For fire 'escapes' and turntable ladders, see under FIRE BRIGADES and FIRE FIGHTING.

Construction. The construction of a telescopic extending ladder, which is typical, is here described. The stiles of a ladder are of 2 kinds: deal sides cut from deals, or pole sides, formed by cutting a straight fir-pole in half and using one half for each side. Douglas fir is also used for stiles at the present time; oak and ash are employed for the rungs or rounds. Stile-lengths, having been brought to the correct size are 'paired-up,' so that stiles with the same grain tendencies are matched together. Stiles are then mortised for fitting with oblong rungs or drilled for round rungs, and are next grooved to take a wire reinforcement. Stiles and rungs are then glued or wedged together. To rebate the wire into the grooves the ladder is bent at the centre with weights and a tautened rope, the wire is fixed to one end of the stile and held away from the groove by draw-arms; the rope and weights are released at the centre and the wire allowed to fall into the grooves.

Tower Bridge, the easternmost bridge over the R. Thames, built in 1886-94. It was designed by Sir Horace Jones and Sir J. Wolfe Barry and it cost the city corporation £1,500,000. It has 2 high Gothic towers 200 ft apart, and is connected with either bank by single-span suspension bridges. The span between the towers in the centre of the river consists of a pair of drawbridges, or bascules, which can be raised in 1½ min., and thus permit the passage of vessels, whilst high up near the top of the towers there is a permanent suspension-bridge for pedestrians, no longer open.

Tower Hamlets, before 1918, a parl. bor. of E. London, returning 7 members and,

so called because of their proximity to the T. of London. The divs. were Bow and Bromley, Limehouse, Mile End, Poplar, St George, Stepney, and Whitechapel.

Tower Mills, see WINDMILLS.

Tower of London, the most historic building in the U.K., connected intimately with the tragic side of Eng. hist. because of the long roll of state prisoners lodged there, so many of whom were executed within or without its walls. It was first built by William the Conqueror to protect and control the city. His building, the Great Tower or Keep, generally called the White Tower, is the oldest part of the T. of L., and lay within the Rom. walled city. Enlargement in the 12th cent. carried the buildings beyond the wall. Part of the Tower therefore lies outside the city, but it forms a Liberty in itself. Considerable successive additions and alterations have been made to the buildings, and they exhibit a variety of architectural styles from the 11th to the 20th cents. The inner ward is defended by a wall flanked by 13 towers. The outer ward is defended by another wall, flanked by 6 towers on the S. or riv. side and by bastions on the NW. and NE., the whole surrounded by a moat, now empty. At the SW. angle there were originally 3 drawbridges (none survives) and 3 towers (2 survive) before entrance could be gained to the outer ward.

The T. of L. has been a fortress, a palace, a prison, has housed the public records, the Royal Mint, the royal menagerie (from 13th or 14th cent. until 1834), the Royal Observatory (for a short time), and was for cents. the arsenal for small arms. It is now a museum of armour, in a limited sense a fortress (it has a military garrison), the repository of the Crown Jewels, and the greatest showpiece of London. As a palace (the palace buildings have not survived), it was used by all sovereigns down to James I. By custom each sovereign lodged in the T. before coronation and then rode in procession through the city to Westminster. As a prison it was used from the earliest times.

The White T. houses the wonderful Armouries, and contains the perfect little Chapel of St John, the earliest Norman building in London. In the NW. corner of the inner ward is the Chapel of St Peter ad Vincula, rebuilt in 1512 after a fire, where many famous people executed after incarceration in the T. are buried, among them Anne Boleyn, Sir Thomas More, Lady Jane Grey, the Earl of Essex, and Monmouth. The space S. of the chapel, Tower Green, is where executions took place within the Tower. The Bloody Tower, built by Henry III and so named because of its tragic associations, is believed to be the scene of the murder of the young princes Edward V and his brother the Duke of York. Raleigh was in this tower for 13 years. Adjoining it is the Wakefield Tower, also built by Henry III, which houses the Crown Jewels. On its W. side there formerly stood the Great Hall, pulled down during

the Commonwealth, where Anne Boleyn was tried. The Beauchamp Tower, built probably in Henry III's reign, contains the inscriptions of many famous prisoners. The famous Traitors' Gate, under St Thomas' Tower, originally a useful river-entrance to the Tower, later became a convenient landing-place for prisoners tried at Westminster. On Tower Hill, NW. of the Tower, a permanent scaffold was erected in 1465, though the first recorded execution had taken place in 1388, and the last, that of Simon Fraser, Lord Lovat, was in 1747. See also YEOMEN OF THE GUARD.

See W. G. Bell, *The Tower of London*, 1935; H.M.S.O., *The Tower of London*, 1948; Col. E. H. Carkeet-James, *Her Majesty's Tower of London*, 1953.

Town and Country Planning. Though many ancient and medieval towns, many towns in colonies of European nations, and a few modern towns were originally laid out on definite plans (often by powerful rulers for military or political reasons), the majority were not. And even where there was originally a plan, there was no continuous control of changes in and extensions of towns, except in a few large estates developed by private landowners on a leasehold basis. In most countries land is held in parcels of varying sizes by many owners, and the siting and character of buildings have been matters of individual enterprise. Villages grew into towns, and towns into great cities without any overall consideration of the total results. In Great Britain and other industrialised countries the vast modern increase of production and wealth has been accompanied in many towns by a grave congestion and disorder of dwellings, work-places, and other buildings, injurious to health and living conditions. And the reaction against urban congestion, especially in the greater cities, made possible by new means of transport, has led to suburban extensions on a vast scale. Masses of unfit and crowded dwellings remain in city centres: the spacious surroundings of suburban life are offset by long journeys between home and work; and much of the countryside near the cities is depreciated by ill-placed buildings. Traffic congestion and shortages of space for recreation, schools, and car-parking have become common complaints in the towns, and spoliation of rural areas a frequent complaint outside them. Recognition that public control of the use of land is necessary to deal with these evils has come slowly. But it is now generally agreed in all countries, especially where rising standards are demanded for houses, schools, factories, public buildings, shops, roads, sports, entertainment and cultural facilities, and airfields, that the demands cannot be met or properly adjusted without a considerable measure of public planning control.

These are the reasons for the emergence of T. and C. P. as a new branch of government. There were foreshadowings of it in laws and byelaws regulating streets and space about buildings, in public-health laws, and in local public efforts for town

improvements. But legislation for town planning in the modern sense came into vogue only in the 1860s and 1870s, beginning in Italy, Sweden, Austria, and Germany with laws to control the lay-out of suburban extensions, and spreading to Great Britain, the U.S.A., and other countries. In Great Britain its first appearance was in the Housing, Town Planning, etc., Act of 1909, which gave permissive powers to certain local authorities to prepare and apply plans, subject to ministerial approval, for areas in course of or prospect of development. In 1919 planning for similar areas became obligatory on local authorities with populations of 20,000 or over, and by Acts of 1925 and 1932 the powers were extended to all counties, districts, and county boroughs, and from 1932 could be applied also to the parts of towns already built up. Though some useful control was exercised, chiefly in new suburban areas, under these Acts, and useful experience was gained, they proved inadequate to ensure the right placing of new development or to promote good redevelopment. In general, the planning areas were found to be too small, and few of the authorities were in a position to meet the costs of compensation that would have arisen from desirable restrictions or prohibitions of development.

Growing realisation that more comprehensive measures were needed prompted the appointment in 1937 of the *Royal Commission on the Distribution of Population*, whose report (the Barlow Report) in 1940 recommended the planned redevelopment of congested areas of cities, the dispersal of part of their industry and population to garden cities and smaller towns, the promotion of a better balance of employment throughout the country, and a national authority to give effect to these proposals. Following this report, that of the Scott Committee on *Land Utilization in Rural Areas*, 1942, while accepting its general thesis, stressed the importance of safeguarding good agricultural land and countryside amenities; and that of the Uthwatt Committee on *Compensation and Betterment*, 1942, proposed stronger powers for the public acquisition of land and a drastic solution of the compensation problem. These 3 reports, along with the special problems created by extensive war damage in many towns, led to an entirely new conception of national T. and C. P.

In 1943 all land in Great Britain was brought under 'interim planning control,' so that pending the preparation of official plans owners were required to obtain consent from the local planning authority for any proposed developments; and an Act of 1944 gave urban authorities positive powers to acquire, re-plan, and rebuild areas of extensive war damage or of bad lay-out or obsolete development.

These and previous Acts were almost wholly replaced by the 2 T. and C. P. Acts of 1947, for England and Wales and for Scotland, which are now the basis of the British planning system. They revolutionised administration and procedure. Planning powers exercised in England

and Wales by dist. councils and all bor., were now transferred to co. councils and co. bor. councils, with permissive delegation of detailed administration to the smaller authorities. In Scotland the powers are exercised by the large burghs, the co. councils, and the 2 small burghs of St Andrews and Thurso. Every planning authority has to prepare within 3 years a full survey of physical and other resources and existing development, and a development plan for its area, and to revise these each 5 years, all plans being subject to approval, in England and Wales by the Ministry of Housing and Local Gov., and in Scotland by the Dept of Health for Scotland (*see ZONING*). The public must be enabled to see the draft plans, and the Ministers must consider local objections. Many public inquiries have been held into these objections, and most of the first series of plans have now been approved, with some Ministerial revisions.

Planning permission must be sought for all proposed developments, including changes of use of land or premises thereon, and the construction or alteration of buildings, roads, etc.—with the exception of farm buildings and minor alterations under General Development Orders. The would-be developer has a right of appeal to the Minister against a decision of the planning authority, and in important cases public inquiries into individual objections may be held.

The T. and C. P. Acts of 1947 also give powers to public authorities to acquire and develop land for planning purposes, and to retain or lease it, and provide for gov. grants for these purposes. The development plans have to define the land likely to be required within 10 years for public purposes. An owner is entitled to require the authority to purchase his land if planning restrictions deprive him of its value. Normally compensation at existing-use value is payable for land acquired or depreciated by restrictions. The provisions in the 1947 Acts for 'global' compensation from a national fund for the prohibition of development on undeveloped land have been considerably modified by the T. and C. P. Act 1954, and the 'development charge' originally payable when financially advantageous development was sanctioned has disappeared. The position now is, briefly, that on public acquisition of land the owner is entitled to compensation (a) for his existing-use value at current market price, plus (b) the 1947 value of his prospective development right. Certain anomalies resulting from this are stimulating a demand for further amending legislation from owners on the ground that full market value would be fair, and from others on the ground that owners ought not to benefit by increments of value due primarily to public action.

Other important provisions of the 1947 Acts are for the control of outdoor advertisement (*see ADVERTISEMENT*), for preserving buildings of architectural or historic interest, and for preserving trees

and woodlands. Conditions for the restoration of land may be imposed where permission is given for mineral workings.

The Acts also provide that applications for consent for building factories or extensions in excess of 5000 sq. ft must be supported by Board of Trade certificates that the proposals are 'consistent with the proper distribution of industry.' (The Board also has powers of planning importance under the Distribution of Industry Acts, 1945 and 1950, for assisting the estab. of factories in areas of potential unemployment, and checking industrial development in congested cities.) *See INDUSTRIAL TRADING ESTATES.*

The aim of British post-war planning is to balance the rival claims of agriculture, industry, housing, public services, military developments, mineral workings, etc., so as to secure that land is used in the best interests of the community at large with the least possible hardship to personal interests. The national policy is now to stop the growth of London and other over-large conurbations, to reduce their congestion on rebuilding, to safeguard good agricultural land, to reserve green belts around tns, and to disperse 'overspills' of persons and employment to new tns and smaller existing tns. Post-war concentration on new housing to relieve the shortage has delayed slum clearance and central reconstruction, except in a few heavily war-damaged cities. By 1956 the accent was on rehabilitation and reconstruction within the cities, with much debate as to how to provide adequately for the 'overspill' if the rebuilding is to be on satisfactory standards of housing density and open space (*see NEW TOWNS; GREEN BELTS; OPEN SPACES*).

Though the necessity of much dispersal is generally accepted, planning theorists differ as to its scale and as to the permissible density of redevelopment within large tns. Some follow the Swiss architect Le Corbusier (q.v.) in favouring very high blocks of flats having shops and other community facilities within the blocks. Some contend that multi-storey flats at high density would reduce journeys to work and the need of dispersal; they are supported by others who fear that dispersal would absorb too much agricultural land. Others, again, argue for terrace housing at high densities with very small gardens. Advocates of dispersal reply that flats are acceptable only to a small minority (5-10 per cent); that they are very costly and involve huge housing subsidies that might be better spent on agricultural improvements; that the utmost conceivable compression of housing could not economise $\frac{1}{4}$ of 1 per cent of farm land; and that the value per housing ac. of food from gardens at low density exceeds that from an average farm ac. Ultimately the resolution of these warring views depends upon effective public opinion.

Planning Associations. The T. and C. P. Association (28 King Street, London, W.C.2), a voluntary society open to anyone interested, has since 1899 consistently

advocated the policy of city decongestion, green belts, and dispersal to new towns, etc. (see GARDEN CITIES). The National Housing and Town Planning Council (42 Devonshire Street, London, W.1) represents most of the local authorities concerned with these subjects. The Town Planning Institute is the chief professional body granting qualifications for planning. Several univs. and other professional institutions also grant degrees and qualifications. The Councils for the Preservation of Rural England, Wales, and Scotland, with their many county branches, maintain a close watch on prospective developments in the countryside.

Town Planning Abroad. In most countries of Europe, the Brit. Commonwealth, the U.S.A., and S. America planning laws analogous to those mostly less complete than those of Great Britain are now in operation. In Soviet Russia and other Communist countries, where land and most industries are nationalised, the system of control is very different, but there are similar problems of excessive urban concentration; as there are also in India, Japan, and other Asian states, where planning legislation is at an earlier phase of evolution. In Germany and Sweden extensive ownership of land by cities has facilitated planned development; in Germany also an age-old municipal control of building pre-dated planning in producing some harmony and order; yet the great cities exhibit the usual defects. Next to Great Britain, the Netherlands has perhaps the most comprehensive national planning in W. states; but the over-building in 'Conurbation Holland' gives great concern. The International Federation for Housing and Town Planning (offices at The Hague) brings together planners from all countries for congresses in different capitals, and is an important means of exchange of experience and ideas. The United Nations Economic and Social Council (E.C.O.S.O.C.) also contributes to such exchange. There is a constant flow of visiting experts between countries, particularly to Great Britain, to study its recent developments in law and policy.

Review (quarterly); *News Sheet of International Federation for Housing and Town Planning* (quarterly).

Town Clerk, see OFFICERS OF LOCAL AUTHORITIES.

Town Council, in England the governing body of a municipal bor. or co. bor. (see BOROUGH). Where the particular tn is included in the co. area the co. council has overriding administrative powers in certain matters; but in the case of co. bors. the T. C. is practically independent of all other local governing authorities (see LOCAL GOVERNMENT). The T. C. consists of the mayor (q.v.), aldermen, and councillors. The qualifications for membership are either the ownership of freehold or leasehold property within the area of the authority or registration as a local gov. elector for the area or residence within the area during 12 months preceding the election. In addition, qualified persons must be Brit. subjects, and at least 21 years of age. There are certain disqualifications contained in the Local Gov. Act, 1933. The term of office is 3 years; one-third of the whole number of councillors of the bor. or of each ward thereof where the bor. is divided into wards (being those with the longest term of membership without re-election), retire in May every year and are eligible for re-election. Persons entitled to vote at an election of councillors are those who appear as local gov. electors on the register of electors for the area. The number of aldermen is one-third the number of councillors, and they are elected by the councillors from the members of the council or persons qualified to be councillors of the bor. The ordinary election of aldermen is held in every third year at the ann. meeting of the council in May, and takes place immediately after the election of the mayor. The mayor is elected annually by the council as the first business of the ann. meeting from persons who are, or who are qualified to be, members of the council. He is the civic head of the bor. and presides over the T. C. The provisions of the Local Government Act, 1933, govern the constitution and meetings of T. C.s. A T. C. must hold an ann. meeting and at least 3 other meetings yearly, which are to be as near as may be at regular intervals. Business cannot be transacted at meetings unless at least one-third of the whole number of members are present. Acts of the Council and all questions coming before the council are decided by a majority of such members as are present and vote. Thus, if there are 36 members of the council and 12 only are present, 7 of them could pass an effective resolution. Bor. councils usually meet monthly. The council can make standing orders for the regulation of their proceedings which may supplement statutory rules, but not be at variance with them. Except in the case of business required by law to be transacted at the ann. meeting no business can be transacted at a meeting of the council other than that specified in the summons relating thereto. See also LOCAL GOVERNMENT.

Towneley Plays, The, or Wakefield Mysteries, are 32 in number, and are believed to have been compiled by the friars of Widdik or Noetel in the 14th and rearranged in the 15th cent. As in the York plays, the various 'pageants' together dealt with the whole Bible story. The simple religious sentiment is by no means marred by the comic element, which never endangers the dignity of the whole. The cycle was ed. for the Surtees Society in 1836, and by G. England, and A. W. Pollard in 1897 for the Early Eng. Text Society. See E. F. Williams, *The Comic Element in the Wakefield Mysteries*, 1914; and M. Carey, *The Wakefield Group in the Towneley Cycle*, 1929. See also MIRACLE PLAY.

Townsend, Mrs Stephen, see BURNETT, FRANCIS ELIZA HOBGSON.

Townshend, Charles, second Viscount (1674-1738), statesman, b. Raynham Hall, Norfolk, and educ. at Eton and King's College, Cambridge. He was one of the commissioners for the Union with Scotland, was joint plenipotentiary with Marlborough at The Hague, and negotiated with Holland the Barrier Treaty. Dismissed in 1712 on the formation of the Harley ministry, he kept up a correspondence with the court of Hanover, secured the confidence of George I. and on the latter's accession was appointed secretary of state of the N. Dept. He lost favour in 1716, but in 1720 he was President of the Council under Stanhope, and on Stanhope's death (1721) became again secretary of state, a position he held until 1730, when he retired into private life. He encouraged turnip growing and greatly improved the rotation of crops, being known as 'Turnip Townshend.'

Townshend, Sir Charles Vere Ferrers (1861-1924), soldier, b. Raynham, Norfolk; entered the Marines in 1881. As capt. in the Indian Army he led the march to Chitral, Jan. 1895; he commanded there during the siege, and was made C.B. He saw service in Egypt and Africa. In April 1915 T. was appointed to command the 6th Div. in Mesopotamia. He proceeded from Basra over flooded country, with barges, reaching Amara, 1 June. He captured Kut in Sept. Fighting Nured-Din at Ctesiphon, 22 Nov. he had to fall back on Kut, was besieged there, and surrendered 29 April, 1916. In 1920 he pub. *My Campaign in Mesopotamia*. He was Independent M.P. for Wrexham, 1920-2. See also KUT AL AMARA. See E. Sherson, *Townshend of Chitral and Kut*, 1928.

Townshend, George, fourth Viscount and first Marquess (1724-1807), soldier, brother of Charles T. (1725-67). He took part in the battles of Dettingen (1743), Fontenoy (1745), Culloden (1746), and Laffeldt (1747). At Quebec he took command after the fall of Wolfe. From 1767 to 1772 he was Lord Lieutenant of Ireland, and from 1783 to 1834 Master General of the Ordnance. He was made a F.M. in 1796. See Sir C. Townshend, his great-great-grandson, *Military Life of Field-Marshal George Townshend*, 1901.

Townshend, Meredith White (1831-1911), journalist, b. London. Educ. at

Queen Elizabeth's Grammar School, Ipswich, he became a schoolmaster, but later went to India and became editor and proprietor of *The Friend of India*. In 1859 he returned to England and in 1861 bought the *Spectator* (q.v.), which he ed. in conjunction with R. H. Hutton (q.v.) till the latter's death in 1897. J. St Loe Strachey, the succeeding editor, declared that T. 'was, in the matter of style, the greatest leader-writer who has ever appeared in the Eng. Press.'

Township, or Vill, originally probably a group of allodial proprietors united by community of agric. interests, the chief officer of which was the tith-reeve. The T. is almost certainly one of the antecedents of the medieval bor. The term is not now in common use, but until recently meant legally a tn containing more than 1 parishioner. In some areas (e.g. Liverpool) the parrs are still termed T.s. e.g. the T. of Everton. also LOCAL GOVERNMENT.

Townsville, city and port of Queensland, Australia, 332 m. by rail N. of Brisbane. It is the outlet and chief commercial and administrative centre for a large section of N. Queensland, and the chief port through which sugar, wool, meat (chilled, frozen, and canned), meat-works by-products, sheep, cattle, minerals, coal, silver, lead, zinc concentrates, copper, and gold are exported. Pop. 41,200.

Towse, Sir Beachcroft (1864-1948), Brit. soldier and president of the National Institute of the Blind. Although originally intended for a naval career, he went to Wellington College and, in 1885, was gazetted to the Gordon Highlanders, with whom he served in Egypt, Malta, and India. He was with the Chitral Relief Force, and was at the storming of the Malakand (q.v.) Pass. In 1899 he went with his regiment to S. Africa, where he was awarded the Victoria Cross, was severely wounded, and lost his sight. In 1901 he joined the council of the National Institute for the Blind, of which he became chairman in 1921, and imbued all those whom he met suffering from his own disability with his maxim 'Blindness can either make a man or a man can master blindness.' He converted his house at Goring into the first of the Institute's homes of rehabilitation for the blind. Through ill health he resigned the chairmanship in 1944, but continued to take great interest in every aspect of the welfare of the blind.

Towton, par. in the W. Riding of Yorks, England, midway between Leeds and York, the scene of the Yorkist victory of 1461. Pop. 134.

Towry, riv. of Wales, rising in the hills between Cardiganshire and Radnorshire. It flows on a southerly course, passing by Llandovery and Carmarthen, and enters Carmarthen Bay at Llanstephan. Length 66 m.

Towyn, urb. dist. and seaside resort of Merioneth, Wales, situated on Cardigan Bay, 12 m. N. of Aberystwyth. Its church of St Cadvan is the largest and most interesting example of Norman

architecture (1150-1200) in Merioneth. Within it is preserved an inscribed stone dated by experts a.c. 660 and accordingly considered to be probably the most ancient monument of the Welsh language. Pop. 4491.

Toxaemia, the presence of toxins (poisons) in the blood. The term is generally used to mean the presence of toxins due to absorption from a local infection. The toxaemia from diphtheria (q.v.) and tetanus (q.v.) are examples (see PYAEMIA).

Toxaemia of Pregnancy, see PREGNANCY.

Toxicology, science dealing with poisons. Its main branches deal with the chemical nature of poisons, their origin and preparation; their physiological action and the tests by means of which their presence may be detected; the pathological changes due to their presence and the recognition of them by post-mortem evidences; their chemical reactions with a view to the determination of antidote and the physiological action of the latter. Poisons may act on various organs and systems of the body. Acids and alkalis are corrosive to the alimentary tract; carbon monoxide reduces the oxygen-carrying capacity of the blood by combining with haemoglobin; digitalis affects the heart; strychnine the medulla and spinal cord. A tolerance is acquired to some substances such as opium, which can ultimately be taken in doses which would initially prove fatal. Certain poisons, such as salts of heavy metals, may accumulate slowly in the body and finally prove toxic in their action. Toxins are produced by pathogenic bacteria, and injections of such toxins, or of toxoids prepared from them, are used in the production of immunity, e.g. to diphtheria. The number of poisons is very large; almost any substance may be dangerous if taken in sufficiently large amounts. See Sir S. Smith and F. S. Fildes, *Forensic Medicine* (10th ed.), 1955; A. S. Taylor, *Principles and Practice of Medical Jurisprudence* (ed. by Sir S. Smith and K. Simpson, vol. 1), 1956. See also POISONS.

Toxophily, see ARCHERY.

Toy-dogs, diminutive breeds usually developed purely as pets. See GRIFFON BRUXELLOIS; KING CHARLES SPANIEL; MALTESE DOG; PAPILLON; PUG-DOG; YORKSHIRE TERRIER; BLACK-AND-TAN TERRIER; POMERANIAN.

Toynbee, Arnold (1852-83), economist and social reformer, b. London. He was intended first for the Army and then for the Bar, but ill health and literary activity prevented the following of either of these professions. He went to Oxford and finally gave himself up to the study of social and economic questions. He also did much practical work for the betterment of industrial conditions. In 1875 he went to Whitechapel where he joined in work with Canon Barnett. T. wrote various articles which were pub. posthumously as *Industrial Revolution in England* (5th ed. with memoir by B. Jowett), 1906. See lives by F. C. Montague, 1889; Viscount Milner, 1901; and

L. L. Price, *Political Economy in England*, 1891, for a criticism of Toynbee as an economist.

Toynbee, Arnold (1889-), historian, b. London, nephew of Arnold and Paget T. (q.v.). Educ. at Winchester and Balliol College, Oxford, of which he became Fellow and tutor (1912-15). After attending the Peace Conference in Paris (1918) and serving for a short time as prof. of Byzantine and Modern Greek at London Univ., he became in 1925 director of studies at the then newly founded Institute of International Affairs (Chatham House). It is with this institution that his name is chiefly associated (see ROYAL INSTITUTE OF INTERNATIONAL AFFAIRS). There he has written contemporary hist. in the ann. *Survey of International Affairs*. The 10 volumes which comprise *A Study of History* (vols. 1-3, 1934, vols. 4-6, 1939, and vols. 6-10, 1954) form a standard work on the evolution of civilisations revealing great erudition in the treatment of ancient and modern historical problems. Abridgements of the work have been made by D. C. Somervell. Other works by T. are *Western Question in Greece and Italy*, 1922, *Greek Historical Thought*, 1924, *Greek Civilisation and Character*, 1924, *The World After the Peace Conference*, 1925, *A Journey to China*, 1931, *Christianity and Civilisation*, 1940, *Civilisation on Trial*, 1948, and *The World and the West*, 1953.

Toynbee, Joseph (1815-66), otologist (ear specialist), b. Heckington, Lincs. He studied particularly the pathology of the ear and pub. in 1860 his medical classic, *Diseases of the Ear*. He was appointed in 1857 aural surgeon to St Mary's Hospital, London, which was the first general hospital to establish an ear dept. T. died as a result of an experiment in which he inhaled chloroform and prussic acid to test its effect on tinnitus (noises) of the ear. 'Toynbee Hall' (Whitechapel), the first Univ. Settlement, was named after his son, Arnold Toynbee.

Toynbee, Paget (1855-1932), philologist, b. Wimbledon. Educ. at Haileybury and Balliol College, Oxford, he was a leading authority on Dante, having ed., *inter alia*, critical texts of the *Divina Commedia*, 1900, and of Dante's *Letters*, 1912-17; also written a *Life of Dante*, 1900. He ed. books in connection with Horace Walpole, including his *Reminiscences*, 1924.

Toynbee Hall, Whitechapel, the first Eng. univ. settlement, founded by Canon Barnett, rector of St Jude's, Whitechapel, and named after his friend and colleague Arnold Toynbee (1852-83) (q.v.). See SOCIAL SETTLEMENTS.

Toys, implying, in a general sense, children's playthings. T. can be traced back to very remote periods. The top is mentioned in Virgil in the seventh book of the *Aeneid*, and was probably introduced into England by the Romans. The Greeks appear to have played with different kinds of ball: the little ball, the great ball, and the empty ball, which was blown out like the modern football. There is a fine collection of early Rom. dolls in the

Musée du Louvre, Paris, of which a description is given in H. R. d'Allemagne's *Histoire de Jouets*, 1903, a book which deals very fully with dolls of different periods.

Trabzon, Trebie, or Trapezus, formerly Trebizond: 1. Il of Asiatic Turkey, on the S. coast of the Black Sea, heavily timbered and generally mountainous. Wheat and barley are grown and valuable timber produced. There are copper and zinc deposits. Area 16,671 sq. m.; pop. 463,918.

2. Cap. of the above, a port on the Black Sea, 108 m. NW. of Erzerum, formerly of great importance as an emporium for the wares of Kurdistan and Persia, but has lost much of its transit trade since the Batum-Tiflis Railway was opened. The chief exports are hides, skins, eggs, opium, tobacco, and filbert nuts. Its silk industry is declining. T. was founded in 600 BC by Gk settlers from Sinope. In 1204 it was the cap. of Trebizond, an empire constituted by Alexis Comnenus. It became Turkish in 1462. In 1895 it was the scene of the Armenian atrocities. It was captured by the Russians in 1916, but in 1918 was retaken by the Turks. Pop. 33,989.

Tracery, in architecture, occurs only in the Gothic period. In England it began, towards the end of the 13th cent., with the grouping of 2 or 3 'lancet' (pointed) windows, enclosed by a dripstone (q.v.) also in the form of a pointed arch, the vacant space above the lancets and beneath the apex of the dripstone being often pierced with a small circular window. This is known as 'plate tracery' (A in illustration). The next step was to reduce the masonry between the various openings to narrow vertical moulded bars of stone ('mullions') and to continue these moulded bars around the tops of the lancets and around the circular window, thus forming 'geometrical tracery' (B), so called because it consisted of regular geometrical forms. In the third stage (C) the masons introduced flowing designs instead of regular geometrical shapes. With the increasing taste for stained glass, the painters began to demand a more convenient shape of window for their pictures; so the flowing designs gave place to nearly rectilinear 'lights'; and, as the size of windows increased, both in width and height, horizontal 'transoms' were introduced to strengthen the mullions (D). This 'rectilinear' or 'perpendicular' tracery, peculiar to England, prevailed until the end of the Gothic style in the middle of the 16th cent.

Trachea, or Windpipe, air tube which leads from the larynx to the bronchi. It is about 4½ in. long, and is made up of fibro-elastic membrane enclosing cartilaginous rings about ½ in. in diameter. The interior is lined with submucous tissue and ciliated epithelium. The T. begins at the larynx and proceeds downwards in front of the oesophagus until it bifurcates into the 2 bronchi (q.v.).

Tracheotomy consists of cutting into the windpipe below the cricoid cartilage (the 'Adam's apple'). A curved tube is

inserted into the orifice, and by this means breathing is carried on. The operation is called for when the upper respiratory passages are obstructed. At one time, when laryngeal diphtheria (q.v.) was a common disease, T. was frequently performed to relieve the asphyxia caused by the diphtheritic membrane blocking the laryngeal opening.

DEVELOPMENT OF ENGLISH TRACERY

A, Plate Tracery; B, Geometrical Tracery; C, Curvilinear or Flowing Tracery; D, Perpendicular or Rectilinear Tracery, with Transom.

Trachoma, form of conjunctivitis (q.v.) due to a virus which is conveyed in the bodies of lice. It is a highly contagious disease and pursues a chronic course, giving rise to corneal ulcers and scarring. It is prevalent in Egypt, Palestine, Africa, and India, and is a common cause of blindness in these countries. Children particularly are susceptible. T. is almost unknown in this country now, thanks to better living standards. Little advance has been made in the treatment of this disease, and the antibiotics and sulphon-

amides are helpful only in the accompanying secondary infection. The World Health Organisation has an expert committee on T.

Trachonitis, dist. of anct Syria, corresponding to the modern Lefja. It lies S. of Damascus, E. of Auranitis, and N. of Batanea, in Bashan. In AD 37 Herod Agrippa, King of Judea, received the tetrachy of Batanea and T. from Caligula.

Trachurus, see HORSE-MACKEREL.

Trachyte, the geological name of a volcanic rock composed essentially of alkali felspar and a ferromagnesian mineral. The coarse-grained intrusive rock of the same composition is syenite (q.v.). T.s occur in sev. volcanic dists., notably in S. Italy, the Auvergne, and in E. Africa. T.s containing the feldspathoid nepheline are termed phonolites, and those containing leucite, leucitophyres. The T.s and syenites are the commonest alkaline igneous rocks.

Track and Field Sports, term applied in the U.S.A. to athletic contests, including flat and hurdle racing on cinder track and field events—long and high jumps, pole vault, throwing the discus, throwing the hammer, putting the weight, and throwing the javelin. The Inter-collegiate Association of Amateur Athletics, to which most Amer. colleges belong, arranges contests annually. Apart from the colleges, the largest body is the Amer. Amateur Athletic Union, but there are many other smaller ones. It is largely due to the keenness engendered by these organisations that Amer. athletes hold their present place in the world's records and in the Olympic Games. See **ATHLETICS**.

Trackways, term applied generally to prehistoric routes and particularly to pre-Rom. ways in England. Their prin. purpose was the conveyance of goods, and they ran roughly in a straight line, being sited by such natural objects as stones, mounds, and ponds. It is probable that some of the Rom. roads (e.g. Watling Street) followed at least in part these T.

Tractarianism, see OXFORD MOVEMENT.

Tractor, name given to a compact mobile power-unit, used primarily for agric. purposes and generally deriving its energy from a petrol, fuel-oil, or vaporising-oil engine, though steam-engined tractors have been used extensively in the past, and are occasionally used to-day for heavier haulage and stationary belt-work. Certain countries, including Russia, are re-experimenting with the use of electricity as the motive power. In the early 1880s Brit. engineers had designed and built heavy steam traction-engines for farming work, but it was the Americans who first conceived the then novel idea of powering the farm tractor by means of the internal-combustion engine. In 1889, the Amer. *Hunger T.* made its appearance in the Middle W. A massive and somewhat unwieldy machine of cumbersome proportions, its chassis was built to steam-engine specifications, yet it was powered by a single-cylinder *Charter* internal-combustion engine. Though exposing the limitations of its designers, the idea caught

on, and from then onwards the general use of steam T.s gradually diminished. The influence of the steam-type chassis, however, was such that it was not until 1899 that a specific friction-driven chassis with a hopper-cooled petrol engine was manufactured in America. This was possibly the first real attempt to break away from the heavy steam-engined type of chassis construction so favoured by the earlier engineers. The development of the many types of farming T.s appearing during the period 1899–1914 was largely in the hands of the Americans, though it is only fair to add that by now many reasonably reliable Brit. machines were being manufactured. Designers were now turning their attention to the problem of affording some sort of weather-protection both to the operator himself and the various vital parts of the power-unit; the Americans were the pioneers in a matter which had remained neglected for too long.

Harry Ferguson, Ltd., Coventry
TRACTOR

The tractor has a 4-cylinder wet-sleeve petrol engine with maximum belt horsepower of 23.9. There is a power take-off shaft for belt and pulley work at the rear, and a hydraulic system of depth control for regulating the working depth of any rear-mounted implement.

But it was the food crisis of 1916 which gave the real impetus to tractor design and production both in Britain and the U.S.A. The Brit. Gov. instructed its ministry of munitions to develop a utility T., and this, known as the 'M.O.M.', is generally reckoned as the forerunner of the lightweight internal-combustion-engined T. as we know it to-day. Since 1918 much progress has been made in T. design. Crawler types (track-layers) were developed to work under those heavy soil conditions in which a wheeled T. would be reduced to immobility. 'Wheelbarrow' T.s, suitable for the market gardener and horticulturist, have also been manufactured. Certain types of T.s have been manufactured with regard to the farmer's requirements in the matter of row-crop work with its many variations of widths and adjustments. The T. is now no longer a mere haulage machine; in the main it is a highly specialised item of

modern farming machinery. Another major development is the integration of the T. and implement as one co-ordinated unit, an idea originated and developed by an Ulsterman, Harry Ferguson. The principle of the system is that the implement is no longer towed by the T. but is an integral part of it, being mounted directly on to the rear of the machine and hydraulically controlled by the tractor driver himself from his seat. The obvious advantage of the system (now widely used all over the world) lies in the more positive and accurate control over the implement concerned plus greater traction and the consequent reduction in labour costs, since one operator only is needed.

With reference to the engines used to-day it may be said that whereas power-units were formerly of the heavy and slow-revolutionary type, the present trend is towards high-efficiency light-weight-to-power-ratio engines developing high brake h.p. and of sturdy endurance. Engines fuelled by vaporising-oil are enjoying great popularity in Britain and indeed throughout the world, while the fuel-oil compression-ignition type and the petrol engine are also used extensively. Each type has its respective merits. To-day it is difficult to foresee the ultimate trend in T. design. On the farm there is little that the T. cannot do, not only in cultivation and haulage but also—by belt and pulley—it is able to drive such necessary accessories as the circular saw and the threshing machine, etc. But power farming is an established fact, and the driving force is the agric. T. See also PLOUGHS AND PLOUGHING. See H. J. Hines, *Tractors on the Farm*, 1942; C. Culpin, *Farm Machinery*, 1952.

Tractory, or **Tractrix**, curve traced by a heavy particle dragged by an inelastic string attached to a point moving in a straight line. In the Fig. the heavy

particle is at the point A and the other end of the string, M, moves along OX. A then traces out a T. Taking OX and OY as co-ordinate axes, the equation of the curve is found by considering 2 expressions for the tangent of the angle AMN. We have $\tan(\text{AMN}) = -\frac{dy}{dx}$ and

$$\tan(\text{AMN}) = \frac{y}{\sqrt{a^2 - y^2}}, \text{ where } \text{AM} = a.$$

Therefore, $-dx = \frac{y}{\sqrt{a^2 - y^2}} dy$. On integration the equation of the curve is obtained, which is best expressed in the parametric form $x = a(\cos \phi + \log \tan \frac{1}{2}\phi)$ and $y = a \sin \phi$.

The centre of curvature at the point A is P. As A moves along the T, the locus of P is a catenary (q.v.), i.e. the evolute of the T. is a catenary.

Tracy, Spencer (1900–), Amer. actor, b. Milwaukee. He began his stage career in stock company, making his New York debut in 1922 in *R.U.R.*; he later appeared in sev. other New York productions. He made his screen debut in 1930 in *Up The River*, and his films include *Stanley and Livingstone*, *Edison the Man*, *Northwest Passage*, *Dr. Jekyll and Mr. Hyde*, *A Guy Named Joe*, *Edward My Son*, *Father of the Bride*, *Father's Little Dividend*, *Broken Lance*, and *Bad Day at Black Rock*. He won the Academy Award for the best actor in 1937 (*Captains Courageous*) and 1938 (*Boys' Town*).

Trade, Board of, gov. dept of the U.K. formerly a committee of the Privy Council. Its present form dates from 1786, when a permanent committee was constituted by an Order in Council (still in force). The members of the Board included the Archbishop of Canterbury, the First Lords of the Treasury and of the Admiralty, the prin. secretaries of state, the holders of a number of other Crown offices, and sev. private persons; but by the end of the Napoleonic wars the president and vice-president were the only operative members. From 1786 until the middle of the 19th cent. the Board's functions were mainly to advise the gov. and other depts and to collect information about trade and industry. During the second half of the 19th cent. the Board was allotted administrative functions under Acts of Parliament with respect to railways, tramways, mercantile marine, harbours, and electricity. However, as a result of increased gov. activity during the First World War, new ministries were created to perform the Board's previous functions in respect of labour, railways, tramways, harbours, and electricity. During the Second World War its responsibilities for food, shipping, the gas industry, petroleum and the coal mines were also transferred to other depts. The Dept of Overseas Trade (q.v.) was absorbed by the Board after 1945. The President of the Board of Trade, now assisted by a Minister of State as well as a Parliamentary Secretary, is responsible to Parliament for the work of the Board in its widest sense. As part of its general responsibility in relation to industry and commerce the Board continues to advise the gov. and other depts on questions concerning the internal and external trade of the U.K., and it interprets gov. policy to industry and commerce. This general responsibility includes also a more specific concern with most of the country's industries individually (though food,

agriculture and fisheries, building, fuel and power, transport, and shipbuilding are the concern of other depts); the fostering of Brit. exports and of Brit. participation in trade exhibitions held abroad; the collection, evaluation, and pub. of a wide range of economic statistics; and pub. of the *Board of Trade Journal*. In addition, the Board has certain administrative powers and duties in relation to insurance, company law, bankruptcy, patents, trade marks and copyright, weights and measures, enemy property, and the location of industrial development.

Trade and Commerce, the exchange of commodities for money or other commodities. The word 'trade' is related to 'tread'—a reminder that the beginnings of trade were associated with travel and the trodden way. Throughout hist. wars have had a profound effect on trade. Early trading expeditions often combined trade and plunder, sea-traders mixing commerce and piracy. Land commerce followed the caravan routes of the anc. world, the Nile and the Euphrates being connected by the route leaving Egypt to pass along the coast of Palestine and by the mts of Lebanon before turning E. to the basin of the Euphrates and Tigris, cradle of Babylonian and still older civilisations. Between Lebanon and the sea was the narrow land of the Phoenicians, a sea-faring people whose ships traded Mediterranean and Black Sea products as well as the tin of Cornwall and the precious caravan freight of the E. Before the Phoenicians there was an active commerce across the E. Mediterranean between highly-civilised Crete (Crete) and Egypt. The Greeks, sailing from is. to is. in the Aegean, became great sailors in their turn, extending their colonies to Marseilles and beyond; rivalling and eventually surpassing their Phoenician tutors. The conquests of Alexander the Great, by bringing E. and W. into contact, gave an immense stimulus to commerce. Alexandria became a great city, a centre of manuf. and of trade with the Far E. through the Red Sea. The Greeks came into collision with the great Phoenician colony of Carthage, founded 800 bc, which dominated the Mediterranean and its commerce; but its power was a new power, Rome, that destroyed it (146 bc). The Romans were not a commercial people; but their Empire, with its superb network of roads, its posts, and above all, its Pax Romana, provided a unique basis for settled trade. The eventual fall of Rome (AD 476) thrust the provs. of the W. Empire back towards barbarism. Roads fell into disrepair. On the ruins of Rom. civilisation trade collapsed. Based on manor and vil. life became localised and primitive. Before trade revived in Europe the rise of Mohammed in the 7th cent. had carried commerce as well as the sword from Bagdad through N. Africa to Spain; making Damascus, Cairo, Kairouan, Fez, Granada, Cordova, Seville, and Toledo, prosperous centres of industry and commerce. European revival came after

AD 1000. Tns, new and old, were growing, and fairs and markets continued to grow in spite of handicaps—bad roads, too little money and too many mints, multiplicity of regulations, tolls, duties, prohibitions, etc. Within the tns trade came under the protection and restriction of the merchant and craft guilds (*see* TRADE UNIONS), and did not escape the regulation of the Church, which forbade usury and frowned on profit. As the tns developed and prospered they gained power which vied with that of lord and bishop. Tns with common interests formed leagues. The Rhenish League in the 13th cent. soon embraced over 90 cities (Cologne, Strasburg, Frankfurt, etc.), with hundreds of vessels on the Rhine. It destroyed castles and swept away tolls. The Swabian League (Augsburg, Nuremberg, Ratisbon, etc.) was based on the Danube and traded N. products with those of the E. through Venice and other cities. In N. Germany and the Baltic the powerful Hanseatic League (q.v.) grew rapidly from the 13th cent. with depots at Bruges, Bergen, Novgorod, and London (Steelyard). The League dominated the Baltic as did Venice the Adriatic; their ships meeting at Bruges exchanged the produce of N. and S. Venice and the League both had their part in the Crusades (1096-1272) which had a greater influence than the campaigns of Alexander in promoting commerce between E. and W. Venice was the gateway to trade with the Levant and the E.; along with Genoa and Florence she enjoyed immense wealth and power until, c. 1500, the discoveries of the Americas and the Cape route to India altered the pattern of world trade. The Mediterranean ports declined in importance and trade went to Antwerp, London, and other ports well-placed for ocean commerce with the new and old worlds. The discoveries of new lands were matched in the realm of ideas by the Renaissance and the Reformation, reinforced by the new art of printing. These influences, with the advance of commerce, the invention of gunpowder, and the standing army, which all favoured national power against tn and league, were ending feudalism and the Middle Ages. The Pope divided the non-Christian world between Spain and Portugal. The Sp. galleons, bringing the precious metals from the New World, helped both to stimulate European trade and to raise prices. Under the new Mercantilist policy pursued by the nation-states it was the general aim to secure an excess of exports over imports—a favourable balance of trade which would command gold or silver for currency or 'war chest' purposes. Portuguese ships monopolised trade with the E. Indies until they lost power and trade to the Dutch in the 17th cent. The same cent. saw the wane of the Sp. power following wars with the Dutch and the growing power of England. In the second half of the century the Eng. were fighting the Dutch for maritime and commercial supremacy and by 1713, the treaty of Utrecht, following Marlborough's

victories over the French, estab. the ascendancy of England, with France as her only rival. The treaty gave England the slave trade monopoly with the Sp. colonies. Colonial trade was conducted frankly in the interest of the mother country, and in the 18th cent. successes against the French in America and India further extended Brit. colonial power and trade. Nevertheless, increasing trade with the U.S.A. after their secession (1776-83) demonstrated the mutually advantageous character of the trade between Britain and her late colonies. Eng. commercial predominance had grown from small beginnings in the Middle Ages when her great export was raw wool. The Eng. Merchants of the Staple exported raw materials via (e.g.) Calais; but up to the time of the Tudors the export trade was mainly in the hands of foreigners. The Hanseatic League privileges were annulled by Elizabeth. By the 14th cent. less wool began to be exported in its raw state and more in the form of cloth. In 1660 wool export was forbidden. Huguenot refugees enriched England and other countries at the expense of France. Thanks to them the Eng. silk industry assumed importance in the early 18th cent. The woollen and silk industries were protected against the competition of Indian cotton goods, a protection serving to foster the cotton industry that became a pillar of Eng. commerce.

At the close of the Middle Ages the growth of national power favoured the rise of national commercial companies, recognised by Royal Charter; and formed, many of them, as their names indicate, to exploit the world as opened up by the voyages of discovery. Eng. companies included, besides the early Merchant Adventurers (1404 and 1505), the Muscovy Company (1553), the Eastland Company (1579), the Guinea Company (1588), the Levant Company (1592), the E. India Company (1600), the Hudson's Bay Company (1670), the Royal African Company (1672), and the S. Sea Company (1711) of 'Bubble' fame. Other famous companies were the Dutch E. India Company (1602) and the Dutch W. India Company (1621). The former broke the Portuguese power in the E.—and for 2 cents. earned an ann. average of 18 per cent; the latter, a corporation of privateers making armed attacks on the Sp. 'silver fleets', often earned from 25 to 100 per cent a year. Company trading was intended to secure regulation and control, but failure in this respect and changing conditions reduced their number, few surviving the 18th cent. One of the last Eng. companies to go was the E. India Company, whose activities in India extended to gov. as well as trade. New ideas were stirring in the later 18th cent. In England Adam Smith was advocating Free Trade; while the Industrial Revolution gathered momentum as invention followed invention. Machinery was being applied with increasing ingenuity to textile and other industries. Steam was harnessed to drive the machine and pump

the mine. Coal was smelting the iron and becoming the main source of industrial power. By the turn of the cent. steam and machinery were playing a great part in the country's industrial and commercial predominance. The railway and the steamer, with good roads and canals, had come to reinforce the Industrial Revolution before 1851-60; and from then on there was the trade fillip of the gold discoveries; and above all, Free Trade. Britain had an export surplus, but used it in no Mercantilist spirit, investing abroad some £4,000m. net by 1913—to her own and the world's great benefit. Free Trade made England the free entrepôt for world trade; brought cheap food to her people and cheap raw materials to keep her exports competitive. More than that, it brought a new spirit to mankind with hopes of universal peace. The Brit. lead made a great impression throughout the civilised world. Tariffs were lowered, and in 1860 there was a reciprocal reduction and abolition of tariffs with France. But in the end the great nations retained and reinforced their protective systems. The U.K. retained Free Trade up to the First World War, but, after the Great Slump and the Second World War, had abandoned *laissez faire* not only for protection but for a planned economy. Planned economies are a world feature—planning is on a world scale and the subject of European and world conference. In the shadow of two world wars and the threat of a third the achievement of general Free Trade seems remote. Increasing freedom in trade is, however, the great aim of the U.N. as of its most powerful member, the U.S.A., now outstandingly the world's greatest industrial and commercial nation. Predominant in manuf. the U.S.A. may be thought to have as little to fear from foreign competition as the U.K. a cent. earlier. The U.K. built her wealth on the exchange of manufactured goods for food and raw materials. The field for this essentially profitable trade is diminishing; but there will always be room for international trade on a large scale given a world of settled peace and freedom from unemployment—a world which dares to plan for maximum specialisation with rational hope of maximum reward.

See CUSTOMS DUTIES; FREE TRADE; MERCANTILE SYSTEM; PROTECTION. See J. B. Condliffe, *The Reconstruction of World Trade*, 1941; W. Röpke, *International and Inter-regional Trade*, 1942; A. J. Brown, *Industrialisation and Trade*, 1943; E. Staley, *World Economic Development*, 1945; E. M. Patterson, *An Introduction to World Economics*, 1947; and J. B. Condliffe, *The Commerce of Nations*, 1951. See United Nations pubs. for latest statistics of world trade.

Trade Boards, statutory bodies estab. under the T. B. Acts of 1909 and 1918. They formed part of the negotiating machinery in the settlement of industrial disputes, especially wage claims, and arise out of the arbitration boards set up before 1909 to settle disputes where collective bargaining failed to produce agreement

between employers and workers. By the Act of 1909 T. B. were instituted in 4 trades (wholesale tailoring, box manuf., lace manuf. and chairmaking). The Board of Trade had power, however, to apply the Act to other trades. The chief object of the T. B. was to prevent sweating, especially in home and factory work (see SWEATING SYSTEM), since the workers in the industries in question were not sufficiently organised to protect themselves from exploitation.

The T. B. Act of 1918 extended the operation of T. B.s to any industry where wage rates were considered by the minister of labour to be low or where any other means of settling wage rates by collective bargaining were lacking. As a result of the Act, 37 new T. B. were set up, but after 1922 on account of trade depression there was little further extension of the system. Under the Wages Councils Act of 1945 the function of the T. B. were taken over by the Wages Councils (q.v.). A T. B. consisted of members representing employers and workers in equal numbers, together with a number of independent persons known as Appointed Members, one of whom acted as chairman. Members normally held office for 2 years. It was obligatory for a Trade Board to fix minimum rates for time work; it could also fix other minimum rates, such as general minimum piece rates, special minimum piece rates, guaranteed time rate, overtime rates, etc. The deliberations of a Trade Board upon a question of wages were regulated by the rate the trade itself could economically afford. Although limited in their functions, T. B. improved working conditions in many depressed trades. See also ARBITRATION; CONCILIATION IN INDUSTRY; INDUSTRIAL RELATIONS (BRITAIN); WAGES; WAGES COUNCILS.

Trade Corporation, see CORPORATION; LOCAL GOVERNMENT.

Trade Cycle, term for the fluctuation of prices, profits, and employment over a period of sev. years.

Trade Diseases, see OCCUPATIONAL DISEASES.

Trade Disputes Acts. These Acts seek to define: (1) what a trade dispute is in the legal sense; (2) the legal position of persons involved in the dispute; and (3) the degree of legal protection persons affected, especially by consequent intimidation or coercion, may claim. Strikes are not illegal *per se* at common law, but such Acts as the Conspiracy and Protection of Property Act, 1875, imposed penalties on combinations, whether of masters or workmen, which resulted in depriving the public of such essentials as gas and water. Various other statutes were passed up to 1875, when the legal position was consolidated under the Combination Act of that year. It was not, however, until the Trades Disputes Act of 1906 that complete statutory immunity from civil and criminal liability was provided with respect to strike action. Other Acts followed, designed to clear the position regarding breach of contract consequent upon 'sympathetic' strikes, and

in 1927, following the General Strike of 1926, new restrictions upon strike action, picketing, and sympathetic strikes were embodied in the Trades Disputes and Trades Unions Act (1927). The Act provided that any 'strike having any object other than, or in addition to, the furtherance of a trade dispute within the trade or industry in which the strikers are engaged is to be unlawful, if it is designed and calculated to coerce the gov., either directly or by inflicting hardship upon the community.' The Act also provided that a lock-out was illegal if it came under the same category. The Act further provided that picketing was to be deemed unlawful if the picket attended in such numbers or such manner as to intimidate any person. It will be seen that the Act possessed very wide powers, aimed at preventing a recurrence of a strike of similar magnitude to that of 1926. After the General Strike the Labour Party placed the removal of this Act from the Statute Book in the forefront of its programme; and got its opportunity when it was returned to office in 1945: the Act was repealed in 1946.

Trade Facilities Acts. The economic and industrial depression of 1921 involved producers in great difficulty in finding sufficient capital either for the extension of business or for new ventures. In order to assist those who were unable to borrow capital in the ordinary way, owing to the stringency of supplies of money, a Trade Facilities Act was passed in 1921 whereby the Treasury guaranteed such loans under certain conditions. In 1926 a further Act was passed raising the limit to £75m., the operation of the Act to expire in 1927. The acute shortage of capital available for schemes of development overseas brought about a Trade Facilities Act in 1924 by which loans were guaranteed up to three-quarters of their amount for the purpose of extending public-utility ventures and expansion. The Sudan, Western Australia, and Newfoundland were the prin. areas to benefit.

Trade Mark (and Trade Names). The law relating to the registration of T. M. is now the Trade Marks Act, 1938, which replaces and largely re-enacts the Trade Marks Act, 1905, the Trade Marks Act, 1919, and the Trade Marks (Amendment) Act of 1937. This last-mentioned Act introduced important amendments concerning the definition of a T. M., severance of the mark from the goodwill, and licensing of T. M.s. The Merchandise Marks Acts also deal with offences as to T. M.s and trade descriptions from a penal point of view. Part of the Patents and Designs Act, 1907, as amended in 1928, which, so far as it concerns T. M.s, substituted 6 for 4 months as the term within which priority may be asked for an application for registration based upon a prior application, remains in force.

Definition. The Act of 1937 defines a T. M. as 'a mark used or proposed to be used in relation to goods for the purpose of indicating, or so as to indicate, a connection in the course of trade between the goods and some person having the right

either as proprietor or as registered user to use the mark, whether with or without any indication of the identity of that person.' As in the Trade Marks Act of 1905, the later Act includes in the term 'mark' a device, brand, heading, label, ticket, name, signature, word, letter, numeral, or any combination of these. A T. M. thus denotes the *producer* of a thing, and not the *thing produced*, and in that respect differs from a 'trade name.' To be valid, the mark chosen need not have any meaning, but whatever it is it must be distinctive. 'Distinctive' is defined as meaning 'adapted in relation to the goods in respect of which a T. M. is registered or proposed to be registered, to distinguish goods with which the proprietor is or may be connected in the course of trade from goods, in the case of which no such connection subsists, either generally or, where the T. M. is registered subject to limitations, in relation to use within the extent of the registration.' The actual distinctiveness of any given T. M. does not depend on abstract consideration of the nature of the mark itself but on the extent to which it has actually become distinctive by its use.

Essential Particulars. No mark will be registered under Part A of the register (*see infra*), unless it contains at least one of the following 'essential particulars': (i) The name of a company, individual, or firm represented in a special or particular manner (called 'name marks'). A surname alone is not the name of an individual, and therefore does not come within the category of essential particulars. But, on the other hand, it may have acquired such notoriety in connection with the goods as to be deemed distinctive and registrable. (ii) The signature of the applicant for registration or some predecessor in his business. (iii) An invented word or words (called 'word marks'). Laudatory epithets are generally rejected; as also mere phonetic renderings or ordinary words even with a meaningless suffix.

As to the use of a word or words as the name or description of an article, section 15 of the 1938 Act provides that the registration is not to be deemed to have become invalid by any such use unless it is proved either: (a) that there is an estab. use of the word or words as the name or description of the article by a person carrying on a trade therein not being used by the proprietor or a registered owner; or (b) that the article was formerly manufactured under a patent (being a patent in force at or granted after 23 Dec. 1919), that a period of 2 years or more after the cesser of the patent has elapsed, and that the word or words is or are the only practicable name or description of the article. (iv) A word or words having no direct reference to the character or quality of the goods, and not being according to its ordinary signification a geographical name or surname. (v) Any other distinctive mark, but a name, signature, or word or words, other than such as fall within the descriptions in (i), (ii), (iii), and (iv) (*supra*), shall not be

registrable under the provisions of this paragraph (i.e. sect. 9 (e) of the Act of 1938) except upon evidence of its distinctiveness. But any special or distinctive word, letters, etc., used as a T. M. by the applicant or his business-predecessors prior to 13 Aug. 1875, which has continued in use without substantial alteration down to the date of the application for registration was registered under the Act of 1905 (i.e. irrespective of its failing to satisfy any of the 'essential particulars' above noted). A thin red line woven into the margin of tracing cloth was held to be a good mark, having been used as such for 50 years.

Trade Marks which are not Registrable—Likely to Deceive. It is unlawful to register as a T. M. any matter the use of which would be likely to deceive or cause confusion or would be disentitled to protection in a court or would be contrary to law or morality or any scandalous design; nor can a T. M. be registered in respect of any goods or description of goods which is identical with a T. M. belonging to a different proprietor which is already on the register in respect of the same goods or which so nearly resembles such a T. M. as to be likely to deceive or cause confusion. But in the case of honest concurrent user or other special circumstances, the court may permit the registration of T. M.s which are identical, subject to such conditions as the court thinks fit to impose.

There are various particulars which are not permitted by the Acts and Rules to appear as or as a part of any registrable T. M. These are representations of the King or Queen or of any member of the Royal Family; words such as 'Patent' or 'Patented', 'Registered', 'Copyright', etc. The following may not be used unless the proprietor of the mark containing such arms, etc., can show a right, if any, to such use: (a) representations of the Royal or of the Imperial armorial bearings; insignia or devices so nearly resembling them as to lead to mistake; (b) the Brit. Royal or Imperial Crown; (c) the Brit. Royal, Imperial, or National flags; (d) anchor devices of the Admiralty, the eagle device and the wings of the R.A.F.; (e) the words 'Royal' or 'Imperial'; (f) any such words (such as 'Empire', 'Dominion', or 'Crown'), letters, or devices used so as to lead persons to think that the applicant has Royal or Imperial patronage or authorisation.

Concurrent User. Where a mark is used by 3 or more independent parties the mark has usually been held to be common to the trade and will not be registered.

Certification Trade Mark. A mark adapted in relation to any goods to distinguish in the course of trade goods certified by any person in respect of origin, material, mode of manuf., goods not so certified, is registrable as a certification T. M. in Part A of the register in respect of those goods, in the name, as proprietors thereof, of that person. Such mark cannot be registered in the name of a person who carried on a trade in goods of the kind certified.

The Register, Part A and Part B. The Act of 1905 continued the system of registration then in use. It was found that the provisions of the Act of 1905 as regards what could be registered did not appear to admit of the registration of marks which had no actual distinctiveness at the moment but might reasonably become distinctive in the future. The somewhat cumbrous method was therefore adopted of setting up a separate register B for these marks. Under the Act of 1919 they were subjected to the disability that they could not be registered under Part B until they had been used at least 2 years in this country. By the T. M.s Act of 1938 this disability was removed. By section 10 of the 1938 Act, to be registrable in Part B, the mark must be 'capable of distinguishing' goods in the manner stated above (see 'Distinctive' under Definition); and in determining whether a T. M. is 'capable of distinguishing' the court may have regard to the extent to which: (a) the T. M. is inherently so capable, and (b) by reason of the use of the T. M. or any other circumstances the T. M. is in fact so capable. A mark may be registered by the same proprietor in both parts. The rules as to registration in the 'A' class are stricter than for 'B' marks, and confer higher rights; for registration under 'A,' if valid, gives exclusive rights to the mark; that under 'B' is merely *prima facie* evidence of such right, and proof that a rival mark is not such as to deceive is a good defence. T. M.s must be affixed in some way to the articles sold, and thus again differ from a 'trade name' (which must not be confused with a 'name mark').

Legal Remedies for Infringement. In case of infringement, the injured party may choose between damages or having an account taken of profits. Registration is a condition precedent to the right to sue. In regard to *trade names* the law merely recognises a person's right to prevent others from personating his business by using any such description as would lead customers to confuse his goods with those of a trade rival. Brit. law recognises that where a person has used a T. M. in connection with his goods, so that it has become generally recognised as distinguishing his goods from those of others, he acquires a common-law right in such a mark. This proposition may be extended to include the general 'get up' of goods. But a proposal or intention to use a mark can give no common-law rights.

Ownership of Trade Marks with Goodwill. The Act of 1938 permits the assignment of a T. M. with or without the goodwill and, if with goodwill, then for all or some only of the goods for which the mark is registered. It is also permissible for a registered user to license the use of the mark (consult sections 22 and 28 of the Act of 1938).

Registration with no Intention to Use the Mark. It was formerly held that where registration of a mark had been obtained by a person who had no intention of using it, such registration was invalid and was not made valid by subsequent assignment

to another person who intended to use or had used the mark. This disability has been to some extent removed by the Act of 1938 if either a body corporate is about to be constituted and the applicant intends to assign the mark to the corporation or if the application to register the mark is accompanied by an application for the registration of a person as registered user of the T. M. and the court is satisfied that such person will be registered as such immediately after the registration of the T. M.

Classification. For the purpose of registration of T. M.s in the U.K. goods are classified in the manner set out in rules made under the Act of 1938. The classification serves as a ready means for bringing together T. M.s relating to the same or similar trades. In the case of an application for registration in respect of all the goods mentioned in a class, or of a large variety of goods, the Registrar may refuse to accept the application unless he is satisfied that the specification is justified by the use of the mark which the applicant has made or intends to make if and when it is registered.

Special Legislation for Protection of Certain Marks and for Certain Compulsory Marks. Special legislation exists for the protection of the Red Cross mark or the words 'Red Cross' (Geneva Convention Act, 1911), the word 'Anzac' (q.v.) (The Anzac (Restriction on Trade Use of Word) Act, 1916), and the words 'Port' and 'Madeira' (Anglo-Portuguese Commercial Treaty Acts, 1914 and 1916). The use of a T. M. is voluntary, but in certain cases the manufacturer is compelled to stamp on goods a specified distinctive mark. Of such goods, gold and silver plate has, from the 15th cent., been the most familiar example, and the most recent are imported watch cases, under an Act of 1907. Others are anchors and chain cables; butter, cheeses, and margarine (under the Food and Drugs (Adulteration) Act, 1928); gun barrels (under an Act of 1868); and gunpowder (under an Act of 1875). Buyers and sellers in good faith of marked goods are protected by various provisions in the Merchandise Acts, 1887-1953. (See also MERCHANDISE MARKS.) There are special provisions relating to false marking of particular goods, such as linen, cutlery, dyed goods, and metal buttons.

Registration of Business Names. The Registration of Business Names Act, 1916, and the Business Names Rules, 1917 and 1926 (made under the Act), provide for the registration of firms and individuals who carry on trade under a name other than their true name. Associations incorporated by Royal Charter now receive protection for their names and uniforms by the provisions of the Chartered Associations (Protection of Names and Uniforms) Act, 1926. Such associations as Boy Scouts, Girl Guides, and the Order of St John of Jerusalem also receive the benefit of this Act by Order in Council. See R. Haddan, *A Compendium of Trade Mark Law and Practice*, 1931-1942; J. and J. E. S. Ricardo, *Handbook on Trade*

Trade Organisation, see CHAMBERS OF COMMERCE; COMMERCIAL INTELLIGENCE DEPARTMENT; OVERSEAS TRADE DEPARTMENT OF; COMMERCIAL TRAVELLER; TRADE BOARD OF; also EXHIBITIONS.

Trade Union, organisation of work-people formed primarily for the purpose of collective bargaining about wages and working conditions. A number of them offer friendly benefits, and some are affiliated to political parties. Though there were elements of T. U. organisation in Great Britain during the 18th cent., their emergence as an industrial force comes with the development of the modern factory system. T. U.s exist in agric. and commerce as well as in industry, and they are now found in most countries in the world, though an important difference in function exists between those in the democratic countries and those in Communist countries. Over a wide area, including Britain, the U.S.A., Canada, Australia, Germany, and in parts of Asia such as India and Pakistan, T. U.s are independent bodies with the prime purpose of negotiating improvements in pay and conditions with the appropriate employers or employers' federations. In these countries the unions generally enjoy the unfettered right to strike. In Russia and the Communist countries, however, T. U.s are controlled by the State and form part of its machine for increasing output and imposing labour discipline. Workers have no right to strike and little control over the policy of their organisations.

After the Second World War free trade unionism had to be rebuilt in Germany, and there is now a powerful democratic movement in the W. Zone. In some W. European countries T. U. forces are divided by political and by religious differences. In France, for example, there are the *Confédération Générale du Travail*, which is mainly Communist in sympathy, the *Force Ouvrière* which is largely democratic socialist, and the *Confédération Française des Travailleurs Chrétiens*. An important T. U. development in the U.S.A. came in 1955 when the American Federation of Labour and the Congress of Industrial Organisations merged to form the A.F.L.-C.I.O. as a unified national centre.

TRADE UNIONISM IN GREAT BRITAIN. The movement achieved its legal emancipation in Great Britain before elsewhere, since here modern industrialism first developed on a large scale. By the end of the 18th cent. there were more than 40 Acts of Parliament to prevent work-people combining in particular trades. General Acts prohibiting combination were passed in 1799 and 1800, when the Brit. governing class was in fear of popular movements following on the Fr. Revolution of 1789 (incidentally, the revolution-

ary gov. in France also prohibited T. U.s, under the *Loi Chapelier* of 1791, and T. U.s only received legal recognition in France in any full sense in 1884). The Eng. Combination Acts were repealed in 1824, after an agitation engineered by Francis Place and the Radicals, but stringent restrictions on T. U. activity were reimposed in 1825, and the T. U.s only secured adequate legal recognition in 1871-5. Prohibitions and restrictions were, however, unsuccessful in preventing working-class combinations, though they sometimes drove them underground, and many leaders were imprisoned for taking part in the work of organisation or attempting to apply collective bargaining.

During the 18th cent. trade unionism was for the most part confined to skilled craft-workers, organised in small local Trade Clubs, which only linked up occasionally over a wider area. These clubs were sometimes powerful, as they had a monopoly of skilled labour, and their main functions were to negotiate with employers (mostly small employers) about wages and hrs. to enforce limitation of apprenticeship, and to act as friendly societies. Until 1813 the magistrates still had power under the Elizabethan Statute of Artificers to regulate wages, and until 1814 to regulate apprenticeship, and often the object of the T. U.s was the enforcement of the Elizabethan statute. These provisions were repealed in 1813 and 1814 under the influence of the new doctrine of *laissez-faire*. From 1799 to 1824 trade unionism was forbidden under the Combination Acts. It continued to exist, and in some trades to negotiate with the employers openly and without prosecution. But T. U.s in the mining and textile trades were subject to severe repression, and unable to maintain a continuous existence, though new societies constantly sprang up in place of those which were dissolved. The repeal of the Combination Acts in 1824 was followed by a great wave of T. U. activity, culminating in the formation of the Grand National Consolidated Trades Union, under Robert Owen's influence, in 1833. But this body was destroyed in the following year after a series of strikes and lock-outs, and after the famous 'Dorchester Labourers,' who had formed an agric. branch, had been transported for the offence of administering unlawful oaths (see TOLPUDDLE MARTYRS).

After 1834 the work of organisation began anew on less ambitious lines. General unionism went out of fashion (though there was a revival of it in 1845-8), and attention was concentrated on building up stable unions in particular trades. The National Miners' Association (1841) came to grief, but from 1850 onwards powerful societies grew up, such as the Amalgamated Society of Engineers (1851), relying on high contributions and a mingling of industrial and friendly benefits to ensure stability of membership. This method was effective in organising skilled workers, but left unorganised the lower-paid workers, who could not afford the high contributions. Under the moderate

leadership of the new Amalgamated Societies of skilled workers the T. U.s at length secured more definite legal recognition under the T. U. Act of 1871. This was at first combined with repressive measures against coercion and intimidation under the Criminal Law Amendment Act of 1871, but the T. U.s, strengthened by the Reform Act of 1887, which gave the urban workers the vote, got this Act replaced by the milder Conspiracy and Protection of Property Act of 1875. During the prosperous years between 1869 and 1874 trade unionism spread to the less skilled workers and, under Joseph Arch's leadership, to the agric. labourers. But in the middle seventies a slump in trade largely destroyed the unions' power. They were reduced to quiescence until the revival of 1888-9. The Miners' Federation was formed in 1888; and in the following year the London Dockers' strike was the beginning of a big movement of agitation among the less-skilled workers. This period marks a time of Socialist influence in the T. U.s, for the 'New Unionism' was led by men who had close affinities with the various groups of socialists now forming. It was the beginning of the 'General' Unions, enrolling unskilled workers, which in power, and influence challenged the earlier 'Craft' Unions.

Under Socialist inspiration, the Unions not only began to supplement collective bargaining with demands for industrial legislation (already a familiar policy among the miners and textile workers), but also to consider taking political action as an independent working-class party. Under Keir Hardie's leadership, the Socialist Independent Labour party (1893) undertook a vigorous campaign with the object of bringing the T. U.s into politics. In 1900 some T. U.s joined with the Socialist groups to form the Trades Union Congress, which was persuaded to launch, in partnership with the Socialist bodies, the Labour Representation Committee, which in 1906 adopted the name 'Labour Party.' The progress of the L.R.C. was slow at first, but an important legal decision threatening the existence of trade unionism rallied the T. U. movement behind it. This was the Taff Vale decision (1901), by which it was laid down that T. U. funds could be made liable for damage caused by a trade dispute. The agitation against this decision led to the winning of a large number of seats by the Labour party in the General Election of 1906, and to the passing of the Trade Disputes Act (1906), which remedied the grievance. But immediately the T. U.s suffered a further setback in the courts, the Osborne Judgment (1909) declaring it unlawful for T. U.s to spend money on political action. Further agitation followed, until this grievance was in part remedied by the T. U. Act of 1913. In the meantime, the failure of wages to rise with increasing prices and national wealth had led, in 1911 and the following years, to a great movement of unrest and strikes (transport workers 1911 and 1912, miners 1912), and to the emergence of new social

theories such as Syndicalism and Guild Socialism, claiming a large share in the control of industry for the organised workers. This movement of unrest continued in being up to the outbreak of war in 1914.

The War greatly increased the membership and power of the T. U.s owing to the high demand for labour and the necessity for constant negotiations as prices rose and industrial methods had to be modified in face of war conditions. The T. U.s emerged from the War with doubled membership, into a period of acute unrest. There were many big strikes between 1919 and 1921, when the coming of the great post-war depression seriously limited the power of the unions. But politically the strength of the Labour party continued to grow, and a minority Labour Gov. came into office for a brief period in 1924. The fall of this gov. was followed by a renewal of industrial strife, culminating in the miners' lock-out and the General Strike of 1926, when the Trades Union Congress organised a national strike movement in support of the miners' claim to a living wage. The defeat of the General Strike was followed by the Trade Disputes and T. U. Act of 1927, which not only declared general and sympathetic strikes to be illegal, but also withdrew many of the privileges gained by the T. U.s under previous Acts, and left the law ambiguous on many matters.

A second Labour Gov. held office, in a minority, from 1929 to 1931, when it fell as a result of the financial crisis arising out of the world slump. Meanwhile, in the industrial field, the T. U.s remained perforce on the defensive, owing to the general depression. Their membership had fallen heavily since the years of boom after the War; and their power was further menaced by the decline of the older industries, in which their strength mainly lay, and the rise of new mechanical trades operated more largely with unskilled labour. Numbers continued to decline until they fell below 4,500,000 by 1933. After that year economic conditions slowly improved, and by the outbreak of war in 1939 membership was back to the 6,000,000 mark, which had not been touched since 1921. One feature of this period was the increasing use of advisory councils and committees in the relations between various T. U.s. The structure of trade unionism and the question of closer unity engaged the attention of the General Council of the Trades Union Congress throughout the thirties. The ground was, therefore, well prepared in the thirties to make possible the important share which trade unionism had in the industrial effort of Great Britain during the Second World War. The Gov. consulted the T. U.s on all matters affecting their interests, and in industry generally joint committees did much to raise output and promote efficiency. One of the first acts of the Labour Gov. which came to power in 1945 was to repeal, in 1946, the Trade Disputes and T. U. Act of 1927. With the nationalisation of coal mining, electricity, and other industries, provision

was made for consultative councils consisting of representatives of the Boards of the nationalised industries and the staff concerned. Furthermore, much of the war-time national and local consultative machinery survived, somewhat adapted, to serve peace-time needs.

Organisation. A union is usually a national body with branches distributed over the whole country. Its branch officers are industrial workers, giving only their spare time to union duties, but it maintains a head office staff of full-time

National Union of Mineworkers and the National Union of Railwaymen. Third, there are the general unions, e.g. the 2 largest, the Transport and General Workers' Union and the National Union of General and Municipal Workers, which cater mainly for semi-skilled and unskilled workers in a wide range of employment, though they may also include skilled workers among their membership. A fourth group of unions is that for non-manual workers or occupational groups, among them being unions for teachers,

Group of Unions	Membership at end of 1955		
	Males	Females	Total
General labour organisations	1,814,290	320,350	2,134,640
Agriculture, forestry, and fishing	140,110	7,750	147,860
Coal mining	819,730	20,460	840,190
Other mining and quarrying	6,060	490	6,550
Treatment of non-metalliferous mining products other than coal	14,070	15,940	30,010
Chemicals and allied trades	13,710	6,390	20,100
Metal manufacture, engineering, shipbuilding, electrical goods, vehicles and other metal trades	1,759,040	95,500	1,854,540
Cotton	66,690	135,260	201,950
Other textiles and textile finishing	85,460	83,370	168,830
Leather, leather goods and fur	12,490	3,960	16,450
Clothing (except boots and shoes)	30,050	105,500	135,550
Boots, shoes, slippers, etc.	51,100	37,930	89,030
Food, drink, and tobacco manufacture	42,510	20,130	62,640
Manufactures of wood and cork	108,930	14,420	123,350
Paper and printing	249,350	79,550	328,900
Other manufacturing industries	10,260	3,220	13,480
Building and contracting	488,170	1,320	489,490
Gas, electricity, and water	37,390	4,770	42,160
Railways	508,710	29,010	537,720
Other transport and communication (excluding general labour unions)	399,620	56,720	456,340
Distributive trades	234,670	159,170	393,840
Insurance, banking and finance	83,000	24,740	107,740
National government service	239,170	124,960	364,130
Local government service	304,300	153,330	457,630
Education	149,440	202,020	351,460
Other professional and business services	90,080	114,230	204,310
Theatre, cinemas, sports, etc.	58,090	22,940	81,030
Other services	1,930	60	1,990
Totals	7,818,420	1,843,490	9,661,910

officials, who manage its affairs under the direction of a full or part-time executive committee and an ann., biennial, or triennial conference of delegates from the branches or districts. Types of T. U. fall into 4 main groups: first, the craft unions, the earliest form of trade unionism. Their membership is limited to skilled workers engaged in the same industrial employment or near allied employment. They are often small, although amalgamations have tended to produce some large multi-craft unions and some, such as the Amalgamated Engineering Union, which take on some of the characteristics of the second group, the industrial unions. The industrial unions are those which seek to include a given industry. Important examples of industrial unions are the

post-office workers, civil servants, municipal workers, and journalists. In almost every tn of importance there is a Trades Council, a federation of the local branches of the various T. U.s. See TRADES COUNCILS.

Almost all T. U.s, except those in the public services, provide benefits for their members in case of strikes or lock-outs. In many unions the expenses of management and negotiation, together with those of strike benefit, absorb nearly all the funds. Under Brit. law, payments for political purposes have to be made out of a separate fund, to which contribution is voluntary; and political payments account for only a very small part of total T. U. expenditure. In some T. U.s in other countries (e.g. France) contribu-

tions are much lower than in Great Britain, and friendly benefits hardly exist. In the U.S.A., on the other hand, contributions are substantially higher. As regards political organisation a number of T. U.s are affiliated to the Labour party. T. U.s are represented at the annual conference of the Labour party by their delegates. Local branches of T. U.s may also affiliate with local branches of the Labour party. Regional Councils of Labour have also been created by the Labour party to serve as links between the National Executive and local affiliated organisations, such as T. U.s, at dist. level.

Educational Activities. The provision of increased educational facilities for its members has been a recognised aim of trade unionism since the beginning of the movement. An important development is the Trades Union Congress training college, which forms part of the new Trades Union Council H.Q., and which will expand considerably the facilities in this field. *See ADULT EDUCATION.*

The number of T. U.s in the U.K. at the end of 1955 was 666, including 25 with H.Q. in N. Ireland, with a total membership of 9,662,000. These figures given by the Ministry of Labour include trade unionists in the forces and in overseas branches of unions with H.Q. in Britain. The Trades Union Congress does not include these in its total membership. The Ministry also counts separately some 180 unions which are shown as 12 federal bodies in the total of Trades Union Congress affiliations set out in the table below. The 6 biggest Brit. unions in order of size are the Transport and General Workers' Union, the Amalgamated Engineering Union, the National Union of General and Municipal Workers, the National Union of Mineworkers, the National Union of Railwaymen, and the Union of Shop, Distributive and Allied Workers (qq.v.). A number of unions register with the Chief Registrar of Friendly Societies under the T. U. Acts. There is no compulsion by law to do this, but many unions find registration an advantage. At the end of 1955 there were 405 registered unions with 8,500,000 members. The industrial distribution of union membership at the end of 1955, according to the Ministry of Labour, was as table on previous page.

See also TRADE BOARDS; TRADE DISPUTES ACTS; TRADE UNIONISM, INTERNATIONAL; TRADE UNIONISM IN THE U.S.A.; TRADES COUNCILS; TRADES UNION CONGRESS.

There is now a large number of books about trade unionism and industrial relations. Among the most useful are: T.U.C. Annual Reports; S. and B. Webb, *History of Trade Unionism* (re-issued), 1950; monographs on National Trade Union Movements pub. by the International Confederation of Free Trade Unions; N. A. Citrine, *Trade Union Law*, 1950; G. D. H. Cole, *An Introduction to Trade Unionism*, 1953; *Industrial Relations Handbook* (H.M.S.O.), 1953; *British Trade Unionism, Five Studies by F.E.P.*,

1955; and special studies and histories of individual T. U.s.

Trade Unionism, International. In its international aspects the tendency within the trade union movement has been towards co-operation and fraternal association between national centres of trade unions and also between individual unions and federations of unions representing specific trades in various countries, e.g. the International Transport Workers' Federation and the Miners' International Federation. The International Working Men's Association ('The First International') was formed in 1864 and held its first meeting in London. It continued its annual congresses, leading a rather troubled existence, until 1872, when it lapsed, but was revived in 1889 ('The Second International'). It was later superseded by the International Federation of Trades Unions (I.F.T.U.), which existed for the interchange of information and ideas rather than for the formation of industrial policy applicable to its member countries. The I.F.T.U. declined during the First World War, but after the War its membership increased to over 18,000,000. More prominent were the activities of the International Labour Organisation (q.v.), set up under the League of Nations and now with the U.N.O. A further step towards international unity was a resolution passed by the Trades Union Congress at Southport in 1943, advocating a world conference of trade unions. The conference opened in London in 1945. As a result, the World Federation of Trade Unions (W.F.T.U.) came into existence and held its inaugural meeting in Paris in 1945. It represented over 60,000,000 workers in 56 countries, and within 2 years it comprised 71 organisations representing 70,000,000 workers. Its purpose was to promote unity of aim and action of the international trade union movement, and with this wider function it superseded the I.F.T.U., which was dissolved in 1945. Proposals were subsequently made to dissolve the international federations of separate trades and industries and transfer their functions to Trade Depts within the W.F.T.U. The W.F.T.U. suffered a setback in 1948 as the result of a split between the representatives of the unions from Communist countries and those which were non-Communist, and the Trades Union Congress, the Congress of Industrial Organisation (U.S.A.), and the Dutch Federation of Trade Unions withdrew their membership in 1949. The Amer. Federation of Labor, which shares with the C.I.O. the representation of labour in the U.S.A., had remained outside the W.F.T.U. from the beginning. A manifesto describing the World Federation as dominated by Communist organisations was issued by the free trade union organisations and their example was followed by the trade union federations or councils of, *inter alia*, Australia, New Zealand, Belgium, Switzerland, and Sweden. With the intention of forming a new international trade union organisation, the Trades Union Congress called a

conference in London at the end of 1949. At this conference the International Confederation of Free Trade Unions (I.C.F.T.U.) came into being, and within a year had the support of 50,000,000 trade unionists from most of the democratic countries of the world. At the beginning of 1957 the I.C.F.T.U. had a membership of more than 54,000,000 in 123 affiliated organisations in 88 countries.

Trade Unionism in Great Britain, see TRADE UNION.

Trade Unionism in the U.S.A. In the U.S.A. the beginnings of labour organisation date back to the days of Washington. Robert Owen carried his theories and practice to America when he set up a community at New Harmony in Indiana on the lines of the New Lanark experiment. By 1833 there were over a hundred trade unions in existence in Philadelphia, New York, Baltimore, and Boston. An attempt to form a national federation in 1834 was, however, short-lived. After the Civil War the growth of Amer. industrialism brought a parallel growth to the craft unions, which were, however, heavily handicapped by the opposition of employers and the constant dilution of labour by immigration. In 1866 the National Labor Union was formed, but lasted only 6 years, the difficulty being to unite local and national interests, immediate benefits, and wider ideals. A second organisation, the Noble Order of the Knights of Labor, fl. for a few years, especially among unskilled workers, but it roused the opposition of the craft unions. It was not until 1886 that Amer. labour was put on a firmer national basis with the creation of the Amer. Federation of Labor. This was largely due to the energy and vision of Samuel Gompers (1850-1924) (q.v.), a member of the Cigar-makers Union, who brought together the leaders of the larger national unions, including the iron and steel workers. The first major conflict was the nation-wide railway strike of 1877, ended by bringing Federal troops into action against the strikers. T. U. was considered to be broken, but it continued its struggle towards more powerful organisation. Legislation favourable to labour was introduced in a number of states, and in 1884 a Federal Bureau of Labor was set up, the forerunner of the present Dept. of Labor. Public opinion was against the severity with which a second railway strike was suppressed in 1886 also by armed force. T. U. slowly came to be recognised as an integral part of industrial life, and employers were more and more urged to settle disputes with the trade unions by arbitration. In 1900 the Amer. Federation of Labor had a membership of only a little over 500,000. By 1914 it was over 2,000,000. Women employees were also organised in a common effort towards obtaining better labour conditions, and the national Women's Trade Union League was formed in 1907. From the beginning of the First World War the wages and living conditions of Amer. workers began to improve considerably. The Amer. Federation

carried on a long campaign against unrestricted immigration, especially of classes likely to lower the standard of labour. By 1927 it secured legislation limiting immigration to an ann. quota or proportion of any nationality already represented in the U.S.A. In July 1935 labour's position was further advanced by the creation of the National Labor Relations Board under the Wagner Act. Its purpose was to conduct elections by secret ballot among union members on receiving a strike petition from the union concerned to remedy unfair labour practices on the part of an employer, and to prevent any discrimination against employees on account of union membership. The following year the Amer. Federation of Labor met with opposition, within the movement, to the form of craft unionism which it favoured. A move in favour of industrial unionism was led by John L. Lewis (q.v.), president of the United Mine Workers of America, who broke away from the Federation and formed a separate body called the Committee for Industrial Organisation (later, the Congress of Industrial Organisations). In the next few years he was successful in encouraging T. U. in the steel and motor industries in which craft unionism had failed to gain a hold. By 1940 the C.I.O. claimed a membership of 5,000,000 as against the 4,000,000 of the Amer. Federation. In that year an unsuccessful attempt sponsored by President Roosevelt was made to bring the 2 organisations together. In 1943 Lewis led the mine workers into a strike for higher wages, damaging though this was to the Amer. war effort. A Bill was hurriedly passed through Congress, making strikes illegal unless approved by a majority by secret ballot, and refusing to allow trade unions to contribute to political funds. In 1946, the year of a second coal strike, the United Mine Workers were briefly reaffiliated to the Amer. Federation. At this time the Federation and the C.I.O. united in denouncing the Labor-Management Relations Act (1947) known as the Taft-Hartley Act, which replaced the Wagner Act of 1935, being passed over President Truman's veto. This law enjoined a 60-day notice of strike or lock-out, and gave the President power to impose a further 80 days' postponement. It made the closed-shop illegal and forbade trade unions to compel their members to obey union policy. Trade unions were also prevented from using their funds for political purposes. The Act also brought the Communist issue to a head. It stipulated that any union wishing to take advantage of the services of the National Labor Relations Board must first certify that none of its officials was Communist. Both the Amer. Federation and the Congress of Industrial Organisations subscribed to this, although deploring the compulsion, as they were opposed to Communism. John L. Lewis, however, objected on principle and withdrew from the Federation. The United Mine Workers therefore stood outside both the

Federation and the C.I.O. and became one of the largest of the independent unions. The Taft-Hartley Act was unsuccessful in stopping the growth of the power of the trade unions, especially as full employment was reaching a new total of 80,000,000 jobs. On 5 Dec. 1955 the 2 general organisations merged under the name A.F.L.-C.I.O. By 1955 the total membership of trade unions was reckoned to be 18,000,000. The Amer. Federation of Labor claimed a membership of 10,000,000, as against 5,200,000 claimed by the Congress of Industrial Organisations. By far the largest union within the Federation was the International Brotherhood of Teamsters, with a membership of over 1,200,000, followed by the International Association of Machinists with 864,095. The 2 largest unions in the C.I.O. were the United Steelworkers of America and the United Automobile Workers of America, each with a membership of 1,200,000. The independent trade unions accounted for about 1,750,000. Among them were the United Mine Workers of America, 600,000, and the railway unions, of which the largest was the Brotherhood of Railroad Trainmen, 204,397.

Trade Winds, currents of air on the earth's surface travelling between the high-pressure belt of the sub-tropics and the low pressure of the equatorial belt. Their discovery is generally attributed to Columbus on his first transatlantic voyage in 1492, although they may have been known before that. Allowing for the normal frictional difference between surface wind and gradient wind (see *further WIND*), the trades follow the normal circulation round the semi-permanent anticyclones over the oceans in about 30° N. or S. In the extreme E. of such an anticyclone in the N. hemisphere the winds are N. to NNE, and veer steadily to NE. in the S. and to E. or a little S. of E. in the extreme W., where they are, however, not quite so marked. The main area of the trades is in the E. and S. half of the anticyclone where the wind is clearly NE. with a strength of about 10-15 m.p.h. A similar effect is noticed in the S. hemisphere. In Mar. the positions are: NE. (Atlantic) 3°-26° N.; (Pacific) 5°-26° N.; SE. (Atlantic) 0°-25° S.; (Pacific) 3°-28° S. In Sept. NE. (Atlantic) 11°-35° N.; (Pacific) 10°-30° N.; SE. (Atlantic) 3°-25° S.; (Pacific) 7°-20° S. From Mar. to July each belt swings northwards; from Sept. to Jan. southwards. Their steadiness of strength and direction led to the name trade (trend). At their origin they are dry, fresh, gentle breezes, but they gradually become damp and stronger, cumulus cloud of characteristic nature forming. The regions are marked by little rainfall and greater salinity over the ocean. Land regions to the E. of the trades are very dry, tending to desert conditions, but to the W. (i.e. the E. coasts of the continents) they cause much rainfall. With hotter air over the subtropical continents than over the sea, high pressure tends to form over

land at high levels, and the upper winds therefore circulate round the continents, *counter-trades* or *anti-trades* as they are called, being at lower levels (3000-6000 ft) near the continents than well out to sea and farther W., but the height of the change-over is variable. The direction is usually SW. in the N. hemisphere and NW. in the S. hemisphere, but the term should not be applied to the prevailing winds of similar direction in temp. latitudes which usually exist up to all heights. *Reversed trades* occur particularly in the Indian Ocean during the summer, when they form the SW. monsoons. They succeed in 'dragging' the SE. trades across the equator, the doldrums thus not occurring.

Trades Councils, local organisations in the Brit. trade-union movement, consisting of representatives from the branches of the various trade unions in a tn or dist. The T. C. first came into existence probably before 1850, but did not emerge as a wider organisation until 10 years later. They were active in consolidating the labour movement, and in 1888 were instrumental in the formation of the Trades Union Congress (q.v.). In 1865, however, they were excluded from the Congress in order to avoid dual representation of the affiliated trade unions. In Scotland they continued to be affiliated to the Scottish Trades Union Congress. In spite of their disaffiliation in England, they played an important although undefined part in the movement, and where they existed they have been prominent in all local affairs whenever a united labour front was desirable. They gradually came to be recognised as the local agents of the Trades Union Congress, and are now the channel for conveying information and ideas between the Congress and local trade-union branches. Their official connection is through the T. C. Joint Consultative Committee consisting of 6 representatives of the Congress and 6 of the T. C. The Committee also appoints a fraternal delegate to attend the Ann. Congress. The function of the T. C. is therefore mainly administrative and they are excluded from political activity. They co-ordinate the activities of local branches but do not take part in formulating policy. They are linked nationally through a series of federations. See also **TRADE UNIONS**.

Trades Union Congress, a permanent association of Brit. trade unions, which has had a continuous existence since 1868 and which each year turns itself into an ann. assembly of delegates meeting together to discuss common problems. The executive body of Congress elected each year is a General Council of 35 members, first constituted in 1921 to replace the old Parliamentary Committee, which had been in existence since 1869. The prin. officer of the T.U.C. is the general secretary, who is elected by Congress and holds office as long as his work gives satisfaction.

Any union may apply for affiliation to the T.U.C., and on acceptance, after a full investigation of its bona fides, shares in

the rights to table motions for discussion at Congress and to appoint delegates on the basis of one for every 5000 members. Neither Congress nor the General Council can override the authority of the individual unions, but there is a strong moral obligation to accept their decisions, and in practice unions accept voluntarily the discipline and obligations of solidarity in an organised movement. Each affiliated union is placed in one of 18 trade groups, and seats on the General Council are allocated according to the size of the group. There is a nineteenth group to cover the women membership. The allocation is as follows:

Group	No. of Members
1. Mining and quarrying	3
2. Railways	3
3. Transport (other than railways)	3
4. Shipbuilding	1
5. Engineering, founding, and vehicle building	3
6. Iron and steel and minor metal trades	2
7. Building, woodworking, and furnishing	2
8. Printing and paper	1
9. Cotton	2
10. Textiles (other than cotton)	1
11. Clothing	1
12. Leather and boot and shoe	1
13. Glass, pottery, chemicals, food, drink, tobacco, brushmaking, and distribution	2
14. Agriculture	1
15. Public employees	1
16. Civil servants	2
17. Non-manual workers	1
18. General workers	3
19. Women workers	2

Nomination to fill these seats is by the unions in each group, but election is by the whole of Congress. The General Council appoints representatives to a

number of national joint advisory committees with employers and the gov., and it has become customary for consultation to take place on all major issues of industrial policy. The only formal relation between the T.U.C. and the Labour party is through the National Council of Labour, which, with the Co-operative Union as a third member, provides opportunity for consultation within the broad British Labour movement. In international matters the T.U.C. is affiliated to the International Confederation of Free Trade Unions, and it supports the work of the International Labour Organisation. Special attention has been given by the T.U.C. in the post-war period to helping the young trade unions in Brit. ters. overseas.

The T.U.C. had 1,000,000 members by 1874, and by the time of the First World War had doubled its strength. Ending that war with some 6,500,000 members, there was a decline to some 3,000,000 in 1934. Thereafter a steady rise brought the total affiliated membership to 8,250,000 at the 1956 Congress. The T.U.C. represents 8 out of 9 of all trade unionists in Britain. Owing to amalgamations during recent years, the total number of unions has declined, and at the 1956 Congress 1000 delegates represented 186 unions with 8,263,741 members. This figure can be broken down into their trade groups as shown in table below.

The Scottish T.U.C. is an organisation of Scottish trade unions, Scottish membership of Brit. trade unions, and trades councils in Scotland. It confines its activities largely to Scottish affairs, and most of its members are affiliated directly to the British T.U.C. In Ireland there are 2 trade union organisations, the Irish T.U.C. and the Congress of Irish Unions.

Tradescant Museum, see ASHMOLEAN.

Tradescantia, genus of plants of the family Commelinaceae, native of N. and tropical America and named after John Tradescant the elder. At least 30 species are cultivated in Brit. flower-gardens.

	No. of Unions	No. of Delegates	Membership in thousands
Mining and quarrying	4	143	719
Railways	3	49	529
Transport (other than railways)	10	96	1,394
Shipbuilding	5	19	125
Engineering, founding and vehicle building	28	117	1,443
Iron and steel and minor metal trades	17	46	205
Building, woodworking, and furnishing	19	74	589
Printing and paper	13	58	317
Cotton	6	35	159
Textiles (other than cotton)	22	32	104
Clothing	7	28	178
Leather and boot and shoe	5	20	108
Glass, pottery, food, chemicals, etc.	15	68	471
Agriculture	1	16	135
Public employees	4	25	250
Civil servants	8	62	464
Non-manual	15	50	260
General workers	4	62	812

T. virginica, the common spiderwort, is the one most usually grown in Britain, and bears purple blue flowers. Other species are *T. albiflora*, Wandering Jew, *T. fluminensis*, also Wandering Jew, and *T. blossfeldiana*.

Tradesmen's Tokens, or Trade Tokens. The official small change of England from Saxon times was of silver, which was coined in the Middle Ages to a value as low as a farthing. By the time of Elizabeth, however, the smallest piece was the halfpenny, weighing only 4 grains, which was inconvenient and easily lost. Some change was essential and a more useful size and weight desired. In the reign of James I, the king delegated his prerogative of striking copper money to Lord Harington, who was given a patent for striking farthings; similar patents were issued in the next reign, but were so grossly abused by the patentees, that, following a public outcry, the coins were suppressed by Parliament in 1644. On the death of Charles I (1649) the exclusive royal prerogative of coining copper and brass ended, and tokens immediately began to be issued by tins, tradesmen, and, occasionally, by private persons. During the whole of the Commonwealth period no copper coinage was officially issued, and tokens continued to be the small currency of the country. The tokens were usually struck in copper or brass, but lead was occasionally used. Their

period occurred at a time when the Royal Mint took a very restricted view of its duty to the public, so that tokens reappeared in 1787-1801 and again in 1807-20, including latterly, silver and gold tokens. Legislation in 1817-23 finally stopped private minting.

Traducianism, theory that souls are propagated in a similar way to the procreation of the body. The doctrine originated in Tertullian's *De anima*. St Augustine seems to have inclined to this belief, without committing himself to it or, on the other hand, pronouncing for creationism (q.v.), the belief now obligatory for Rom. Catholics, the opinion that the soul was immediately created by God. The orthodox party were attacked as *Traducianists* by the Pelagians, in connection with the doctrine of the transmission of original sin.

Trafalgar, cape on the S. coast of Spain, and the scene of the great naval victory of the Eng. fleet under Lord Nelson over the combined Fr. and Sp. fleets under Villeneuve on 21 Oct. 1805. This battle shattered the power of France and Spain at sea at a time when Napoleon had made himself master of Europe and protector of the Confederation of the Rhine. In the winter of 1804 Nelson watched Toulon harbour, where the French were preparing to embark a large body of troops for some unknown destination. Nelson sailed for Barcelona to draw them out, and in his absence Villeneuve with 10 ships-of-the-line and many frigates put to sea (18 Jan. 1805). Nelson, believing Villeneuve to be going to Egypt, himself sailed for Sicily, but Villeneuve had passed the Straits of Gibraltar and effected a junction with the Sp. fleet at Cadiz. Nelson, on learning this, chased Villeneuve to the W. Indies, whence the French, in terror of his name, returned without accomplishing anything. Nelson returned in pursuit. Learning that the enemy had arrived at Cadiz, he returned to England, but immediately volunteered his services again, and joined Collingwood's squadron off Cadiz (29 Sept.). Early in Oct. Nelson received information from which he concluded the enemy would soon put to sea, and having on 4 Oct. laid before his adms. and caps. a simple plan of attack, he disposed his fleet in such a manner as to tempt the enemy to come out. The enemy put to sea on the 19th. The Brit. fleet consisted of 32 sail-of-the-line and 5 frigates. Perhaps the most remarkable phase of the battle itself was the desperate struggle between the *Victory* and *Téméraire* on the one side and the *Redoubtable* and the *Fougueux* on the other. It was a shot from the cross-trees of the *Redoubtable* that killed Nelson. The Brit. casualties were 450 killed and 1250 wounded. Nineteen of the enemy's fleet (which had comprised 33 sail-of-the-line and 7 frigates) were captured and 1 blown up. The prisoners numbered 12,000. The result of the victory saved England from all chance of an invasion and paved the way for the ultimate success of the Anglo-Russian treaty to resist the encroachments of France and to secure the

A SEVENTEENTH-CENTURY TOKEN
FROM BARNET, HERTFORDSHIRE

Left, obverse; right, reverse.

denominations were farthing, halfpenny, and penny, though not many of the latter were minted. Generally speaking they were round in shape, but square, heart and diamond shaped, and octagonal tokens were also made. The inscription on these tokens issued by tradesmen commonly consisted of the Christian and surname of the issuer, his trade and occupation, and the tn or vil. in which he resided. In addition, they had the value, the initials of the issuer, and a device. These designs were the arms of his trade guild, family arms, tavern- or shop-signs, and a device indicating the issuer's handicraft or trade. A regal copper coinage was started under Charles II in 1672, and a Royal Proclamation announcing the new currency forbade the use of all others (i.e. tokens). In the 18th cent. Industrialists were much exercised over the problem of obtaining small change in which to pay their employees' wages, and Brit. industrial expansion during this

Independence of Europe. See J. S. Corbett, *The Campaign of Trafalgar*, 1910; R. H. Mackenzie, *Trafalgar Roll*, 1913; A. F. Freemantle, *Trafalgar*, 1933.

Trafalgar Square, open space in London N. of Whitehall, laid out, partly on the site of an old royal mews, in 1829-45 (not fully completed until 1867) from the designs of Sir Charles Barry. It commemorates the battle of Trafalgar, and the central feature is the Nelson Column, 145 ft high, surmounted by his statue, with bas-reliefs of his battles at the base, and 4 large bronze lions (designed by Sir E. Landseer) beyond the angles. Below the N. wall of the square are kept the official imperial standards of length. T. S. is used for public meetings and demonstrations.

Traffic Regulations and Signs. These have a threefold object—the avoidance of congestion, the promotion of safety, and the guidance of road users. The Road Traffic Act, 1930-56, enable highway authorities to regulate traffic by order. One-way traffic restrictions on parking and on the type of vehicle which may use certain roads are among the measures used to ensure a smooth and safe flow of traffic. The Acts also enable highway authorities to erect traffic signs to convey warnings, requirements, restrictions, prohibitions, or information to road users, and to lay down carriageway markings. Warning signs are surmounted by a red equilateral triangle; mandatory signs are surmounted by a red ring; prohibitory signs are on or surmounted by a red disc; informative signs are rectangular without a surmounting symbol. Continuous white lines are used to indicate the centre of the carriageway at danger points, and broken white lines are used to isolate traffic lanes. They may be fitted with reflecting studs ('cats-eyes') to make them visible at night. Under the Road Traffic Acts of 1934 and 1956 speed in built-up areas is restricted to 30 m.p.h. as a safety measure indicated by a sign with black figures on a white ground within a red ring. Pedestrian crossings, either controlled by police or by light signals, or uncontrolled, are in use throughout Great Britain. Drivers of vehicles are obliged to give precedence to pedestrians on uncontrolled ('zebra') crossings (Pedestrian Crossing Regulations, 1954). Under the School Crossing Patrol Act, 1953, persons may be appointed with powers to halt traffic while children cross the road going to and from school. See also DRIVING LICENCES; HIGHWAY, *see* ROAD TRAFFIC ACTS; MOTOR LAW.

Tragedy, see DRAMA.

Traherne, Thomas (c. 1638-1674), poet and mystical writer, b. Hereford, son of a shoemaker. Educ. at Brasenose College, Oxford, he took orders, and in 1657 obtained the living of Credenhill, near his bp.; 10 years later he became chaplain to Sir Orlando Bridgeman, Lord Keeper of the Great Seal, in whose household at Teddington he passed the remainder of his life. T.'s *Roman Forgeries*, 1673, and *Christian Ethics*, 1675, have only historical interest, but *Centuries of Meditation*, first printed in 1908, consists of short

reflections on religion in translucent prose of a wonderful musical quality, sometimes more poetical than his verse, which has occasional technical faults. His poems, discovered in MS. in 1896, were at first thought to be the work of Henry Vaughan (q.v.). Bertram Dobell (q.v.) identified them as Traherne's, and pub. them in 1903. Pure and limpid, with brilliant natural imagery, they have affinities with Blake and Wordsworth, and rank with the best of the 17th-cent. lyrical poets. The latest ed. of T.'s poems is by G. I. Wade, 1932, who also wrote his life in 1944; see also study by G. E. Willett, 1919.

Trail, city of Brit. Columbia, Canada, 48 m. SW. of Nelson on the R. Columbia. There is a large metallurgical plant, and near by a fertilizer factory. Pop. 11,319.

Trail, Henry Duff (1842-1900), poet and critic, b. London. Educ. at Merchant Taylors' and Oxford, he studied law but turned to writing, and from 1882 to 1897 was a leader-writer on the *Daily Telegraph*. His humorous verses, which show a rare gift of parody, were collected as *Recaptured Rhymes*, 1882, and *Saturday Songs*, 1890. He pub. studies of Sterne, 1882, and Coleridge, 1884, and wrote the standard life of Sir John Franklin, 1896. *The New Lucian*, 1884, is a series of 'dialogues of the dead.'

Trained Bands. Originally the élite of the General Levy of the Tudor period, provided by the larger towns and better trained because they could be assembled more regularly and for longer periods. Prov. T. B. appear all to have been modelled on those of London, who appear to have owed their efficiency to the leaven of the Honourable Artillery Company (q.v.). Only the London T. B. need seriously be considered here. In 1539 Henry VIII reviewed the City of London militia who were all dressed in white uniforms with the arms of the city worked on them before and behind (see UNIFORM).

In 1585 the first line of the London T. B., all musketeers, to the number of 4000, were exercised separately in Mile End Fields and reviewed at Greenwich. This body was trained by the H.A.C., which was in reality more a guild of archers and arquebusers than a fighting unit. James I. in 1614 organised the London T. B. in companies, and in 1616 into 4 regiments, one each for N., W., S., and E., all under command of the Lord Mayor. This number was greatly expanded in the Civil war, and a Royalist spy's report roll of 1643 shows 9 regiments of T. B. and 5 of auxiliaries with an average strength of 1270 and 1000 respectively. Each regiment had about 70 officers, including sergeants and corporals, and a varying number of companies, each containing about 175 musketeers and 120 pikemen. It was these troops who raised the siege of Gloucester and won the battles of Newbury and Worcester, besides providing a strong Parl. garrison for the capital.

In 1661 Charles II abolished all T. B. except those of London. These con-

tinued to exist until 1794 when the 4 regiments of trained bands were reorganised as 2 regiments of militia. In renewing its charter William III specifically ordered that all commissioned officers of T. B must be members of the H.A.C., and this arrangement continued until 1779.

See MS. in Royal United Service Museum, London, 'The Ensigns of the Regiments of the Rebellious City of London . . . per opera Guilielmi Lovell, Armigeri, Sept. 26, 1643'; C. Sebag-Montefiore, *The Volunteer Force*, 1909.

Training (Athletic), process of raising the level of mental and physical fitness as a means of preparation to take part in an athletic event. T. may be divided into 2 parts: (1) the attainment of general physical fitness, and (2) specific practice to perfect the technique required by the particular athletic event for which the T. is a preparation. The first is the sole object of T. in its early stages. Long walks, jog-trot, road or cross-country running, and attention to diet, are among the means employed. Gymnastic exercises may be included, and should be selected to develop the muscles required for the particular athletic event. If T. is overdone, staleness may result. The mental attitude is important. Perseverance, development of the powers of concentration and equally the ability to relax, and absence of worry are essential in successful T. After a fairly prolonged course of general T. the muscles become attuned, stamina is created, and specific T. for the event in question may then begin. Style and technique can only be perfected by regular practice. Since the Second World War interval, T. has become the most important factor in the development of middle-distance runners. This T. requires an athlete to run certain distances in set times with timed intervals. Almost every track and field athlete of international standard also now uses weight lifting in T. See Franz Stampfl, *On Running*, 1955. For a bibliography, see **ATHLETICS**; see also **PHYSICAL TRAINING**.

Training College, or Normal School, an institution in which intending teachers (being at least 18 years old) receive professional training and general education. The term N. S. is still widely used on the continent of Europe, but is no longer in use in the U.K. During the early part of the 19th cent. J. Lancaster and A. Bell (qq.v.) independently initiated a scheme of teacher training called the monitorial system, in which pupils under instruction helped to teach those who were still younger. Largely as a result of the efforts of Kay Shuttleworth (q.v.) a T. C. was opened at Battersea in 1840. The subsequent development of teacher training up to the 1902 Act was largely through voluntary efforts. Most of the T. C.s were maintained and estab. by the various denominations with the help of gov. grants. By 1880 of the 43 T. C.s, 30 were Church of England, 2 Wesleyan, 3 Rom. Catholic, 2 undenominational, and 6 were undenominational and Brit. and

Foreign Bible Society. The majority of elementary school teachers, however, continued to be trained under the pupil-teacher system—an apprenticeship training whereby senior elementary school pupils remained at school, received further general education, and acquired the techniques of teaching under the guidance of estab. teachers. In 1890 training depts (known as Day Training Colleges) were set up and attached to the univs. After 1902 municipal authorities were empowered to build and maintain T. C.s, and the Day Training Colleges became Depts of Education within the univs. and undertook the training of graduates who were to teach in the secondary schools estab. by the 1902 Act.

Under the reorganisation proposed in the McNair Report (1944), the T. C.s and Depts of Education in England and Wales are administered in academic matters through the Area Training Organisations or Institutes of Education centred on the various univs. These institutes award certificates to non-graduate T. C. students on the basis of which the Ministry of Education confers on them 'qualified' teacher status. A graduate of a recognised univ. is *ipso facto* a 'qualified' teacher. He may, however, undertake one further year of study at a univ. Dept of Education. If successful in the examinations he receives a Diploma of the Institute.

T. C. courses are normally of 2 years duration—they will be extended to 3 years in 1960. The period of training includes courses in 3 main fields: (1) theoretical studies in the principles of education, educational psychology, and health education; (2) instruction in methods of teaching children in certain age ranges, e.g. infant, junior, or secondary; and (3) further instruction in the student's special subject field. In addition, students spend a number of weeks in selected schools teaching under the guidance of their college tutors and the trained teachers already in the school.

T. C.s may be univ., Local Education Authority, or voluntarily maintained. Only one T. C. is for day-time students only, the rest are residential. There are special T. C.s for the training of physical-education teachers; some T. C.s concentrate on handicrafts and housecraft. Art teachers might be trained in 1-year courses at approved Art Schools. There are 3 T. C.s for intending teachers of technical subjects. In 1957 there were 157 T. C.s in England and Wales and 22 univ. Depts of Educ. In Scotland the system is different, and there are 4 Training Centres for men and women, at Aberdeen, Edinburgh, Glasgow, and Dundee. There are also 3 T. C.s for women: 2 of these, at Glasgow and Edinburgh, are for Rom. Catholics, and the third at Dunfermline is for physical training. In N. Ireland there are 2 T. C.s.

In the U.S.A. most T. C.s and N. S.s are state supported. They have become Teachers Colleges with the power to grant first degrees, or State Univs. where post-graduate studies either to the M.A. or

Ph.D. levels are undertaken. The courses of study vary considerably. Unlike Eng. undergraduate courses, those in the U.S.A. can, and often do, include educational studies (in philosophy of education, psychology, history of education, sociology, and so on). Undergraduate courses combine professional studies with liberal arts instruction. Entry into T. C.s is on the basis of secondary-school graduation. Chairs of education have been established everywhere in the univs., and in the larger cities City Training Schools have been set up for the training of teachers.

Training Corps, Officers', see COMBINED CADET FORCE.

Trains (Named). Although quite early in railway history some of the more important trains bore names, these were almost always unofficial; such as the *Zulu* of the Great Western. Not until the present cent. did the practice of giving official names to important trains become well estab. The publicity value of named trains in these days of keen competition in transport is undoubted, and many countries follow the practice. Below is given a selection of such names, with, in parentheses, the towns served by the trains: *Flying Scotsman* (London-Edinburgh); *Royal Scot* (London-Glasgow); *Irish Mail* (London-Holyhead); *Cornish Riviera Express* (London-Plymouth-Penzance); *Golden Arrow* (London-Dover/Folkestone-Calais-Paris) (as *Flèche d'Or* in France); *Red Rose* (London-Liverpool); *G Granite City* (Glasgow-Aberdeen); *Enterprise* (Dublin-Belfast); *Queen of Scots* (London-Leeds-Harrogate-Newcastle-Edinburgh-Glasgow); *Mistral* (Paris-Lyons-Marseille-Nice); *Nord-Express* (Paris-Cologne-Hamburg-Copenhagen-Oslo-Stockholm); *Süd-Express* (Paris-Bordeaux-San Sebastian-Burgos-Madrid-Lisbon); *Rome Express* (Paris-Dijon-Turin-Genoa-Rome-Naples); *Stimpon Orient Express* (Calais-Paris-Lausanne-Milan-Venice-Trieste-Zagreb-Belgrade-Salonika-Athens-Sofia-Istanbul); *Adria* (Copenhagen-Hanover-Munich-Venice-Zagreb-Split); *Rheingold* (Hook of Holland - Cologne - Mainz - Basel - Milan - Rome); *Lusitania Express* (Madrid-Lisbon); *Red Arrow* (Moscow-Leningrad); *Taurus Express* (Istanbul-Ankara-Aleppo-Baghdad); *Star of Egypt* (Cairo-Luxor-Aswan); *Blue Train* (Cape Town-Kimberley - Johannesburg - Pretoria); *Frontier Mail* (Bombay-Baroda-Delhi-Amritsar); *Spirit of Progress* (Melbourne-Albury); *Sunlander* (Brisbane-Cairns); *Canadian* (Montreal and Toronto-Winnipeg-Calgary-Vancouver); *Super Continental* (Montreal and Toronto-Winnipeg-Edmonton-Vancouver); *Twentieth Century Limited* (New York-Chicago); *Super Chief* (Chicago-Kansas City-Los Angeles); *Sunset Limited* (New Orleans-Kl Paso-Los Angeles); *California Zephyr* (Chicago-Denver-Salt Lake City-San Francisco); *Empire Builder* (Chicago-St Paul-Minneapolis-Spokane-Seattle); *Olympian Hiawatha* (Chicago-Seattle); *Estrella del Sur* (Mexico City-Puebla-Oaxaca); *Panamericano* (Buenos Aires-Rosario-Santa Fe-Tucuman); *El Marplatense* (Buenos

Aires-Mar del Plata); *Tsubame* (Swallow) (Tokyo-Osaka).

Trajan (Marcus Ulpius Nerva Trajanus), Rom. emperor (AD 98-117), b. Italica near Seville, AD 53. After serving with distinction in the F. and in Germany, he was consul in 91. In 97 he was adopted by Nerva, whom he succeeded on the imperial throne in the following year. In 101 he set out upon his first Dacian campaign, and celebrated a triumph in 103, when he assumed the title *Dacicus*. The second campaign opened in 104 and was entirely successful: the Dacian monarch Decebalus committed suicide (106), his cap. Sarmizegethusa became the Rom. colony of *Ulpia Traiana*, and Dacia itself was made a Rom. province. The celebrations in honour of these victories lasted at Rome for 123 days. In 114 T. once again moved eastwards to deal with the Armenians and Parthians, spending the winter of that year at Antioch. Two campaigns (115-16) sufficed for the conquest of most of the Parthian empire. T. then descended the Tigris to the Erythraean Sea (Persian Gulf). He was obliged, however, to return, owing to a fresh revolt. On arrival at Ctesiphon he gave the Parthians a king. In 117 he fell ill, set out for Italy, but *d.* at Selinus in Cilicia. T. had married Pompeia Plotina, who persuaded him to adopt Hadrian (q.v.); he had no children of his own. One of the greatest men of antiquity, he was strong, hard-working, and of noble appearance. His public works included sev. important roads, a number of libraries, and a theatre in the Campus Martius at Rome. There too he built the Forum Traianum, at the centre of which stands a column, once the repository of his ashes. See B. W. Henderson, *Five Roman Emperors*, 1927.

Trajani, Portus, see CIVITAVECCHIA.

Trajectory, see BALLISTICS.

Trajectus Superior, see MAASTRICHT.

Tralee, chief tn of co. Kerry, Rep. of Ireland, the gateway to the Dingle peninsula. Its history is associated with the Desmond clan and the Dominicans who arrived in 1243. Principal churches are St John's, and the Dominican Church of the Holy Cross, which has stained glass by Michael Healy. Rathass Church, 1 m. E. of T., is a national monument. T. is now a progressive tn with agric. and light industries; the Ashe Memorial Hall houses the Council offices, and there is a tn park of 75 ac. The world-famous song *The Rose of Tralee* was composed by William Mulhnick (1820-64). T. was a centre of the struggle for Irish independence. Pop. 11,400.

Trammel, see ELIOTIC COMPASS.

Trammel-net, see FISHERIES.

Tramore, popular seaside resort of co. Waterford, Rep. of Ireland, 8 m. S. of Waterford. Town commissioners constituted Dec. 1948.

Trampoline Act, see ACROBAT.

Tramps, see VAGRANTS.

Tramways The word is used to denote 2 differing methods of railway transport—mineral lines and the street railway—and probably originated with the Scandinavian word *tram*, meaning a beam. The

early mineral T. developed from wooden beams laid in the road to facilitate the smooth passage of carts to a specialised way on which the vehicles were retained by flanged wheels, illustrated in Ger. 16th-cent. mining text-books; among early Eng. examples are pictures of Ralph Allen's Prior Park wagonway, serving stone quarries near Bath, in *A Course in Experimental Philosophy*, by Dr J. T. Desaguliers, 1734. Towards the end of the 18th cent., the platway with angle-iron rails to take ordinary carts or wagons with flangeless wheels, was evolved and Trevithick's steam locomotive of 1804 was intended to run on such a tramroad

purchase a system at a low price, and this clause retarded development and postponed electrification in many systems. Steam traction was introduced on some lines after authorisation of mechanical power by an Act of 1879. From the middle eighties cable systems were built in Birmingham, Edinburgh, and on Highgate Hill, London; Edinburgh's lasted until 1922. The trams on Blackpool front operated electrically from conductor rails in a conduit from 1884; in Lytham St Annes gas engines were employed. The Roundhay Park line, Leeds, inaugurated overhead electric traction in 1891. The London United Tramways

A. T. Kelly

Glasgow Corporation Transport

A GLASGOW TRAM: 1950

The tram has seating accommodation for 70 passengers: 30 in the lower and 40 in the upper saloon. The overall length is 34 ft 6 in.; the width 7 ft 3 in.; and the height from the rail, 15 ft 3 in.

at Penryn. The further progress of the steam railway from such lines was by use of the normal edge rail and flanged wheel.

The street tramway transferred the railway to public streets, and was introduced by the New York and Harlem undertaking in 1832. It was the invention of John Stephenson, a carriage builder, and soon captured business from the buses owing to the poor state of road surfaces on Manhattan Island at that time. Moreover, 2 horses could haul, say, 46 passengers on a tram, compared with 26 on a bus. Horse T. were introduced in Paris, 1853, and London, 1861; the projecting rails overturned carriages and the lines had to be removed; only after the grooved rail flush with the road surface had been introduced to take the flanged wheels did the street tram develop here. Two lines opened in London in 1870. Under the Tramways Act of that year after 21 years local authorities could

began electric traction in London in 1901; the London Co. Council's first electric tramway was opened in 1903 on the conduit system. Surface contact systems were operated in Hastings, Lincoln, Torquay, and Wolverhampton.

Besides authorisation under Parl. Bill procedure under the Tramways Act, 1870, T. were sanctioned under the Light Railways Act, 1896, a much cheaper process, because there was no definition in that Act of a light railway. There were at the peak in Great Britain 171 local-authority T. (some of which were worked by larger undertakings), and in 1918, 103 tramways companies. Of the 96 municipal transport undertakings in 1936 only Blackpool, Leeds, Liverpool, and Sheffield still operated T. in England and Aberdeen and Glasgow in Scotland, Dundee and Edinburgh having converted to motor buses during the year. There was also the short horse tramway, for

summer visitors, in Douglas, I.O.M. During 1956 the last company-owned tramway, Llandudno and Colwyn Bay, was abandoned. In addition tramway-type vehicles operate the Swansea and Mumbles Railway, on which the first passenger-carrying service in the world began in 1807, and the British Transport Commission's Grimsby and Immingham Light Railway.

The peak traffic on Brit. T. took place in 1919-20 with 4,800,000,000 passengers, with a revenue of £32m.; although some horse systems, such as Cambridge and Oxford, were never electrified and electric-tramway abandonment began at Sheerness in 1917, the all-time record mileage was 2624 in 1923-4. Large-scale abandonment in favour of trolley-buses (more than 30 systems, but few entire conversions; first systems at Leeds and Bradford in 1911 were feeder routes) or motor buses (usually diesel-engined after 1930) began from 1927 onwards.

The tramway is still a prin. factor in city transport in many European countries, notably the Netherlands, Belgium, Germany, and Switzerland; but considerable mileage has been given up in many countries in favour of the cheap and mobile motor bus, and long-term plans indicate considerable reductions in mileage even in countries such as Italy, where hydro-electric power is available. It has its best chance of survival where it can be placed on its own right of way—in tunnel, for example, under a city centre—thus becoming virtually a rapid transit railway. See ELECTRIC TRACTION.

See A. T. Dover, *Electric Traction*, 1917, 1929; J. H. Clapham, *Economic History of Modern Britain*, 1926; Charles E. Lee, *Evolution of Railways*, 1937, 1943.

Tranarossan Bay, see under ROSAPENNA.

Trance (Lat. *transire*, to cross over), is one of many popular names which have been used to describe hysterical stupor. In former times the condition was attributed to the passage of the soul out of the body of the subject and the invasion of another spirit for the time being. T. may occur spontaneously or may be induced by hypnosis. The spontaneous form may last for a week or even more, with intermissions, eventually passing into normal sleep, from which the patient can be roused in the ordinary way. In the hypnotically induced type, the duration and intensity are controlled by the hypnotist. The depth or intensity of a spontaneous T.-state can vary within wide limits. The degree of intensity may be sufficiently light to permit of the existence of some ideational activity, and the patient may exhibit some measure of discrimination in his reaction to stimuli. The more profound types may present the signs of catalepsy (q.v.), with a complete absence of response to all sensory stimuli, and 'flexibilitas cerea.' In T. loss of memory for the period varies in proportion to the intensity of the state. See also ECSTASY.

Tranent, burgh of E. Lothian, Scotland, 10 m. E. of Edinburgh, centre of an agric.

area. There are coal mines and quarries in the vicinity. Pop. 6600.

Trani (anc. *Turenam*), It. fishing port, in Apulia (q.v.), on the Adriatic, 25 m. NW. of Bari (q.v.). In the 11th cent. it had a code of maritime law, and during the Crusades (q.v.) it was a place of importance. With Barletta (q.v.) it forms an archbishop's see; the splendid cathedral dates from the 11th cent. The surrounding dist. is very fertile, and produces grain, olive oil, and wine. Pop. 35,000.

Tranquebar, tn of Madras State, India, on the SE. coast. T. is an old Dan. settlement (1616-1845), later acquired by the British. It is reputed to be the site of the first Protestant mission in India (1706) and contains a number of interesting old churches.

Transbaykalia, or **Dauria**, mountainous area in SE. Siberia, between Lake Baykal in the W. and Amur Oblast (q.v.) in the E., with forested ranges and steppe valleys, and rich in mineral resources. It was annexed to Russia in the 17th cent. See BURYAT-MONGOL AUTONOMOUS REPUBLIC; CHITA.

Trans-Canada Highway. In Dec. 1949 a programme of road-building designed to provide Canada with a national coast-to-coast highway was inaugurated. The general administration and co-ordination of the programme is the responsibility of the Federal Gov., but each participating prov. undertakes to construct and maintain that portion of the highway, other than on federal lands, within its borders. The Federal Gov. shares equally with the prov. govts. the cost of new construction and of existing highways incorporated into the system. By the spring of 1952, all the provinces except Quebec had signed agreements to this effect with the Federal Gov. Quebec, though not co-operating financially with the Federal Gov., has undertaken to provide a highway linking the W. end of the New Brunswick portion with the E. end of the Ontario portion. The total length of the highway, excluding the Quebec link, will be 4580 m. By Nov. 1955, 2853 m. had been paved, but only 1523 of them to T.-C. H. standards. There were 2 important gaps where construction had not begun, one of 50 m. in Newfoundland, and another of 180 m. in W. Ontario.

Transcarpathia, Oblast in W. Ukraine, adjacent to the Hungarian and Czechoslovak frontiers. It is situated on the S. slopes of the Carpathian Mts and the adjacent lowland in the SW. There are salt deposits. Grain and potatoes are grown, livestock is bred, and there are timber and food industries, salt and coal-mining. The prin. tns are Uzhgorod (cap.) and Mukachevo. From the 11th cent. it belonged to Hungary, 1919-39 to Czechoslovakia (as an autonomous unit), then again to Hungary, and from 1944 to the U.S.S.R. Czechoslovakia officially ceded T. to the U.S.S.R. in 1945. Area 5000 sq. m., pop. (1956) 929,000, mostly Ukrainians and Hungarians. See J. B. Heisler and J. E. Mellon, *Under the Carpathians*, 1946.

Transcaucasia, region bounded by the main Caucasian range in the N., the U.S.S.R. state frontier with Turkey and Persia in the S., and the Black and Caspian Seas in the W. and E. respectively. It includes the U.S.S.R. constituent reps. of Armenia, Azerbaijan, and Georgia (q.v.). Georgia joined Russia voluntarily, but the rest of T. was captured by Russia in the 19th cent. from Persia and Turkey, largely with the consent or even support of the local inhab. The period of Russian rule was one of rapid economic and cultural advance and the emergence of a native intelligentsia (q.v.) with autonomist views. After the seizure of power by the Bolsheviks (see OCTOBER REVOLUTION) in 1917 T. separated itself from Russia (see TRANSCAUCASIAN FEDERATION), but was conquered by the Red Army with the help of local Communists in 1920. Within the U.S.S.R. T. is an important producer of oil, manganese ore, tea, citrus fruits, and wine. Transcaucasians, particularly Armenians and Georgians, have played an important part in Russian political life throughout the 19th and 20th cents.

Transcaucasian Federation, ephemeral state formed after the seizure of power by the Bolsheviks in Russia (see OCTOBER REVOLUTION) in 1917, and proclaimed an independent democratic rep. in April 1918. Its legislative assembly, composed of members from Transcaucasia of the All-Russian Constituent Assembly (see CONSTITUENT ASSEMBLY), was dominated by Georgian Mensheviks (see MENSHEVICS), the Azerbaijani party Mussavat (q.v.), and the Armenian party Dashnaktsutyun (q.v.). Because of the difficult international situation—the Turkish invasion to take possession of ters. ceded to her by Soviet Russia in the Brest-Litovsk Treaty, and differences between the parties (owing to the mainly pro-Turkish attitude of the Mussavat)—the T. F. was dissolved in May 1918 into the reps. of Armenia, Azerbaijan, and Georgia (q.v.). After the conquest of these reps. by the Red Army, a Transcaucasian Socialist Federal Soviet Rep. was estab. in 1922, which became a constituent rep. of the Union of Soviet Socialist Republics (q.v.) in the same year. It was abolished in 1936 and the 3 reps. were directly subordinated to the gov. of the U.S.S.R. See F. Kazemzadeh, *The Struggle for Transcaucasia*, New York, 1951; R. Pipes, *The Formation of the Soviet Union*, Harvard, Mass., 1954.

Transcendental Number, a number which is not 'algebraic,' i.e. cannot be the root of an algebraic equation. A T. N. can be expressed as an infinite series, and can be calculated to any degree of precision required.

See also EXPONENT; LOGARITHMS.

Transcendentalism has both a philosophical and a theological meaning. Philosophical T. is associated chiefly with Kant (whose use of the term differs, however, from that of previous philosophers), and his successors who defended the idea of *a priori* (or intuitive) as opposed to a *posteriori* (or experiential) cognition. In

a broader sense, T. signifies the spiritual or intuitive attitude of mind. Theological T. is allied to this latter significance, and expresses the idea of a supersensuous religious consciousness, an intuitive perception of divine truth, as opposed to dogmatic rationalism. The most prominent school of theological T. began in New England (the Transcendental Club, 1836), and included Emerson, Ridley, Bronson, Alcott, Thoreau, Margaret Fuller, and others.

Transcona, tn. of Manitoba, Canada, 6 m. E. of Winnipeg. There is a creosoting works, and railway workshops. Pop. 8270.

Transcription, see ARRANGEMENT.

Transenna, a pierced marble slab or lattice in an Early Christian church.

Transept, in architecture, that part of a cruciform church which lies across, or in a direction at right angles to, the main axis.

Transfer of Shares. Shares in limited-liability companies are transferred by a deed called a transfer which must be signed, sealed, and delivered by transferor and transferee. The transferee must pay the appropriate stamp duty, the amount of which varies according to the amount paid for the shares. The transfer and share certificate are lodged with a registration fee (usually 2s. 6d.). The Articles of Association of some companies restrict the absolute right of transfer of shares. When the transfer has been registered a new share certificate is issued to the transferee, evidencing his title to the shares.

Transferred Epithet, see HYPALLAGE.

Transfiguration, Feast of (the 6 Aug.), commemorates the vision of His glory given by Christ to the Apostles Peter, James, and John (Matt. xvii) after Peter's great confession. The feast was instituted in 1457 for the W. Church, but is sev. centuries older in the E.

Transformer, 2 inductively coupled windings usually wound on an iron core, though air-cored T.s. are used on high frequency. If one winding (the primary) is connected to an a.c. supply, the current produces an alternating magnetic flux in the core which induces an e.m.f. in the other winding (the secondary). The primary voltage is to the secondary as the number of turns in the primary to that in the secondary, assuming that the flux links equally with both windings. When the secondary is supplying current to a load, the secondary current is to the primary as the number of primary turns to the number of secondary turns. This is the transformation ratio, assuming no losses. The actual losses in a T. are partly copper losses due to resistance of the windings, partly core or iron losses due to eddy currents (q.v.) and hysteresis. The former are determined by a short-circuit test: the secondary is short-circuited and the primary is supplied at reduced voltage. The flux due to the secondary current is equal but opposed to that produced by the primary, the core loss is thus negligible, and the power supplied to the T. is expended in copper

losses. When the secondary is open and the primary supplied at normal voltage the current is negligible and the power supplied is expended in magnetisation and iron losses. If V_s = the secondary voltage on open-circuit when the primary is on full voltage and V_r = secondary voltage on full load, the percentage regulation is $100 (V_s - V_r)/V_s$. T. cores are built up of thin (0.014-in.) steel plates bolted together but insulated from one another by paper, varnish, or glass. They have usually 2 limbs, and the windings are coils or discs. Large T.s are immersed in oil in a steel tank, and the oil is cooled by air or water circulating in pipes, sometimes under pressure. Modern T.s are highly efficient, they have no revolving parts, and if properly installed they require little attention. See ALTERNATING CURRENT; ELECTRICITY.

Transfusion, passage of fluid from one vessel to another, especially the introduction of fluid into the blood-vessels. Saline solutions may be used for this purpose, but T. of blood alone provides the necessary ingredients when much blood has been lost. See further BLOOD TRANSFUSION.

Transgression, in geology, the invasion of land areas by the sea, as a result either of subsidence of the land or of a rise of sea-level. Minor T.s have taken place repeatedly in the course of geological hist., and the more recent of such minor T.s are attested by the occurrence of such phenomena as submerged forests and drowned valleys. Major T.s involve the submergence of enormous areas of land, and may result in a total change in the size and shape of the land areas. After a major T. marine sediments are laid down upon the surface of rocks which once formed part of the dry land, and such episodes are therefore marked in the geological record by unconformities (q.v.). The last great marine T. took place towards the end of the Cretaceous Period.

Transients, in electric circuits, machines, and transmission lines, are voltage and current phenomena occurring when a state of equilibrium is disturbed, until a new state of equilibrium is established. They may be due to internal causes—a change of load conditions, the switching-on or -off of a generator, a short-circuit, the action of a circuit-breaker; or external causes—atmospheric conditions, lightning, flash-over of insulators due to fog or moisture. T. often take the form of travelling waves on transmission lines or in transformer windings, which are reflected at points where the line characteristics change, as in connections of cables to overhead lines. In modern interconnected systems spanning many hundreds of miles, covering large areas, and involving vast amounts of energy, generated, consumed, and transmitted over the lines, T. face the engineer with some of the most important—and complicated—problems.

Transistor, a device similar in action to a thermionic valve, consisting of a single crystal of germanium with 3 electrodes, a base, a collector, and an emitter. A

voltage applied between base and collector gives rise to a weak current, a change of current between emitter and base produces amplification of the current through the collector. In one type, the germanium crystal, a small pellet is soldered to a cylindrical brass plug forming the base, the other 2 electrodes on a phosphor-bronze and a copper-beryllium wire placed close together in contact with the crystal. The T. depends for its action on the semi-conducting properties of germanium. It is a very small but robust instrument; its use as power rectifier is being developed, and it is already widely used in hearing-aids and telecommunication apparatus for medium frequencies. See SEMICONDUCTOR.

Transit Circle, see TRANSIT INSTRUMENT.

Transit Instrument, an instrument for determining the moment when a star, planet, etc., crosses the meridian, for the purpose (1) of ascertaining its place 'fundamentally' on the celestial sphere, or (2) of determining the local apparent sidereal time when the star's 'place' is known; from this apparent time the mean solar time follows if the long. is known, or the long. if the mean solar time on some standard meridian (e.g. Greenwich) is known. The instrument consists of a very rigid telescope with its optical axis closely perpendicular to a mechanical axis which terminates in a pair of heavy pivots, symmetrically placed on opposite sides of the telescope. These pivots lie in bearings as nearly as possible horizontal E.-W., so that the telescope can be directed only to points on the meridian. In the field of view is inserted a system of wires—the *reticle*—consisting of 5 or more vertical lines and 1 horizontal line. These wires are usually spider threads, and their distances apart are found very accurately by repeated observations. The time of transit of a heavenly body across the central vertical wire is determined by noting its time of passage across the other vertical wires and then taking the mean; this was formerly done by listening to a clock beating sec. and then estimating the instant to the tenth of a sec. when the body passed over each wire. This 'eye-and-ear' method was replaced by an electric tapper which the observer used the instant the star passed over a wire, and this sent an electric impulse which actuated a pen; this in turn traced a line on a revolving drum of paper on which the sec. of a standard clock were also automatically recorded. The paper recordings could be read at leisure, and this chronograph (q.v.) method was improved on early in the present cent. by the 'impersonal micrometer.' Instead of taking observations by the fixed wires, the observer slowly turns a wheel which moves a wire across the field of view so that the star is bisected by the wire all the time, and as the wire moves it passes over contacts which automatically record the instant very accurately on a chronograph. Continuous observation is unnecessary, because as the star takes about a min. to pass over the field of view the observer

need not concentrate on it, except about the time the star is nearing contact, and in fact when it is nearing this a warning pip on a loudspeaker warns him to concentrate on bisecting the star. A small electric motor is used to drive the wire across the field a little slower than the true speed, and at the end of the transit the wire is rapidly turned back.

Transit Circle (or meridian circle). A transit equipped to determine also the altitude (and hence the declination) of the star at transit. A large divided circle is attached to the transit and read by 4 or 6 fixed microscopes with micrometer eyepieces, and there is a second moving spider-thread, with its micrometer screw, in the focal plane of the telescope, at right angles to the first. The micrometer reading for bisection by this wire is usually taken before and after meridian passage. It has to be combined with the circle readings. The division-errors of the circle must be determined; this is also a laborious process, but in a good instrument they should never change.

Broken Transit. Some small reversible transits have the optic axis turned through a right angle, by reflection at a 45° mirror, so that the light comes out through one of the pivots, made hollow for the purpose; the eyepiece is then in a fixed position on the end of the pivot.

The method of transit-observation was started in principle before actual transit instruments had been invented; the first Greenwich transit was erected by Halley in 1721, and the first transit circle by Airy in 1850. This instrument still defines the Greenwich meridian (as adopted internationally in 1884), but is now a museum piece. Observations are now made at Hurstmonceux with a newer instrument (1955) and are corrected to the Greenwich meridian. For further information see *Astronomy for Everyman* (ed. Martin Davidson), chap. ix, 'Light and Instruments,' by E. G. Martin.

Transjordan, ter. roughly corresponding to the area of the medieval Seljuk kingdom of Kerak and of Oultrejordain in the Lat. kingdom of Jerusalem, is now (together with the Arab parts of Palestine, q.v.) an independent Arab kingdom, the 'Hashemite Kingdom of Jordan' (q.v.).

Physical Geography. The N. part of the ter. is elevated country, rising to about 4500 ft above sea-level, which, on its W. side, declines sharply to the narrow fertile plain of the Jordan valley and, on its E., slopes more gradually to grasslands traversed by the Hejaz railway and eventually becomes merged in the desert. This grassland strip forms the summer pastures of Bedouin tribes who in winter move E. for pasturage. The wheat and barley lands of the Kerak and Balqa tribes, of the Circassian colonies, and of Arab villagers lie W. of the Hejaz railway. Generally speaking, the country to the E. of this railway is largely desert, but to the W. of this line it is potentially of high agric. value. The deep lateral valleys yield water for irrigation of valley lands and of considerable land areas of the Jordan depression which latter are cul-

tivated by semi-nomad tribes or used as winter grazing ground.

Cereals are grown, vines flourish, and some of the anct forests of Gilead survive; but of the whole area of T. only a very small part receives enough rain to render cultivation possible. T. consists of the 5 dists. of Maan, Amman, Kerak, Balqa, and Ajlun, and the Desert Area. There are many large vils. in the N., but the only tns of any size are Amman (the cap.), Salt, and Kerak. There are phosphate deposits; potash is found in the Dead Sea, and possibly there is oil in the S. area. The road running from Amman to Maan has been continued to Aqaba (Akabah), and from this main road, branches run to Madaba, Kerak, Rafiah, Petra, and other tns. A metalled road, fit for motor traffic, connects Amman with Jerusalem.

Population. There has been no official census in T., but in 1938 (the last year an official report was issued) the pop. was estimated at 300,000; of these 260,000 were Arab Muslims, 30,000 were Arab Christians, and 10,000 were Caucasian elements (chiefly Circassian) settled by the Turks over 60 years ago following the Turco-Russian war. There are also small minorities of Turcomans, Persian Baha'is, and Shishans. According to the organic law of 1928, Arabic is the official language (Art. 15), and Islam the State religion (Art. 10). The people of T. are divided into the following groups: (1) the inhab. of the tns; (2) the settled agric. pop. concentrated on the strip of tableland situated on the edge of the Jordan valley and of the Dead Sea, and measuring 200 m. from N. to S. and some 25 m. in average from W. to E.; (3) the semi-nomads living in tents but cultivating the soil; and (4) the Bedouin, or Nomads, who are dependent on their flocks; the nomadic tribes are subdivided (according to the Electoral Law of 1928) into 'the people of the N.' (the Beni Sukhr, Sirhan, Beni Khalid, Issa, and Sleit), and 'the people of the S.' (Howeitat, Mana'in, Hajaya, and others). There are constant seasonal migrations on the part of the Bedouin from T. into Palestine, and from Arabia into T., and back again. Land settlement is important, for the pop. is increasing with remarkable rapidity. Much *mashaa* (common) land has been divided, and a Dept of Development and Hydrographic Survey has been estab. The outlay on social services and public works has increased steadily.

The Formation of the Kingdom of Jordan. Under Turkish rule, T. was part of the vilayet of Damascus. After the First World War the Supreme Council of Allied Powers at San Remo, on 25 April 1920, allocated a mandate for Palestine (q.v.), including T., to Great Britain. This was later confirmed by the Council of the League of Nations on 24 July 1924. In April 1923 the Brit. Gov. recognised the existence of an independent gov. in T. under the rule of Amir (later King) Abdullah (q.v.), and on 20 Feb. 1928 an Agreement between His Britannic Majesty and the Emir (Amir)

of T. was signed in Jerusalem, and having been accepted by the Legislative Assembly (set up under Art. 11) was ratified on 31 Oct. 1929. In 1934 the Agreement was amended, and in 1938 the Organic Law was amended. On 16 May 1938 Great Britain agreed to the formation in T. of a Council of Ministers, responsible to the Emir, in place of the existing Executive Council. In Feb. 1946 the Emir visited the U.K., and a treaty of alliance for 25 years was signed on 22 Mar. 1946; the U.K. recognised T. as an independent state with the Emir Abdullah as sovereign. On 25 Apr. 1946 the Emir was proclaimed King of T. in a ceremony at Amman, and on 12 June 1946 the

technique and varied in form, painted designs being common. The walls of the houses were adorned with amazing fresco paintings, which reached a higher pitch of achievement than the art of Palestine, Syria, and Mesopotamia did for thousands of years thereafter. An important civilisation flourished between the 23rd and 20th cents. BC along the NS. track through central T., but c. 1900 BC the formerly flourishing settlements and fortresses fell into disuse; presumably it was around this period that the catastrophic destruction of Sodom and Gomorrah (Gen. xix. 24-8) took place. Not until the beginning of the 13th cent. AD did a new agric. civilisation appear belonging to the

TRANSJORDAN: THE TOMB OF THE THREE STOREYS AT PETRA

E.N.A.

Foreign Office announced the appointment of an Envoy Extraordinary and Minister Plenipotentiary to T. On 15 Mar. 1948 a new Anglo-T. treaty of alliance was signed in Amman. In June 1949 the name of T. was changed to 'The Hashimite Kingdom of Jordan', and the annexed Arab Palestine forms an integral part of it, see JORDAN, KINGDOM OF.

Prehistoric and Ancient History. T. is rich in ancient remains. There are prehistoric rock-drawings, including representations of the ox and the ibex, which probably come from the Middle Stone Age, and also menhirs and dolmens, which probably date from the Late Stone Age (up to c. 5000 BC). Extremely interesting is the Chalcolithic culture (5th and 4th millennia BC), known as the Ghassulian. It takes its name from the site of its first discovery, Telilat el-Ghassul, just N. of the Dead Sea; it was excavated by the Jesuit fathers from 1929 to 1938. The pottery was much improved in

Edomites, Moabites, and Ammonites. From the 6th to the 2nd cent. BC, there was little or no settlement, and mainly nomadic occupation, but the 1st cent. BC and the 1st cent. AD witnessed the flourishing Nabataean culture (see under NABATAEI), which is exemplified in the abandoned cap. of Petra, one of the most remarkable cities of the ancient world. Also the Decapolis (q.v.) fl. in this period. It is mentioned on 3 occasions in the Gospels. Except Scythopolis (see under BEISAN), all of the towns of the Decapolis lay to the E. of the Jordan. Gadara is identified with the ruins of Umm Qeis, some 5 m. SE. of the Sea of Galilee. Gerasa (q.v.), known to-day as Jerash, lay on one of the tributaries of the Jabbok. Excavations conducted by Yale Univ., Brit. School of Archaeology in Jerusalem, and the Amer. Schools of Oriental Research, in 1925-31 and 1933-4, have revealed that in the early cents. AD Gerasa was one of the most brilliant cities of T. Pella (Fahl), midway between

Gadara and Gerasa, was the city to which the Christians fled from Jerusalem in AD 68 and again in AD 135. Philadelphia (it was formerly known as 'Amman,' having been the chief city of the Ammonites, and it is now called Amman, the cap. of T.), the Rabbat-Ammon of the O.T., was rebuilt by Ptolemy II Philadelphus and named for him: extensive Rom. ruins are still to be seen of this southernmost of the cities of the Decapolis. Christian Bishops of Pella are mentioned as late as the 5th and 6th cents. AD, and a number of early Christian churches (of the 4th to the early 7th cent.) have been investigated in Gerasa (which was shattered by earthquakes in the 8th cent., and left deserted for most of the next 1000 years), but generally speaking T. was already apart from the main streams in which the hist. of the future, till modern times, was to flow. A systematic archaeological survey of T. was carried out, in the years 1933-43 by the Amor. scholar Nelson Glueck, who also discovered (in 3 short campaigns, 1937-40) at Tell el-Kheleifeh (ancient Ezion Geber) on the Gulf of Akabah, remains of copper refineries going back to the 10th cent. BC and the reign of King Solomon.

See F. G. Peake, *A History of Trans-Jordan and its Tribes*, 1934; A. Konikoff, *Transjordan: an Economic Survey*, 1946; J. B. Glubb, *The Story of the Arab Legion*, 1948; King Abdullah, *Memoirs*, 1950. See also bibliography under PALESTINE.

Transkei, native reserve in the Cape Prov. of S. Africa, 16,554 sq. m. of some of the most fertile and beautiful country in S. Africa. The home of 4 tribes, Fingoland, Tembuland, East Griqualand, and Pondoland. There is a high degree of local autonomy administered by the Bunga (equivalent to Native Parliament) estab. in 1895. The apostles of *apartheid* (q.v.) are encouraged in their policy by the undoubted and absolute support of the policy by the Bunga. Under the policy of *apartheid* Europeans can no longer acquire property in Transkeian Ter., and it is probable that some Europeans will be dispossessed and compensated by the S. African Gov. in furtherance of *apartheid* policy. The T. is capable of much greater development, and vast sums are being spent towards this end. Pop. (Europeans) 18,413; (Coloured) 13,677; (Africans) 1,258,590.

Translation, in literature, is the art of rendering the writings of one language into another language. The art of translating lies not merely in translating the literal sense of one language into another, but of translating also the feeling, thought, and character of the work, so that the finished T. is equal in quality to the original. In FitzGerald's T. of the *Quatrains* of Omar Khayyám, the Persian astronomer and poet, the T. is not the accessory, but the equal and even the superior of its original. See J. P. Postgate, *Translation and Translations*, 1922; Theodore Savory, *The Art of Translation*, 1957.

Transmigration, or Metempsychosis, the migration of the soul, as an immortal

essence, into successive bodily forms, human or animal. See REINCARNATION.

Transmission, see GEARING; BELTS and ROPES.

Transmission, Electric, Power, concerns the part of a supply system between the high-voltage busbars of the power station and the first substation. This part is not tapped for supply to consumers on the way. At the substation the voltage is stepped down for distribution, which is usually divided into sev. stages of decreasing voltage by intermediary substations. The stages in the Brit. Grid are 66, 33, 6.6 kV and 415/240 V. The first transmission line was opened 1891, from Lauffen to Frankfurt am Main, operating at 10 kV. The usual voltages at present are 132, 220, 275, and 380 kV. The choice depends on the distance and the amount of power to be transmitted. Up to 200 km. distance the transmission capacities are 70-90 MW at 132 kV, 250-300 MW at 220 kV, 400 MW at 275 kV, and 800-1000 MW at 380 kV. A transmission line has ohmic resistance, inductance, leakage conductance, and capacitance between lines, uniformly distributed along the length. These characteristics depend on the cross-section area of the conductors and on their spacing and, in cables, on the insulation. As a first approximation, ohmic resistance and leakage conductance may be neglected. The a.c. electromagnetic field is then propagated as a wave of wavelength 8000 km. and the instantaneous 'natural' voltage/current ratio is $\sqrt{L/C}$, the characteristic (or surge) impedance, which, for overhead lines is of the order of 500 ohms and for cables about 150 ohms, independently of the length of lines. The 'natural' power

is $E^2/\sqrt{L/C} = P \cdot \sqrt{L/C}$. Owing to the appreciable capacitance of a cable, amounting to about 0.3 μF per m., long-distance high-voltage transmission of a.c. by cables would require such charging current as to make it impracticable. Transmission by submarine cable over any distance is possible only on d.c. A line of 1500 km. length, at $f = 50$ c/s, represents a quarter-wavelength line, with standing waves of current and voltage, equivalent to a resonance circuit. In any transmission line the voltage and current along the line gradually lag behind the sending-end values and the phase angle alters. The first problem in the electrical design is to determine the sending-end voltage and current which will produce the required voltage and current at the load end, given the line length and the characteristics. An equivalent circuit is used in the first approximation: 2 parallel conductors bridged by a capacitor in the middle and with inductance and resistance evenly divided between the 2 halves of the circuit. Approx. values for the characteristics are used, subject to correction for a second approx. design. For long lines, over-excited synchronous motors or static phase-advancers (q.v.) are installed at the load end. When the power transmitted

has the value of the 'natural' power the phase angle remains constant along the line. Overhead-line conductors (q.v.) may be copper, copper-clad steel, or steel-cord aluminium, carried on poles of impregnated wood or reinforced concrete, or on steel pylons, the conductors fixed on pin-type or suspension insulators (q.v.). An earth-wire (see EARTHING) is added as protection. Modern networks are all 3-phase systems (q.v.), but experiments are now being carried out on d.c. transmission. As the amounts of power increase, higher voltages become necessary and the problem of stability becomes important on long lines. This arises from the reactive power required to compensate for the lag of the current in overhead lines, increasing along the line to the extent of endangering the working of a.c. machines. Such problems are absent from d.c. lines. A d.c. system designed by Thury has all power stations and substances connected in series. Any machine is 'disconnected' by being 'bypassed.' The system is based on constant-current supply. See DISTRIBUTION, ELECTRIC POWER; GRID SYSTEM; POWER STATIONS.

Transmitter, any piece of apparatus from which intelligence is sent out by mechanical means, by telephone or telegraph line or, more especially, by radio. A radio T. generates h.f. waves (see RADIO COMMUNICATION); it amplifies these up to the power level required for transmission, impresses upon them, the intelligence to be conveyed (see MODULATION), and finally feeds them to an aerial (q.v.) which sends them into space, subsequently to be intercepted at the receiver (q.v.).

The first stage in a T. is the oscillator (q.v.). The frequency so produced must always bear some simple mathematical relation to the final carrier frequency. Frequency multiplier stages follow the oscillator and double, treble, etc., the oscillator frequency to the required value. After this follow amplifier or 'buffer' valves which bring the level up to that required to drive the output valves, which in turn handle the power delivered to the aerial. If this power is high (several hundred kW in the case of the larger broadcasting stations) the final amplifier valves are usually operated in pairs as push-pull (q.v.) amplifiers with sev. pairs operated in phase to give the required power output. The heat produced must be abstracted by water or air-blast cooling of valve anodes in high-power T.s.

Low-power T.s or portable, mobile, and fixed stations use powers which range from fractions of a watt to a few hundred watts according to the service. Notable among these are the equipments used by the Armed Forces for paratroop communications, etc., where a complete T.-receiver ('transceiver') is powered from dry batteries and has a range of a m. or two. Large units for vehicle use have correspondingly greater ranges, and are powered either by accumulators driving rotary transformers or by petrol-electric generators carried with them.

Special T.s operating in the V.H.F. bands are used for mobile communications work with police forces, fire services, taxi companies, etc. They are crystal controlled, and the portable versions operate at powers of the order of 10 W. Fixed V.H.F. T.s are of lower power than h.f. T.s, since the aerial directivity can be made much greater with consequent saving of T. rating.

T.s for radar (q.v.) and television (q.v.) have special features. The former type are designed to be capable of producing pulses of 1 μ s or less duration having exceedingly high peak power (up to 1 MW). As these pulses are of short duration and their repetition frequency is low, the average power is small. The valves have large cathodes capable of meeting the peak emission requirements, but the anodes are designed to deal with the average power dissipation. Television T.s must possess wideband characteristics if the full picture detail is to be radiated without distortion. The modern tendency is to design such T.s to transmit the carrier and only one sideband, as this leads to maximum economy of frequencies and power rating of the final amplifier. The system is known as 'vestigial sideband' transmission.

See *Admiralty Handbook on Wireless Telegraphy*, 1928; A. T. Starr, *Radio and Radar Techniques*, 1932.

Transmutation of the Elements, the conversion of one chemical element (q.v.) into another. The possibility of T. is a very old belief which formed one of the central ideas of the alchemists who were searching (among other things) for the philosopher's stone which would be the agent for the turning of base metals into gold (see ALCHEMY for a hist. of the early ideas). It was known that iron when placed in a solution of blue vitriol appeared to be converted into copper and that a new substance resembling gold (really an alloy) could be made from copper and arsenic, and these and other observations appeared to confirm such possibilities. Naturally their methods were immature, and the distinction between transmutation and replacement was not appreciated. With the discovery of radium (q.v.) and radioactive substances in general a new era opened (see RADIOACTIVITY). Ramsay and Soddy found that radium bromide, by spontaneous change, gave rise to radon (a gas), and by spectroscopic examination helium gas was shown to be a product of the change. Now it is quite certain that radium itself is an element, so that here there appears to be a definite example of 1 element splitting up to give rise to 2 entirely different elements. This disintegration has been shown to be a characteristic property of radioactive bodies. When an atom loses 1 α -particle (q.v.) (a doubly ionised helium atom) its atomic weight decreases by 4 and its atomic number (i.e. number of positive charges on the nucleus) decreases by 2. On the other hand, when an atom loses a β -particle (q.v., a fast electron) its atomic weight remains unaltered, but its atomic number

increases by 1. In either case it will be noted that a new element is the product of the change (see RADIOACTIVITY). These spontaneous changes therefore do call to mind vividly the ideal of the alchemist-chemists. Natural radioactivity led to the discovery of many properties of the nucleus. Rutherford found in 1917 that natural α -particles reacted with nitrogen nuclei to form oxygen and hydrogen—the first example of artificial transmutation. Since then a very large number of such reactions have been observed, especially after the introduction of such machines as the cyclotron (q.v.) and the nuclear chain reaction (see NUCLEAR POWER) which produce beams of atomic particles. See TRANSURANIC ELEMENTS.

Transnistria, name given by Rumanians to the Rumanian zone of occupation in the SW. Ukraine between the rivs. Dniester (Rumanian Nistru) and S. Bug in 1941-4, with Odessa as cap.

Transom, in architecture, a horizontal bar of stone, wood, or occasionally brick, across a window-opening. T.s. rarely occur before the 15th cent.

Transpadane Republic, see CISALPINE R.

Transparent Ferns, see FILMY FERNS.

Transpiration, evaporation of water from the surfaces of green plants; in part directly from the cuticle or outer epidermal cells, but largely through the stomata, pore openings to the intercellular spaces in the leaves, regulated by bean-shaped guard cells, and most numerous on the undersides of dors-ventral leaves. Factors affecting T. are: 1. Relative humidity of the air; the amount of moisture vapour in the air governs the additional amount it can absorb from plants. 2. Temp.; T. rises and falls with the rise and fall of temp. 3. Light; stomata open as light increases, and close with darkness. Light also quickens molecular movement, and promotes diffusion. 4. Wind; the bending effect tends to pump air in and out of leaves through the stoma pores; drying air currents accelerate the rate of evaporation. 5. Nature of leaf surface; thickness of cuticle, hairiness, wax covering, and texture affect T. rate. Functions of T. are chiefly to regulate temp., by the cooling effect of evaporation; and to initiate flow of water transporting mineral salts from the soil, through and up the plant, a flow known as the T. stream. Excessive T. results in wilting. When water is forced up through the plant by root pressure more quickly than it can be transpired, drops are forced out through special glands, hydathodes, around leaf margins, and this is called guttation. Plants growing in dry situations (*xerophytes*) transpire more rapidly than plants of more normal situations (*mesophytes*) when the water supply is adequate, but apparently resist desiccation in drought by efficient stomatal control, certain xeromorphic features of form and structure, such as thick cuticle and leaf walls, sunken stomata, fleshy leaves, relatively small leaves, etc., and a protoplasmic property resistant to drying-out. See H. H. Dixon, *Transpiration and the Ascent of Sap in Plants*, 1914; *The*

Transpiration Stream, 1924; N. A. Mazimov, *The Plant in Relation to Water*, 1929; E. C. Barton Wright, *Recent Advances in Plant Physiology*, (2nd ed.), 1933; and E. C. Miller, *Plant Physiology*, 1939.

Transplanting, the removal of a plant from one situation to another. As a rule, newly germinated seedlings recover best when moved as young as practicable. Some plants, such as brassicas, benefit from the breaking of the tap root, which induces a good fibrous root system. Deciduous trees and shrubs are best transplanted in mild open weather between Oct. and Mar.; evergreens in early autumn or late spring. By spraying foliage and stems with a plastic transplanting material, plants may also be moved in full growth. It is important that roots should never be allowed to dry out, and the sooner plants can be reformed in prepared stations, the better. Some plants dislike root disturbance or breakage and are transplanted out of pots.

Transport. For land T., see BUSES AND COACHES; CARRIER, COMMON; ELECTRIC TRACTION; MOTOR CAR; MOTOR TRANSPORT, COMMERCIAL; RAILWAYS; TRAMWAYS; for sea see CANAL; DOCKS; LIGHTER AND LIGHTERMAN; LLOYD'S REGISTER; SHIPPING ROUTES; SHIPS AND SHIPBUILDING; for air T., see AIR MAIL; AVIATION, CIVIL. See also TRANSPORT ACT, 1947.

Transport, Military, process of carrying supplies for a military expedition. The armies of the Middle Ages invariably lived on the country in which they were campaigning, with the result that the inhab. were quickly rendered destitute of food and the army itself became ineffective through the impoverishment of the country. In modern armies a specialised branch of the military organisation is devoted to questions of T. and supply, and the Brit. Army, has a well-developed T. service. Road T. is worked by the Royal Army Service Corps. The supply of field units is divided into 2 echelons. 'A' echelon carries ammunition, tools, and ambulance supplies, and is in immediate contact with the fighting troops; 'B' echelon carries camp supplies, with a reserve of ammunition, tools, medical supplies, etc. Airborne supplies played a large part in the success of the Allied defence and recovery of Burma in the Second World War. See also ROYAL ARMY SERVICE CORPS; MILITARY VEHICLES.

Transport and Civil Aviation, Ministry of. The powers and duties of the Minister now relate to the following 4 categories:

1. *Inland Transport*—railways, tramways, inland waterways; roads, bridges, and ferries and vehicles and traffic thereon.

2. *Shipping*—national and international shipping policy; harbours, docks, and piers; ships and their personnel; safety of life at sea, navigation (including pilotage, lighthouses, and other aids to safety in navigation); wreck and salvage; the investigation of casualties to ships and

their personnel; coastguard; and boiler explosions at sea or on land.

3. *Civil Aviation*—the organisation, implementation, and encouragement of measures for its development; the promotion of safety and efficiency in the use of civil aircraft; research into matters relating to the navigation and operation of aircraft; general oversight of the activities of the Air Corporations; the investigation of aircraft accidents; the licensing and supervision of training arrangements for aircrews.

4. *Civil Aviation Services*—the operation of over 30 civil aerodromes, including fire and constabulary services, air traffic control, and telecommunications; technical training schools.

Transport Salaried Staffs' Association (T.S.S.A.), formerly **Railway Clerks' Association** (founded 1897), represents the great majority of administrative, clerical, supervisory, professional, and technical staffs employed under British Transport Commission, and Irish and Ulster Transport Authorities, and negotiates agreements on their behalf. It is a party to national negotiating machinery, and is represented on Joint Advisory Councils for training, education, welfare, etc. It is affiliated to the T.U.C. and Labour party. The membership is over 90,000; funds £1m.

Transportation. According to Stephen the earliest instances of T. as a punishment in England probably occurred in the reign of Charles II, when pardons were granted to persons under sentence of death conditionally on their being transported for a number of years, usually 7. T. was unknown to the common law (q.v.). T. was not legalised until an Act of 1719. During the 18th and early part of the 19th cents. numerous Acts were passed by which various terms of T. with alternative terms of imprisonment, and, in some cases, whipping either as an alternative or cumulative punishment, were allotted to specific offences. In 1783 convicts were first transported to Botany Bay, Australia, but this ceased in 1840, and from then until 1853 they were sent to Tasmania, which already had penal settlements. T. was gradually abolished between 1853 and 1864, principally because the colonies objected to receiving the convicts; penal servitude or imprisonment with or without hard labour being substituted. In Russia, before the Oct. Revolution, T. was a common practice, prisoners being sent to Siberia, especially to the silver mines of Nerchinsk. Many of these prisoners were transported for purely political offences. A similar system still prevails. The system was until recently still practised in France and other countries.

Transporter Bridge, see **BRIDGE**.

Transposing Instruments. Many wind instruments are built in fundamental tunings in which the major scale without key signature, written as C major, actually sounds higher or lower. A clarinet in B \flat , for example, will automatically play the scale of that key when the music is written in C major; or, conversely stated,

if it is to play a piece in F major, the music must be written in G major, and so on. A horn in F will transpose a fifth down, a trumpet in F a fourth up, and both will play, for example, in E \flat if their music is written in B \flat , but the former an octave lower than the latter. Among the most common orchestral instruments, Eng. horns, clarinets, horns, and trumpets are T. 1.; flutes, oboes, bassoons, and trombones are not.

Transposition. The process, either in composing or performing, of turning a piece or passage from one key into another in such a way that the music remains exactly the same except for the change in pitch. All melodic and chordal intervals thus remain of the same size, whatever the new key may be. The difficulties of T., both in writing and in playing, are somewhat mitigated by the mathematical fact that, owing to the change in key signature, all accidentals arising incidentally in the course of the music (i.e. not contained in the key signature) still remain accidentals. In a piece transposed from E major up to F major, for example, an incidental A \sharp will become B \natural , and incidental F \natural will be G \flat , and so on. Accompanists are often required to transpose at sight when a song is too high or low for a singer's voice, and occasionally the instrumental parts of a whole orchestra have to be transposed in the same way for similar reasons. A special kind of double T. is sometimes made by horn players when they wish to play on the usual horn in F a part written for a horn in some other tuning.

Trans-Siberian Railway, longest railway in the world, from Chelyabinsk in the Urals to Vladivostok on the Pacific, 4388 m.; it was built between 1891 and 1915, most of it with record speed in 9 years, 1891-9. It greatly facilitated Russian colonisation of Siberia and the Far East. In connection with its construction large-scale geological prospecting of the Kuznetak, Karaganda, Ekibastuz, and Chermkhovo coal basins, Amur and Kolyma gold deposits, etc., was carried out, which laid the basis for the future economic development of Siberia. A through service is operated from Moscow to Peking over the Trans-Siberian and the Changchun Railway (see **CHINESE EASTERN RAILWAY**) via Harbin and Mukden. A new line under construction across Mongolia will greatly shorten the route between Moscow and Peking.

Transubstantiation (Lat. *transubstantiatio*, change of substance), the change which is believed by Rom. Catholics to take place in the Eucharistic elements of bread and wine, in virtue of the consecration, viz.: the whole substance of the bread and the whole substance of the wine is changed into the Body and Blood of Christ, the accidents alone remaining. By 'accidents' is meant those qualities or conditions which produce upon the senses the impression of the presence of bread and wine.

Transuranic Elements, are chemical elements with an atomic number i.e.

number of positive charges on the nucleus, greater than that of uranium ($Z = 92$). Until 1936 no such elements were known, but in that year Hahn, Meitner, and Strassman in Germany interpreted some phenomena associated with the bombardment of uranium with neutrons (q.v.) as the emission of a β -particle from a uranium isotope (q.v.). This would be expected to produce a nucleus with $Z = 93$ (see RADIOACTIVITY), and further work by McMillan in America confirmed the existence of such an element, which came to be known as *neptunium*, symbol Np, after the planet Neptune, which lies beyond Uranus in the solar system. Sev. isotopes of neptunium were soon prepared, and some were β -active, thereby producing another new element, $Z = 94$, named *plutonium* (Pu), which plays such an important role in the Atom Bomb (q.v.) and Nuclear Energy (q.v.). Further elements were discovered as the result of nuclear reactions induced by α -particle or neutron bombardment, with the designations:

Z = 95,	Am	Americium,
96,	Cm	Curium,
97,	Bk	Berkelium,
98,	Cf	Californium,
99,	E	Einsteinium,
100,	Fm	Fermium,
101,	Mv	Mendelevium,
102,	No	Nobelium.

Transvaal, original prov. of the Union of S. Africa, lies immediately N. of the Orange Free State and Natal and S. of S. Rhodesia, bounded E. by Portuguese E. Africa and Swaziland, and W. by Cape Prov. and the Bechuanaland Protectorate. The Limpopo or Crocodile R. flows along its N. frontier, and the Vaal R. marks its S. border. The area of the prov., which is divided into 45 dists., is 110,450 sq. m. In 1903 about 7000 sq. m., including the dists. of Wakkerstroom, Utrecht, and Vryheid, were annexed to Natal. The pop. (census 1936) was 3,341,470 (European, 820,756; non-European, 2,520,714). According to the census in 1946 the pop. had increased to 4,183,779 (European, 1,041,835; non-European, 3,141,944). The cap. of the T. is Pretoria, which is also the administrative cap. of the Union of S. Africa (white pop. 124,500, census 1946) but the largest tn is Johannesburg, with a white pop. (city and suburbs) 330,100 (census 1946). Johannesburg is 5740 ft above sea-level and is built close to the summit of the Witwatersrand. Other large tns are Germiston, Brakpan, Springs, Benoni, Krugersdorp, Roodepoort, Boksburg, Potchefstroom, and Vereeniging. The T. is represented by 64 members in the House of Assembly of the Union. In addition, there is a Prov. Council of 64 elected members. The surface has an average elevation of 4000 ft. A plateau, called the High Veld or Hooge Veld, extends across the prov., broken here and there by low mts and detached heights. The chief mts are the Witwatersrand, lying between Pretoria and Johannesburg on the E. and Mateking on the W.; the Lydenburg and

Barberton Mts in the dist. of Barberton; the Sand River Mts in the dist. of Waterberg; and the Murchison and Zoutpansberg ranges in the Zoutpansberg dist. The land slopes in wide plains in 3 directions: N. to Limpopo, S. to the Vaal, and E. to the sea. The High Veld forms the watershed between the basin of the Limpopo and the basin of the Vaal, their numerous tribs., including the Olifants R., the Ingalele, the Sand R., the Marico, and numerous other streams, flowing N. and S. from the Witwatersrand. The rivs. in the SE. of the prov. flow towards Delagoa Bay. The largest lake is Lake Chrissie, NE. of Ermelo, S. of the Witwatersrand Range, which forms the N. limit of the High Veld area. The climate may be regarded as not only uniformly healthy, but as perhaps the most delectable in the world. Even in summer the heat is rarely oppressive and the nights are cool; a rainfall of about 30 in. occurs generally in short and sometimes violent thunderstorms. The Berg winds, at times so oppressive on the coast, are unknown. In the winter, night frosts are frequent and winds are cold. Every few years a snowfall occurs, occasionally to a depth of sev. in. The chief industry is gold mining, extensive mines being in operation near Johannesburg, Witwatersrand, and Barberton. The output of gold has risen steadily from about 2,000,000 fine oz. at the beginning of the cent. to 13,210,000 fine oz. in 1954. The highest monthly value ever obtained in the T. and Orange Free State was 1,191,827 oz. valued at £14,937,565. Over 95 per cent comes from the Witwatersrand.

The output of diamonds has fluctuated. The peak year since 1883 was 1910, the output for which was 2,090,068 carats with a value of £1,416,464. Ten years later the output had gone down to 905,297 carats with a value of over £3m., and in 1930 an increased output had a value of only £2m. Since 1930 there was a decline and a number of mines stopped operations. In 1939 an output of only 85,000 carats had a value of £192,000. During the war years there was a further decline, and washing operations ceased altogether. In 1954, however, diamond production in the T. was 1,431,281.00 carats from mines, valued at 42s. per carat, and 159,878.50 carats from alluvial diggings, valued at 74s. 11d. per carat. The largest diamond mine in the T. is the Premier Mine, 25 m. E. of Pretoria; it yields the great bulk of the T. mine stones. The prin. sources of alluvial diamonds are in and near the bed of the Vaal R., in the SW. T. It was on 16 Jan. 1905 that the 'Cullinan,' the largest white diamond, was found; its weight was 3024½ carats (1½ lb.). Coal has become important, the value of production in 1949 being over 19,000,000 tons, valued at over £6,300,000. The output of copper ore averaged at 13,000 tons in the 10 years 1930-40, with a value of £1,206,700 in 1949. Other minerals are tin, chromium, manganese, nickel; platinum was discovered in 1923.

In addition to the export of minerals, there are large exports of horses, mules,

tobacco, coal, wool, clothing, jewellery, skins, hides, horns, machinery, hardware, and coaches. The T. has iron and brass foundries and engineering works, grain mills, printing works, tobacco factories, brick and tile and pottery works, breweries, coach and wagon works, soap and candle factories. Agriculture is also a prominent industry and continues to grow in importance. The production of wheat on European farms for 1949 was 433,869 300-lb. bags; but the larger crop is maize, the annual production on European farms for 1949 being 10,388,190 200-lb. bags. Stock raising is the most important agric. occupation; the veld supports large numbers of cattle, horses, sheep, and pigs (the live-stock in 1949 numbered close upon 4,000,000 cattle, 3,000,000 sheep, 1000 goats, 300,000 pigs). The ann. expenditure of the prov. is within the normal revenue (£49,177,113 for 1949).

There are in the T. 761 primary and secondary public schools and 52 high schools for Europeans, with over 184,500 pupils; 1,269 state and state-aided schools for coloured, native, and Indian children, with nearly 320,000 pupils; and 4 training institutions for European teachers, and 12 for coloured teachers. No doctrine or dogma peculiar to any religious denomination or sect may be taught in these schools. The Dutch churches take first place, being followed by the Anglican, Presbyterian, Methodist, Rom. Catholic, Apostolic Faith Mission, Lutheran.

History. The T. was practically unknown ter. before the advent of the Boers, who trekked from Cape Colony in 1836-7, first came into collision with the Matabele in the vicinity of Kroonstad in the Orange Free State, and finally drove them from N. of the Vaal, which they crossed themselves in 1836. Under the command of Hendrik Potgieter, they drove the Zulu warriors of Moslekatshe, the revolted gen. of Chaka (successor of Dingiswayo, chief of the Ababewu, and leader of a confederation of warriors of Zululand), across the Limpopo. After the overthrow of Dingaan, the successor of Chaka, by Pretorius, the independence of the rep. was acknowledged by Britain at the Zand R. Convention of 1852, and Marthinus Wessels was elected president 3 years later. The Boers were constantly at war with the natives, especially on the N. and E. borders, and in 1876 a commando was sent to attack Sekukuni, a native chief living S. of the Olifants R., which, however, was defeated. This reverse caused the Transvaalers to appeal to Britain for help. In consequence of their financial difficulties and troubles with the natives, the country was annexed by Britain in 1877 by Sir Theophilus Shepstone. Three years later the Boers took up arms for the restoration of their independence, and after the fall of Colley at Majuba Hill, they gained their object in 1881, subject to the suzerainty of the Brit. Gov. Gold had been worked since 1869, but it was the discovery of the Witwatersrand goldfields in 1886 which opened up the country to prospectors. It brought a great influx

of 'Uitlanders,' who were looked upon with considerable disfavour by President Kruger. Difficulties arose, leading to the Jameson Raid and the gauntlet being thrown down to Britain in 1899, culminating in the Boer war, which resulted in the loss of Boer independence in 1902. On 31 May 1910 the T. was merged in the Union of S. Africa. (See SOUTH AFRICA, UNION OF.)

See H. Cloete, *History of the Great Boer Trek*, 1899; W. C. Willoughby, *Native Life on the Transvaal Border*, 1900; P. Kruger, *Memoirs of Paul Kruger*, 1902; W. J. Leyds, *The First Annexation of the Transvaal*, 1906; G. McCall Theal, *History of South Africa since 1795*, 1916-20; C. L. Harries, *Laws and Customs of the Bapedi of the Transvaal*, 1928; A. K. Bot, *A Century of Education in the Transvaal*, 1936; *Cambridge History of the British Empire*, vol. viii, 1938; D. Jacobsen, *Fifty Golden Years of the Rand*, 1936; J. Gray and E. L. Gray, *Payable Gold*, 1937.

Transverse and Transversal, in geometry, the straight line intersecting 2 parallel straight lines. The angles formed are thus related: (1) alternate angles are equal; (2) the exterior angle is equal to the interior and opposite angle on the same side; (3) the sum of the 2 interior angles on the same side is equal to 2 right angles.

Transylvania, prov. of Rumania, the Carpathian Mts bound it to the E. and N., the Transylvanian Alps to the S., the Munții Apuseni to the SW. and lower hills to the NW. The area is 22,312 sq. m. The surface is tableland, maintained over the greater part, and is watered by the numerous affluents of the Pruth and the Tisza. The minerals include gold, silver, copper, iron, quicksilver, lead, and salt. Stock-raising, agriculture, and fruit-growing are important industries; wine is made and brandy distilled. A fertile plain in the centre of the country yields large crops of maize, wheat, rye, flax, hemp, potatoes, and tobacco. There are 5,500,000 ac. of forest. Cluj (former Kolozsvár or Klausenburg), Stálin (Brasov, Brassó, Kronstadt), and Sibiu (Nagyseben, Hermannstadt) are the chief towns. A univ. was founded at Cluj in 1919. Pop. 3,100,000, consisting of Rumanians, Magyars, and Germans. T. corresponds with the Rom. Dacia, which was overrun by the Huns under Attila in the 5th cent. This invasion was followed by incursions from the Gepidae, the Avars, the Slavs and the Magyars under King Stephen of Hungary, who appeared at the close of the 9th cent. and won T.'s alliance in 1002. In the 13th cent. many thousands of Germans settled in T. which in the 16th cent. became a principality when John Zapolya, the voivode of T., threw off his allegiance to the emperor and acknowledged the suzerainty of the sultan. In the early part of the 19th cent. efforts were made to bring about a union with Hungary, which ended in T. being made a crown land of Austria in 1849. In 1868 the principality was merged into the Austro-Hungarian empire. As a result of the First World War Rumania gained accessions of ter., including T. (confirmed by

the treaty of St Germain, 1919). In Aug. 1940 Hungary with Ger. support demanded the return of T. A settlement was then imposed by Germany and Italy. By the resulting Vienna award (30 Aug. 1940) some three-quarters of T., comprising 17,000 sq. m. and a pop. of 2,500,000, was ceded to Hungary, including valuable mines and agric. and forest land. The Russian Army entered T. in Aug. 1944, and on 10 Mar. 1945. the ter.

Rumanian Legation

A WOODEN CHURCH IN TRANSYLVANIA

was restored to Rumania. This was confirmed by the peace treaties between the Allied and associated powers with Rumania and Hungary (10 Feb. 1947). By the terms of these treaties the 1938 frontiers between Rumania and Hungary were restored, placing T. in Rumania. See E. Gerard, *The Land Beyond the Forest*, 1888; L. von Sawicki, *Beitragen zur Morphologie Siebenbürgens*, 1912; N. Jorga, *Histoire des Roumains de Transylvanie et de Hongrie*, 1915-16; J. Cabot, *The Racial Conflict in Transylvania*, 1926; W. Starkie, *Raggle-Taggle*, 1933, 1947; T. G. Ciupagca, *Nouvelles données sur la structure du bassin transylvanien*, 1935.

Trap, term applied vaguely, in geology, to any dark-coloured fine- or medium-grained basic igneous rocks, such as dolerite and diabase. Mica-trap is the name applied to mica-lamprophyre. These trap rocks occur as dyke rocks and lava flows.

Trapani: 1. Prov. of Italy, in W. Sicily (q.v.). It has coast-lines on the N., W., and S., and there are mts in the N. and E. The chief rivs. are the Belice, Mazara, Bordinio, and Freddo. The prin. tns include T., Marsala, Castellammare del Golfo, and Alcamo (qq.v.). Area 965 sq. m.; pop. 422,000.

2. (Anct Drepana), seaport in Sicily, cap. of the prov. of T., 44 m. WSW. of Palermo (q.v.). It is on the NW. coast, and was once the port of Eryx (q.v.). In a naval battle here in 249 BC Carthage (q.v.) was victorious over Rome; and in a naval battle in 1266 the Venetians here defeated the Genoese. During the Second World War there was much damage. T. has a cathedral (1635) and some fine baroque buildings. It has salt, wine, macaroni, and tunny-fishing industries. Pop. 71,800.

Trapassi, Pietro Antonio Domenico Bonaventura, see METASTASIO.

Trapeze Artist, see ACROBAT.

Trapezium, a quadrilateral having one pair of opposite sides parallel. Area = $\frac{1}{2}(a + b)p$.

Trapezoid is sometimes used for a quadrilateral in which no pairs of sides are parallel.

Trapezus, see TRABZON.

Trapping and **Trappers**. The art of capturing or killing animals by means of traps has been practised since prehistoric times, and is one of the oldest in existence. The earliest trap was probably the simple pitfall, a cavity dug in the ground into which the unsuspecting victim fell. A variation of this type of trap is a cage into which the victim is lured but from which it cannot escape. A second type of trap is a mechanical device, or perhaps a snare made of cord or wire, which seizes the victim and holds it without killing it. There is also a third type of trap, of which there are various forms, designed to kill rather than merely to capture the victim.

Trapping is practised to some extent in many parts of the world where game animals form part of the food supply, but it is chiefly used as a means of capturing animals in order to secure their pelts or furs without damage. Since the fur-bearing animals live in the cold N. climates, N. Canada and the N. parts of the U.S.S.R. are the prin. areas of the

world where trapping is carried on on a large scale for commercial purposes. In Canada it was the possibilities of the fur-trade that led to the founding of Quebec by Champlain in 1608 and to the further exploration and opening up of the interior. During the whole period of Canada's early hist., furs remained the prin. article of commerce and the basis of the country's economy. Furs still contribute many millions of dollars annually to the national income (over \$24m. in 1952), and although fur-farming has developed rapidly during the present cent. nearly 60 per cent of the total ann. value is provided by trapping. Wild fur-bearers are still taken in moderate numbers in settled parts of Canada, but settlement has so reduced their numbers that the main trapping areas are now N. Ontario, the N. parts of the Prairie provs., and the NW. Ters. The season for trapping, of course, is in the winter, when the animals' furs are in the best condition. Muskrat and squirrel provide the greatest numbers of pelts taken annually; mink, beaver, and muskrat lead in value.

The numbers of some fur-bearing animals are subject to marked fluctuations from year to year, and changes in fashion, causing fluctuations in the demand for particular kinds of fur, also affect the ann. 'take.' For these and other reasons, the conservation and management of fur-bearers is receiving increasing attention in Canada from federal and prov. authorities. All Canadian provs. and ters. now have trapping regulations, and individual trappers are licensed. Some provs. register trap-lines, while others register trapping areas. Responsibility is put upon individual trappers to conserve the wild-life in their own areas and to guard against practices which may deplete or wipe out the local pops. of fur-bearers on which their livelihood depends.

The most important aspects of management of the fur-trapping industry are: constant scientific research, maintenance and improvement of habitat, regulation of the harvest of fur-bearers, provision of competent and adequate field staffs, and free education of trappers in the principles of wild-life management. By these means many areas depleted of fur-bearers have once again become productive.

Trappists, name usually given to a branch of the Cistercian order reformed by Dominique Armand Jean le Bouthillier de Rancé (1626-1700). Until the age of 34 de Rancé led the voluptuous life of a courtier-priest. Then in 1660 a sudden change came over him and he retired to live a life of austerity and devotion in the Cistercian abbey of La Trappe, which had long formed part of his possessions. The abbey, which had been founded about the middle of the 12th cent. was lax in discipline, and it was with the greatest difficulty that de Rancé introduced his strict observance. The new community devoted itself to the observance of strict silence and seclusion from the world, to hard labour, to total abstinence from wine, meat, eggs, fish, and all seasoning of

their simple diet of bread and vegetables. The reform of La Trappe spread to other houses, and is found to-day all over the world, even in China. The prin. Trappist monasteries in the Brit. Is. are at Mount St Bernard, Leicestershire, Caldey Is., S. Wales, and Mount Melleray and Roscrea, Ireland. See L. F. Du Bois, *Histoire de La Trappe*, 1924; Y. von Estienne, *Les Trappistes*, 1937; T. Merton, *Elected Silence* (in U.S.A., *Seven Storey Mountain*), 1949.

Trasimene Lake, also known as Lake Perugia, in Umbria, Italy. In 1898 it was partially drained into the Tiber, some 5500 ac. of land being reclaimed. It is famous for Hannibal's great victory over the Romans under Flaminius, gained on its shores in 217 BC.

Trás-os-Montes e Alto Douro, prov. of N. Portugal, containing the dists. of Bragança and Vila Real, and parts of the dists. of Guarda and Viseu (qq.v.). It is generally mountainous, and is crossed E.-W. by the valley of the Douro (q.v.). The prin. tn is Vila Real. Area 4569 sq. m.; pop. 636,350.

Traumatic Neurosis, see SHELLSHOCK.

Traun, Lake, see SALZKAMMERGUT.

Trautenuau, see TRUTNOV.

Travancore, former state of India, stretching along the Malabar coast from Cape Comorin to Cochin, its shores being washed by the Indian Ocean. It is 140 m. long, with a maximum breadth of 70 m. The coast is low, but the foothills of the W. Ghats diversify the scenery and slope towards the ocean. Its cap. is Trivandrum. Since 1949 T. has formed part of the joint State of Travancore-Cochin. It has the reputation of having the highest standard of literacy in India, and the univ. (1935) was founded by the Maharajah. It is identified with the anc. Kerala, and together with Cochin and the Malabar Dist. of Madras State is the area where the language Malayalam is spoken, now Kerala State.

Traveller's Joy, see CLEMATIS.

Traveller's Tree, or *Ravenala madagascariensis*, tree with long and large fan-shaped leaves, the petioles or leaf stalks of which form a large cavity at their base, in which water collects, forming a useful store for travellers and animals.

Traverse, in pleadings, means denying the whole or some essential part of the averments of fact contained in the opponent's pleading. There are 2 other ways of dealing with the opponent's pleading, namely, by *confession and avoidance* (q.v.) and by an *objection in point of law*. Formerly the party pleading had to elect which of these 3 courses to adopt, but now he may adopt either or any of these methods, though a good pleader will not multiply the issues needlessly, for the client may be ordered to pay the costs of the issues on which he fails. A T. cannot be made to do the work of a plea in confession and avoidance; its office is to contradict, not to excuse. Matter justifying an act may not be inserted into a plea which denies the act. As a rule the burden lies on the opponent to prove at the trial the facts which are

traversed in the pleadings. There are 3 fundamental rules in traversing: every allegation of fact, if not denied specifically or by necessary implication or stated to be not admitted in the pleading of the opposite party, will be taken to be admitted (except as against an infant, lunatic, etc.); each party must deal specifically with each allegation of fact of which he does not admit the truth, except damages; and when a party denies an allegation of fact in the previous pleading of the opposite party, he must not do so evasively, but answer the point of substance.

Traverse City, city, co. seat of Grand Traverse co., Michigan, U.S.A., on Grand Traverse Bay of Lake Michigan in orchard, farm, resort area, with fisheries. It has some manufs. Pop. 17,000.

Traverser Bridge, see **BRIDGE**.

Travertine, or **Calc-sinter**, is porous calcareous material deposited from mineral springs (q.v.). There are well-known T. deposits at Tivoli, near Rome, and in the Auvergne dist. of France. T. may be chalk-like in texture, but is often hard enough for building stone, many of the buildings in Rome (e.g. St Peter's) being built with it. At San Filippo the T. is deposited at the rate of 3 ft a year.

Travnik, tn in Bosnia-Herzegovina, Yugoslavia, on the Lašva. It is Oriental in appearance, has an anct citadel and Turkish walls, and was once the seat of the viziers of Bosnia. Pop. 12,900.

Trawling, see **FISHERIES**.

Treachery, see **TREASON**.

Treacle, see **MOLASSES**.

Treadmill, known as 'the everlasting staircase', worked by persons treading on steps fixed on the periphery of a wheel. It was once used as a means of prison discipline, or to give useful employment in the shape of grinding corn or moving machinery to persons imprisoned for crime, and came under the category of 'hard labour'. The prisoners held on to a hand rail and worked in separated compartments, the speed being regulated by a warden by means of a lever.

Trearddur, see **HOLY ISLAND**.

Treason, treachery against the sovereign. By the Statute of Treasons, 1351, it is T.: (1) To compass the death of the king, queen, or their eldest son. 'Compass' imports design, which must be manifested by an overt act (e.g. providing weapons), for idle words do not now constitute T., though they may amount to a misdemeanour. The conviction of Peacham and Sydney shows that the commission, even without pub. of 'treasonable' ideas, or writing is T., but it is extremely doubtful whether a modern judge would direct a conviction for T. at the present day. (2) To violate the king's companion, eldest unmarried daughter, or eldest son's wife. (3) To levy war against the king in his realm. This includes levying war to reform religion, remove councillors, or redress grievances, inasmuch as private persons may not forcibly interfere in grave matters, e.g. in Anne's reign Darnace and Purchase were convicted of T. for burning certain dissenting meeting-houses, the court inferring a

general design against the State. (4) To adhere to the king's enemies in his realm by giving them aid in his realm or elsewhere. The overshadowing power of present-day central govts. makes it grotesque for any individual to hope to approach a project of rebellion in England with the prospect of even partial success. When the case of R. v. Lynch (1903) came before the courts there had not previously been a charge of high T. tried for 62 years. It was moved to quash the indictment (q.v.) in this trial on the ground that each count charged an adhering 'without the realm' (viz. in the Transvaal), and so disclosed no statutory offence. The court held that the statutory words did not mean merely that the accused *being in the realm* has been adherent to the king's enemies *wherever they were*, for that so narrow a construction not only would enable an Englishman to engage with a hostile Power against his own country so long as he took care to remain abroad, but also makes the words 'or elsewhere' meaningless. (5) To counterfeit the king's seal or money or to import money (not now T.). (6) To slay the chancellor, treasurer, or king's justices. The punishment for T. was formerly hanging, drawing, and quartering after the traitor had been dragged to the place of execution on a hurdle; it is now hanging only. T. cannot be committed against a *de jure* king who is not also *de facto* king. In the case of Roger Casement (q.v.) in 1916 it was decided that a man may 'adhere to the king's enemies in his realm' and be found guilty of T. whether the act complained of was committed within or without the realm.

Early in the Second World War a new Treachery Bill was passed in the House of Commons. Its object was to close up any legal loophole which might be found in the anct statute and its interpretations; for instance, it was not clear to whom the former Acts could be extended and whether they applied to all aliens or only those normally living within the king's jurisdiction. They might, in consequence, be held to be inapplicable to aliens coming into this country under the guise of refugees for the sole purpose of espionage or sabotage. Secondly, the crime of T., because of its gravity, was accorded a special form of trial, and it was in order to avoid a cumbersome procedure that the new Bill was necessary, so that persons accused of treachery under Clause I could be tried in accordance with the ordinary procedure of the courts. The third reasons why new legislation was thought advisable was to make provision whereby enemy aliens could be tried in suitable cases by court-martial, though any Brit. subject or neutral alien retains the right to be tried by jury. Finally, in accordance with the old Treason Laws, the Treachery Bill imposes the death penalty for persons found guilty under it.

The trial of William Joyce for T., in 1945 (appeal dismissed by the Court of Criminal Appeal, 7 Nov. 1945, and by the House of Lords, 31 Jan. 1946), estab. important points of legal principle. The

majority judgment decided that an alien can in law be guilty of T. to the sovereign in respect of an act committed outside the realm. The case establishes that an alien, as long as he holds a Brit. passport, commits T. within the meaning of the Statute of 1351, if he adheres to the queen's enemies. In effect, a passport issued by the Brit. authorities imposes on an alien the obligation of allegiance to Her Majesty; and that obligation is equally binding within and without the realm.

By the constitution of the U.S.A., T. consists in levying war against them or in adhering to their enemies, giving them aid and comfort. The punishment by an Act of 1790 is death by hanging; it was altered at the time of the Civil war to death, or at the discretion of the court imprisonment for at least 5 years with hard labour and a fine of not less than \$10,000; this included disability to hold office. In some state constitutions there are provisions for T. against the State as distinct from the Federal Gov.

See also CRIMINAL LAW; POLITICAL OFFENCES; ROYAL FAMILY.

'Treasure State,' see MONTANA.

Treasure Trove. Money, plate, or similar articles discovered hidden in the earth or some other secret place after so long a time that the owner is unknown. In default of finding the owner, the estab. principle of Eng. law is that the Crown is entitled to the treasure. Finders are legally entitled to obtain the market value of their discoveries without any deduction for expenses. The chief finds in Great Britain are of gold and silver coins, and the orthodox definition of T. T., 'objects of gold or silver which have been hidden in the soil or in buildings, and of which the owner cannot be traced,' is repeated in the leaflet issued by the Brit. Museum on the agreement, which points out that finders should report to the coroner either direct or through the police or the Director of the Brit. Museum. If the objects are retained by the Crown or a museum the finder will receive their full antiquarian value; if not retained he will receive back the objects or, if he wishes it, the Brit. Museum will sell them at the best price obtainable. See LOST PROPERTY. See G. F. Hill, *Treasure Trove in Law and Practice*, 1936.

Treasury, central dept of State concerned with the management of the financial resources of the U.K., control of public expenditure, and supervision over the Civil Service (q.v.); it also co-ordinates general economic policy and planning. The origin of the T. Board, consisting of a number of lords commissioners, was the occasion in 1612 on which the office of Lord High Treasurer was first put into commission; the Board has been continuously in commission since 1714. With rare exceptions the First Lord of the T. has, since 1721, been the Prime Minister. The Chancellor of the Exchequer as Second Lord of the T. is its effective head, and he has 2 ministerial assistants, the Financial Secretary and the Economic Secretary.

Treasury Bill, form of Brit. Gov. security, specially suited for temporary borrowing. Introduced in 1877. T.B.s are sold by tender to banks and financial houses at the lowest rate of interest that can be obtained. They are issued in multiples of £5000, normally repayable in 91 days. At 31 Mar. 1956, £4,788,020,000 T.B.s were outstanding, or nearly one-quarter of the total internal unfunded debt.

Treasury Solicitor, legal adviser to the Treasury and gov. depts not having their legal advisers. He deals with such intestate estates as escheat (q.v.) to the Crown. He is generally a qualified barrister. As to his duties in his capacity of Queen's Proctor, see that title.

Treating, see ELECTIONS.

Treaty. The T.-making power is the prerogative of the Crown (q.v.), as is the power to conclude peace. In negotiations for a T. the minister representing the Supreme Authority in the country with whom the T. is to be made is first sent an instrument under the Great Seal (see SEAL) containing the authorisation to sign a T. The T. itself usually contains a clause providing for its ratification by both sides, and until the ratifications are exchanged neither party is bound by the T. The Crown is in theory the sole T.-making power in England, but it seems to be a settled principle that a T. which lays a pecuniary burden on the people, or which alters the law, requires parl. sanction.

In the U.S.A. T.s are negotiated by the President, but have to be ratified by the Senate, which has often refused to ratify negotiated T.s, or at times claims the right to ratify only a portion of the projected T. Even after ratification Congress may, in its turn, withhold the necessary legislation to carry the stipulations of the T. into effect.

As T.s cover the entire sphere of international relations, no satisfactory classification is possible. They may operate for a definite or indefinite period. They usually exist for some specific purpose, e.g. the definition of boundaries, reciprocal extradition (q.v.) or commercial arrangements, defensive alliances, guarantees of neutrality or assistance. It is important to distinguish between mere private arrangements concerning 2 or more states and those which are concluded by a number of leading states for the purpose of supplementing or amending existing provisions of international law or, in other words, law-making T.s, e.g. The Hague Conventions, the Declaration of Paris (q.v.), 1856, the Covenant (q.v.) of the League of Nations, 1919, and the Charter of the United Nations (q.v.), 1945. A T. of guarantee may be collective or joint and sev., whereby a guaranteeing state would be obliged to fulfil, if necessary, its obligations alone even though its co-guarantors refused to fulfil their obligations. An historic example of such T. was the Quintuple T. of 1839 (the 'scrap of paper') (see QUINTUPLE TREATY), which estab. the neutrality of Belgium. For the states members of the League of Nations the condition precedent of registration of

a T. had to be satisfied before the T. came into force. By Art. 18 of the Covenant every T. or international engagement entered into by any member of the League had to be registered with the secretariat and be pub. by it, and would not be binding until it was registered. The constituent parts of the U.N. organisation were, at first, almost identical with those of the old League of Nations; but the later Dumbarton Oaks (q.v.) document was very different from the Covenant of the League. For, by reason, no doubt, of the fact that the moral aspirations of the Covenant ultimately came to nothing, the Dumbarton Oaks conference produced a plan that invoked no principles, but contained practical arrangements for restraining an aggressor, leaving it for the Yalta conference (q.v.) to decide on the rules for voting in the Security Council (see also SAN FRANCISCO CONFERENCE). The Charter of the U.N. provides that all T.s must be registered with the secretariat and pub. by it, otherwise they will not be recognised by the U.N. organisation. Obligations under the Charter override any other T. obligations for members of the U.N. T.s affecting the rights of third parties cannot be said to be abrogated or even suspended by war except in so far as war causes for the time being difficulties of performance. But the practice is by no means uniform: e.g. after the Crimean war, fresh T.s of commerce were concluded; after the Turco-It. war the T. of Lausanne (q.v.), 1912, renewed all T.s and engagements of every kind existing before that war; and after the First World War the T.s of peace revived a number of multilateral T.s of an economic or technical character, in some cases introducing new clauses. With regard to bilateral T.s, each of the Allied states was empowered to revive such of its T.s with the ex-enemy states as it wished.

In the U.K., subject to possible exceptions, a T. has no effect on private rights, and if the Crown concludes a T. which is intended to modify such rights, it must obtain an Act of Parliament to give it that operation. In the U.S.A. it is otherwise, for the 6th Art. of the Constitution provides that 'all T.s made or which shall be made under the authority of the U.S.A. shall be the supreme law of the land, and the judges in every state shall be bound thereby, anything in the constitution or laws of any state notwithstanding.' Hence when the 9th Art. of the Jay Treaty in 1794 enabled the subjects of either country to hold lands in the other, and to sell or devise them as if they were natives, this stipulation at once took effect in the U.S.A. in favour of Brit. subjects, repealing of itself so much either of common law or of statute law on the disabilities of aliens as stood in its way; while in England an Act of 37 Geo. III had to be passed to give effect to the reciprocal stipulation in favour of the citizens of the U.S.A. See *The Collected Papers of John Westlake on Public International Law*, ed. by L. Oppenheim, 1914. See also bibliography of INTERNATIONAL LAW.

Treaty Port, name given to certain seaports in China which were open to European trade by treaty, China being peculiar in that inland navigation was permissible to foreign vessels only by treaty. The earliest of these treaties was that of 1842 following a war between Britain and China. Before the Second World War there were over 40 T.P.s, being all the chief ports of the country. Between 1943 and 1947 the Treaty Powers relinquished the extra-territorial rights and privileges in China for which the various treaties made provision.

Trebbia, or **Trebia**, riv. of Italy, which rises in the Ligurian Mts (see APENNINES) and flows N. across Emilia-Romagna to join the Po (q.v.) W. of Piacenza. Hannibal (q.v.) gained a victory over the Romans on its banks in 218 BC. Length 48 m.

Trebiz, or **Trebizond**, see TRABZON.

Treble, highest voice in a vocal composition in sev. parts, derived from the Lat. *tripilus*, which was the top part of the earliest 3-part motets. T. is now often taken as the synonym of soprano, but strictly it is so only if it denotes the soprano part in a composition for sev. voices. The term is also loosely used for a top part in an instrumental composition.

Tredegar, tn of Monmouthshire, England, on the Sirhowy, 26 m. N. of Cardiff, and 21 m. NW. of Newport. The chief industries are coal mining and light engineering. The title of Baron T. has been borne by the family of Morgan since 1859, the family seat being T. Park, near Newport. Pop. 20,375.

Tree, Sir **Herbert Beerbohm** (1852-1917), actor-manager, b. London, second son of Julius B. Educ. in Germany, he took the name of T., and made his first appearance on the stage in 1876. His first great hit was as Rev. Robert Spalding in *The Private Secretary*, 1884. Manager of the Haymarket Theatre, 1887-96, he was thenceforth proprietor and manager of Her (His) Majesty's Theatre. He was knighted in 1909. T. was especially famous for his productions of Shakespeare's plays. His *Thoughts and Afterthoughts* were pub. in 1913. His greatest strength lay in the presentation of 'character' parts such as Fagin in *Oliver Twist*, D'Orsay in *The Last of the Dandies*, Malvolio in *Twelfth Night*, Richard II, Falstaff, and especially Svengali in *Trilby*. See life by Max Beerbohm, 1920.

Tree, perennial plant with a woody stem and branches, differing only in size from a shrub. In classification, as in the plant-kingdom generally, trees are divided into 2 groups, the angiosperms (q.v.) and the gymnosperms (q.v.). There are 4 classes of the latter, the cycads, maiden-hair trees, gnetum, and conifer. The angiosperms are further classified in 2 great groups, the monocotyledons (q.v.), and the dicotyledons (q.v.), distinguished by the fact that the seedling of the former produces first a single seed-leaf, and of the latter a pair. The monocotyledons are peculiar in form. One great family, palm, consists entirely of T.s. Among the

grasses is found the tree-form in, e.g. some of the bamboos. In the lily family T.s are represented by the yuccas of Mexico and the dragon-trees of the Canary Is. It is in the dicotyledons that are found the more typical and important T.s.

T.s are either deciduous, as the oak and elm, or evergreen, like the pine or holly. In palms and some other trees the terminal bud of the primary stem is the only one to develop, and thus a long, unbranched trunk is formed. T.s do not often exceed 300 ft (the greatest authentic height is 364 ft—a Californian Redwood). The eucalypts of Australia and the conifers of Brit. Columbia and Washington also often approach 250 ft or more. See also AGE OF TREES; ARBORICULTURE; BOTANY; FORESTRY; FOSSIL; PLANTS; TIMBER; TREE-WORSHIP; and under names of T.s.

Tree-bear, or Kinkajou (*Potos flavus*), small cat-like mammal of the racoon family (Procyonidae). It is long and feline in body, is covered with soft, yellow-brown hair, and has a remarkably long prehensile tail. It is found in Central and S. America.

Tree-creeper, small Eng. bird, the *Certhia familiaris*. See CERTHIIDAE.

Tree-fern, fern with a trunk-like rhizome, somewhat resembling a tree in structure. Many T.s belong to the family *Cyatheaceae* (q.v.).

Tree-frog, name given to members of the family Hylidae. They are widely distributed, especially in America, but absent from Britain. The Common T. (*Hyla arborea*) is about 1 in. in length, bright leaf-green above and white underneath, and possesses some powers of colour change. The male is able to croak very loudly by means of a very distensible throat sac. The digits bear adhesive discs, with which it readily climbs even up grass.

Tree-worship, in some form or other, is v. common. In Europe, the veneration of trees as sacred or the abode of deities survived late, and is found in many of the accounts of early Christian missions in the N. The veneration of the sacred oak featured in the old Prussian religion, and the oak and its parasite the mistletoe were sacred to the anc. Britons. In Lithuania this cult lasted to the 14th cent. T. is of 2 types. In the more primitive the tree is itself regarded as an animate being. In the later and commoner form it is thought of as the residence of a separate being whose fortunes, however, are sometimes bound up with those of the tree.

Trefoil, common name of Trifolium (q.v.) species. Bird's-foot T. is *Lotus corniculatus*; Moon T., *Medicago arborea*; scarlet T., *Melilotus* species.

Trefores, see under PONTYPRIDD.

Trefowret, Jeanne, see HADING, JANE.

Tregaron, mkt tn of Cardiganshire, Wales, 18 m. from Aberystwyth. Pop. 800.

Tregruier, tn in the dept of Côtes-du-Nord, France. It has a splendid 14th-cent. cathedral. T. was the bp. of Ernest Renan (q.v.) Pop. 3000.

Treharris, vil. in the co. bor. of Merthyr Tydfil, Glamorgan, Wales, 8 m. S. of Merthyr Tydfil. It is a coal-mining area. Pop. 7500.

Treinta y Tres, dept of Uruguay (q.v.). Area 3682 sq. m.; pop. 69,000. Its name celebrates the Thirty-three Patriots whose rising ensured the country's complete independence from Sp. and Argentine domination. This was finally achieved in 1823. Also the name of its cap., a picturesquely situated tn near the Olimar R., it is on a branch line of the Central Uruguayan Railway leading to the Brazilian frontier, and trades in cattle, sheep, and rice. Pop. 21,500.

Treitschke, Heinrich von (1834-96), Ger. historian and political writer, b. Dresden, Saxony, and educ. at the univs. of Bonn, Tübingen, and Heidelberg. In 1859 he obtained his doctorate at the univ. of Leipzig with the essay *Die Gesellschaftswissenschaft: Ein Kritischer Versuch*. This little work determined his future career. T.'s ideas are found in the statement that the science of human society and the science of the State should be the same thing; that the State should be the organised society; and although he was without concrete knowledge of the spirit of the Brit. society and State he mentions England as the example of his theory. He was already both theorist and practical politician, arriving at the conclusion that if Germany was to become united she must be so as a 'Nationale Staat' and under Prussian leadership. He followed this theory throughout his life.

From 1863 until 1865 he was lecturer in hist. at the univ. of Freiburg in Baden. After the Austro-Prussian war he urged Prussia to incorporate the whole of Saxony; thus he, as a Saxon, became a Prussian from choice, and was lecturer at the univ. of Kiel for a short time. From 1867 to 1873 he was in Heidelberg, and in 1874 settled in Berlin for the rest of his life. In 1886 T. became the successor to the famous Prussian historian, Ranke, with the title 'Historiograph der Preussischen Staaten.' During these years 8 books were pub., most of them works on political hist. When the new Ger. Empire was founded in 1871 under Prussian leadership, he became a member of the Ger. Reichstag as a National Liberal. But this party became too liberal for his feelings, and he left it, without, however, attaching himself to another party. His greatest achievement was *Deutsche Geschichte im neunzehnten Jahrhundert*, and in the years 1879-94 5 vols. of this work were pub.; but when he died the work covered only the years till 1848.

See G. P. Gooch, *History and Historians in the Nineteenth Century*, 1913; H. W. O. Davies, *The Political Thought of Heinrich von Treitschke*, 1914; F. Meinecke, *Die Idee der Staatsräson* (3rd ed.), 1929; H. Kohn, *Völker und Führer*, 1914; A. Hausrath, *Life and Works* (Eng. trans.), 1914.

Trek, Afrikaans (q.v.), word in common use throughout S. and E. Africa meaning a distance travelled or a journey.

Trelawny. Edward John (1792-1881), traveller and biographer, *b.* London. He joined the Navy, but deserted from it. In 1821 he met Shelley and Byron in Italy, and after Shelley was drowned he was present at the cremation of the body. In 1823 he went with Byron and took part in the Gk struggle for independence. Later he was a distinguished figure in London society. He wrote an autobiography, *The Adventures of a Younger Son*, 1831, and *Recollections of Shelley and Byron*, 1858, later republished as *Records of Shelley, Byron, and the Author*. His *Letters* were ed. in 1910 by H. Buxton Forman. See H. J. Massingham, *The Friend of Shelley, a Memoir of Trelawny*, 1930; Rosalie G. Grylls, *Trelawny*, 1950.

Trelawny, Sir Jonathan (1650-1721), divine, *b.* near Pelynt, Cornwall, held successively the bishoprics of Bristol, Exeter, and Winchester. In 1688 he was numbered among the 7 bishops tried under

sea.' Such well-organised and planned strongholds could only have been built under powerful patronage, and it is suggested that King Sweyn Forkbeard was responsible for T. and that units of his troops stationed there may have been among those which invaded Britain. The camp consists of a circular inner ward, with outer defences and other attributes, surrounded by a massive bank of earth strengthened with timber, within which is a regularly laid-out plan of streets, and of barrack buildings now revealed by the holes and slots of their decayed beams in the underlying clay soil. There were 4 main blocks of buildings, each consisting of 4 rectangular boat-shaped houses which would accommodate about 1500 men. One house has been rebuilt, the lines of the others being permanently marked, and the site has been given by the owner to the National Museum at Copenhagen. There is good evidence of Rom.

National Museum, Copenhagen

TRELLEBORG: A MODEL OF THE CAMP BY P. WILLADEN

James II for refusing to conform to the Declaration of Indulgence, but was acquitted. He is believed by many to be the hero of R. S. Hawker's ballad, *And Shall Trelawny Die?* Others, however, maintain that this referred to T.'s grandfather, Sir John (a staunch royalist imprisoned by the House of Commons in 1628), and was merely revived in Sir Jonathan's favour.

Trelew (Treleu), tn of Patagonia, Argentina, on the Belgrano Railway about 40 m. from Puerto Madryn (q.v.) and, like the latter tn, founded by Welsh settlers in 1881. It is commercially the chief tn of Patagonia, with its own airport, and the centre of a large sheep-farming area. Pop. (Welsh, Italians, and Argentines) 11,000.

Trelleborg, on the is. of W. Zealand, Denmark, is the site of a large and imposing Viking stronghold occupied between AD 950 and 1050, which was skillfully excavated with the most modern archaeological technique in 1932-42. A similar but larger fortress is known at Aggersbord on the Lim Fjord, and in both 'aspiring youth was trained under discipline and fixed regulations for the craft of war and for the grim voyage over the

heritage in the street-plan of the fort and in the fact that the rigid unit of measurement is a Rom. ft, but whether it came by way of Byzantium or the military works of the Slavonic peoples is not yet decided. See P. Nerlund 'Trelleborg' (*Nordiske Fortidsminder*), 1948, with good summary in English.

Trematodes, class of flat worms, with an oval non-segmented body. Many of them are parasitic, and among the most important are *Distomum hepaticum* and *D. lanceolatum*, which cause liver fluke (q.v.) in sheep and other ungulates, also *Ampelastomum Collinsii* and *Gastrodiscus Aegyptiacus*, both of which infest the intestines of horses, and *Bilharzia crassa*, a blood parasite of cattle and of man in the tropics; this and other species lay their eggs in the bladder and rectum, and are the cause of *bilharziasis* (q.v.).

Tremolite, see AMPHIBOLE.

Trench, Frederic Herbert (1865-1923), poet and playwright, *b.* Avoncote, co. Cork, great-nephew of Richard Chenevix T. (q.v.). Educ. at Haileybury and Keble College, Oxford, in 1889 he was elected a Fellow of All Souls. From 1900 to 1909 he was senior examiner at the Board of Education, and then for 2

years was a director of the Haymarket Theatre. His books of verse include *Deirdre Wed*, 1900, *New Poems*, 1907, *Lyrics and Narrative Poems*, 1911, *Ode from Italy in Time of War*, 1915, and *Poems, with Fables in Prose*, 1918. *Napoleon*, 1918, is a 4-act play, and he was working on another, *Talleyrand*, when he died in Italy. See A. Chevalley, *Herbert Trench: sa vie et ses œuvres*, 1925.

Trench, Richard Chenevix (1807-1886), prelate and philologist, b. Dublin. Educ. at Harrow and Cambridge, he took orders and became in 1847 prof. of theology in King's College, London, in 1856 dean of Westminster, and in 1864 Archbishop of Dublin. In theology his best-known works were his *Hulsean Lectures*, 1845, *Notes on the Parables*, 1841, and *Notes on the Miracles*, 1846, while his *Sacred Latin Poetry* is a valuable collection of medieval hymns. Philological works are *The Study of Words*, 1851, and *English Past and Present*, 1855. He also wrote many poems. See life by J. Silvester, 1891.

Trench, or Trench Warfare, in military engineering, a T. is an excavation in the earth used to protect infantry from the enemy's fire. T. W. was an almost entirely new method of fighting when adopted early in 1915 in the First World War, though its principles had been applied as early as the Russo-Japanese war of 1904-5. Old principles were largely discarded when the war of movement or *guerre de manœuvre* on the W. front ceased and the lines of the opposed forces became stabilised in trenches extending from Alsace to the Belgian coast. In the course of the 4 years of T. W., T.s became most elaborate examples of field fortifications. There were advance of fire T.s so sited that the occupants could fire on the enemy; support T.s farther to the rear to give cover for troops sufficiently near the front line to be able to reinforce it at need, and sometimes arranged so that the occupants could fire over the front line T.s; and communication T.s which provided a zig-zag road for troops to pass between the front line and support T.s and positions farther to the rear without being exposed to enfilade fire. Among weapons specially developed for T. warfare were a cutter for excavation and a mortar for throwing bombs against hostile machine-gun emplacements and sniper's posts or into the enemy's T.s (see MORTAR). A disease known as T. fever developed among soldiers serving in the T.s. A feature of this T. W. was that advances were usually small and extremely costly in casualties. T. W. played little part in the Second World War.

Trenchard, Hugh Montague, first Viscount (1873-1956), soldier, airman, and administrator, entered the Army in 1893 and served with distinction in the S. African War (1899-1902). In 1912 he obtained his air pilot's certificate and in 1914, in the First World War, was commandant of the military wing of the Royal Flying Corps. In 1915 he was appointed chief of the air staff. Colonel in 1915,

and maj.-gen. in 1916, in 1918 he was appointed to command the independent Air Force in France. In 1919 he was again chief of the air staff, which position he held for 10 years, becoming air chief marshal, 1919. He was created baronet in 1919, and G.C.B., 1924, and was raised to the peerage in 1930, becoming Viscount in 1936. From 1931 until 1935 he held the post of Commissioner of the Metropolitan Police Force; the Hendon police college was one of the reforms instituted by him.

Trenčín (Magyar *Trencsén*), Czechoslovak tn in the region of Bratislava (q.v.), on the Váh. It was once cap. of a Hungarian co. Pop. 13,600.

Trenck, Friedrich von der, Baron (1726-94), Prussian soldier, b. Königsberg; when only 16 years of age became a cadet in the bodyguard of Frederick the Great. He was soon promoted, and distinguished himself in a campaign against Austria, but his intrigue with Princess Amelia of Prussia led to his imprisonment in the citadel of Glatz in 1745. He escaped, however, and entered Russian service. In 1745 he was again arrested and imprisoned in the fortress of Magdeburg, and was only set at liberty in 1763. T. was ultimately guillotined in Paris.

Trencsén, see **TRENČÍN**.

Trendelenburg, Friedrich (1844-1924), Ger. surgeon, b. at Berlin, studied medicine there and was M.D. 1866. He was professor of surgery at Rostock (1875-82), at Bonn (1882-95), and at Leipzig (1895-1911). He devised an operation for excision of varicose veins (1890), invented a cannula (tube for insertion into the body) (1873), and was first to attempt the surgical removal of pulmonary embolism (1908), an operation first successfully performed in 1912. He is also remembered for *T.'s position* (1890), with the patient lying face upwards and the pelvis raised at an angle of 45 degrees, useful, e.g. for gynaecological operations, since the intestines are kept out of the field of operation.

Trendelenburg, Friedrich Adolf (1802-72), Ger. philosopher, b. Eutin, near Lübeck; educ. at Kiel, Leipzig, and Berlin univs., at which last he was prof. from 1833 until his death. His prin. work, *Naturrecht auf die Gründe der Ethik*, was pub. in 1860; but he also made valuable contributions to Aristotelian studies with *Geschichte der Kategorienlehre* (3rd ed.), 1876, and *Elementa Logicae Aristoteleae* (9th ed.), 1892. See life by H. Bonitz, 1872.

Trengganu, state of the Federation of Malaya (q.v.), formerly federated Malay States under Brit. protection. It lies on the E. coast of the Malay Peninsula, and is bounded by Kelantan (q.v.) on the N. and NW., by Pahang on the S. and SW., and by the China Sea on the E. Its inland boundaries follow the watersheds of its larger rvs., the Besut, Trengganu, Dungun, and Kemaman. The W. and inland half is mountainous and almost uninhabited. The pop. is concentrated on the rvs. and along the coast-line. The highest peak is Gunung Lawit (4985 ft).

The administrative centres are Besut in the N., Kuala Trengganu in the centre, and Kemaman in the S. The seat of gov. is at Kuala Trengganu, which is also the residence of the Sultan. Nearly all the characteristic commodities of Malaya are produced in T.

The early hist. of T. is obscure. A Chinese Buddhist monk and traveller, Chau Ju Kua, mentions it among places subject to the old kingdom of Palembang. A Javanese work, the *Nagarakretagama*, written 1365, speaks of both T. and Dungun as tributary to Majapahit (see MALAYA, *History*). The discovery in 1923 of a Malay stone at Kuala Brang, 20 m. from Kuala Trengganu, with a remarkable mixed Malay-Arab inscription, dated 702 AH (AD 1303) on the subject of the Islamic law of sexual offences, points to the existence of a Mohammedan kingdom in the upper Trengganu R. a century before the recorded date of the Mohammedan conversion of Malacca. This stone is now in the Raffles Museum, Singapore. The ruling house of T. is descended from the ancestor of the present rulers of Johore and Pahang. In 1776 Sultan Mansur (1730-92) sent the *bunga mas* or golden flower to the King of Siam, and this practice was continued until, by a treaty in 1909, the Siamese Gov. transferred to Great Britain all rights of suzerainty over the States of Kelantan, Kedah, Trengganu, etc. A treaty in 1910 between Great Britain and T. provided that T. should receive a Brit. officer to reside in T. to be an Agent with functions similar to those of a consular officer. In 1919 this provision was cancelled and a Brit. Adviser substituted, whose advice had to be sought and acted on in all matters affecting the general administration of the country and all questions other than those touching the Mohammedan religion. Area 5050 sq. m.; pop. 263,000.

Trent, Jesse Boot, first Baron (1850-1931), industrialist, b. Nottingham, founder of Boot's Pure Drug Company. As a boy he worked in a herbalist's shop owned by his mother, but after about 14 years he had a shop of his own. In 1883 he formed the company of J. Boot and Co., Ltd., which was among the first 'chain stores' in the country. Five years later the company became Boot's Pure Drug Co. and by 1896 owned 60 shops in 30 tns. B. was a munificent patron of education, and among his donations was the sum of £500,000 to build Univ. College, Nottingham (see also NOTTINGHAM UNIVERSITY). He was an active Liberal. Knighted in 1909, he was created a peer in 1929.

Trent, see TRENT.

Trent, third most important riv. of England, rising in Staffordshire and flowing through the cos. of Derby, Leicester, Nottingham, and Lincoln, eventually joining the Ouse to form the Humber. It is about 170 m. long, and is connected with other rivs., and with the Birmingham and Lancashire dists. by the Trent and Mersey and Grand Union canals.

Trent, Council of, the 19th oecumenical council of the Church. It was convoked by Pope Paul III in 1545 to restore peace to the Church, then distracted by the teaching of Luther and other reformers. It sat till 1563 and passed a number of decrees defining doctrines questioned by the Protestants and reforming abuses. The Council was of considerable importance as laying down the main lines of Roman Catholic development in post-Reformation times. Its decrees were confirmed by Pope Pius IV in 1564.

Trente-et-Quarante, or Rouge-et-Noir, is played with 6 packs of cards on a table (see diagram) marked out for the game. The cards having been shuffled, one of the players cuts, and so many cards are dealt out face upwards in a row, until the sum of the pips exceeds 30 in number.

The court cards and tens count 10 each, and the aces 1. A second row is then dealt out below the first one, until the pips in this row also exceed 30. The top row (see diagram) is called 'black' and the second 'red,' the winning row being that which contains the fewer pips. A total of 31 would be the best possible, and 40 the worst possible 'point.' Players can also put their stakes on couleur or inverse. The 4 even chances, black, red, couleur, and inverse, are played and paid in precisely the same way as the even chances in roulette. The chances couleur and inverse are decided by the colour of the first card turned up. If the colour corresponds with the colour of the row containing the fewer pips, couleur wins;

if with the other row, inverse wins. Playing may be *à cheval*, i.e. on combinations of the above, either on red and couleur or black and couleur, red and inverse or black and inverse. Staking *à cheval*, i.e. on combinations of the above, either on red and couleur or black and couleur is the same as staking on the line between red and impair, or noir and pair at roulette. If both chances win, the bank pays even money; but if both lose the stake is lost. If one wins and the other loses, the bet is 'off', and the player may either take his stake up or leave it for the next coup. Where both rows total 31, the result, which is called a *refait*, is analogous to that in roulette when zero appears, i.e. the stakes are put *en prison*, and after the ensuing deal the stakes on the winning chances are withdrawn from prison and the others lost. But instead of being put in prison in the first instance, the player may, at his option, as at roulette, halve his stake with the bank. If, however, the player chooses to go into prison, he has the option to choose the prison before the next deal; and if he selects the right coloured prison (see diagram), e.g. if he chooses red, and the red chance wins the next coup, he can do as he likes with his stake. If, on the other hand, a second *refait* appears, he must win twice in succession before he can withdraw his stake. If the 2 rows come out at the same total of any number over 31, the coup is null and void, and the stakes may be removed from the table or not, as the players choose. A *refait* is said to occur once in 38 deals on the average, which, if true, would give the bank a slightly less advantage than at roulette, where it is 1 in 37. Again, the odds against black and red both totalling 31 are 81 to 1. The punter or 'player', however, is at liberty to insure against the *refait* by paying 1 per cent on his stake; but a minimum premium payment is set by the bank. The effect of insuring is that, if the *refait* appears, the punter's stake does not go into prison, and he is at liberty to remove it. See H. Jacobson, *Roulette, Trente-et-quarante and Boule*, 1928.

Trentino-Alto Adige (formerly Venezia Tridentina), region (*compartimento*) of N. Italy, comprising the provs. of Trento and Bolzano (qq.v.). It is bounded N. by Austria, W. by Lombardy, and S. and E. by Veneto (qq.v.). Before 1919 the dist. belonged to the Austrian Tirol (q.v.), thus leaving 400,000 Italians under Austrian rule. By the treaty of St Germain-en-Laye (q.v.) it was ceded to Italy. It was the scene of prolonged fighting between the Italians and the Austrians in the First World War, particularly in 1916. The last considerable fighting here was the Austrian offensive in June 1918 (see ITALIAN FRONT, FIRST WORLD WAR CAMPAIGN ON). The chief tn is Trento, and the region has a local autonomy. Area 5250 sq. m.; pop. 750,000.

Trento: 1. Prov. of Italy, the S. part of Trentino-Alto Adige (q.v.). It is in the Alps (q.v.), with high mts and steep riv. valleys. The prov. is crossed by the road

to the Brenner Pass (q.v.), and in ant times was the main entrance to Italy from N. Europe. The N. end of Lake Garda (q.v.) is in the S. of the prov. The prin. tns include T., Rovereto, and Levico (qq.v.). Area 2450 sq. m.; pop. 401,000.

2. Or Trent (Ger. Trient; ant Tridenum), It. city, cap. of the prov. of T., and also chief tn of Trentino-Alto Adige. It occupies a strategic position on the Brenner Pass (q.v.) route and the Adige (q.v.), 290 m. N. by W. of Rome (q.v.). It is of pre-Rom. origin, and became part of the Ger. Empire in the time of Otto I (q.v.). It remained Ger., ruled by prince-bishops, until 1801, in which year it was taken by the French. It was ceded to Austria in 1803, and passed to Italy after the First World War. During the Second World War it was again for a time (1943-5) re-incorporated in Germany, but was returned to Italy at the end of the war. The tn has an archiepiscopal cathedral (Lombard-Romanesque and Gothic), old walls, and a castle (now a museum). Most of the sessions of the famous Council of T. (q.v.) took place in the Renaissance church of S. Maria Maggiore. The prin. manufs. are silk, pottery, and wine. Pop. (tn) 40,500; (com.) 65,500.

Trenton, city (pop. 128,000), cap. of Mercer co. and of New Jersey, U.S.A., on Delaware R. and at head of navigation, c. 30 m. above Camden. It manufs. wire, ropes, cable, structural steel, pottery, rubber goods, aeroplane and auto equipment, steam turbines, hardware, cigars, porcelain, clothing, paper, linoleum, asbestos fabrics, and home appliances. It has a state teachers' college (1855), Rider College, a junior college, a state prison, and other institutions. The Revolutionary Battle of Trenton is commemorated by a 155-ft granite monument topped by the figure of Washington. Washington's Delaware R. crossing point, c. 8 m. N., is a state park. Points of interest are the state capitol, with golden dome; the capitol annex with state library and museum; the First World War memorial building; the barracks built in 1758 (restored); Bloombsbury Court (1719); and Bow Hill, home of Annette Savage, mistress of Joseph Bonaparte.

Trepang, see BÊCHE-DE-MER.

Trepanning (Gk *trapanon*, bore), operation of boring a circular hole, usually in the cranium to permit access to the brain. The instrument used is a trepan (trephine), and resembles a carpenter's bit provided with a handle. The discovery of prehistoric skulls bearing circular scars with signs of healing shows that T. is an operation of great antiquity, being performed presumably for the purpose of releasing imaginary evil spirits and devils. Nowadays it is carried out in operations on the brain, and also to relieve excessive intracranial pressure resulting, for instance, from a fracture of the skull. T. is also performed with miniature trephines on the eyeball (see under GLAUCOMA). See D. Guthrie, *History of Medicine*, 1945.

Tréport, Le, Fr. port and seaside resort on the English Channel, in the dept. of Seine-Inférieure. It has a striking 16th-cent. church and the ruins of an 11th-cent. abbey. It is separated by the R. Bresle from Mers-le-Bains, which is in the dept. of Somme. Fishing is carried on, and a coasting-trade, and there is a casino. Pop. 5100.

Tres Arroyos, tn of Argentina, in the prov. of Buenos Aires, 110 m. E. of Bahía Blanca and 270 m. SW. of Buenos Aires on the Roca Railway. It is the centre of an agric. and live-stock dist. Pop. 32,000.

Tresco, one of the Scilly is. and the second in size; lies 1 m. NW. of St Mary's. The area is about 700 ac., and it contains the ruins of a Benedictine abbey. Pop. 200.

Trespass, in a wide sense, denotes any transgression to persons or property. In Eng. law T. to property is the most common type. An unauthorised entry on to another's land is technically a T. and, despite the common warnings that 'trespassers will be prosecuted,' a prosecution is possible only if any damage is done. The owner of land or a house can sue civilly for T. anyone unlawfully retaining possession, e.g. a squatter or a former tenant who has been given a valid notice to quit which has expired. T. of goods is an act which infringes the owner's possession. T. to the person is the unlawful application of force to the body of another; examples of this form of T. are assault, battery, and false imprisonment (q.v.).

Tret, allowance of 4 lb. in 104 lb. (i.e. $\frac{1}{4}$) on goods sold by weight after deduction for tare.

Trevelyan, George Macaulay (1876-), historian, third son of Sir G. O. Trevelyan. Educ. at Harrow and Trinity College, Cambridge, during the First World War he was Commandant of the 1st Brit. Ambulance Unit in Italy. He became Chevalier of the Order of St Maurice and St Lazarus (Italy), 1920; C.B.E., 1920; and O.M., 1930. From 1927 he was Regius Professor of Modern History at Cambridge Univ. until 1940 when he became Master of Trinity College (until 1951). Pubs. include: *England in the Age of Wycliff*, 1899, *England under the Stuarts*, 1904, *The Life of J. Bright*, 1913, *Lord Grey of the Reform Bill*, 1920, *British History in the Nineteenth Century*, 1922, *History of England*, 1926, *England under Queen Anne*, 1930, *The Peace and the Protestant Succession*, 1934, *Sir George Trevelyan: A Memoir*, 1932, *Grey of Fallodon*, 1937, *The English Revolution*, 1688 (Home University Library), 1938, *English Social History: A Survey of Six Centuries*, 1944 (illustrated ed.), 1949, *The Seven Years of William IV*, 1952, and *An Autobiography and Other Essays*, 1949. He holds hon. doctorates of many Brit. and Amer. univs. Chancellor of Durham Univ., 1949. T.'s pubs. combine great scholarship with readability: his *English Social History* was an outstanding best-seller.

Trevelyan, Sir George Otto (1838-1928), statesman and author, b. Rothley Temple,

Leicestershire, a nephew of Lord Macaulay and educ. at Harrow and Trinity College, Cambridge. In 1865 he entered Parliament as Liberal for Tynemouth. T. was successively Civil Lord of the Admiralty, 1869-70; secretary of the Admiralty, 1880-2; chief secretary for Ireland, 1882-4; chancellor of the Duchy of Lancaster and member of the cabinet, 1884-5; secretary for Scotland, 1886 and 1892-5. In 1897 he retired from public life. He pub. a number of works dealing with historical and general subjects, including his famous *Life and Letters of Lord Macaulay*, 1876, and *Early History of Charles James Fox*, 1880. See memoir by G. M. Trevelyan, 1932.

Trevelyan, Robert Calverley (1872-1951), poet and playwright, son of Sir George T. Educ. at Harrow and Trinity College, Cambridge, he made many trans. from Gk authors and from the works of Leopardi. Vols. of his own verse include *Mallow and Asphodel*, 1898, *Polyphemus*, 1901, *The Bride of Dionysus*, 1912, *The Death of Man*, 1919, *Poems and Fables*, 1925, *Rimeless Numbers*, 1932, *Beelzebub*, 1935, and *From the Skiffolds*, 1947. Among his plays are *The Birth of Parsival*, 1905, *Meleager*, 1927, and *Cheiron*, 1928. In prose he pub. *Thamyris, or the Future of Poetry*, 1925, and *Windfalls*, 1944, a book of essays.

Trevena, see TINTAGEL.

Treves, Sir Frederick (1853-1923), surgeon and author, b. Dorchester, where, and at Merchant Taylors' School in London, he was educ. M.R.C.S. in 1875, he practised for a time in Derbyshire, returned to hospital practice in London, and was Hunterian prof. of anatomy and Wilson prof. of pathology at the Royal College of Surgeons, 1881-6, and consulting surgeon to the forces in S. Africa, 1900. Surgeon to Edward VII from 1901, he performed the operation on that king for appendicitis in 1902. He became K.C.V.O., 1901, and baronet, 1902. He returned from retirement during the First World War, and was president of the H.Q. medical board at the War Office. From 1920 he lived in France. His works include: *System of Surgery*, 1895, *Manual of Operative Surgery*, 1891, *German-English Dictionary of Medical Terms* (with H. Lang), 1890, *Highways and Byways in Dorset*, 1906, *Cradle of the Deep* (on the W. Indies), 1908, *Through the Desolate Land*, 1912, *The Riviera of the Corniche Road*, 1921, and *The Elephant Man and other Reminiscences*, 1923. See *Dictionary of National Biography*.

Trèves, see TRIR.

Trevisa, John de (c. 1322-1402), priest, b. Cornwall. He was at Exeter College, Oxford (1362-5), and fellow of Queen's (1369), and from 1362 he held the vicarage of Berkeley, where he is buried. He trans. Ranulf Higden's *Polychronicon* (q.v.). The trans. was completed in 1387, printed in 1482 by Caxton, and long remained a standard work. He also trans. Glanville's *De Proprietatibus Rerum* and other Lat. works.

Treviso: 1. Prov. of Italy, in E. Veneto (q.v.). It is mainly part of the great N.

plain of Italy, but in the N. it has ridges of the Alps (q.v.). It is crossed NW.-SE. by the Piave; other rvs. are the Sile, the Piavesella, and the Musone. The prov. is mainly agric. Among the prin. tns are T., Montebelluna, Conegliano, and Vittorio Veneto (qq.v.). During the First World War it was the scene of severe fighting (see PIAVE, BATTLE OF; VITTORIO VENETO, BATTLE OF). Area 975 sq. m., pop. 613,000.

2. (Anct Tarvisium), It. tn, cap. of the prov. of T., at the junction of the Sile and the Piavesella, 16 m. N. by W. of Venice (q.v.). It is a picturesque tn, with canals, curious houses, winding alleys, and arcades. There is a 13th-cent. palace (restored after bomb damage), and a cathedral (12th-19th cents.) containing an altar piece by Titian (q.v.). The tn suffered very heavy damage in both World Wars. There is a large trade in agric. produce. Pop. 67,000.

Trevithick, Richard (1771-1833), inventor of locomotives, b. Illogan, Cornwall, the only son of Richard T., mine manager and friend of Weeley. He attended Camborne School, but was frequently truant; he was a notable wrestler and weight-lifter. About 1797 T. made a steam-engine for Herland mine, and in 1800 made a double-acting high-pressure engine for Cook's Kitchen mine. Having experimented with model locomotives from 1796, he completed by the end of 1801 the first steam carriage that ever drew passengers; another, in 1803, worked for a short time in London. In Wales, Feb. 1804, he put the first practical rail locomotive into use; it had a fly-wheel, and did not work long. T. was the first to turn steam-exhaust into the chimney and to rely on friction of smooth rails and wheels. In 1809 he failed in an attempt to make a tunnel under the Thames. He made a steam threshing-machine, 1811. In 1816 T. went to Peru, where his engines were being installed in the mines, and lost all his property in the insurrection of the twenties. He prospected for an inter-oceanic railroad in Costa Rica. T. took out his last patent, 1832, for superheated steam; but he had numerous unpatented projects, including a stern driving propeller. He d. in Dartford penniless. See lives by his son, Francis, 1872, and H. W. Dickinson and A. Titley, 1934.

Trévoux, Fr. tn in the dept of Ain, on the Saône, the anct cap. of Dombes (q.v.). It has wire and silk making. Pop. 3000.

Triad: 1. In mythology, a group of 3 associated deities. In Brahmanism the Hindu T. consists of Brahma, Vishnu, and Siva (see also TRIMURTI), who mark the second great development of Hinduism, Brahma not figuring at all in the Vedic hymns, Vishnu there being only the god of the shining firmament, while Siva was evolved from the Vedic Indra, god of storms. The Sumerians had a T. (Anna, Enlil, and Enki), originals of the Babylonian T., Anu, lord of heaven, Bel, lord of earth, and Ea, lord of the abysses, dividing the universe between them, of

Zeus, Poseidon, and Hades among the Greeks. In anct Egypt, from the time of the Hyksos, a marked tendency to identify every god with the Sun, Ra, and add his name to theirs marks latent belief in monotheism, but in priestly circles it helped to promote a pantheistic creed, with the formation of triads and enneads (of 9 deities, a later attempt at systematic grouping). In Egyptian religion the T. in any dist. usually consisted of a goddess, a god, and their son. As the gods were mortal the son was destined to take his father's place and was his exact counterpart—a symbolic way, perhaps, of expressing the idea of eternity. In Chinese religion there are the Three Holy Ones, instructors and benefactors of mankind, whose immense images are, or were, worshipped in every Taoist temple (see LAO-TSE). In Scandinavian religion Thor, Odin, and Loke were always warring against the giants, who represented the rude forces of nature.

2. A Welsh form of literary composition depending on arrangement in groups of 3. The Welsh T.s are an arrangement of similar subjects, things, or events in series of 3 under some general title suggesting that they were more or less connected. Among the best-known are the T.s of Horses, which are included in the 12th-cent. Black Book of Carmarthen; the T.s of Arthur and his warriors, believed to be of the 13th cent.; the T.s of the Island of Britain, in the Red Book of Hergest (a 14th-cent. MS. in the possession of Jesus College, Oxford); and the later T.s of *Dyfnwal, Moelmud*, a legendary king of Britain. The Third Series of T.s in the *Myyrrian Archaeology of Wales* are the forgeries of the 18th-cent. Iolo Morganwg (Edward Williams).

3. In the pseudonymous writings of Dionysius the Areopagite (q.v.) the word is used of the celestial and eccles. hierarchies. Thus, in the celestial are the 3 T.s of seraphim, cherubim, and thrones; dominations, virtues and powers; principalities, archangels, and angels. In the eccles. or earthly hierarchy the first T. is formed by baptism, chrism (i.e. confirmation), and communion; the second by bishops, priests, and deacons; the third by monks, 'initiated' (i.e. ordinary laity), and catechumens.

4. In chemistry T. is the name given to those elements which can directly unite with or replace 3 atoms of hydrogen, chlorine, or other monatomic element. The T.s are boron, gold, indium, and thallium.

5. In music T. denotes a common chord or harmony, because it is formed of 3 radical sounds: a fundamental note or bass, its third, and its fifth. T.s are said to be major or minor, augmented or diminished.

Trial. T.s of civil actions in England respecting common law matter (i.e. generally speaking, breaches of contract and torts, see TORT) if tried in the High Court may be either before a judge and jury or by consent before a judge alone. Actions in the commercial list are tried before a judge alone (see COMMERCIAL

COURT. Actions involving accounts are assigned for T. before official referees. Actions touching matters of equity (q.v.) are tried exclusively before judges only; similarly in the case of bankruptcy matters. Admiralty causes are tried before a judge of the Probate, Divorce, and Admiralty Division with or without the aid of nautical assessors (*see EVIDENCE; TRINITY HOUSE*). Divorce petitions, if undefended, are disposed of by a judge alone; if defended may or may not be tried before a jury at the discretion of the court or a judge. Notice of T. may be given by the plaintiff or other party in the position of plaintiff. Such notice may be given with the plaintiff's reply whether the latter closes the pleadings or not, or (in other than Admiralty actions), where no order for a reply has been made, on the expiration of 4 days after the defence or last of the defences shall have been delivered, or at any time after the issues of fact are ready for T. The notice of T. must state the place and the day which the plaintiff proposes for the T. and must be given at least 10 days before that day, unless the defendant has consented, or has been ordered to accept short notice of T., which is usually 4 days. In every action in every division of the High Court the place of T. is fixed by a master, and in fixing the place regard will be had to the convenience of the parties and their witnesses. The plaintiff, however, has *prima facie* the right to select the place of T., and the defendant must show a distinct preponderance of convenience to oust him of this right. But the defendant will be entitled to have the venue changed if he can show that there is no probability of a fair T. in the place the plaintiff has selected. A plaintiff who proposes to try at some place other than Middx must name the place in his original Statement of Claim. If the plaintiff does not within 6 weeks after the time when he first becomes entitled to give notice of T. (or within such extended time as the court or a judge may allow) give notice of T., the defendant may himself give notice of T. or apply to the court or a judge to dismiss the action for want of prosecution. If the action be for trial at assizes, the notice must be entered either at the district registry of the assize in or with the associate of the circuit. The rights of the parties to a jury in civil cases have been limited by the Administration of Justice (Miscellaneous Provisions) Act, 1933. It is now a matter for the discretion of the master in most actions in the Queen's Bench Div. whether there shall be T. by jury or not. (*Hope v. G. W. Ry.*, 1937). The power to order a jury is used sparingly; but if either party applies not later than 4 days after notice of T. has been given, or, if no notice of T. is required, 4 days after the action has been set down for T., and satisfies the master either that a charge of fraud has been made against him or a claim in respect of libel, slander, malicious prosecution, false imprisonment, seduction, or breach of promise is in issue, he still has an absolute right to a jury, unless the T.

will require prolonged examination of documents or accounts or any scientific or local investigation which cannot be conveniently made with a jury—in such cases, even though the master has ordered T. by jury, the judge in charge of the list may order the case to be transferred to the non-jury list whether the parties consent or not (*Mayhead v. The Hydraulic Hotel Co.*, 1931). A T. will not be held with a jury in the Chancery Div., but if the issues are such that one of the parties is entitled and insists on a jury, as it seems that he can, the action will be transferred to the Queen's Bench Div. Where a jury is ordered either party may insist on a special jury (*see JURY*). Co. court actions may be tried before a judge and jury of 8 men, or before a judge alone (*see COUNTRY COURT; INTERIOR COURT*). The right to begin at a trial depends upon the mode of raising the issues on the pleadings so far as actions for debt or liquidated (i.e. certain or fixed) damages are concerned. The plaintiff will ordinarily begin in order to substantiate his affirmative pleas, but the defendant may gain the right if his defence contains none but affirmative pleas. In actions for unliquidated actions (which, generally speaking, include all those in which parties can demand a jury as of right) the plaintiff is always entitled to begin irrespective of whether the burden of proof lies upon the defendant. The right is a formidable one in a jury action, as the 'last word' (unless the other party calls no witnesses) rests with him who begins. It is a right of no great value where the judge sits alone. For the rules of evidence at a T. and the difference between examination-in-chief and cross-examination, *see EVIDENCE; EXAMINATION; and LEADING QUESTION*. An application for a new trial may be made on several grounds: e.g. misdirection by judge, misreception of evidence, misbehaviour of the jury, excessive damages. Such application is made by notice of motion to the Court of Appeal within 8 days after the T. Criminal T.s in England at assizes (including the Central Criminal Court) and quarter sessions are held before a judge and jury. Petty offences are tried before a bench of justices of the peace or a stipendiary magistrate. *See W. B. Odgers, Principles of Pleading and Practice* (15th ed.), 1955; *Annual Practice of the Supreme Court* ('The White Book').

Trial by Combat, or Wager of Battle. This mode of trial, which was introduced into England by the Conqueror, was resorted to in civil actions, 'appeals' of felony, and cases before the Court of Chivalry. In civil cases, to avoid the possible loss of one of the parties, the duel was fought by hired champions, but in military cases the parties themselves fought until one was slain or gave in (when he was put to death unless the king intervened). Where the blood relations of a murdered person 'appealed' (meaning in this sense accused) the supposed murderer, the latter, where the accuser was not a woman, child, priest, or infirm person, could claim T. by C. with his accuser. The accused was hanged if

vanquished, but if he killed his accuser or prolonged the fight from sunrise till dark he was acquitted. From the 12th cent. onwards, T. by C. was repeatedly condemned by the Church, notably by the Lateran Council in 1215, and gradually fell into disuse as the belief of the medieval lawyer in the rationality of law gained popular hold. Owing to the principle of Eng. jurisprudence that no law can be abrogated by mere desuetude, one

Czechoslovakia and the Kingdom of the Serbs, Croats, and Slovenes was recognised. The independence of Hungary was made inalienable otherwise than with the consent of the League of Nations. Hungary renounced all claim over ter. outside Hungary which formerly belonged to Austria-Hungary.

Triassic System, in geology, is the first of the 3 rock systems of the Mesozoic period. It constituted the upper half of the original New Red Sandstone before the elimination of the lower half as the Permian (q.v.). The system shows 3 distinct lithological types, viz.: (1) the marine facies of the Alpine Trias; (2) the semi-marine and semi-continental facies of the Ger. Trias; and (3) the continental facies of Great Britain, S. Africa, etc. The 3 members of the original Ger. T. system were named Bunter or variegated sandstones, Muschelkalk or shelly limestone, and the Keuper or marly beds. In Britain, only 2 members of the series are developed, the Bunter and the Keuper, and the system attains its greatest development in Cheshire and Warwick (about 2000 ft thick). The Bunter or Lower Trias is made up of the Upper and Lower variegated sandstones with the intermediate pebble beds, and the Keuper or Upper Trias consists of the Keuper marls and waterstones. The Bunter and Keuper are practically barren of fossils, but the latter affords beds of gypsum and rock salt as well as building stone. A large part of Germany is occupied by Triassic rocks, the Bunter affording beds of dolomite and the Keuper local seams of coal (Lettenkohl) and beds of gypsum. The middle member of the Ger. Trias (the Muschelkalk) is very rich in fossils. The Brit. and Ger. Trias were probably laid down in irregular basins, and the Muschelkalk of Germany must have been formed when the waters of the Ger. basin were in communication with the open sea. The grand development of the marine facies of the Triassic in the E. Alps consists of thick bedded limestones, dolomites, and calcareous shales. The system here is generally divided into 4 sub-divisions, viz. the Alpine Bunter, the Alpine Muschelkalk, the Norian, and the Carinthian, none of which can be individually correlated with the Ger. types, although the range in time is equivalent. The transition beds between the Trias and the Lias (the Alpine Rhaetic beds) can be paralleled with the Rhaetic or Penarth beds of Britain. These beds are very fossiliferous, and are sometimes designated 'Avicula Contorta' beds. The Alpine or marine type of Trias recurs in the Balkans, Apennines, Peru, Himalaya, Alaska, and Japan. The continental type of Triassic occurs in S. India, S. Africa, and in parts of N. America. The life of Triassic time was rich and varied. The animals include fishes (Dipnoids), amphibia, and all classes of reptiles. Pecoeteris, conifers, and cycads represented the plant life of the time, and the invertebrata embrace all classes. Lamellibranchs, gasteropods, cephalopods, and crinoids were most abundant, and the Muschelkalk is rich in their remains.

British Museum

TRIAL BY COMBAT (15TH CENT.)

The guilty man is indicated by a black bird (symbolising evil) hovering over his visor.

Abraham Thornton, accused of murder in 1817, revived this archaism of chivalry and challenged his accuser to T. by C. The 'appellant' declined, and Thornton had perforce to be discharged. T. by C. was then hastily abolished by statute.

Triangle, percussion instrument consisting of a simple steel bar in 3-cornered form. It is struck with a short steel rod and produces a bright tinkling sound of no definite pitch.

Triangulation, see ORDNANCE SURVEY; SURVEYING AND LEVELLING.

Trianon, Treaty of, between the Allies and Hungary, signed 4 June 1920, at the Grand Trianon, a building in the park of the palace of Versailles, France. The principal effect of the treaty was to reduce considerably Hungary's ter. The N. portion went to Czechoslovakia and the S. to Yugoslavia, whilst Hungary retained the middle portion. The Covenant of the League of Nations forms part of this treaty as in the case of the treaty of Versailles (q.v.). The independence of

Tribe, group of barbarous clans under recognised chiefs. In Rom. hist. the word denotes each of the political divs. of Romans, originally 3 in number, probably representing clans, and ultimately numbering 35 (see *GENE*); also any similar div. whether of natural or political origin, e.g. the Israelites were divided into 12 T.s, descendants of the sons of Jacob (the 10 T.s were these Jewish T.s without Judah and Benjamin, and the 'lost tribes' were the 10 T.s after deportation by Shalmaneser (see *LOST TRIBES*)). There were also T.s among the anc. Greeks. The Amer. Indians were divided into T.s to-day (see *AMERICAN INDIANS*). To-day the word tribe is chiefly associated with tribal organisation in Africa, especially in the tropical African dependencies, in the study of which the researches of social anthropologists have greatly increased our knowledge. In Africa, however, a study of cultural origins is of less importance than that kind of investigation which concerns itself with existing peoples and their social institutions, its object being to assist the gov. and development of the peoples studied. Modern anthropological work of this type in Africa attempts to record the behaviour of the African tribesman in his reaction to indigenous and imported influences, and it is progressively devoting greater attention to the latter, especially in its relation to the evils of 'detrification'. The study of African reactions to European culture in such matters as marriage, inheritance, the private ownership of land (see *LAND TENURE*, *PRIMITIVE OR COLONIAL*), and the sanctions for law and order are among the most important aspects of social anthropology in Africa to-day. See also *AFRICA*, *Social Anthropology*; and under tribal names BANTU, HOTTENTOT, KIKUYU, MASAI. See also Lord Hailey, *An African Survey*, 1957; A. Phillips, *Survey of African Marriage and Family Life*, 1953.

Tribonian (d. 545), Byzantine jurist, b. Paphlagonia. He was president of the commission which drew up the *Pandects* and *Code of Justinian* (see *ROMAN LAW*).

Tribromomethane, see *BROMOFORM*.

Tribune (Lat. *tribunus*), name given to officers of various descriptions in the constitution of anc. Rome. Of these the most important were the *tribuni plebis*, or T.s of the commons. At first their power was small and they were only 2 in number (afterwards raised to 10). But soon they became formidable and not only preserved the rights of the people, but could summon assemblies, propose laws, stop the consultations of the senate, and even abolish its decrees by their veto. Their consent was also necessary for the confirmation of the *senatus consulta*, and if any irregularity happened in the State their power was almost absolute, for they could even imprison a consul if he acted so as to disturb the peace of Rome. Again, their persons were held sacrosanct, and to interrupt them while speaking was a punishable offence, while to strike them was a crime. Their power was under-

mined by Sulla. Pompey and Cotta, however, restored their privileges, and the office remained in full force until the time of Augustus, who accepted the office for himself in order to strengthen his own hand. It was totally abolished by Constantine. Other officials bearing the title were: (1) The *tribuni militum*, who were officers in the Rom. Army (q.v.). (2) The *tribuni cohortium praetoriarum*, who formed the emperor's bodyguard. (3) The *tribuni aerarii*, who kept the money to defray the expenses of the army. These latter were abolished by Julius Caesar, but re-estab. by Augustus, who added to their number. (4) The *tribuni voluptatum*, who had charge of popular entertainments.

Tribune, in architecture, either: (i) the apse of a basilican church; or (ii) a rostrum, gallery, or pulpit in a church.

Tricala, see *CALTABELLOTTA*.

Triceratops, genus of Upper Cretaceous horned dinosaurs (q.v.) belonging to the Ceratopsian group of the order Ornithischia. They were massive and quadrupedal, up to 20 ft long, with large heavy skulls extended into a neck frill at the rear, and with horns on the snout.

Trichinopoly, or Tiruchirappalli, tn of Madras State, India. T. figured more than once in the fighting between the British and French, the latter suffering a signal defeat here at the hands of Stringer Lawrence in 1753. There are missionary schools, and Bishop Heber, after whom a College is named, d. here in 1826. The area of Golden Rock close by is one of the biggest railway centres of S. India.

Trichinosis, or Trichiniasis, disease caused by the presence of the parasitic nematode *Trichina spiralis*, which is found chiefly in man, the pig, and the rat, but also in the dog, cat, rabbit, etc. The parasite finds its way into man from infected pork which has not been properly cooked. The young forms are found encysted in the muscular fibres of the pig, and when the cysts reach the intestines, the solution of the calcified capsule sets free the parasites, which grow rapidly and reproduce in enormous numbers. The young trichinae then develop and bore through the intestinal walls, ultimately reaching the muscles, where they become encysted by the secretion of lime salts. They are then quiescent, and can further develop only by reaching the intestines of another host. The acute symptoms of the disease are caused by the migration of the trichinae from the intestines. The early indications are nausea, fever, and loss of appetite; later on exhausting diarrhoea may occur, together with delirium, swollen eyelids, and tenderness and pain in the muscles. The most decisive symptom is a pronounced leucocytosis marked by eosinophilia (i.e. excess of eosinophilic white corpuscles in the blood). The treatment should include purgatives if the diagnosis is made in the early stages, otherwise this expedient is contra-indicated, as all efforts must be directed towards avoiding the debilitation of the patient. Preventive measures are important: meat should be regularly

inspected and condemned if there is infection. Those, such as sausage makers, who handle raw pork should be careful not to convey to their mouths fragments of raw meat which may be adherent to their fingers. The disease is now rare in Great Britain, but there was a recent outbreak among sausage makers in a N. tn. and on inquiry it was found that the infected persons had been in the habit of sampling the raw sausage meat. *See also* NEMATODES.

Triennial Acts. The object of these Acts, passed in 1641 and 1694, was to ensure the frequent meeting of Parliament. Charles I ruled for 11 years without summoning a Parliament; the result was that the Long Parliament passed the first Triennial Act, 1641, empowering the Chancellor, or in default the Peers, to issue the necessary writs, if the king failed to call a Parliament for 3 years, or in the last resort, allowing the electors to proceed to choose their representatives. The Act was repealed in 1664 by an Act which provided that Parliament must not be intermitted for more than 3 years. In 1694 William III assented to the second Triennial Act, which followed upon the declaration in the Bill of Rights that 'Parliament ought to be held frequently.' In 1716 the triennial limit was increased to 7 years. That period was reduced to 5 years by the Parliament Act, 1911.

Trient, *see* TRENTO.

Trier (Fr. Trèves), Ger. city in the *Land* of Rhineland-Palatinate (q.v.), on the Moselle (q.v.), near the Luxembourg border, 74 m. W. by W. of Mainz. It was founded by the Emperor Augustus c. 15 BC, and during the 3rd and 4th cents. was frequently the imperial residence. It was made the seat of a bishopric at the beginning of the 4th cent., and later the seat of an archbishopric. The Golden Bull (q.v.) of 1356 created the Archbishop of T. an Elector of the Empire, and from the Middle Ages until the end of the 18th cent. the city was the cap. of an ecclesiastical principality. In 1794 T. was taken by the French. Until 1814 it was the chief tn. of the Saar, but in that year it was annexed by Prussia. The city was again in Fr. hands from 1918 until 1940. It was severely damaged in the Second World War; it was taken by the Third Amer. Army on 2 Mar. 1945. T. has more important Rom. remains than any other place in N. Europe. The prin.

of these are a bridge; a 1st-cent. amphitheatre; a 4th-cent. imperial palace; 2 ruined baths; and a remarkable, massive gate, the *Porta Nigra*. The cathedral, rebuilt from a Rom. basilica, was extended in the 12th and 13th cents., and has baroque additions. The adjoining *Liebfrauenkirche* is one of the finest Gothic buildings in Germany. There are other medieval and baroque structures of interest, and there are sev. museums. T. is an important centre of the Moselle wine trade. Its prin. manufs. are machinery, precision instruments, textiles, tobacco, and beer. St Ambrose (q.v.) was a native of T., as was Karl Marx (q.v.). Pop. 85,000.

Trieste (Slovenian *Trst*; anct *Tergeste*), seaport situated on the Gulf of T., at the head of the Adriatic (q.v.), 70 m. ENE. of Venice (q.v.). It is the chief tn. of the Free Ter. of T. (*see below*), and is the cap. of the It. prov. of T. It was settled by the Romans in 178 BC, and became a prosperous port in the 1st cent. AD. The Romans were followed by the Ostrogoths, the Byzantines, and the Longobards, and eventually the city became part of the Empire of Charlemagne (q.v.). In the 13th and 14th cents. it was controlled by Venice, and in 1382 it submitted to Austrian suzerainty. After 1719 it was a free port. It was in Fr. hands 1797-1805, and was part of the Illyrian provs. 1809-13. During the 19th cent. it developed greatly, and was an important outlet for Austria. It became an Austrian crownland in 1867, and cap. of *Küstenland* (q.v.). For long a centre of It. irredentism, it was occupied by Italy in 1918; it was formally ceded to Italy in 1920, and became cap. of T. prov. of Venezia Giulia. During the Second World War it was heavily bombed. After the War it was in the Anglo-Amer. zone of the Free Ter. of T., and since 1954 has been in the It. zone. In the 'Memorandum of Understanding' of Oct. 1954, Italy undertook to maintain T. as a free port. The city is dominated by the hill of San Giusto (martyred at T. in AD 303, and patron of the city), on which stand the cathedral (14th cent.), the castle (16th cent., restored 1936), and Rom. remains. The old tn, with its steep and narrow streets, extends down the hill to the main square, the Piazza dell'Unità d'Italia, in which are the tn hall, and governmental and shipping offices. The new tn, on the seafloor, is spacious and well laid out. In the Piazza della Borsa there is a Rom. theatre. There are shipyards, iron- and steel-works, and oil-refineries. Machinery, textiles, foodstuffs, spirits, paper, and paints are manufactured. The city is a centre of shipping and marine insurance, and its port (with 3 basins) extends for 8 m. along the Gulf of T. Pop. (tn) 271,000; (prov.), 292,000.

The Free Territory of Trieste. At the end of the Second World War the city of T. and its environs were the subject of a dispute between Italy and Yugoslavia. The pop. of T. is largely It. in origin. T. had been in It. hands since the end of the First World War, and Italy had developed

shipyards, refineries, and irrigation works. On the other hand, T. is of more importance economically to central Europe and to Yugoslavia than it is to Italy, its immediate hinterland is largely Slovene ter., and there are Slovenian and Croatian minorities. As a compromise, under the terms of the It. Peace Treaty of 10 Feb. 1947, Italy gave up the city of T. and the Istrian peninsula (see *ISTRIA*); and the Free Ter. of T. was formed, comprising the city and an Adriatic coastal strip, 30 m. long and varying in width from 2 m. in the N. (at Duino) to 15 m. in the S. The Free Ter. was bounded on the landward side by Yugoslavia except in the extreme NW., where it had a 2-m.-long common frontier with Italy.

It was under the aegis of the U.N. Security Council, and its inauguration in Sept. 1947 was marked by a threat of serious disorder when Yugoslav troops appeared at a frontier post and announced their intention of marching on T.; they retired after the road had been blocked by a small Brit. force. Pending the appointment by the Security Council of a governor (whose selection could not be agreed upon), the Free Ter. was divided into 2 zones under military gov.: *Zone A*, under Anglo-Amer. administration, included the city of T., other tns (including Muggia, Miramare, Aurisina, and Duino), and some infertile rural areas of the Karst (q.v.), total area 86 sq. m., pop. (1949) 310,000; and *Zone B*, under Yugoslav administration, included the tns of Capodistria, Piran, and Cittanova (qq.v.), and some fertile agric. dista., total area 199 sq. m., pop. (1949) about 70,000. In 1948 Britain, France, and the U.S.A. came to the conclusion that the problem of T. would not, after all, be solved by the estab. of the Free Ter., and these powers consequently proposed that the clauses of the It. Peace Treaty which concerned T. should be rescinded, and that a protocol should be added restoring the whole of the ter. to It. sovereignty. This remained the policy of the W. powers for some years, and T., meanwhile, stayed under military control. In 1954, however, the interested parties reached agreement on the future of the Ter. On 5 Oct. the govs. of Great Britain, the U.S.A., Italy, and Yugoslavia initialled in London a Memorandum of Understanding terminating military gov. in both zones. On 25 Oct. the Anglo-Amer. forces were withdrawn from Zone A, which was handed over (less one small strip of ter.) to the It. gov. Zone B (and the additional strip) came under Yugoslav civil administration. The U.N. Security Council was given notice of these 'practical arrangements.'

See *Commentary on the Treaties of Peace with Italy* (H.M.S.O.), 1947; *Memorandum of Understanding* (Cmd. 9288) (H.M.S.O.), 1954.

Trieste, Gulf of, see **VENICE, GULF OF**.
Trifolium, family Leguminosae, a genus of nearly 300 species, including *T. pratense*, Red clover; *T. arvense*, Hare's-foot; *T. hybridum*, Alsike Clover; *T. repens*, White or Dutch Clover; *T.*

campestre, Hop Trefoil; etc. *T. alpinum* and *T. uniflorum* are grown on rock gardens.

Triforium, or **Blind Storey**, in Romanesque and Gothic aisled churches, the stage of wall between the top of the nave arcade and the bottom of the clerestory, masking the lean-to roof over the aisle. The T. is usually pierced with open arcading.

Triglyph (Gk, literally 'three grooves'), in Gk architecture, a slightly projecting block placed at regular intervals in the frieze of the Doric Order (see **ORDERS**) and decorated with 3 grooves.

Trigonometry, in its primary meaning, signifies the measurement of triangles; it has a much wider scope, however, embracing all types of geometrical and algebraical investigations by means of certain quantities termed trigonometrical ratios. These ratios are defined as follows: Take any system of rectangular axes OX, OY, and with centre O describe a circle of any radius. On its circumference take any point P. Join OP, draw PM perpendicular to OX. Then the co-ordinates of P are (OM, MP), or in ordinary Cartesian notation (x, y), where $x = OM$, $y = MP$. If the angle POM be denoted by θ , then $\sin \theta = \frac{MP}{OP}$, $\cos \theta = \frac{OM}{OP}$, $\tan \theta = \frac{MP}{OM}$, $\operatorname{cosec} \theta = \frac{OP}{MP}$, $\sec \theta = \frac{OP}{OM}$, $\cot \theta = \frac{OM}{MP}$. The terms sin, cos, etc., are abbreviations for sine, cosine, tangent, cosecant, secant, and cotangent. From the above definitions the following relations hold: $\sin \theta = \frac{1}{\operatorname{cosec} \theta}$, $\cos \theta = \frac{1}{\sec \theta}$,

$\tan \theta = \frac{1}{\cot \theta}$. Also since OMP is a right-angled triangle, $MP^2 + OM^2 = OP^2$
 $\therefore \left(\frac{MP}{OP}\right)^2 + \left(\frac{OM}{OP}\right)^2 = 1$, i.e. $\sin^2 \theta + \cos^2 \theta = 1$. From these, other relations, such as $\sec^2 \theta = 1 + \tan^2 \theta$ and $\operatorname{cosec}^2 \theta = 1 + \cot^2 \theta$, may be deduced. In the construction of tables for the values of the different trigonometrical ratios of θ , the labour of finding these values is greatly minimised by the use of the following relations, it being only necessary to calculate these values as θ takes the various values from 0° to 45° . These relations may easily be proved by reference to the diagram, $\sin (90^\circ - \theta) = \frac{OM}{OP} = \cos \theta$.

$\cos (90^\circ - \theta) = \frac{MP}{OP} = \sin \theta$, $\tan (90^\circ - \theta) = \frac{OM}{MP} = \cot \theta$. The following may also be easily deduced: $\sin (90^\circ + \theta) = \cos \theta$, $\cos (90^\circ + \theta) = -\sin \theta$; $\sin (180^\circ - \theta) = \sin \theta$; $\cos (180^\circ - \theta) = -\cos \theta$. Thus $\cos 170^\circ = \cos (90^\circ + 80^\circ) = -\sin 80^\circ = -\sin (90^\circ - 10^\circ) = -\cos 10^\circ$.

The *addition theorem* is useful in finding the values of the functions of the sum or difference of 2 angles, the values of these functions for each angle being known. $\sin (\theta + \phi) = \sin \theta \cos \phi + \cos \theta \sin \phi$

$$\cos(\theta + \phi) = \cos \theta \cos \phi - \sin \theta \sin \phi$$

$$\tan(\theta + \phi) = \frac{\tan \theta + \tan \phi}{1 - \tan \theta \tan \phi}$$

For differences, write $-\phi$ for $+\phi$ in the above, and note that $\sin \phi = -\sin(-\phi)$, $\cos \phi = \cos(-\phi)$, $\tan \phi = -\tan(-\phi)$. Often an angle is denoted by its trigonometrical ratio; this value is called the inverse function, e.g. $\sin^{-1}\frac{1}{2}$ is the angle whose sine is $\frac{1}{2}$, $\cos^{-1}\frac{1}{2}$ is the angle whose cosine is $\frac{1}{2}$. For the construction of tables, the sine and cosine functions are expanded into the following series:

$$\sin \theta = \theta - \frac{\theta^3}{3!} + \frac{\theta^5}{5!} - \dots \text{ad inf.},$$

$$\cos \theta = 1 - \frac{\theta^2}{2!} + \frac{\theta^4}{4!} - \dots \text{ad inf.},$$

where θ is measured in radians. Thus if θ° is value of the angle in degrees, the number of radians $= \frac{\pi \theta}{180}$. Trigonometry

is applied to the solution of triangles. These triangles may be plane or spherical: the chief relations existing between the sides and the trigonometrical ratios of the angles in plane triangles are: $\frac{\sin A}{a} =$

$$\frac{\sin B}{b} = \frac{\sin C}{c}, \quad a^2 = b^2 + c^2 - 2bc \cos A,$$

etc., where A, B, and C denote the angles, and a, b, c the sides opposite to these angles. In spherical triangles $\frac{\sin A}{\sin a} =$

$$\frac{\sin B}{\sin b} = \frac{\sin C}{\sin c}, \quad \cos a = \cos b \cos c + \sin b \sin c \cos A.$$

The sides a, b, c are the three arcs of great circles which form the spherical triangle, and the angles A, B, C are formed by the arcs at the points where they meet. The subject arose out of the study of astronomy, the Gk astronomer Hipparchus (160 BC) inventing it. The man who greatly extended the subject was Ptolemy, the Alexandrian astronomer. Regiomontanus made the subject a science quite independent of astronomy. See Todhunter, *Plane Trigonometry*, 1903; Todhunter and Leathem, *Spherical Trigonometry*, 1907; J. A. Bullard and A. Kiernan, *Plane and Spherical Trigonometry*, 1923; T. M. MacRobert and W. Arthur, *Trigonometry*, 1937-8; A. Page, *Trigonometry*, 1949.

Trihydroxypropane, see GLYCEROL.

Tri-iodomethane, see IODOFORM.

Trikkala, tn of Greece, cap. of the dept of T., 38 m. SW. of Larissa in Thessaly.

It is the chief mrkt for the pastoral products of the Pindus mts and for the crops of the Thessalian plain, wheat, maize, tobacco, and cotton. It is the see of an archbishop. Pop.: (dept) 128,000; (tn) 24,100.

From 'British Regional Geology—The Welsh Borderland' by Porcock & Whitehead. Reproduced by permission of the Controller of H.M. Stationery Office.

OGYGIOCARIS, AN ORDOVICIAN TRILOBITE

Trilene, or Trichlorethylene, see ANAETHESIA.

Trilinear Co-ordinates, used in solid geometry. They are an extension of the principles developed in analytical (or coordinate) plane geometry. To the 2 imaginary perpendicular axes Ox , Oy is added a third, Oz , which is perpendicular to the plane containing Ox , Oy . The position of any point in space can then be defined by the T. C. x , y , z , representing the perpendicular distances of the point from the axes Ox , Oy , Oz respectively.

See also under GEOMETRY, Analytical.

Trillium, genus of perennial plants (family Liliaceae), with thick rhizomatous stems and roots, and a solitary nodding white, pink, or purple flower borne in the centre of a whorl of 3 leaves. *T. grandiflorum*, the wake robin, is often grown in gardens.

Trillo del Diavolo, Devil's trill, name given to Tartini's (q.v.) violin sonata. The work is in 4 movements, of which the finale contains the famous trill.

It is said to have been inspired by a dream in which Tartini bargained his soul with the devil in return for musical inspiration. On waking he wrote down

what he had heard, but related that the version as written fell far short of the devil's performance.

Trilobites, an extinct group of marine Palaeozoic arthropods in which the dorsal exo-skeleton has a prominent transverse trilobation, with a convex axial portion and flattened pleural areas. Longitudinally, the dorsal shield is also divided into 3 distinct parts, the head or cephalon, the flexible thorax, and the tail or pygidium. The body was divided into segments, each bearing a pair of biramous

Trim, cap. of co. Meath, Rep. of Ireland, on the R. Boyne. It is one of the oldest eccles. centres in Ireland, and St Patrick built the first church here. The huge T. castle is the largest Anglo-Norman fortress in the country. The Yellow Steeple was part of the 13th-cent. St Mary's Abbey (Augustinian). Dean Swift was rector of Laracor (2 m. S.) from 1700 to 1713, and Stella Johnson lived there. The Duke of Wellington was at school and later resident in T. To-day T. has agric. and light industries. Pop. 1400.

THE HARBOUR OF TRINCOMALEE

Brian Chirlian

appendages, but these are only rarely preserved. Some trilobites were burrowing or bottom-dwelling forms, while others were planktonic. Highly developed trilobites occur in the oldest Cambrian rocks; they reached their acme in Ordovician times, and died out in the Permian. They are valuable as index fossils.

Trilogy, group of 3 tragedies which are either connected by a common subject or each is a distinct story. In the great period of Attic drama all competitors who took part in the contest had to produce a T. and a satyric drama. The only surviving example is the *Orestia* of Aeschylus consisting of the 'Agamemnon,' 'Choephorae,' and 'Eumenides.' Its satyric appendage is lost.

Trimethylamine, see AMINES; ETHYLAMINE.

Trimorphism, see DIMORPHISM.

Trimurti, in Indian religion, the later Hindu triad (q.v.), Brahma, Vishnu, and Siva, considered as an inseparable unity. T. implies the unity of the 3 principles of creation, preservation, and destruction, and is an expression of philosophical, rather than popular belief. The mystic word Om (Aum) used in prayer is said to be the symbol of the T., the letters A, U, and M standing for Brahma, Vishnu, and Siva respectively. T. as the representation of the Hindu triad consists of 1 human body with 3 heads, that of Brahma in the middle, that of Vishnu at the right, and that of Siva at the left.

Trinacri, or Trinacria, *see* SICILY.

Trincomalee, seaport on the NE. coast of Ceylon, with an excellent harbour. It is the site of the Temple of the Thousand Columns, a pilgrimage resort, reduced to ruins by the Portuguese during the 17th cent. T. was a Brit. naval base in Ceylon during the Second World War.

Tring, mkt tn of Herts, England. Here are Tring Park and the Rothschild zoological museum. T. reservoirs have recently been declared a national nature reserve by the Nature Conservancy. There is a trade in agric. produce. Pop. 5290.

Trinidad, the second largest W. Indian is. belonging to Britain, situated at the extreme S. of the chain of W. Indian is., immediately opposite to the delta of the Orinoco R., and lying between 10° 3' and 10° 50' N. lat. and 60° 55' and 61° 56' W. long. It is 4005 m. by sea from London and 1958 m. from New York. T. is rectangular with promontories at the 4 corners, those at the NW. and SW. being extended towards the mainland of S. America, of which, geologically, it is a part, and enclosing the Gulf of Paria, which is practically a land-locked sea between T. and Venezuela, with narrow straits at the N. and S. The Straits at the N. are called Bocas del Dragon or Dragon's Mouths, and those at the S. the Boca do la Serpiente or Serpent's Mouth. T. has an area of 1864 sq. m.; its average length is 50 m. and breadth, 37½ m. The NE. and S. coasts are steep and lofty, with few harbours, but on the W. the coast is low, rising gradually towards the interior, with fertile plains, hills, and valleys. The N. coast is much indented, but most of its bays are rock-bound excepting those of Maracas and Las Cuevas. The E. coast, being exposed to the Atlantic, is often unapproachable by shipping, and on the S. coast the bays of Erin, Quinam, Moruga, and Guayaguayare are so shallow that vessels have to lie well off the shore. Three mt ranges traverse the is. from E. to W. Between the N. (where Mt Aripo reaches 3085 ft) and the Central ranges the country is flat and well watered, but the land to the S. of the Central range is undulating and the water supply poor. The 3 most important and navigable rvs. are the Caroni, which drains the NW. portion of the is., the Ororeio, which drains the SE section, and the Oropuche draining the NE. Other rvs. are the Poole, the Navet, and another Oropuche in the SW. of the is. The climate is tropical yet not too warm. Agriculture and oil production are the chief occupations. An agric. dept with a highly trained technical staff, the Imperial College of Agriculture, founded in 1921, and a recently estab. microbiological laboratory, keep the colony abreast of the latest discoveries tending to the improvement of its soil and flora. Since 1954 the E. Caribbean Farm Institute at Centeno, Arima, has supplemented this work by training suitable staff. There is a fisheries experimental station at Bamboo Grove. The chief agric. products are sugar, coconuts, and cocoa. Other crops

are citrus fruits (lime, grapefruit, and oranges), coffee (both robusta and arabica), rice, and bananas. T. is the source of Angostura bitters, the manuf. of which was transferred to the is. from Angostura or Ciudad Bolivar in 1875, owing to the troubled state of Venezuela. The prin. mineral products are crude petroleum (output for 1954 was 23,629,000 barrels), asphalt (output 142,100 tons), building stone, and road metal. On 1 Aug. 1956 the gov. sold the T. Oil Company to the Texas Oil Company under conditions calculated to ensure greater production and more income for the is. workers. One of the features of the is. is the pitch lake at La Brea, which contains an enormous supply of asphaltum. The lake occupies 114 ac. Oilfields are being developed, and the is. is now the second largest producer of petroleum in the Commonwealth. The prin. exports are petroleum, asphalt by-products, cocoa, sugar, and rum. Exports in 1954, including re-exports, were worth \$261,600,000, a surplus of \$12,100,000 over imports.

In 1955 192,793 tons of sugar were manufactured, representing one-tenth of the weight of the cane grown. The oil industry contributes directly and indirectly some 40 per cent of the gov.'s revenue. The cocoa grown in T. is the best in quality in the world. Coconuts and products of coconuts are a valuable subsidiary industry. Secondary industries include the manuf. of cement, beer, glass, and matches. T. is reasonably stable and prosperous, the budget for 1955 balancing at about \$81,600,000 (about £17m.). There exist, however, poverty, some unemployment, disease, and an acute housing shortage. The overall pop. is about 721,000 (including Tobago, 34,000). Of these some 50 per cent are W. Indian, i.e. of W. African origin; there are about 300,000 E. Indians (mostly Hindus, but with large Christian and Muslim sections among them); the remainder are chiefly of Brit., Fr., Sp., and Portuguese descent, as well as Chinese, Syrians, Jews, and others (the pop. of Tobago is mostly W. Indian).

In 1946 universal adult suffrage was introduced, thereby increasing the electorate from 30,000 to 250,000. The present constitution, which came into force in 1956, provides, as did its predecessor, for single-chamber gov. only; it brings T. in line with Barbados and Jamaica in their progress towards self-gov. within the Commonwealth. The Legislature or Legislative Council consists of 2 *ex officio* members (the colonial secretary and attorney-general), 5 members nominated by the governor, and 24 elected members. The speaker is elected by the Legislative Council from among their own number. The Executive Council comprises the governor as chairman, the 2 *ex officio* members of the Legislative Council, and 8 ministers. A chief minister chosen by the Legislative Council leads the gov. in both Legislative and Executive Councils and selects the other ministers. The Executive Council is the chief instrument of policy, and in

all ordinary circumstances the governor is obliged to act upon its advice. At the election of 1950, 4 parties won seats, and 6 Independent members were elected. The report of the 1955 Constitutional Reform Committee is expected to develop this liberalisation.

Co. councils were estab. in 1946 and granted executive powers in 1952, the chairman of each council being elected members on the legislature of the colony (there are 8 cos.). There are 504 primary

109 m.: one line runs through St Joseph and Arima to Guanapo and passes through some of the cacao dists., affording fine views of the Central Range of mts. Four wireless stations are maintained by the gov. Under an agreement concluded 27 Mar. 1941 defence bases have been leased to the U.S. Gov. for a period of 99 years. There is a civil airfield at Piarco, and an emergency airfield at Toco (N. T.), and 4 other landing strips. Wireless and wired broadcasting are operated

MARACAS BAY, TRINIDAD

Camera Press

and intermediate schools in the colony, including both gov. and assisted schools. The majority of the latter are Rom. Catholic, Church of England, and Canadian Presbyterian. There are 2 gov. secondary schools, 1 for boys and 1 co-educational, and 12 assisted secondary schools, 4 for boys, 6 for girls, and 1 co-educational. The Supreme Court of T. is a superior court of record, and consists of a chief justice and 6 puisne judges, and its jurisdiction is assimilated as nearly as possible with the practice and procedure in the High Court of Justice in England so far as not displaced by local rules of court. There are also petty civil courts in various parts of the colony and magistrates' courts.

There are 1407 m. of main and 1059 m. of local roads. There is a gov. railway of

by a commercial company. Port of Spain (q.v.) (pop. 114,000), the cap., has many modern amenities. Other important tns are San Fernando and Arima.

History. T. was discovered by Columbus on his third voyage, in 1498, and taken possession of by him for the King of Spain. He named it La Trinidad or 'The Trinity.' Columbus never came to T. again, and the Spaniards made no attempt to found a settlement for over 30 years. The aboriginal Arawak Indians called the is. 'Jere' or 'The Land of the Humming Bird,' a name by no means inappropriate until recent times. For almost 2 cents. after the discovery of T., the is. remained as undeveloped as it was before the advent of Columbus, a prey to internecine strife between the fierce Caribs and the milder-mannered Arawaks and to the cruelties of

the Spaniards in quest of mythical gold. Sir Robert Dudley (or Dudley) (styled Duke of Northumberland and Earl of Warwick) with Capt. Munck, sailed to Cedros Bay in 1595, but, growing tired of waiting for Sir Walter Raleigh, whom he expected to meet in T., he sailed for the Orinoco. Ten days later Raleigh sailed into Cedros Bay and up to La Brea (which he describes in his *Discoverie of Guiana*, Hakluyt series). In T. he learned that the Sp. governor intended to cross to Guiana in quest of El Dorado. Unwilling to leave a Sp. garrison in his rear, he hurled his force on the Sp. Corps du Guard, put them to the sword, and sacked the little tn of San Josef de Oruna. In the 17th cent. T. was twice raided (1640, 1677) by the Dutch and, in 1690 by the Fr., rivalry among the chief maritime powers being at its height. These raids had some unifying effect on the activities of the inhab., for despite the mercantilist policy of the Sp. gov., there was a considerable growth of trade (especially in 1695). Towards the end of the 17th and the first decade of the 18th cents. cocoa was successfully cultivated in T., but a blight destroyed the plantations (c. 1725) and T. made little further progress until 1783, when a royal proclamation was issued, by which extraordinary advantages were offered to foreigners of all nations to settle in T., on condition that they were Rom. Catholics. The result was a large influx of pop., which was soon augmented by many Fr. families who were driven from St Domingo (q.v.), Haiti (q.v.), and elsewhere in consequence of the Fr. Revolution. To this cause is to be traced the preponderance of the Fr. element in a colony which never (like, e.g. St Lucia) belonged to France. On 18 Feb. 1797 articles of capitulation were signed by the Spanish by which England's sovereignty over the is. was recognised. The final cession of the colony took place in 1802 under the Treaty of Amiens.

Trinidad: 1. City on the S. coast of Cuba, 175 m. SE. of Havana, and 45 m. by rail from Santa Clara through beautiful scenery. Altitude 1000 ft. It is an interesting old tn, founded in 1514, and

the dwelling-house of Cortés (q.v.) when he was alcaide of Santiago de Cuba is still in existence. T. exports sugar and honey, and has general agric., dairy, and tobacco production. Pop. 15,500.

2. Tn of Bolivia, in Beni Prov., of which it is the cap., 265 m. NE. of Cochabamba. It is a few m. from the Mamoré R. in a hot malarial region, and is one of the most important trading centres in NE. Bolivia, with important air and riv. facilities, in an area producing cotton, cacao, sugar, and cattle. Pop. 13,500.

3. Cap. of Flores dept, Uruguay, on a branch of the central railway, 100 m. NW. of Montevideo. T. produces wheat, linseed, fruit, and vines, and cattle and sheep are raised. Pop. 15,750.

Trinitarians, or Redemptionists, Fr. religious order founded by John of Matha and Felix of Valois for the redemption of Christians captive among infidels. The T. were founded in 1198 and followed the rule of St Augustine.

Trinitro-phenol, see PICRIC ACID.

Trinitrotoluene, 'T.N.T.', high explosive, $C_6H_5(NO_2)_3CH_3$, largely used in the World Wars. It is a pale yellow crystalline solid, m.p. 80-8° C., prepared by acting upon toluene (q.v.) with a mixture of concentrated sulphuric and nitric acids. See EXPLOSIVES.

Trinity, see JAN MAYEN ISLAND.

Trinity, The Blessed, term used for the highest mystery of the Christian faith, the doctrine that God, while one in nature and being, is 3 distinct persons, the Father, the Son, and the Holy Spirit. In the O.T. this doctrine is barely adumbrated, for the Jews had to learn to maintain the ethical holiness and the unity of God as against immoral polytheism. In the N.T. we meet the Son of God, who is divine and a third Person in whom divine attributes are recognised. The 3 persons are grouped in the formula of Matt. xxviii. 19: 'Baptising them in the name of the Father and of the Son and of the Holy Ghost.' The development of these concepts and convictions was the work of the early cents., and the clear expression of the doctrine was the fruit of Gk thought. In the W. the great exponent of Trinitarian doctrine is St Augustine of Hippo (*De Trinitate*). The fullest expression, however, is found in the *Quicunque Vult*, the so-called Athanasian Creed (q.v.). See HOLY SPIRIT; CONSUBSTANTIAL.

Trinity College, Cambridge, incorporates Michaelhouse founded in 1324 by Hervey de Stanton, chancellor of the Exchequer to Edward II, and King's Hall, founded in 1337 by Edward III. The fusion was effected in 1546 by Henry VIII who largely endowed the college. The Great Gate and the clock tower were built for King's Hall. The present chapel was completed in 1564. The lay-out of Great Court and the fountain and Neville's Court (modernised in 1756) were the work of Dr Thomas Neville, master 1593-1615. The library is by Wren with busts by Roubiliac and carvings by Grinling Gibbons. T. C. is a miniature university. Amongst famous members have been Bacon, Byron, Dryden,

Macaulay, Issaac Newton, Tennyson, and Thackeray. See G. M. Trevelyan, *Trinity College*, 1943.

Trinity College, Dublin, univ. of Dublin, founded in 1591. During the 16th cent. many efforts were made to found a univ. in Dublin. In 1590 Adam Loftus, Archbishop of Dublin, and other influential persons brought matters to a conclusion, and the mayor and corporation of Dublin were persuaded to give the old Augustinian monastery of All Hallows, granted to them at the Dissolution, for the site. In 1591 royal assent for the foundation of the college was sought, and the college was incorporated on 3 Mar. 1592, Wm Cecil, Lord Burghley, being the first chancellor and Loftus the first provost. 'The College of the Most Holy and Undivided Trinity of Queen Elizabeth, near Dublin' was founded as *mater universitatis*, but no other colleges were ever founded, with the result that the univ. of Dublin and Trinity College, Dublin, are inextricably entangled. The college continues to occupy the 30-ac. site originally granted, now in the heart of the city. At the W. of the site are the 18th-cent. buildings: the chapel, public theatre, dining-hall, and library. The library has many treasures, including the Book of Kells, and continues to enjoy Brit. copyright privileges. There is residential accommodation for 350 male students. Women students are accommodated in Trinity Hall in the suburbs. In the centre of the site are the playing-fields. At the E. of the site are the 19th- and 20th-cent. buildings for the scientific and medical departments. There is a botanic garden at Ballsbridge. In 1871 the last traces of religious tests were abolished, and in 1903, women were admitted to degrees. The univ. returns 3 members to Seanad Éireann.

Many famous Irish names appear on the rolls of the college, including those of satirists, poets, novelists, orators, scientists, historians, publicists, and politicians of every party. Among very many, Wm Congreve, Oliver Goldsmith, Henry Grattan, Wolfe Tone, Jeremy Taylor, Edmund Burke, James Ussher, Jonathan Swift, and George Berkeley may be listed. See Constantia Maxwell, *A History of Trinity College, Dublin, 1591-1892*, 1946 (contains full bibliography); Kenneth C. Bailey, *A History of Trinity College, Dublin, 1892-1945*, 1947.

Trinity College, Oxford, founded in 1555 by Sir Thomas Pope on the site of the former Durham College, dissolved priory of the Benedictine House at Durham. Its main beauties are the chapel (rebuilt 1691-4) and the garden. Famous members have included Lord Chatham, Lord North, W. S. Landor, Cardinal Newman, James Elroy Flecker, Archbishop Davidson, A. E. W. Mason, Lord Goddard, and Monsignor Ronald Knox.

Trinity Friars, see CRUTCHED FRIARS. **Trinity Hall**, Cambridge, founded in 1350 by Wm Bateman, Bishop of Norwich, for the study of canon and civil law. The buildings were much altered early in the 18th cent. T. H. has always had, and still retains, a strong legal tradition.

Trinity House, name of 5 maritime societies, of which only the 'Corporation of Trinity House of Deptford Strond', London, retains its ancient powers and privileges. The others, at Leith, Dundee, Hull, and Newcastle-on-Tyne, dwindled to mere benefit societies. The London House, however, still retains the management of some of the most important interests of the seamen and shipping of England as the general lighthouse authority for England, Wales, and the Channel Islands and the principal pilotage authority in the U.K. Its corporation consists of a master, deputy-master, and 9 elder brethren, usually 1 R.N., and 8 Merchant Service, 2 of whom sit as Nautical Assessors in the Court of Admiralty in cases where any question upon navigation is likely to arise. There are also many younger brethren, and sev. honorary elder brethren, e.g. H.R.H. the Duke of Edinburgh, Sir Winston Churchill, Earl Mountbatten of Burma. The Corporation received its first Charter on 20 May 1514 from Henry VIII, but it is clear from this document that the 'guild of fraternity' existed prior to that date. The T. H. of Hull began in the 14th cent. as a religious fraternity seemingly connected with a guild of shipmen, which survived the dissolution of religious guilds in 1547.

Trinity Sunday, the first Sunday after Pentecost, or Whitsunday, observed by the Rom. Catholic and Anglican Churches. The Anglican Church, following the Sarum Use, names the succeeding Sundays after *Trinity*, while the Rom. Catholic Church reckons them after *Pentecost*. The Sarum and Anglican practice may be due to the Eng. origin of the feast. Gervase of Canterbury says that St Thomas Becket instituted it in England soon after his consecration in AD 1162. It was made a universal observance by John XXII.

Trinoda Necessitas, duties laid upon holders of land in A.-S. England, comprising the manning of fortified places, repair of bridges, and service in the fyrd. The term 'obligations' was used in A.-S. documents: T. N. is a 17th-cent. phrase.

Trinovantes, tribal group of non-Belgic character, who lived N. and N.E. of the Thames in the latter part of the Early Iron Age in Britain. Caesar accepted their submission, as did Claudius in AD 43. The T. joined the revolt of the Iceni under Boudicca (Boadicea) and suffered as a result. Their cap. was made into the colony of Camulodunum, now Colchester.

Trío, musical composition or movement for 3 vocal or instrumental parts; more particularly a chamber work for 3 instruments, especially violin, cello, and pianoforte (pianoforte T.), or violin, viola, and cello (string T.); also the alternative section in a minuet, scherzo, march, or sometimes other kinds of movement in a sonata-form work, so called because originally such sections were by convention written in 3 parts.

Triolet, poem of 8, usually 8-syllabled, lines, with only 2 rhymes, arranged abaaabab. The first line is repeated as the fourth and seventh, and the second as the eighth, so that there are only 5 lines

of independent sense. The T. has been described as a short form of the rondeau (q.v.).

Triphenylmethane, $\text{CH}(\text{C}_6\text{H}_5)_3$, is obtained by the action of benzal chloride, $\text{C}_6\text{H}_5\text{CHCl}_2$, on benzene, in presence of aluminium chloride; or from benzaldehyde and benzene in conjunction with zinc chloride. It forms colourless prisms melting at 93°C . and boiling at 359°C . It is the parent substance of a number of dyes. Thus by the condensation of benzaldehyde and dimethylaniline with zinc chloride, leucomalachite green is obtained (the leuco base), which, on oxidation with lead dioxide and hydrochloric acid, gives rise to the colour base (a carbinol), and this loses water to give the dye *malachite green*. *Crystal violet* is another example. *Pararosaniline* can be made by the condensation of *para*-toluidine (1 molecule) and aniline (2 molecules) in presence of arsenic acid. *Rosaniline* is similarly obtained from a mixture of *ortho*- and *para*-toluidines. In each case the colour base formed loses hydrogen to give the dye. See DYE.

Triple Alliance. The first was ratified between the States-General and England against France in 1668 for the protection of the Sp. Netherlands. It was afterwards joined by Sweden, thus forming a T. A. Another was arranged in 1717 between England, the Netherlands, and France against Spain, and after the accession to it of Austria in 1718 it was known as the Quadruple Alliance. In 1788 England, Prussia, and the Netherlands allied, and in 1795 England, Russia, and Austria. About 1882 an alliance was arranged between Germany, Austria, and Italy to check the power of Russia and France. Although this T. A. expired in 1892, it was renewed and extended for a number of years, and this, together with the dual alliance between France and Russia and the triple entente between England, France, and Russia, was relied upon to preserve the balance of power between the great nations of the world. The T. A. was last renewed in 1912, and it bound Italy to the Central Powers in a defensive alliance. However, during the First World War Italy's initial neutrality became gradually less 'benevolent,' and eventually on 4 May 1915 Italy denounced her treaty of alliance with Austria-Hungary. See further under ITALY; see also EUROPE; WORLD WAR, FIRST.

Triple Point. The variation of boiling point with pressure can be indicated on a graph of pressure plotted against temp., as shown by the line TB in the figure. At a given pressure P, the substance is liquid at temps just below the temp. corresponding to the point N, and is a vapour for higher temps. Similarly, the relation between freezing point and pressure can be represented by the line TC, and the region between TC and TB will correspond to the liquid phase or state. For lower pressures, e.g. P_1 , the solid can pass directly into the vapour phase by heating alone—this is known as sublimation (q.v.), and the temp. at which it occurs also varies with pressure as

shown by the line TA. These 3 lines meet at the point T, known as the Triple Point. Under the conditions of temp. and pressure corresponding to T, the 3 phases, solid, liquid, and vapour, can coexist in equilibrium. For some substances this diagram, known as the Phase Diagram, is more complicated, mainly

because of the existence of different crystalline structures for the solid. In the case of water the melting line TC slants to the left, indicating that ice (q.v.) can be melted at a given temperature by the application of pressure, a process known as regelation.

Tripoli, seaport and city of N. Africa, cap. of Tripolitania, itself sometimes known as Tripoli. Situated on a promontory of the Mediterranean, it is a typical Moorish city, containing a Sp. fortress, many beautiful gardens, and sev. fine mosques. A notable feature is the arch of Marcus Aurelius in marble. During the It. occupation a number of modern gov. buildings were erected, together with a fort. T. is at the junction of caravan routes to Timbuktu, Lake Chad, and Darfur, and 3 railway lines diverge from it to Zuara, Garian, and Taghura; it is connected by telegraph cable with Malta and Syracuse. It has a court of assize and a court of appeal. The city was repeatedly bombed by the R.A.F. in 1941-2. With its capture on 23 Jan. 1943 the Eighth Army secured the best N. African port between Tunis and Alexandria. (See also AFRICA, NORTH, SECOND WORLD WAR CAMPAIGNS IN.) Pop. 130,238 (Italians, 39,000).

Tripoli, tn of the Lebanon, 40 m. NNE. of Beirut, its port being El Mina. There are rail connections with Haifa and Homs. In 1109 T. was taken by the Crusaders. A varied trade is carried on in oranges, silk, etc. Pop. 80,000.

Tripolitania, prov. of Libya, a former It. ter. of N. Africa, stretching from the Mediterranean some 800 m. into the Sahara Desert. Cap. Tripoli, pop. 130,238. Total pop. 764,064, including 45,000 Italians (1956). Tunis and Algeria lie to the W., and the Libyan prov. of Cyrenaica to the E. The greater part of the coast-line is low and sandy, and thus quite unfit for harbourage. There are

no rivs. of importance. The country is flat near the coast, but there are low mt ranges in the W., centre, and S. There are fisheries for sponges and tunny along the coast, but T. is almost an entirely agric. country, possessed of no minerals but salt, which, however, is of excellent quality and produced in large quantities. Along the coast all kinds of Mediterranean fruit, palms, olives, etc., are produced. Farther inland are grown barley and wheat, olives, tobacco, mulberries, figs, almonds, dates, and the vine. There is good pasture land for cattle and sheep. It is in this part of T. that lt. colonisation was thickest. Farther inland come the dunes, which, during the lt. occupation were afforested with poplar, pine, acacia, and robinia; next comes the mt dist., which produces vines, figs, and olives. The sub-desert zone, still farther inland, produces only alfa, a source of cellulose, and farther S. still is the desert itself, barren save for fertile oases. The chief exports are tobacco, dates, figs, olives, grapes, almonds, salt, barley, esparto grass, ostrich feathers, and sponges, and the chief imports, foodstuffs, cotton, and metal goods. There is an important caravan trade with the central Sudan. About 144 m. of railroad are centred on Tripoli, the cap. and chief port. Other centres are Sirte, Azicz, Nofilia, Misurata, Homs, and the oasis of Ghadames.

The remains of anct Rom. houses, baths, theatres, and temples tell of the first Rom. occupation over 2000 years ago. T. then enjoyed a long period of prosperity. It was rich in grain and olive oil, and it supplied a third of the corn imported by Rome. In later cents. Arabs from the E. conquered T., bringing with them the new faith of Mohammed. During the 16th cent. T. came under Turkish rule, and in 1835 was made into a vilayet of the Ottoman empire. In Sept. 1911, however, Italy, which had long been dissatisfied with its relations with Turkey, issued an ultimatum, which was immediately followed by war. The tn of T. was blockaded, and in the beginning of Oct. the whole ter. was annexed. This annexation was recognised by the treaty of Ouchy in Oct. 1912. T. was thereafter, until the Second World War, administered under the It. Colonial Ministry. The It. policy of energetic development met with a severe check at the beginning of the First World War, when there was a general rising of the natives. Not until the governorship of Giuseppe Volpi, 1921-5, was order thoroughly restored. In 1919 the W. frontier was fixed by arrangement with France, and in 1928 effective occupation was greatly extended S. T. was united to Cyrenaica in 1938 to form It. Libya (q.v.) as it was under It. rule until 1939.

In the Second World War the Italians were driven out of N. Africa, and T., like the other former It. colonies, was occupied by the Allied forces, Italy having by the peace treaty (Art. 23) renounced all right and title to these possessions, the final disposal of which remained to be determined by the Allies, Brit. administration

meanwhile being estab. Later, in 1956 the Standard Oil Company of California obtained a 50 per cent interest in an oil exploration concession covering an area of approximately 14,200,000 ac. in T. and Cyrenaica. For the campaign of 1943, see AFRICA, NORTH, SECOND WORLD WAR, CAMPAIGNS IN; TRIPOLI.

See H. M. de Mathuisieulx, *La Tripolitaine d'hier et de demain*, 1913; W. K. McClure, *Italy in North Africa*, 1913; V. Mantegazza, *La Tripolitania* 1913; F. T. Marinetti, *La Battaglia di Tripoli*, 1912; E. Camevari, *La Tripolitania*, 1924; L. C. Férand, *Annales Tripolitaines*, 1927; G. E. Simpson, *The Heart of Libya*, 1929; R. di Lauro, *Tripolitania*, 1932; M. Moore, *Fourth Shore: Italy's Mass Colonisation of Libya*, 1940; G. Casserley, *Tripolitania*, 1943; H. J. Legg, *Economic and Commercial Conditions in Libya* (H.M.S.O.), 1953.

Tripolite, see KIESELGUHR.

Tripes, final examination for the honours degree at Cambridge Univ. The name recalls the 3-legged stool (Gk *tripous*) on which an 'old bachelour' sat when the senior bachelor for the year propounded to him 2 questions. The T. examination is taken in more than 1 subject, each course of study having 2 parts which may be inter-changed. The first part is devised as a 2-year course and the second generally as a 1-year course; so that the T. may be taken in 2 parts over the ordinary 3 years' residence at Cambridge.

Triptolemus, son of Celeus and Metanira, who dwelt in Eleusis. See THESMOPHORIA.

Triptych (Gr for threefold), a tablet, picture, or altar piece, made in 3 sections that fold together. See DIPTYCH.

Trirème, anct Gk warship, held by some to have been of Phoenician if not of Egyptian origin. It was a light craft about 120 ft long with a beam of some 20 ft; was fitted with 2 masts, except when in action; and normally carried 200 men, of whom 170 were rowers, 10 marines, and 20 seamen. The prow was armed with a strong 'beak' and other projections for ramming. The T.'s speed was probably 4 or 5 knots. The arrangement of oars is the subject of much discussion; but the theory that there were 3 distinct banks one above the other is now usually rejected in favour of forward-sloping benches, each occupied by 3 men with 1 oar apiece. The gradual strengthening of the bows, which enabled T.s to meet a head-on attack, led to the construction of heavier quadrimeres and quinqueremes with relatively greater oar-power; and these had become the standard warships by Hellenistic times. See C. Torr, *Ancient Ships*, 1894; W. W. Tarn, 'The Greek Warship' (*Journal of Hellenic Studies*), 1905; F. Brevster, 'The Arrangement of Oars in the Trirème' (*Harvard Studies*), 1933.

Trisagion (Gk *tris*, thrice, *hagios*, holy), name of a short hymn in the Eucharistic liturgies of the E. Churches, so called from the threefold repetition of *hagios*, O holy One! In the W. Churches it is found only

in the liturgy of Good Friday at the 'adoration of the cross.'

Trismegistus, see HERMETIC BOOKS.

Tristan, or **Tristram**, hero of romantic Celtic legend. The scene of the story, which deals with the tragic and fateful love story of T. and the 2 Iseults, Iseult of Ireland and Iseult of the fair hand, is laid in Ireland and Brittany, but chiefly in Cornwall at the court of King Mark.

Tristan da Cunha, prin. of a group of is. discovered by the Portuguese navigator of that name, lying in 37° 6' S. lat. and long. 12° 2' W., some 2000 m. W. of the Cape of Good Hope. Its inhabitable area is 12 sq. m. The other is., inaccessible, Nightingale, and Gough Is., or Diego Alvarez, are uninhabited. They are Brit. possessions, which, in 1938, were made dependencies of St Helena. In 1956 the islanders of Tristan numbered 286, nearly all of whom were born in the is. T. is an extinct volcano (7640 ft) with a crater lake near its summit. The inhab. have about 250 head of cattle, 750 sheep, and a stock of poultry. Potatoes are the staple diet. There is a crayfish canning and freezing industry on the is. which exported some 27,000 cases to S. Africa in 1954-5. About 10 ships a year visit the is., about 5 bringing the inward mail and stores, most of which have to be imported. Sale of postage stamps first issued in 1954 brought the is. administration a revenue of about £23,000 in the first year. There is a daily radio-telegraph service with Cape Town. The is. is in charge of an Administrator. A Brit. survey expedition visited Gough Is. (230 m. SSE. of Tristan) in 1955-6.

T. was taken possession of by a military force during the residence of Napoleon at St Helena. When the garrison was withdrawn in 1817 Wm Glass, a corporal of artillery, and his wife, elected to remain, and they were joined by 2 ex-naval men; these, with some shipwrecked sailors, were the founders of the present settlement. After some years the 5 unmarried settlers contracted with a sea capt. to bring them wives from St Helena. Stores and provisions were provided out of a grant voted by Parliament and sent out by a warship, nearly all the able-bodied men having been drowned while attempting to board a vessel in Dec. 1885. In 1904 the is. was visited by H.M.S. *Odin* in order to ascertain whether the islanders would accept the offer of the Cape Gov. to settle them in the Cape Colony, but out of 11 families only 3 elected to go. During the Second World War detachments of the R.N. and the S. African Air Force were stationed on the is. to maintain a meteorological and wireless station. See Mrs Rose A. Rogers, *The Lonely Isle*, 1926; Douglas M. Gane, *Tristan da Cunha: an empire outpost and its keepers*, 1932; E. Christophersen, *Tristan da Cunha, the lonely isle*, 1940; A. B. Crawford, *I went to Tristan*, 1941; J. Brander, *Tristan da Cunha*, 1940; P. A. Munch, *Sociology of Tristan da Cunha*, 1945; D. M. Booy, *Rock of Exile*, 1957.

Tristearin see STEARIN.

Tristram, see TRISTAN.

Tristram Casket, The, famous piece of early medieval art, a casket of wood with 6 decorative panels of carved ivory depicting the romance of Tristram and Iseult. It came to light in 1913 in the shop of an unknown Paris dealer; it was acquired for the Brit. Museum in 1948 with the assistance of a grant from the National Arts Collection Fund. It is generally regarded as of late 12th cent. date, and is ascribed to the Rhineland or possibly E. France.

Tritoma, earlier name of Knipphofa (q.v.).

Triton, son of Poseidon and Amphitrite, represented as human to the waist and dolphin below, usually blowing a shell to calm the seas.

Triton, satellite of Neptune (q.v.).

Tritonia, family Iridaceae, genus of 16 S. African cormous plants, related to *Monbretia* and *Crocodylia*. *T. flavida*, is hardy, but *T. crocata* and *T. hylaina* with their many-flowered colourful heads need greenhouse shelter.

Triumph, highest honour accorded to a victorious commander among the Romans. Only a dictator, consul, or praetor holding the Imperium or highest command was entitled to the distinction, and then only after success in true warfare, not rebellion, civil strife, etc. The honour with necessary expenses was granted by the senate, who assembled outside the city to receive the victorious gen. still in command. The celebration took the form of a procession to the Capitol through the city; the streets were decorated with garlands, and the procession, headed by the senate and state officials, passed through crowds of spectators, who greeted it with cries of '*Io triumphe*.' Next came trumpeters, then the spoils and trophies, and the crowns presented to the gen. by provinces. Following these came the sacrificial bulls, captives in chains, victors, musicians, and priests. Immediately behind was the triumphal car, gilded, garlanded, and drawn by white horses; in this stood the gen. wearing the garb of the Capitoline Jupiter, the purple *tunica palmata*, and *toga picta*, the former decorated with palm shoots, the latter with golden stars. An ivory sceptre surmounted by a golden eagle was carried in the left, a branch of bay in the right hand. Over his head a slave held the golden crown of Jupiter. Then followed the soldiers. Arriving at the Capitol, solemn sacrifice was made, and general festivity followed in the city. When the senate refused to authorise a T., the gen. might undertake one on his own account to the temple of Jupiter Latiaris, or he might be granted an ovation (q.v.).

Triumviri, 3 magistrates who constituted themselves supreme heads of the Rom. rep. The first triumvirate, or board of triumvirs, was that of Julius Caesar, Pompey, and Crassus (60 bc), and the second, and last, that of Augustus, Antony, and Lepidus (43 bc). The term was also applied to groups of 3 ordinary magistrates, or sometimes extraordinary commissioners, appointed to execute some public office. *T. capitales* were first

appointed c. 292 BC to help to preserve public order and to administer the law in capital cases.

Trivandrum, tn of former Travancore (q.v.) State, India, and site of the residence of the Maharajah. There are many palaces; the alleged reason is that each Maharajah built a new one. T. is also the site of the univ. of Travancore.

Tnovo, see **TYRNOVO**.

Troad, The, see **TROY**.

Troas, see **TROY**.

Trobriand Islands, a small cluster of is. in N.W. Melanesia. The inhab. are among the anthropologically best-known peoples in the world, due to the writings of the late Bronislaw Malinowski (q.v.). The islanders are divided into 4 matrilineal clans, each with its chief, one being of higher status than the others. Their staples are yams and fish, and they are great navigators. They engage in a trade with neighbouring is. in the exchange of particular valuables, armbands and necklaces, known as the Kula (q.v.) exchange. See B. Malinowski, *Argonauts of the Western Pacific*, 1922; *Crime and Custom in Savage Society*, 1926; *The Sexual Life of Savages in North-Western Melanesia*, 1929; *Coral Gardens and their Magic*, 1935.

Trocadero Palace, see **CHAILLOT**.

Trochee (Gk *trōchein*, to run) metrical foot, which in the classical quantitative system consists of one long and one short syllable, and in the Eng. accentual system of one accented and one unaccented syllable.

Trochilus, see **HUMMING-BIRDS**.

Trochu, Louis Jules (1815-96), Fr. gen.-b. Le Palais (Belle-Ile-en-Mer.). He exposed in his anonymously pub. *L'Armée française en 1877* the crying need of military reforms. Served in the Crimean campaign and in Italy (1859) and in 1866 was engaged in the War Ministry on army reorganisation. As governor of Paris during the melancholy siege of 1870 he made the best of inadequate resources. On the outbreak of the Franco-Ger. war of 1870 he was refused a field command, but following the disasters of 1870 he was made governor of Paris and Commander-in-Chief of all the forces organised for the defence of the cap. He put the city in a good state of defence. At the revolution of 4 Sept. he was made president of the Gov. of National Defence, and his plan for defending the city failed; but though he resigned the governorship of the cap. in Jan. 1871, he retained the presidency of the gov. until after the Armistice. Elected to the National Assembly, for Morbihan, he retired in 1872.

Troglodytes, general Gk name for uncivilised cave dwellers of the Caucasus, Ethiopia, and along the S. Red Sea coast of Egypt.

Trogon (Gk *trōgōn*, pres. part. *trōgein*, to gnaw), bird of the genus *Trogon* or family Trogonidae, widely distributed in tropical and subtropical regions, especially in America. It is about the size of a thrush. It has soft plumage of varied and generally brilliant colouring, particularly marked in the quessal (q.v.)

species, and is noted for its short, spasmodic flight.

Trogon, Long-tailed, see **QUESAL**.

Trogus Pompeius, Rom. historian of Gallic origin, who lived in Rome during the reign of Augustus. He wrote *Historiae Philippicae*, a hist. (with numerous digressions) of the Macedonian empire down to the Rom. conquest of the E. Selections are preserved in the *Historiarum Philippicarum Libri XLIV* of Justinus (2nd cent. AD).

Troilus, son of Hecuba and Priam, King of Troy, who was slain in battle or taken captive by Achilles. Chaucer unfolds in *Troilus and Cressida* and Shakespeare in *Troilus and Cressida*, a tale of faithless love derived from medieval pseudo-Homeric writings.

Trois-Rivières, city of Quebec, Canada, on the N. shore of the St Lawrence R., at the mouth of the St Maurice R., half-way between the cities of Montreal and Quebec. It is a natural ocean port and the pop. is largely Fr.-Canadian. The city is the see of a Rom. Catholic bishop. T.-R. was founded in 1634, and the first Canadian industry, 'The Old Forges', was estab. there in 1737, where nails, stores, kettles, and frying-pans, previously imported from France, were manuf. The city is now a large producer of newsprint and a centre of the textile industry. It possesses important metallurgical plant and is the gateway to one of Canada's greatest sources of electrical energy. Pop. 50,220.

Troitse-Sergiyeva Lavra, monastery of the Holy Trinity, the biggest Russian Orthodox monastery, founded c. 1340 by St Sergius of Radonezh (q.v.), situated 44 m. N. of Moscow, and now within the tn of Zagorsk (q.v.). It has outstanding 15th-18th-cent. architectural monuments, including the Cathedral of the Holy Trinity (built 1423 in the Early Muscovite style), the Cathedral of the Assumption (1559-85), the baroque bell-tower (1741-70), etc. In the 14th-17th cents. T.-S. L. was an important religious, cultural, and political centre, supporting the centralistic policy of the Muscovite princes and tsars. The monastery was abolished in 1920 and transformed into a museum. From 1814 to 1918, and again from 1948, it has housed the Moscow Theological Academy.

Troitsk, tn in the Chelyabinsk Oblast of the Urals, 85 m. S. of Chelyabinsk. It has agric. industries and is an important railway junction. It is a local cultural centre. Founded in 1743 as a Russian fortress, T. has a lively trade in agric. products. Pop. (1956) 68,000.

Troitskosavsk, see **KYAKHTA**.

Trojan Planets, group of asteroids (q.v.), namely Achilles, Hector, Patroclus, Nestor, Priamus, Agamemnon, Odysseus, Aeneas, Anchises, Troilus, and one discovered in 1936 which has not yet been named, which verify an important problem solved by Lagrange. This is a particular case of the problem of 3 bodies, which can be stated as follows: if 3 bodies are placed at the angles of an equilateral triangle and move round their common centre of gravity under the influence of

their mutual attractions, then, provided they were originally projected in directions that all make the same angle with the lines joining them to their common centre of gravity, the velocity of projection of each being proportional to its distance from that centre of gravity, they will continually form an equilateral triangle.

Trojan War, see **TROY**, and under **ACHILLES**, **AGAMEMNON**, and **ULYSSES**.

Troll, or **Trold** (old Norse, demon, giant), in Scandinavian folk-lore an ogre (sometimes a gnome) of either sex with evil powers exercised in darkness. T.s are represented as berg- or cave-dwellers, whence their appellation, *Bjergfolk*. They are described as living in families, sometimes tribes, and often as possessing kings (cf. Ibsen's *Peer Gynt*, Act. II). Today they have become mere bogies in children's books (cf. Ashbjørnsen and Moe, *Fairy Tales*) and their character has degenerated to that of peasant-life, where some belief continues. In Eng. literature many of the giants (as in Jack and the Beanstalk) and gnomes are descendants of T.s in Scandinavian folk-lore, and pixies and malicious fairies are close relations.

Trolley-bus, see **ELECTRIC TRACTION**.

Trollhättan, in the prov. of Elfsborg, Sweden. The falls of Trollhätta, over 100 ft high, afford water power for the surrounding factories. Pop. 27,569.

Trollope, Anthony (1815-82), novelist and civil servant, b. London, fourth son of Thomas Anthony and Frances T. (q.v.). His parents removing to Harrow, Anthony became a day-boy at its school, where he was ill-treated and neglected. Obtaining a clerkship in the Post Office in 1834, he avoided dismissal in 1841 by taking a surveyorship in Ireland, where he acquired his taste for hunting, manifest throughout his stories. T. married in 1844. He pub. his first novel, *The Macdermots of Ballacorney*, in 1847. *The Kellys* and *the O'Kellys*, 1848, and *La Vendée*, 1850, also belong to this period. Appointed inspector of postal deliveries, T. for 2 years toured England on horseback. He instituted pillar-boxes in 1853. Officially visiting Egypt and the W. Indies, 1858, on his return he pub. *The West Indies and the Spanish Main*, 1859, a book of shrewd comments on the way of life of the people of the is. he visited. He visited the U.S.A. in 1861. Disappointed of an assistant-secretaryship T. left the Post Office in 1867. In 1868 he stood for parliament as a Liberal at Beverley. He visited Australasia, 1871-2, and S. Africa in 1877, writing books about these countries. Meanwhile, through serials pub. in the *Cornhill*, the *Fortnightly*, and the *Pall Mall Gazette*, he had become a popular novelist. Besides domestic interest, he worked 2 veins—eccles. and political. His descriptions are precise and piquant, and his portraits, like his pictures of daily life, are the results of intuition and conjecture, rather than a photographic reproduction of what he saw. Nevertheless, his methods tend to give an impression of average truth. Although but slightly acquainted with the clergy, he made his clerics convincing and, like

himself, stubbornly Eng. rather than saintly. The bishop's wife, Mrs Proudie (carried, like most of T.'s characters, from book to book), is immortal as a type of domineering vulgarity. The specially eccles. or 'Barchester' series begins with *The Warden*, 1855, and ends with *The Last Chronicle of Barset*, 1867. The other novels in the series were *Barchester Towers*, 1857, *Doctor Thorne*, 1858, *Framley Parsonage*, 1861, and *The Small House at Allington*, 1864. The political interest in T.'s novels begins in *Phineas Finn*, 1869; it tails away with *Is He Popenjoy?*, 1878. T. wrote 47 novels, besides short stories; also left one novel, *The Land-Leaguers*, unfinished when he died. It was pub. in 1883. His *Autobiography*, written in 1875, was pub. in 1883. During the Second World War there was a considerable revival of interest in his work.

See H. James in *Partial Portraits*, 1888; T. H. S. Escott, *Trollope: His Work, Associates, and Literary Originals*, 1913; A. A. Baumann, *The Last Victorians*, 1927; H. Walpole, *Anthony Trollope*, 1928; M. Sadleir, *Trollope: a Bibliography*, 1928, and *Trollope: a Commentary*, 1927; L. P. and R. P. Stebbins, *The Trollopes: A Chronicle of a Writing Family*, 1946; Elizabeth Bowen, *Anthony Trollope: A New Judgment*, 1946.

Trollope, Frances (1780-1863), novelist and travel writer, b. Stapleton, near Bristol, daughter of William Milton. In 1809 she married Thomas A. Trollope and later went with him to the U.S.A. After his death she returned to England and brought herself into prominence with her *Domestic Manners of the Americans*, 1832, an unfavourable and inaccurate account. In all she wrote over 100 vols., her novels including *The Vicar of Wrexhill*, 1837, and *The Widow Barnaby*, 1829. See life by F. E. Trollope, 1895.

Trombone, brass wind instrument, developed from the medieval sackbut, made in 4 sizes apart from some freaks: alto, tenor, bass, and contra-bass, the first of which is now very rarely used, parts written for it being played on the tenor T., while the last hardly ever appears in the orchestra, except in Wagner's *Ring*. The T.'s most characteristic feature is the slide, by means of which the tube can be adjusted to different lengths in 7 positions, so that all the notes of the chromatic scale can be produced as natural harmonics. The T. was thus a chromatic instrument long before the horn and trumpet became so by the invention of the valves. The intonation, as in string instruments, is not fixed, but depends entirely on the player's ear and skill. Many notes are, of course, available in more than one position (as different harmonics), so that the player often has the choice between an easier and a more difficult way of passing from note to note. A strict *legato* between notes in different positions is not possible, as the breath has to be interrupted during the change of the slide to avoid an unpleasant scoop; but this scoop, usually designated by the hybrid term *glissando*, can be used as a

special effect, though, having been exploited by the music-halls as a comic

TENOR
TROMBONE

vulgarity, it rarely appears in serious scores. The range of the tenor T. is from E below the stave in the bass clef to B \flat above middle C, with 2 or 3 possible but dangerous notes higher and 3 pedal notes (B \flat , A and A \flat) below the bass E. The alto T. has the same range a perfect fifth higher, the bass T. an augmented fourth lower, and the contrabass T. an octave lower. In the 19th cent. valve T.s were invented and gained favour in military and brass bands as being easier to play, though even there it is admitted that their tone is inferior to that of the slide T. The valve T. never gained a firm footing in the orchestra.

Trommeter, see SEISMOGRAPH AND SEISMOLOGY.

Tromp, Martin Harpertsoon (1597-1653), Dutch adm., b. Brielle, whose name is associated with the 17th-cent. struggle for the command of the seas between the Dutch and the English. As a boy he went to the E. Indies in a merchant ship, was made prisoner, and passed some years aboard an Eng. cruiser. Escaping to Holland, he entered the Navy in 1624, becoming lieutenant-adm. in 1637. In Feb. 1639 he destroyed a large Sp. squadron off Gravelines, and in Sept. of the same year defeated the combined fleets of Spain and Portugal off the Eng. coast, capturing 13 richly laden merchantmen. When war broke out with England he sailed to the Downs with a large fleet and anchored off Dover, but was worsted by Blake (19 May 1652), whose fleet was much inferior in numbers. In Nov. he returned with 80 warships and a large convoy of merchantmen. Blake attacked near Dungeness on 30 Nov., but after sustaining severe losses drew off in the darkness and anchored off Dover, sailing next day to the Downs while T. anchored off Boulogne until his convoy had reached safety. The story was that T. sailed up the Channel with a broom at his masthead is of doubtful authenticity. In Feb. of the following year, while again conveying many merchantmen, he kept up a running fight with the combined fleets of Blake, Monck, and Penn off Portland to the Fr. coast near Calais, and had the worst of the encounter, losing 9 warships and 40 merchantmen. On 3 June he fought an indecisive engagement with an Eng. fleet in the Channel, but Blake came up with

reinforcements and so enabled the English to gain the upper hand. T. withdrew to the Texel with the loss of nearly a score of ships. The Dutch then negotiated for peace, but war was soon renewed, and T. again appeared in the Channel towards the end of July 1653, and in a fierce battle with the English under Monck on 29 July T. was shot through the heart. In all he was credited with victories in over 30 encounters. He was buried at Delft, where in the old church there is a monument to his memory. See his *Journal* (ed. and trans. by C. R. Boxer), 1930.

Tromsø, cap. of the co. of Troms, in the N. of Norway, on an is. of the same name. It is the chief port for Spitsbergen, and the seat of a bishop. It is a base for Arctic sealing expeditions and does important trade in fish and fish products. During the Second World War T. was converted into a seaplane base by the Germans. Attacks were made from it on the Allied convoys sailing to Murmansk. The dist. has Lapp settlements, and fishing is carried on. Area of dist., 10,005 sq. m.; pop. (of tn) 11,000; (of co.) 113,200.

Trondheim, city and seaport in Norway, and former cap., lies at the mouth of the Nid, on Trondheim Fjord, 84 m. ENE. of Kristiansund. Third biggest city, co. tn of Sor-Trøndelag, seat of Norway's Univ. College of Technology. Broad thoroughfares pass between rows of wooden houses. Since earliest times the coronation of the Kings of Norway took place in the cathedral, which is one of the most celebrated in Scandinavia. From 1152 T. was the seat of the Archbishopric of Norway, but the importance of T. began to wane after the Reformation. In the Second World War T. fell to the Germans in the spring of 1940 and became an important U-boat base and was frequently bombed by the Allies: the Ger. cruiser *Prinz Eugen* was heavily damaged by an R.A.F. attack while undergoing repairs in T. It was from T. that the mass-resignation movement of Norwegian clergy began, as a protest against the appointment of the collaborator, Quisling, as Prime Minister. T. was liberated by the Allies in May 1945. Pop. 59,400.

Troon, municipal burgh and port of Ayrshire, Scotland, on the Firth of Clyde, opposite Arran. Until the 18th cent. T. was a small fishing hamlet, but the building of a harbour in 1808 made it both port and shipbuilding centre. To-day it is a holiday resort and golfing centre. Pop. 10,000.

Troop, originally the unit of cavalry corresponding to the company. A capt.'s command, in the 18th cent. it could be up to 400 strong. It now corresponds to the infantry platoon, and is hence a subaltern's command in armoured regiments. T. is also the traditional unit of horse artillery, and since 1938 has been the sub-unit of other artillery. In field regiments R.A. it constitutes half the 8 guns of a battery and is commanded by a capt. In light anti-aircraft regiments it consists of 6 guns, also commanded by a capt. In anti-tank regiments it consists of 4 guns and is commanded by a subaltern.

Tropaeolum, family Tropaeolaceae, genus of ann. and perennial S. Amer. herbs, of which *T. majus*, Indian Cress or Nasturtium, is a favourite half-hardy climbing annual; and there are many forms and hybrids. *T. speciosum* is the perennial Flame Nasturtium, and *T. peregrinum*, the half-hardy Canary Crooper. *T. polyphyllum* is hardy in Britain, and *T. leptophyllum* and *T. tuberosum* have tubers which may be boiled and eaten.

Trophy (from Gk *tropaion*, and *trepein*, to rout) in classical times a memorial of victory set up at the spot where the enemy had turned.

Tropical Agriculture, Imperial College of, see IMPERIAL COLLEGE OF TROPICAL AGRICULTURE.

Tropical Hygiene, see under HYGIENE.

Tropical Medicine. Owing chiefly to climatic conditions, poverty and the backwardness of the people, many diseases rare or unknown in temperate and colder regions are common in the tropics. The tropical climate favours a great variety of parasites causing serious diseases in man. The parasites are transmitted directly from man to man by food and drinking water contaminated with faeces; by water harbouring parasites discharged from snails; by water containing crustacea infected with parasites or by blood-sucking insects which inoculate parasites when they bite. Other tropical diseases such as beri-beri and pellagra (q.v.) are due to deficiencies in diet and to animal and vegetable poisons. Aet. Egyptian and Indian records show some knowledge of T. M., and the extraction of the guinea-worm (q.v.) was known to Moses; but the scientific study of the subject may be regarded as beginning in the 16th cent., a result of explorations and the estab. of communication between the Old World and the New. This led not only to the discovery, but also to the dissemination, of diseases hitherto unknown to Europeans. The literature of T. M. began during last cent. and has subsequently grown considerably. The microscope made possible the identification of minute parasites and the study of their life histories. It led to the discovery of the causative organisms and transmission of such diseases as malaria (q.v.), sleeping sickness (q.v.), leprosy (q.v.), and amoebic dysentery (q.v.). Results of microscopic research were often fully confirmed by experimental infection of the research workers, sometimes with fatal results. The chief diseases due to Protozoa (q.v.) are malaria, black-water fever (q.v.), black fever (kala-azar), sleeping sickness (trypanosomiasis) (q.v.), and amoebic dysentery. Tsetse flies, carriers of the trypanosomes of sleeping sickness, are confined to Africa, so that African slaves transported to America failed to establish the disease there. Trypanamide injected in the early stages effects a cure, and may even do so in advanced stages; the drug antitriche has recently been introduced for trypanosomiasis of cattle in Africa. No effective treatment is known for S. Amer. trypanosomiasis, carried by bugs.

Quinine and the synthetic mepracine and paludrine are specific remedies for malaria, and antimony compounds for kala-azar. Relapsing fevers are caused by spirochaetae carried by ticks, lice, and the teeth of rodents. The injection of arsenical compounds is an effective treatment. Typhus fevers are divided into 3 groups according to their transmission by lice, ticks, and mites. Diseases due to filterable viruses are yellow fever (q.v.), and dengue (q.v.), transmitted by mosquitoes, and sandfly fever (q.v.), carried by sandflies (*Phlebotomist*). Plague (q.v.), a pandemic disease discovered by Kitasato and Yersin to be caused by *Bacillus pestis*, is transmitted by rat fleas. Scrum has been used for treatment and vaccines for protection. Cholera (q.v.), a water-borne disease, causes serious epidemics with high mortality rate. Treatment consists in maintaining the fluid content of the body by injection of salt solutions, while protection is conferred by vaccines. Leprosy (q.v.), an aet. disease long considered incurable, was discovered by Hansen (1874) to be due to *Mycobacterium leprae*. During the 20th cent., treatment with the derivatives of chaulmoogra, hydrocarpus oil, has been found to effect a cure in the early stages, and in a small percentage of advanced cases; sulphonamide drugs are now being used. Brilliant research has been carried out in connection with the various parasitic worms causing ankylostomiasis, filariasis, guinea-worm, bilharziasis (q.v.), and other diseases. Antimony compounds are specific for bilharziasis, and oil of chenopodium in carbon tetrachloride for ankylostomiasis (hookworm). The antibiotics, which have proved effective against many tropical infections, and the powerful insecticides represent probably the most important of the recent advances in T. M. The resident in the tropics now faces a far better prospect than his predecessor in 1900, while the temporary resident who takes proper precautions can hope to escape infection. If he does not, at least he has every hope of a permanent cure. A similar improvement in the native population must await improvements in education, living standards, and hygiene. Much is being done by W.H.O. to assist various tropical countries in introducing their own health measures. The advance of T. M. has been accomplished by the devotion and sacrifice of workers too numerous to mention. A few of the outstanding names are those of Manson, Rose, Emin Pasha, Laveran, Grassi, Bruce, Reed, Leishman, Eijkmann, and Stanton. There are schools of T. M. associated with the univs. of Liverpool and of London. Two world wars, in which large numbers of British troops were stationed in tropical countries, did much to accelerate research in T. M. See H. H. Scott, *History of Tropical Medicine* (2nd ed.), 1942; Sir L. Rogers and J. W. D. Megaw, *Tropical Medicine* (6th ed.), 1952; Sir P. Manson, *Tropical Diseases* (14th ed.), 1954; J. S. K. Boyd, Chapter 'Fifty Years of Tropical Medicine,' *Fifty Years of Medicine* (B.M.A.), 1950.

See also ANKYLOSTOMIASIS; BILHARZIASIS; BLACK-WATER FEVER; CHOLERA; DENGUE; FILARIASIS; GUINEA-WORM; HYGIENE; LEPROSY; PALUDRINE; PLAGUE; SLEEPING SICKNESS; TSETSE FLY.

Tropical or Equinoctial Year, see YEAR.

Tropics, see CANCER; CAPRICORN.

Tropine, $C_{17}H_{21}NO$, white crystalline solid, m.p. $108^{\circ}C$, obtained by the hydrolysis of the alkaloid atropine (q.v.). It is poisonous, hygroscopic, and optically inactive.

Tropism, name applied in biology to the movements of plants and animals, or parts of them, in response to external stimuli. Thus plant roots will grow towards water (positive *hydrotropism*) and towards the centre of the earth (positive *geotropism*), while plant shoots grow towards the light (positive *heliotropism*) and away from the centre of the earth (negative *geotropism*). Other T.s are *chemotropism* (towards or away from regions of greater concentrations of certain chemical reagents), *galvanotropism* (electrical), *thermotropism* (heat), etc. The T.s are involuntary and automatic.

Tropopause, see STRATOSPHERE; TROPOSPHERE.

Troposphere, the lower part of the atmosphere, extending in temperate regions about 7 m. up from the earth's surface, in which, except for temporary intervals, temp. falls with height. *Tropopause* denotes the upper limit of the T., where it joins the stratosphere (q.v.).

Troppau, see ORAVA.

Trossachs (i.e. bristled ter.), picturesque glen of Scotland, Perthshire, between Lochs Katrine and Achray. This rugged and narrow defile is about 1½ m. in length, and overlooking it are Ben Venue, 2390 ft. and Ben A'an, 1850 ft. It was first made popular by Sir Walter Scott in his *Lady of the Lake*.

Trotsky, see: CHAPAYEVSK; GATCHINA.

Trotsky (real name Bronshteyn), Lev Davidovich (1879-1940), Russian politician of Jewish origin. He joined the Social Democratic movement in 1896, was banished to Siberia, escaped abroad, and joined the Iskra (q.v.) organisation. When the party split in 1903 T. became a Menshevik (see MENSHEVIKS) and strongly denounced Lenin's organisational principles as leading to a one-man dictatorship. He became prominent during the revolution of 1905 (q.v.) as chairman of the St Petersburg Soviet (see SOVIET), was again arrested, banished, and escaped abroad, where he tried to reunite all Russian Social Democratic factions and groups, continuing the struggle against Lenin's dictatorial tactics. During the First World War T., together with Martov (q.v.), led the internationalist wing of the Mensheviks, was expelled from France for pacifist propaganda, and lived in the U.S.A. After the February revolution (q.v.) in 1917 he embarked for Russia, but was detained for sev. weeks by the British at Halifax, N.S. In Russia he joined the Bolsheviks and became Lenin's

chief partner in organising the October revolution (q.v.). As leader of the St Petersburg Soviet and of its Military Revolutionary Committee T. conducted the seizure of power in the capital. In 1917-18 he was commissar for foreign affairs; he represented Soviet Russia at Brest-Litovsk, but was opposed to the conclusion of the treaty and resigned. From 1918 to 1925 he was commissar for war, the chief organiser and leader of the Red Army in the civil war (q.v.). He was a Politburo member 1919-27, and repeatedly opposed Lenin. After Lenin's death T. was ousted from power in Russia and in the world Communist movement by Stalin, Zinov'ev, and Kamenev, but continued to fight back, later joining forces with Zinov'ev and Kamenev in the 'combined opposition' (see LEFT OPPOSITION) until he was expelled from the party in 1927, banished to Central Asia in 1928, and expelled from Russia in 1929. During the Great Purge (q.v.) he was accused of conducting espionage and subversive activities in the Soviet Union on behalf of foreign intelligence services. He was murdered, probably by Stalin's agents, in Mexico City, where he had spent the last years of his life.

Followers of T. still exist in sov. countries as Communist splinter groups, and in Ceylon they form an important political party. His works include *Our Revolution* (N.Y.), 1918, *The Defence of Terrorism*, 1921, *Literature and Revolution*, 1925, *The Real Situation in Russia*, 1928, *My Life*, 1930, *The History of the Russian Revolution* (3 vols.), 1932-3, *The Revolution Betrayed*, 1937, *The Stalin School of Falsification* (N.Y.), 1937, and *Stalin*, 1946. See B. D. Wolfe, *Three Who Made a Revolution* (N.Y.), 1948; I. Deutscher, *The Prophet Armed*, 1954.

Trotsky, Lev, see TROTSKIY.

Trotting form of horse-racing peculiarly Amer., though a great part of the best trotters in the U.S.A. are descended through *Hambledonian* from the Eng. thoroughbred *Messenger*. The horse is driven in a small trap known as a sulky. The race is run in heats, and a horse must win 3 heats before it can be declared the winner. T. still holds an important place in the U.S.A. The world's record for 1 m. in T. (1 min. 55½ sec.) was gained by *Greyhound* (against time) at Lexington in Kentucky, 29 Sept. 1938. The fastest pacing m. recorded (1 min. 55 sec.) is that of *Billy Direct* (1938).

Troubadours, class of early poets who appeared in Provence. The etymology of the word is uncertain: Provençal *trobar* means 'to find,' but it is possibly connected with late Lat. *trobare* or *tropium inventire*, to find or invent verses. The T. were inventors of a species of lyrical poetry, characterised by an almost entire devotion to the subject of chivalric love, and generally very complicated in regard to the metre and rhyme.

They fl. from the 11th to the latter part of the 13th cent. principally in the S. of France (but also in Aquitaine, Auvergne, Languedoc), and in Catalonia, Aragon, and N. Italy. The T. spoke the *langue*

d'or. They were no doubt the natural heirs of the poets of the Latin decadence, for their poetry had its birth and its development exclusively in the countries forming the S. provs. of Rom. Gaul. The distinctive characteristics of their poetry are tenderness, elegance, and flattery; it admirably reflects their wandering life, love of women, and the need to provide for life's necessities. The *trouvères* of N. France, with a more virile style and in a ruder tongue, favoured epics and raised poetry to the level of their character, which is exemplified in their proverbial description as men who held a pen in one hand and a sword in the other. The T., softened by a milder life and a more enervating climate, were contented with the composition of songs alone, and these songs were sometimes notable for their wit, though mainly for their naïveté, and they were almost always marred by want of taste, tedium, and diffuse subtlety. None the less, the intimate life of the whole *midî* breathes through the lyrical or satirical songs of the T. War, religion, and women were the 3 grand sources of their inspiration.

It is generally considered that it was the destruction of the co. of Toulouse that dealt the death-blow to the T. as an institution, for they could then no longer find patrons or protectors of sufficient power to afford them personal security. Some of the most celebrated T. were Bertrand de Born, Geoffroy Rudel, Bernard de Ventadour, Gaucelm Faydit, Arnaud de Marvell, Bertrand de la Tour, Pierre Vidal, Raymonde le Preux, Geoffroy de Luc, Pierre du St Rémy, Boniface, Ogiers, Arnaut Daniel, Giraud de Bornell, Marcheburse, and Sordello. Often T. were of a servile or low condition, but by no means always, for nobles, princes, and even kings either were T. or cultivated the arts of the T., e.g. Frederick Barbarossa, Richard Cœur de Lion, Alphonse II and Pierre III of Aragon, the Marquis de Montferrat, and the Comte de Foix. These gave themselves over to Provençal poetry and vied with the other T. in the courts of love for the prizes accorded to poetry; and out of this rivalry sprang a veritable camaraderie of talent. See H. J. Chaytor, *Troubadours and England*, 1923; J. Anglade (ed.), *Anthologie des Troubadours*, 1927, *Les Troubadours, vies, oeuvres, etc.*, 1929; A. Jeanroy, *Poésie lyrique des troubadours*, 1934, and J. A. Fleming, *Troubadours of Provence*, 1952.

Troubles, Time of, period in Russian hist. (1598-1613) between the extinction of the House of Rurikides and the estab. of the House of Romanov. During this time there were 5 tsars in Moscow whose claims were dubious (including an impostor and a Polish prince), Polish and Swedish invasions, and widespread popular and Cossack unrest. It ended with the expulsion of the Poles from Moscow by patriotic volunteers under K. Minin and Prince Pozharsky and the election of Tsar Mikhail Romanov.

Troupial, or **Troopial** (*Icterus*), genus of birds with yellow and black plumage.

The common T. or Brazilian hangnest (*I. vulgaris*) is a handsome bird which is sometimes kept as a pet; it learns to whistle tunes.

Trousseau, Armand (1801-67), Fr. physician, b. Tours. He studied medicine at Paris and graduated in 1825. He was appointed physician at the Hôpital St Antoine in 1839 and at the Hôtel-Dieu in 1850, in which year he became prof of medicine at the univ. of Paris. He was an outstanding clinician and teacher, one of the leaders of French medicine. He made important advances in the treatment of typhoid, scarlet fever, and other conditions. His important textbook, *Clinique Médicale de l'Hôtel-Dieu*, 1861, containing much of his best work, was trans. into English and German. With H. Belloc he wrote a classical account of tuberculosis of the larynx (1837), and he was the first to perform tracheotomy in Paris, writing a treatise on this subject in 1851.

Trout. The T. is a widely distributed fresh-water fish of the salmon family. Its appearance is unmistakable, although its colouring is extremely variable, ranging from almost black to light olive, according to habitat, with the characteristic black or red spots. The eggs are laid in the gravel of streams, in winter, and hatch 3-4 months later, but the fish may move into lakes at other times. The food is mainly animal, consisting of insects, their larvae, and small fish, the size attained depending almost entirely on the abundance of the food supply; in Britain T. of over 20 lb. have been caught, but the normal size is below 1 lb. It is considered at present that the native T. is one species (*Salmo trutta*), of which the *sea trout*, which feeds at sea and ascends rvs. to spawn is a particular variety. This fish, broadly speaking, resembles a salmon in appearance, and has a similar life cycle, descending to the sea at 2-4 years of age, and returning to spawn annually when adult. The term 'Bull trout' is applied locally to old T., sea T., and also to salmon which have spawned in the past; there is no evidence of a distinct variety to which the name could be strictly applied, and its use leads to confusion.

The T. is prized for its culinary and sporting qualities, and is commercially bred and reared (see PISCICULTURE) to stock streams. The Rainbow T. (*S. irideus*), an Amer. introduction, is more commonly reared for the table, as it grows faster, but it does not establish itself when used for stocking waters in Great Britain. The life hist. of salmon and T. can conveniently be determined by microscopic examination of their scales; age, growth rate, and spawning hist. can be determined, which greatly assists the proper management of waters.

Trouvères, see TROUBADOURS.
Trouville (-sur-Mer), Fr. seaside resort in the dept of Calvados. It is linked by a bridge across the R. Touques with the more exclusive Deauville (q.v.). It has a good beach and a casino, and is the most popular resort on the Eng. Channel. It

has a fishing trade, and there is some commercial traffic in the port. Pop. 7600.

Trover, or **Trover and Conversion**, in law, the name of an old form of action which lay against anyone who converted or appropriated to his own use any personal property, in which the plaintiff had either a general property as owner or a special property as bailee. Since the Common Law Procedure Act, 1852, which practically abolished the old common law forms of action, the substance only and not the form of the action has survived.

Trowbridge, mrkt. and manufacturing tn of Wilts, England, famous for its W. of England cloths. About 1530 Leland described T. as 'flourishing by drapery,' but since then other industries have developed, including light engineering, brewing, manufs. of bedding, bacon curing, creameries, etc. Many of the fine stone houses of the 18th and early 19th cents. remain. T. is mentioned in Domesday Book; the par. church of St James dates from the 14th cent., and here George Crabbe, the poet, was rector. T. was the bp. of Sir Isaac Pittman (q.v.). It is the centre of co. administration. Pop. 14,000.

Troxidone, drug for the treatment of epilepsy (q.v.). Good results have been claimed for it in that variety of epilepsy known as *petit mal*; for *grand mal* phenobarbitone and related substances are preferred. The use of T. involves certain risks, such as the development of skin rashes and disorders of vision, and its administration should therefore be medically supervised. See *British Med. Jour.* vol. 2, p. 325, 1949.

Troy, Jean François de (1679-1752), Fr. painter, b. Paris. He was the most famous of a family of Fr. painters, and studied in his father's school. He excelled in delicate miniatures and in historical tableaux. He also erected a monument to Gobelin.

Troy, Ilium, or **The Troad**, famous city and dist. of Asia Minor, forming the NW. of Mysia. The dist., usually known as 'The Troad,' was bounded W. and NW. by the Aegean and the Hellespont, E. by a ridge of Mt Ida, S. by the Gulf of Adramyttium, its coast-line extending from Lectum promontory (S.) to the R. Rhodius (N.) below Abydos. The greatest length of the Troad from NW. at Cape Sigeum (now Yenî Shehr) to the SW. at the Lectum promontory (Baba Kale) is about 40 m., and the breadth about the same. The central part is drained by the Menderes, anct Scamander, which rises in Ida and reaches the Hellespont E. of Cape Sigeum. There are pine forests on Mt Ida and, in the plains, willow, cypress, tamarisk, valoria, oak, etc. The vine is cultivated, together with wheat and matze. Even in anct times it was fertile and populous, while under Turkish rule its fertility alleviated the poverty of its inhab.

In classic legend the earliest king of this country was Teucer, after whom the Trojans are called Teucri or Teucrians. His daughter married Dardanus, a neighbouring chieftain, hence Dardanidae (sons

of Dardanus) is another name for Trojans. They were probably a Pelasgian race, possibly descended from Thracian emigrants. Dardanus was grandfather of Tros, whose son Ilius founded Ilium or the city of Troy, the largest and strongest settlement in The Troad. The next king of T. was Laomedon, who was succeeded by his son Priam, in whose reign the famous siege of T. by the Greeks took place, to avenge the rape of Helen, wife of Menelaus of Sparta, by Priam's son Paris. This siege lasted nearly 10 years, and ended with the sack and capture of T. by a stratagem of the Greeks (c. 1184 bc). The story is told in Homer's *Iliad*, and part in Virgil's *Aeneid*, II. Once considered purely legendary, it is now commonly regarded as historical in the main outlines, the rape of Helen, perhaps, representing some act of piracy. Among the chief Gk heroes of the siege were Achilles, Agamemnon, Menelaus, and Odysseus; and among the Trojans, Hector, Paris, and Aeneas. A small city on the site in Alexander's day was in ruins by Strabo's time. The site of the anct T. is marked by the Hissarlik mound. The explorations carried on here by Schliemann (1870-90) and Dörpfeld (1893-4) brought to light much valuable information. Remains of some 9 different cities were discovered, buried one beneath another, the earliest dating from about 3000 to 2560 bc. Probably the beginning of the seventh phase in the hist. of the city was the Homeric T. There are traces of 2 Gk settlements (1000-1st cent. bc), and of a new Ilium (1st cent. bc-AD 500). See *Herodotus*, v. 95, vii. 75; *Strabo*, xiii; J. B. Lechevalier, *Voyage de la Troade*, 1802; H. Schliemann, *Ilios*, 1880, and *Troja*, 1883; C. W. Blegen, 'Excavations at Troy' in the *American Journal of Archaeology*, 1932-9.

Troy, co. seat of Rensselaer co., New York, U.S.A., on Hudson R., a port and a commercial and industrial centre. Shirts, collars, and cuffs are among the chief manufs., and it also produces other clothing, machinery, fire hydrants, brushes, abrasives, and aircraft and auto parts. It is the seat of Rensselaer Polytechnic Institute and the Russell Sage College. Pop. 72,300.

Troy Weight, see METROLOGY.

Troyes, Fr. tn, cap. of the dept of Aube, on the Seine. Once the settlement of the Tricassi, it became in the Middle Ages the cap. of Champagne (q.v.). A treaty signed here in 1420 between Henry V of England and Charles VI (qq.v.) recognised Henry as heir to the Fr. throne. The tn has sev. Gothic churches, including a beautiful cathedral, and many anct houses. It was probably the bp. of Chrétien de Troyes (q.v.). It has an agric. mrkt, textile industries, and manufs. machinery and foodstuffs. Pop. 58,800. (See also TROY WEIGHT.)

Troyon, Constant (1810-65), Fr. painter, b. Sévres. He was an accomplished colourist and excelled as a painter of cattle. He is associated with the painters of the Barbizon school. There are pictures by him in the Louvre, the

Wallace Collection, and the Glasgow Art Galleries. See life by A. Hustin, 1893; W. Gensel, *Corot et Troyon*, 1901.

Trst, see TRIESTE.

Trubetskoy, the name of 3 Russian philosophers from an old aristocratic family:

1. *Sergey Nikolayevich, Prince* (1862–1905), prof. and rector of Moscow Univ., editor of the chief philosophical jour. in pre-1917 Russia, *Problems of Philosophy and Psychology*. In his historical (*Metaphysics in Ancient Greece*, 1890, *The Doctrine of Logos in its History*, 1900) and systematic works (*On the Nature of Human Consciousness*, 1891, *The Foundations of Idealism*, 1896, *Belief in Immortality*, 1908) he endeavoured to combine Hegelian rationalistic idealism with the mysticism of Solov'ev (q.v.). He was active in the constitutional movement before the Revolution of 1905 (q.v.), and became famous for his address to Nicholas II as spokesman of a Zemstvo (q.v.) and municipal deputation.

2. *Yevgeniy Nikolayevich* (1863–1920), brother of the above; legal philosopher (a follower of Solov'ev) and liberal politician. He was prof. at Kiev, then at Moscow Univ., and editor of *Moscow Weekly*. His chief works are *Religious and Social Ideal of Western Christianity in the Fifth Century, St Augustine*, 1892, *Religious and Social Ideal of Western Christianity in the Eleventh Century, Gregory VII and his Contemporaries*, 1897, *The Philosophy of Nietzsche*, 1904, *The Philosophy of V. I. Solov'ev* (2 vols.), 1913, *Lectures on the Encyclopaedia of Law*, 1916, *The Metaphysical Assumptions of Knowledge*, 1917, and *The Meaning of Life*, 1918.

3. *Nikolay Sergeyevich* (1890–1938), son of Sergey; philologist and philosopher. He was prof. at Vienna Univ., 1923, studied Slavonic, Finnish, and Caucasian languages, and created a new branch of linguistics—phonology, the science of vocal sounds (*Principes de Phonologie* (Paris), 1949). During 1921–8 he was one of the leaders of the Eurasians (q.v.), and his *To the Problem of Russian Self-Knowledge*, 1927, defines his views on the Asiatic factors in Russian culture and origins. See N. O. Lossky, *History of Russian Philosophy*, 1952; V. V. Zenkovsky, *A History of Russian Philosophy* (vol. 2), 1953.

Trübner, Wilhelm (1851–1917), Ger. landscape and portrait painter, b. Heidelberg, where he was pupil of A. Feuerbach. He studied at Karlsruhe and Stuttgart; and later at Munich under Leibl, when he was strongly influenced by the Impressionists. T. was prof. at Frankfurt-on-the-Main, 1898–1903, and at Karlsruhe from 1905. There are frescoes in Heidelberg tn hall, and pictures throughout Germany. His wife Sophie was also a painter. See study by H. Rosenhagen, 1909; W. Hansenstein, *Meister und Werke*, 1930.

Truce of God, see GOD'S TRUCE.

Truck Acts. The object of the T. A. are: (1) to ensure the payment in coin of wages in hiring contracts, and (2) to

render illegal any provision in a contract for the payment of wages otherwise than in current coin. Historically the T. A. had their origin in 15th-cent. enactments framed to put an end to the practice of defrauding workmen and labourers by paying them in goods of a poor quality or by making unreasonable and excessive deductions from their wages. The Act of 1831 makes it a misdemeanour to make payment by delivery of goods; and by the combined operations of that Act and the Act of 1887 it is illegal for an employer to make any deduction or set-off for goods supplied either by himself or through any agent of his; and, further, contracts which attempt to specify the place or manner in which wages are to be expended are null and void. The Act of 1896 punishes employers who make contracts with workmen for any deductions from wages by way of fines, unless: (1) the terms of the contract are contained in a notice kept constantly posted up in some conspicuous place; and (2) the contract is in writing and signed by the workman, and specifies the acts or omissions in respect of which fines may be imposed, and the amount of such fines. In any event fines can be imposed only for acts or omissions likely to cause damage or loss to the employer, or 'an interruption or hindrance to his business.' There are similar provisions in the Coal and Metalliferous Mines Regulation Acts. The prin. exemptions from the T. A., apart from those impliedly stated above, are: (1) deductions (under written contracts) in respect of materials and tools to miners, fuel, provender for beasts in business, rent, and medical attendance; and (2) deductions for advances by way of contributions to benefit societies or for education of children (including, of course, payments under the National Insurance Acts). The T. Act, 1940, was passed in consequence of the House of Lords' decision of that year in *Pratt v. Cook, Sons and Co. (St Paul's Ltd.)*, where an artificer had been employed for wages plus meals prepared on the employers' premises, there being no written agreement signed by the employee. The court decided that the contract and payments made otherwise than in current coin were illegal and void and that the employee could recover so much of his wages as had not been paid in cash for a period not exceeding 20 years. The Act of 1940 restrains legal proceedings under the T. A. in respect of transactions which, like the above, might lawfully have been effected in another form. Currency notes and bank-notes for £1 and 10s. are equivalent to cash, and may be, and of course are, given in payment of wages, notwithstanding the provisions of the T. A., 1831, which, as a general principle, requires payment to be made in current coin of the realm (Currency and Bank Notes Acts 1914 and 1928). See H. S. G. Halsbury, *Laws of England*, vol. 14; A. S. Diamond, *Law of Master and Servant* (2nd ed.), 1946 (supplement 1952); M. Cooper, *Outlines of Industrial Law*, 1954; S. Stone, *Justices' Manual* (ann.).

'Truculent,' Brit. submarine of the 'T' class patrol submarines of the war construction programme, completed in 1942, of just over 1000 tons. On 12 Jan. 1950, in the vicinity of the W. Oaze buoy, Thames estuary, at 7.4 p.m., she collided in 9 fathoms of water with the 643-ton Swedish tanker, *Divina*, with the loss of 64 men, there being 80 aboard (6 officers, 56 ratings, and 18 dockyard workers). The *Divina* rescued 10 men.

Trudelin, see FRIDOLIN, St.

Truffles, underground fungi. The Brit. *T. (Tuber oestivum)* is found just below the surface in beech and oak plantations in the autumn. When mature it is hard and black and warted externally. Inside it is mottled with white and yellowish brown. The *T.* used in France is *T. melanosporum*, and the garlic-scented *T.* of Italy is *T. marginatum*.

Trujillo: 1. Sp. tn in the prov. of Cáceres. It is partly walled, has a Moorish castle, and has many fine anc't mansions. Pizarro (q.v.) was b. and is buried here. *T.* is the centre of an agric. dist. Pop. 15,000.

2. Seaport of Honduras on a bay of the same name, opposite Roatan is., on the Caribbean coast. It is the cap. of Colón dept. Live-stock are reared, and there is some tropical agriculture. Pop. 3000.

3. Third largest city in Peru, cap. of dept of La Libertad, with ruins of the anc't Indian city of Chan Chan on the outskirts. Cocoa is grown in the dist. or oases of *T.* The dist. is occupied predominantly by large estates devoted to the cultivation of sugar cane, and the 2 oases of *T.* produce 56 per cent of Peruvian sugar. It is also an important communications centre by air, rail, and road. It is a univ. tn and the seat of a bishop. Pop. 47,730.

4. State and its cap. in Venezuela. The town stands at an altitude of 2700 ft on the Bolivarian Highway. It produces coffee, cacao, sugar, Indian corn, and tobacco. Part of the Lake Maracaibo petroleum area is in the state. Area 2856 sq. m.; pop. (of tn) 12,000; (of state) 284,000.

Truman, Harry S. (1884-), thirty-third president of the U.S.A., b. in Lamar, Barton co., Missouri, of Scottish and Eng. descent. He was educ. at the high school, Independence, Missouri. From 1900 to 1905 *T.* held small commercial posts, and for the next 12 years farmed his parents' land near Independence. Soon after the U.S.A. entered the First World War, *T.* joined the Army and served with distinction in France. In 1922 *T.* was elected judge of the Jackson co. court, a body concerned with the supervision of the co. administration. In 1934 he was elected a senator for Missouri in the Democratic interest and re-elected in 1940. The following year he turned his attention to the spending of public money in war contracts, and he was instrumental in the formation of a Senate committee, of which he became chairman. When President Roosevelt was nominated for a fourth term in July 1944 the Democratic Convention's choice of *T.* as vice-president was acceptable to both the liberal and left-wing groups and to the

more conservative elements. The value of avoiding a change of leadership at that particular juncture of world affairs—a value which *T.* himself recognised—was destroyed by the death of Roosevelt on 12 April 1945. *T.* succeeded to the presidency after having been in office as vice-president only 83 days.

U.S. Information Service: American Embassy

HARRY S. TRUMAN

On 16 April *T.* as president addressed Congress for the first time, stating he would follow Roosevelt's policy at home and abroad. The war in Europe ended on 8 May and in July *T.* was in Berlin, taking part in the Potsdam Conference (q.v.). It then fell to him to announce to the world the fact of the existence of the atom bomb and to authorise its use against Japan.

In general, *T.* had the support of Congress, on which he relied for the passage of his legislative programme, but only a small part of it was passed by the end of 1945, including principally Amer. participation in the Bretton Woods Agreements (q.v.) and in the U.N. Organisation. Actions which were criticised were the cancellation, with some exception, of all outstanding contracts under lend-lease, and the removal of price-control and rationing. Throughout 1946 *T.* was faced with severe labour troubles against which he took energetic action, but he showed his sympathies towards labour by vetoing the strike control bill, which Congress eventually passed. On foreign affairs he paved the way for the U.S.A. to take up its position of leadership among

the democratic countries, and in this T. made his greatest contribution to post-war statesmanship. When the Eightieth Congress assembled in Jan. 1947 with a Republican majority hostile to T., he reaffirmed the end of isolationism and declared that America must continue to shoulder its responsibilities to the world. Addressing Congress again on 12 March, he made a notable speech, calling for aid to Greece and Turkey and initiating what later came to be known as the 'Truman doctrine,' the policy for helping countries threatened by, and anxious to resist, Communism. Later in the same year he supported his secretary of state, Gen. Marshall, in the plan to aid Europe, and the following year launched the Economic Co-operation Administration (see ORGANISATION FOR EUROPEAN ECONOMIC CO-OPERATION). In the presidential elections of 1948, T. based his campaign on the failure of Congress, controlled by the Republicans, either to carry his anti-inflationary legislation or to check the rising cost of living. T. was confident of success at the polls, but all forecasts were against him. In the event 24,105,812 votes were cast for him and 21,970,065 for his nearest rival, Dewey (q.v.). He carried 28 states, giving him 303 electoral votes against 189 for Dewey. T.'s reelection as president was a great and unexpected personal triumph for T., and in his message to Congress in Jan. 1949 he proposed to put into effect his 'Fair Deal' policy of increased social security combined with measures to keep down prices. In his inaugural address as president for his second term he promised Amer. participation in the security arrangements of the N. Atlantic. Shortly afterwards the Atlantic Pact was negotiated, and T. was present at the ceremony in Washington on 4 April 1949, when the treaty was signed by the foreign ministers of the 12 nations concerned. He consistently realised the responsibilities of the U.S.A. in international affairs, and gave effect to this both in the Atlantic Pact and in his economic policy. On 27 June 1950, immediately following the invasion of the S. Korean rep., he announced the armed intervention of the U.S.A. (see UNITED NATIONS CHARTER; UNITED STATES, History). In domestic politics his success rested largely on his great ability as an administrator, his adherence to constitutional procedure, and his powers of quick decision. In Nov. 1950 an unsuccessful attempt was made on T.'s life by Puerto Rican fanatics. T.'s second term ended somewhat stormily. There was disillusion because the Korean peace talks had so far produced no result; and a vociferous Right Wing Republican wave of criticism of T.'s conduct over the MacArthur dismissal, and of the Democratic administration's treatment of Communists generally. T. announced that he would not stand for the presidency again, although he was personally exempt from the 22nd amendment to the Constitution, adopted 1951, limiting his successors to 2 terms of office only. In 1956, however, he emerged from what

had amounted to political retirement in an attempt to secure the nomination of Harriman (q.v.) as Democratic presidential candidate; but in spite of his efforts, the nomination went to Stevenson (q.v.). See his *Memoirs*, 2 vols., 1955, 1956.

Trumbull, John (1750-1831), Amer. poet, b. Westbury, Connecticut. Educ. at Yale, he studied law and became a judge. Most important of the group known as the Hartford Wits, he advocated departure from the prevailing neo-classical style of poetry, but nevertheless often followed it himself. In 1773 he pub. *The Progress of Dulness*, a burlesque, and *The Correspondent*, a series of satirical essays. His mock-epic *McFingal*, 1775, modelled on *Hudibras*, satirised the British. See A. Cowie, *John Trumbull: Connecticut Wit*, 1936.

Trumbull, John (1756-1843), Amer. painter, son of Jonathan T., lived alternately in his native country and England, where he studied under Benjamin West. He is pre-eminently the artist-historian of the War of Independence, in which for a time he served as aide-de-camp to Washington, whose portrait he painted. The largest single collection of his pictures is in the possession of Yale College, but 'The Signing of the Declaration of Independence' and 3 other large pictures are at the Capitol at Washington.

Trumbull, Jonathan (1710-85), Amer. revolutionary, b. Lebanon, Connecticut, rose to become governor of his native state. During the Amer. Revolution he had considerable influence on Washington, who referred to him always as 'Brother Jonathan.'

Trumper, Victor Thomas (1877-1915), Australian cricketer, b. Sydney, New S. Wales. He played for New S. Wales and represented Australia 43 times; toured England in 1899, 1902, 1905, and 1909. T. was a brilliant and graceful batsman with an ability to make big scores by unorthodox methods on treacherous wickets. Thus he was at his best in the wet Eng. summer of 1902, when he scored 2570 runs. His best score against England was 185 not out, 1903-4; against Sussex in 1899 he made 300 not out. He was in fine form against the S. Africans in 1910-11, when he made his highest test score, 214 not out at Adelaide. In 1913-14, for an Australian XI v. Canterbury, he and (Sir) Arthur Sims estab. the world record 8th-wicket partnership of 433.

Trumpet. A brass wind instrument tracing its descent through the bugle to the Rom. *lituus* or tuba. It consists of a long narrow brass or silver tube, bent twice on itself, so that 2 of the parallel branches form with the third a kind of rectangle with rounded corners. The mouthpiece is cup-shaped, and the other extremity broadens out like a convolvulus. Until the invention of the valves in the 19th cent. the T. was capable of producing only the natural harmonic notes, for which reason, combined with that of its incisive and carrying tone, it was found useful for fanfares, and for military purposes was

often combined with kettledrums, a practice clearly reflected in the scores of classical orchestral works up to the early 19th cent. The valves made the T. a chromatic instrument, first made in the pitch of F., transposing a perfect 4th up. The T.s in modern use, however, are usually in B \flat or A, transposing a major 2nd or a minor 3rd down, respectively, the written compass being from F \sharp below middle C to C above the stave in the treble clef, sounding respectively E-B \flat and D-A. There are also T.s in C, and the T. in F is still in use.

Trumpet Flower, or **Cross-Vine**, alternative names for the *Bignonia* (q.v.).

Trumpet Marine, a one-stringed musical instrument of the monochord (q.v.) type, quite unconnected with the trumpet, except by its sound, obsolete since the 18th cent. and never of great artistic value. It was used mainly to maintain pitch among singers in church and in convents, hence the Ger. name *Nonnen-geige* (nuns' fiddle). Another Ger. name was *Trummscheitl*, and the It. and Fr. names were *tromba marina* and *trompette marine*. The adj. 'marine' has never been satisfactorily explained.

Trumpeter, or *Psophia*, genus of S. Amer. birds allied to the cranes. *P. crepitans* is a bird of lustrous and brilliantly coloured plumage and is often domesticated.

Truro, city and municipal bor. of Cornwall, England, on the R. Truro, a branch of the Fal, 9 m. N. of Falmouth and 279 m. from London. It is an anct tn, the *Treuru* of Domesday Book. The old bor. was comprised in the parish of S. Mary on land at the junction of the Allen and Kenwyn Rls., but even in Tudor times the township had grown beyond these narrow limits. Leland (c. 1535) mentions 'Kenwyn Streate' and 'Clementes Streate', suburbs of T. They were not formally incorporated until 1835. The Allen is still a noticeable feature with its 3 bridges. Kenwyn R. runs underground through the centre of the city, but the higher portion, with the 'Leates,' forms an attractive walk to the Victoria Gardens. Lemon Street (c. 1795), named after an 18th-cent. merchant, is a splendidly planned street familiar under the name of 'Orange Street' to readers of Hugh Walpole's novels. In Prince's Street, named after the Regent, is the house of W. Lemon, the massive mahogany woodwork of which attests the magnificence of former days. Here, too, was born Henry Martyn (q.v.), the missionary philologist, commemorated in the Cathedral by the baptistery. Near by is the site of the old Colnage Hall, where for 500 years until 1837 royal officials came to examine the smelted tin and where the Tinnars' Parliament held its often stormy gatherings, and also where Wesley preached. The whole city is dominated by the cathedral, whose central tower is 250 ft high. The anct diocese was re-estab. in 1876, and the cathedral was the first erected in Britain since the rebuilding of St Paul's in the reign of Charles II. The foundation stone was laid on 20 May 1880, by the

Duke of Cornwall (later Edward VII). In 1903 the nave was added and the Central Tower in 1904. In 1910 the Western Towers, named after Edward VII and Queen Alexandra, were dedicated. The Co. Museum and Art Gallery contains many paintings by John Opie (1761-1807) and by modern Cornish artists. Near the museum is the site of the Dominican Friary, of which the church was dedicated in 1259. The cattle market, the most important in the co., was built in 1840 on the site of T. Castle. This was the anct Truro, but even in Leland's time it was 'now clene down' and the site 'used for a shoting and playing.' Although T. cannot be described as an industrial tn, there are some important works: gingerbread, sweets, pottery, pitchers, knitted goods, electrical goods, and motor-car bodies. Notable schools are the high school for girls founded in 1880 by Bishop Benson; the Cathedral School for boys founded in 1549 or earlier, as the Truro grammar school; and, on a hill above the cathedral and city, the Truro School founded in 1879, and now administered by a Board of Governors mainly appointed by the Methodist Conference. Pop. 13,350.

2. Cap. of Colchester co., Nova Scotia, Canada, an important junction of the Canadian National Railways. It is an industrial centre, noted for hats, caps, hosiery, textiles, milk products, and lies in the heart of an agric. area. It has the Provincial Agric. College and the Nova Scotia Normal College for training teachers. Pop. 10,760.

Truss, see under **HERNIA**.

Trust (Commercial). T. is the term somewhat loosely applied in the business world to a large financial and industrial combination of firms 'federated' for common policies on price, output, etc., but otherwise independent in domestic matters. The aim of T.s is partly monopolistic. In essence they are really the union of separate corporations or companies trading in the same or similar commodities. The shareholders of the separate companies taking part in the union surrender their holdings to a board of trustees, and in return for such surrender receive a T. certificate setting forth the value of their holding in the T. The trustees now virtually become a board of directors controlling and directing the different members of the T. as one single whole. By such arrangements competition can be eliminated, overhead charges reduced to a minimum, expenses of production and distribution curtailed. If there were no other factors operating, the public would stand to gain in the long run. But too often, when competition has been eliminated, the T. is more concerned in increasing profits than in passing on to the public the benefits of successful trading. There is a limit to which prices may be raised through T.s, as rival concerns would not be long in establishing themselves. The first of these modern T.s was that estab. in the U.S.A. by John D. Rockefeller (q.v.) in 1882: the Standard Oil Trust, with a capital of \$100m. This T. at its inception was able to control

85 per cent of the total output of refined petroleum in the U.S.A. In 1911 the U.S. Supreme Court ordered its disintegration. In the U.S.A. T.s are regarded as a potential danger to the community. Laws have been passed by Congress, including the Sherman Anti-Trust Act of 1890, and different states in the Union declaring them illegal and forbidding their promotion. They could also be investigated under British anti-monopoly legislation if they control a third or more of the output or supply of a commodity. *See also* CARTEL; COMBINE; CAPITAL AND CAPITALISM, *History of Capitalism*; MONOPOLIES; TAFT, WILLIAM HOWARD.

Trust Companies, *see* TRUSTS (COMMERCIAL).

Trust Investments, are regulated by the Will or Settlement, and by the consolidating Trustee Act, 1925 (Part I). A trustee may invest any trust funds in his hands, whether at the time in a state of investment or not, in any of a number of investments specified in section 1 of the Act. These include: parl. stocks or public funds, or gov. securities in the U.K.; real or heritable securities in the U.K., including the security of a charge on freehold land by way of legal mortgage; stock of the Bank of England or the Bank of Ireland (all Bank of England stock has been transferred to the Treasury pursuant to section 1 of the Bank of England Act, 1946. The Bank of Ireland stock is retained in the Act, but stocks of the Republic of Ireland are excluded); India 7%, 5½%, 4½%, 3½%, and 2½% stock (but reference should be made to the Gov. of India Act, 1935, section 165, and to the India Independence Act, 1947, section 18, as to the interpretation of pre-existing law); securities the interest of which is for the time being guaranteed by Parliament (including, under an Act of 1945, the Parliament of N. Ireland); consolidated stock created by the Metropolitan Board of Works, or by the L.C.C., or debenture stock created by the Receiver for the Metropolitan Police Dist., or Metropolitan Water stock; the debentures or preference stock of any railway company in the U.K. incorporated by special Act of Parliament and having during the previous 10 years paid a dividend at the rate of not less than 3 per cent on its ordinary stock (under the Transport Act, 1947, provision is made for the replacement of securities of railway companies by Brit. Transport stock); debenture stock and 'B' annuities of Indian railways (subject to the effect of the India Independence Act, 1947); debentures, or guaranteed or preference stock of any company in the U.K., estab. for the supply of water and incorporated by special Act or Royal Charter and having paid a dividend of 5 per cent for the last 10 years; inscribed stock issued by any municipal bor. having a pop. of over 50,000, or by any co. council; municipal stocks issued under Act of Parliament or provisional order; and stocks authorised under the Colonial Stock Act, 1900. Trustees may also

invest in any security issued under the National Loans Act, 1939-45, and section 1 of the Miscellaneous Financial Provisions Act, 1946. Securities created and issued to raise money under section 12 (4) of the New Towns Act, 1946 or under section 66 (3) of the Town and Country Planning Act, 1947, are to be deemed for all purposes to have been created and issued under the National Loans Act, 1939, and are, accordingly, trustee securities. Trustees, unless expressly prohibited from so doing, may invest in bearer securities which if they were not payable to bearer would have been authorised securities. Most modern wills and settlements allow of a wider range than either the Act of 1925 or the Rules of Court, and so long as the trustee keeps within that range and acts in good faith he is protected. The investments authorised by the High Court are those stated in the Rules of the Supreme Court (Order 22, rule 17). They only require of the stocks named in section 1 (1) (9) of the Act that a dividend shall have been paid on ordinary stock or shares for 10 years before the date of investment. It should be noted that even when the Will or Settlement contains a list of authorised investments, the trustees may also invest in the securities authorised by the Trustee Act, 1925, unless expressly forbidden to do so (*Re Warren, Public Trustee v. Warren*, 1939); and further, that when specific investments are settled there is no power to realise the same and invest the proceeds in investments authorised by the Act (*Re Pretti, Barrow v. McCarthy*, 1943). Trustees who have held land on trust for sale may invest the proceeds in the purchase of land so long as such proceeds remain identifiable (*Re Wellsted's Will Trusts, Wellsted v. Hanson*, 1949).

Trustee Savings Banks, *see* SAVINGS BANKS.

Trusteeship Council, council of the United Nations (U.N.), provided for under the Charter of the U.N. to safeguard the interests of the inhab. of ters. which are not yet fully self-governing and which may be placed under it by individual trusteeship agreements. Its estab. was ensured on 14 Dec. 1946, after the General Assembly of the U.N. had approved 8 trusteeship agreements submitted by the administering nations (in brackets): *New Guinea* (Australia); *Ruanda-Urundi* (Belgium); *French Cameroons* and *French Togoland* (France); *Western Samoa* (New Zealand); *British Cameroons*, *British Togoland*, and *Tanganyika* (U.K.); a ninth agreement was afterward approved concerning *Nauru* (admin. by Australia on behalf of herself, New Zealand, and the U.K.). Another agreement for a 'strategic area' was submitted, and approved by the Security Council in Apr. 1947. It concerned the former Jap. mandated is. *Marshalls*, *Marianas*, and *Carolines*. The T. C. consists of members administering trust ters.; permanent members of the Security Council that are not administering trust ters.: China, U.S.S.R.; and as many other members elected for 3-year

terms by the General Assembly, to ensure that the total number of the T. C. is equally divided between those members of the U.N. which administer trust ters, and those which do not. The responsibility for exercising the functions of the U.N. respecting trusteeship in ters, not classed as 'strategic areas' are vested in the General Assembly; for 'strategic areas' in the Security Council. The functions of the T. C. are to consider reports from the administering authorities; to accept and examine petitions; to make periodic inspection visits; and to check conditions in the ters, with an ann. questionnaire on the political, economic, social, and educational advancement of the inhab. Decisions of the Council are made by a majority of the members, each having 1 vote. In addition to the Trusteeship System, the Charter of the U.N. contains a declaration in which those members of the U.N. which administer or may in the future administer non-self-governing ters, recognise the principle that the interests of the inhab. of these ters, are paramount. Periodic visiting missions have been sent out to ters., including to E. Africa in 1948 and 1951; and to W. Africa in 1949 and 1952; and to the Pacific trust ters. in 1950 and 1953.

Trusts and Trustees. *Legal.* A trust is an 'equitable obligation binding a person (who is called a trustee) to deal with property over which he has control (which is called the trust property) for the benefit of persons (who are called the beneficiaries of whom he may himself be one, and any one of whom may enforce the obligation.'—(Underhill on *Trusts and Trustees*.) Legal historians for the most part trace the development of trusts in Eng. law through the doctrine of *uses*. In all probability the Chancery lawyers, who were ever indebted to the principles of civil law, borrowed the whole idea direct from the Rom. *fidei commissum* (q.v.). Equitable estates (see *ESTATE*) are not now ignored or challenged by the common law (see *EQUITY*), but in construing a trust or considering the powers or duties of trustee and beneficiary respectively it is necessary to observe that the trustee usually has the legal ownership of the trust property, subject, of course, to his fiduciary obligations; while the beneficiary has only the equitable ownership, though such ownership confers upon him the beneficial right to the income or other profits accruing from the property. Any act or default on the part of a trustee which is unauthorised either by the terms of the instrument creating the trust or by law is called a breach of trust, in respect of which the beneficiary is entitled to sue for damages. The Trustee Act, 1925, which consolidates certain of the previous statutes relating to trustees, re-enacts the statutory provision of the Judicial Trustee Act, 1896, whereby the court can exonerate a trustee who has committed a breach of trust but has acted honestly and reasonably (Section 29). The appointment of a Public Trustee may be made either by the creator of the trust, by the person having by

the Trustee Acts or by the trust instrument power to appoint new or additional trustees when required, or by the court. The Public Trustee is forbidden by the Public Trustee Act, 1906, to accept the responsibility of certain trusts; e.g. trusts exclusively for religious or charitable purposes, trusts for the benefit of creditors, and trusts involving the management of a business. Where there are no trustees available for the purpose of vesting in them land which requires a legal owner under a Settlement, the court may, under the Law of Property Acts, vest the land in the Public Trustee on the statutory trusts, in which case the Public Trustee may not charge fees or act unless requested to do so. Trusts are said to be: (a) *Express*, when created intentionally by the act of the settlor. Express trusts are generally created by deed or will. They are the common means whereby owners of property provide for their issue on their own death or settle property on the children at marriage. (b) *Constructive*, when, though the legal title to property is in one person, the court will decree that he ought in equity to hold the property subject to the beneficial enjoyment of another. (See *CONTRACTS*, and *FRAUDS*, *STATUTE OF*.) All property, real (q.v.) or personal, whether situate at home or abroad, and whether in possession or in action (see *CHOSE IN ACTION*), remainder (see *LAND LAWS*), reversion (q.v.), or expectancy, may be made the subject of a trust, unless the law has made it inalienable (e.g. pensions and salaries to public servants), or being land the tenure (see *TENURE*) is inconsistent with the trusts sought to be created. The expressed object of the trust must be lawful or it will be held void; hence trusts conducive to immorality or fraud, trusts restricting the power of alienation of the beneficiaries' interest, are void (see also *RESTRAINT OF MARRIAGE*, *PERPETUITY*, *THELLUSSON*). Trusts of land must for the most part be evidenced by writing signed by the settlor. Trusts of personal property may be created orally, though it would be highly inadvisable not to use written instruments.

Trustees may employ agents, and are not liable for their default, but they should not allow money or property to remain in the hands of a solicitor or banker longer than is reasonably necessary to enable him to pay or transfer it to the trustees (Act of 1925, Section 23); but under Section 11 of the Act of 1925 the trustee may leave money with a banker pending investment. A trustee who is going abroad for more than a month may delegate his trust to an attorney provided the latter is not his sole co-trustee, but he will, notwithstanding, remain liable for the default of the attorney.

Previously to the Act of 1925, the appointor of new trustees could not appoint himself, but he may now do so, so that now the tenant-for-life under a Settlement (q.v.) may appoint himself trustee of the Settlement. The Court may appoint new trustees 'whenever it is expedient' and there is difficulty in

doing so without its help, e.g. where the trustee is a convict, lunatic, or bankrupt, or, being a corporation, has been dissolved. The power of advancing capital money to the persons entitled absolutely or contingently on reaching any specified age, or on the concurrence of any other event, may extend to as much as one-half of the capital in the case of personality settlements, but no advancement may be made so as to prejudice any person entitled to a prior life or other interest, whether that interest be vested or contingent, unless such person, being of full age, gives his consent.

Trust Corporation is defined by the Trustee Act of 1925 to mean the Public Trustee or a corporation appointed by the court in any particular case to act as trustee, or a corporation entitled, under rules made pursuant to the Trustee Act, 1906, to act as 'custodian trustee.' Recent acts have extended the powers and facilities given to such corporations. These corporations are generally banks and insurance companies, but, by the Law of Property Amendment Act, 1926, there are included the Treasury solicitor and official solicitor, and any person holding any other official position presented by the Lord Chancellor, the trustee in bankruptcy, and also certain charitable corporations. Recent legislation has extended the powers of such corporations; e.g. they may give valid receipts for the purchase money of land (Trustee Act, 1925, Section 14). Experience shows that banks and insurance companies have been ready to assume these privileges and to accept such trusts either directly or through companies formed by them for the purpose; and indeed it is possible to see in such corporations the natural and appropriate substitute for the gratuitous trustee. Express provision for the remuneration of the trustee corporations can be made in the instrument appointing them. If the court appoints the corporation it may fix its remuneration. See Sir A. Underhill, *Law of Trusts and Trustees* (10th ed.), 1950 (supplement 1955); G. W. Keeton, *Law of Trusts* (5th ed.), 1950; T. Lewin, *Law of Trusts* (15th ed.), 1950 (supplement 1955).

Truth, in philosophy, is defined by Jacques Maritain as a word which expresses, as it really is, the speaker's thought, and a true thought represents, as it really is, the thing to which it refers. T. in the mind therefore conforms with the thing. The degree of T. depends upon our organs of knowledge. The search for T. and especially criticism of T. form a branch of philosophy called epistemology (q.v.). Nietzsche regarded T. as a form of letter which the world must, to know itself, break asunder, while at the opposite pole are the sceptics, who challenge the possibility of T. in itself. Famous sceptics include the ancients Pyrrho, Arcesilas, and Carneades; Montaigne and Sanchez in the 16th cent., with David Hume in the 18th cent. Later philosophers who challenged ratiocination as capable of finding T. include Rousseau, Fichte, Schopenhauer, Bergson, and Wm

James. They claim that T. is to be found rather in the will, in feeling, or in action. Rationalists hold that T. is easy to attain, and undertake to bring all things within the comprehension of reason, which is competent to attain T. independent of reality, or of God. They claim to achieve perfect wisdom by natural powers, and reject the necessity of Divine revelation. Descartes, Malebranche, Spinoza, and Leibniz (q.v.) are among them. The school of Aristotle and St. Thomas Aquinas teaches that T. is neither impossible nor easy to attain. It is thus opposed to both scepticism and rationalism. Kant, the founder of subjective philosophy, and his successors Schelling and Hegel, deified the human subject of knowledge, and rationalism and scepticism appear to find common ground in their anti-intellectualism. Such philosophy is termed modernist. See the works of the philosophers mentioned above; also KNOWLEDGE; PHILOSOPHY; METAPHYSICS.

'Truth', weekly paper pub. in London, founded in 1877 by Henry Labouchere. Notable for its attacks on fake and humbug, T. devoted special attention to politics, the arts, finance, and social topicalities. Ceased pub. Dec. 1957.

Trutnov (Ger. *Trautenau*), Czechoslovakia in the region of Hradec Králové (q.v.), near the Polish border. It has a linen industry. Pop. 18,400.

Tryfan, 3010 ft., mt in N. Wales, noted for its striking pyramidal appearance and general steepness of incline. The best view of it is from the Capel Curig side. It stands above lake Ogwen, with Snowdon to the SW., separated from it by the Glyders and the Llanberis pass. The upper half of the E. and SE. faces is a precipice which offers some of the best and safest rock climbing in Britain. The foot of the climbs can be reached in a few hrs either from Pen-y-pass or Ogwen. The prin. features are the N., central, and S. buttresses, with the intervening N. and S. gullies, and the climbs all lead to the rocky summit ridge capped by its twin 10-ft. monoliths, Adam and Eve.

Trygon, see STING-RAYS.

Trypanosomes, **Trypanosomiasis**, see SLEEPING SICKNESS, TSETSE FLY, and TROPICAL MEDICINE.

Tryagris, Kleomenis-George (1889-), Gk writer, b. Nauplia. He studied at Athens Univ. where he received the degree of Doctor of Law. His prose possesses a poetic quality based on deep emotion and thought. His masterpiece is the prose poem, *Hardus*, 1925, and other works include *Rosli*, 1916, *A Spring Ramble* (three lyric novels), 1919, and *Blue Narcissus*, 1926.

Tsaidam (or Tsádum), central Asian region in the prov. of Chinghai, China, lying between NE. Tibet and W. of Koko-nor, formerly the bed of a vast salt lake. Oilfields have been worked since 1956, and a railway is being built from Lanchow to T.

Tsamkong, see KWANGCHOWWAN.

Tsana Lake, see ETHIOPIA.

Ts'angwu, see WUCHOW.

Ts'ao Chih, Prince, see CHINESE LITERATURE.

Tsar, title of the kings of Bulgaria and of the monarchs of Muscovy from the 15th cent. until Peter the Great took the title of Emperor of All Russia. The title T. was, however, widely used unofficially throughout the Imperial period. Though derived from Lat. *Cæsar*, it lost its Imperial rank (cf. Ger. *Kaiser*) and became equivalent to King.

Tsaritsyn, see STALINGRAD.

Tsarskoe Selo, or **Tsarskoye Selo**, see PUSHKIN.

Tsavo National Park, see KENYA COLONY AND PROTECTORATE, *Divisions and Physical Features*.

Tschaslau, see ČASLAV.

Tschudi, Gilles or Aegidius (1505-72), Swiss chronicler, a zealous Catholic, became 'landammann' or chief magistrate of Glarus. His *Chronicon helveticum*, 1600-1470, in spite of its unreliable character, remains a groundwork of Swiss hist., containing one of the prin. accounts of Wm Tell (q.v.).

Tsetse Fly, fly belonging to the same family (Muscidae) as the common house flies, 4 species of which, *Glossina morsitans*,

TSETSE FLY

G. swynnertoni, *G. tachinoides*, and *G. palpalis* are the cause of enormous loss among domesticated animals in most parts of tropical Africa. It is a blood-sucker, and though its bite is not itself dangerous, it is the means by which a parasitic protozoan is introduced into the blood, causing trypanosomiasis or sleeping sickness (q.v.) in humans or 'nagana', i.e. fly disease, in the case of cattle and other beasts. *G. palpalis* has entirely different habitats from *G. morsitans*, the former breeding mostly in riverine bush, the latter in savannah country; and control measures therefore differ in each case, though the object in both cases is to break the contact between the T. F. and man. The T. F. is similar in appearance to the house-fly, but has a very long and slender proboscis. The wings are more leaden and more opaque, and the thorax is chestnut with 4 black longitudinal stripes. The abdomen is yellowish-white with a black spot on 4 of the 5 segments. T. F. is widely distributed throughout Central

Africa, infected areas being found on the W. coast, in the Belgian Congo, in E. Africa, and as far S. as the Rhodesias. New patches frequently occur, as migrations of fly are frequent in areas in which it is hitherto unknown. The same family of flies conveys both human and animal disease, and not only occasions widespread human suffering, but renders it impossible to keep cattle and other live-stock in large areas. An epidemic of trypanosomiasis along the shores of Lake Victoria Nyanza early in this cent. is said to have caused the death of a quarter of a million people. The Royal Society sent out 2 commissions to Uganda to investigate the disease. Sir David Bruce, a member of the first commission, concluded that the disease was due to infection with a trypanosome. Prof. F. K. Kleins found that the trypanosome underwent cyclical development in T. F. From these and other researches it is commonly agreed that human trypanosomiasis is due to the infection of man with either of 2 species of trypanosome, *T. gambiense* or *T. rhodesiense*; and that these trypanosomes are conveyed by certain species of T. F., either by direct transmission of a trypanosome from one infected person to another, or by cyclical transmission, after the trypanosome has undergone a certain part of its cycle of development in the tissues of the T. F., the latter being the more usual method. One theory of the development of human trypanosomiasis is that both parasites (*T. gambiense* and *T. rhodesiense*) are altered forms of *T. brucei*, the cattle and game trypanosome (other virulent forms of cattle or game parasite are *T. congolense* and *T. vivax*) which normally dies when introduced into man. Expert opinion holds the view that wild animals are undoubtedly a reservoir for *T. rhodesiense*, which causes a more acute disease for man than *T. gambiense*. Remedies for dealing with the T. F. include the killing of game to limit the range of infection and the burning of bush to exterminate the fly, but in the latter case the resulting deforestation may form the starting-point of new soil erosion. As the result of further research begun in 1944 and experimentation with a new drug then known as M.7555, a drug named Anttrycide was eventually discovered which gives immunity for definite periods to cattle, horses, camels, and other animals. It has been estab. that a single treatment will cure cattle of *T. congolense* and *T. vivax*, the 2 worst forms of the disease, and it has been used with success against the *T. brucei* infection in cattle, horses, and dogs, against *T. evansi* in cattle, and against *T. simiae* in pigs. See Lord Hailey, *An African Survey*, 1938; J. Smart, *Insects of Medical Importance*, 1943; R.M.A. (ed. H. Clegg), *Fifty Years of Medicine* (Chapter 'Fifty Years of Tropical Medicine'), 1950.

Tsimshian Language, see NORTH AMERICAN NATIVE LANGUAGES: *Pacific Areas*.

Tsimshians, or **Chimmesyans**, tribe of N. Amer. Indians, who dwell along the shores of the Pacific, facing the Queen

Charlotte Is. They live mainly by hunting and fishing. There are to-day some 6100.

Tsinan, or **Chi-nan**, cap. of the Chinese prov. of Shantung, was the first city in the Chinese Empire in which a foreign commercial settlement was voluntarily opened by the Chinese Gov. (1906). A considerable number of foreigners and foreign institutions, including the Shantung Christian Univ., have for many years estab. themselves in it. There are many factories. T. is one of the healthiest cities in China, and the city is famous for its many springs and lakes. The pop. is estimated at 600,000, of whom some thousands are Muslims.

Tsichow, see CHINGCHENG.

Tsingtao, city on Kiaochow (Chiaochow, or Chiao-chow) Bay, Shantung, China. T. was leased to Germany in 1898 for 99 years and a harbour and fortress were developed there by the Ger. Gov. When the First World War broke out the harbour served as a base for Ger. raiding warships. It was blockaded by the Jap. Navy, and a Brit.-Jap. military force attacked it from the N. By the end of Oct. 1914 the investment had begun and the fortress capitulated on 7 Nov. 1914. Restored by Japan to China in Dec. 1922, it was taken by the Japanese in the Sino-Japanese War, but restored to China after the Second World War. Kiaochow Bay is a well-protected natural harbour, 19 m. long by 15 m. wide. The Jap. salt fields and fisheries at T. were taken over by the Salt Administration under the Sino-Jap. Agreement of 1922, and China paid Japan 2,000,000 yen. The National Shantung Univ. is situated in T., which is connected by railway with the prov. cap. Tsinan and the port of Chefoo. T. is the best seaside resort in N. China. Pop. (including neighbouring dist.) 1,100,000.

Tsuga, Hemlock or Hemlock Spruce, a genus of 10 species of evergreen conifers, family Pinaceae, of which *T. heterophylla*, W. Hemlock, *T. canadensis*, K. Hemlock, and *T. merletiana*, Mountain Hemlock, are N. Amer. forest trees, now grown in Britain.

Tsüni, Chinese city in Kweichow prov. on the Chungking-Kweiyang railway (begun in 1957). In Jan. 1935 the Politic-Bureau of the Chinese Communist party held its enlarged congress in T. in which Mao Tse-tung was elected Chairman of the party and assumed leadership, which eventually led to the co-operation between the Nationalist gov. and the Communists during the Sino-Japanese War (1937-45). See CHINA, History.

Tsushima, is. of Nagasaki, Japan, situated S. of Korea. It is mountainous, and really consists of 2 is., the uniting neck being dry only at low tide. There are also included some 40 adjacent small is. In the strait of this name (in 1905, during the Russo-Jap. war), the Russian fleet was annihilated by the Japanese under Togo, and following this the Russians were driven out of Korea and Manchuria. Area 262 sq. m.; pop. 39,000. Prin. tn Izuhara. See A. S. Novilloff-Prilsoy, *Tsushima* (Eng. trans.), 1936.

Tsyetsyn, see QUELFART.

Tu Fu, see CHINESE LITERATURE.

Tuam, chief tn in N. Galway, Rep. of Ireland. There are 2 cathedrals: that of the Church of Ireland has been rebuilt round the anct Catholic structure (c. 1130); the present Rom. Catholic cathedral was erected c. 1846. T. is the seat of a Catholic archbishop and a Protestant bishop. It has a beet-sugar refinery and is noted for its live-stock fairs. Pop. (urban dist.) 4000.

Tuamotu Archipelago (also called **Panmotu**, Low or Dangerous Archipelago), comprises a dozen fairly large atolls and countless small atolls and reefs, which make navigation extremely dangerous. Scattered over 15° of long. and 10° of lat., E. of the Society Is. (q.v.). Area 343 sq. m.; pop. in 1951 7245. From the middle of the last cent., for 50 years, the Tuamotus were famed for their pearls. But with the introduction of diving apparatus the mrlts became glutted, and the Fr. Gov. took drastic action to control the industry. It was on Raroia, one of this group, that the famous raft *Kon-Tiki* ended its voyage from Peru in 1947. H.Q. of the Fr. administration is on Apataki. At the SE. extremity of the Tuamotus is a group of high volcanic is. known as Mangaveva (or the Gambiers), which is administered as a separate dist.

Tuapse, tn in the Krasnodar Kray of S. Russia, Black Sea port. There are metal-working, oil refining, and food industries, and oil is exported (pipeline from Grozny). Pop. (1939) 30,000. T. was founded as a fort in 1838; it was the scene of much fighting in 1942.

Tuaregs, tribe of Berber Arabs, inhabiting the region of the Sahara. By complexion they are a 'white' race and their main characteristics are dark hair and hazel eyes. They are a war-like tribe and adhere to the Mohammedan religion. The men wear veils. These nomads have large flocks of camels and goats. See BERBERS.

Tuatera, see SPHENODON PUNCTATUS.

Tuba. An anct Rom. military instrument of the born type; now the bass instrument of the horn family, used in the orchestra as the bass of the brass instruments and more often associated in 4-part harmony with the trombones than with the horns, though its tone is nearer the latter. The instrument, owing to its 3 or 4 valves, controls a complete chromatic scale from F, an octave below the bass-clef stave to c. F an octave above it.

Tubal-cain, son of Lamech by his wife Zillah (Gen. iv. 22) described as 'instructor of every artificer in brass and iron.' He is hence regarded as the legendary founder of the metal industry, the earliest of all blacksmiths, and has been compared with Vulcan. According to Jewish tradition he was distinguished for his great strength and success in war, and was responsible for the slaying of his ancestor Cain. Attempts have been made to identify him as the eponymous ancestor of a Scythian people of the same name who dwelt near the Black Sea.

Tubercles, Root, see ROOT TUBERCLES. Tuberculosis, infectious disease caused by the bacillus *Mycobacterium tuberculosis*, and characterised by the formation of tubercles. Tubercles as a rule proceed to abscess formation, the pus having the appearance and consistency of cheese. The caseous mass may slowly calcify and be surrounded by fibrous tissue. In this way the disease may be healed, and most adults have healed, calcified tuberculous foci resulting from infection in childhood. In other cases the tubercle does not heal to the extent of calcification, but remains latent and surrounded by a varying amount of fibrous tissue. These lesions are apt to break down and become active again under any conditions in which the host's resistance becomes lowered. Thus overtiredness, malnutrition, intercurrent infections, or physiological strain, as in pregnancy, may cause a quiescent primary focus to become active. Again, the caseous abscess may grow in size and, overcoming the forces of natural resistance, eat its way farther into the surrounding tissues. If not halted in its spread, the disease and the increasing toxæmia may lead to death. Sometimes the forces of attack and defence strike a balance and caseation remains at a chronic stage. Caseous pus may discharge through a sinus either into a bronchus or from a joint or lymph gland to the body surface, and by this means a persistent abscess cavity with a sinus is formed.

The 3 common types of tubercle bacillus are the human, the bovine, and the avian. The avian type is not infectious to man. Tuberculous lesions occur mostly in the lungs (phthisis), the intestinal tract (tabes mesenterica), the lymphatic glands, the bones and joints, the skin (lupus), and the meninges of the brain (tuberculous meningitis). In England 99 per cent of pulmonary T. and 75 per cent of non-pulmonary T. are due to the human type of infection. The 25 per cent of bovine type, non-pulmonary T. occurs mostly in children. But any lesion is capable of originating a secondary spread into any tissue through the bloodstream or lymphatic channels. A tuberculous septicaemia may cause a miliary, or generalised, infection, setting up seedling tubercles throughout the body—a highly dangerous condition, earning for itself in the old days the title of 'galloping consumption.' T. was known to the ancients and went by various names, according to the site of the lesion, such as scrofula, and king's evil, phthisis, consumption, and decline. Bunyan graphically, and correctly, called T. 'the captain of the men of death.' Villemin, in 1865, proved experimentally that T. could be transmitted from one host to another, but it was not until 1882 that Koch cultured and identified the specific infecting bacillus. Thereafter began attempts to produce specific anti-toxins or vaccines along the lines that were being successfully followed in other infections. Tuberculin vaccine had its practical difficulties and dangers. When

injected intradermally in small, diluted doses, however, it formed a useful diagnostic test for T., a positive reaction being shown by a red, sometimes vesiculated reaction at the site of injection. This method was developed by the French physician, Mantoux. Spallinger's (q.v.) treatment (1912), by first injecting anti-toxins and then tuberculin, found only temporary favour in this country. Immunisation by the attenuated Bacillus Calmette-Guérin (B.C.G.) was used in France, where it originated, and Scandinavia for many years, but it was not until 1949 that it was taken up seriously in this country. Results with it have proved encouraging, and as a prophylactic it is beginning to be used extensively in infants and in those exposed to special risk, such as students and nurses, in whom the Mantoux test is negative.

The main significance of Koch's identification of the tubercle bacillus was that it led the way to an epidemiological attack on the disease. It was established that the reservoirs of infection were, on the one hand, human beings with T., and, on the other hand, infected cattle. In human T. the infection is conveyed to others by exhaled droplet particles either from direct contact or from coughing or sputum. The T. bacillus is very resistant in the dried state, and dried sputum may be a source of infected dust for as long as 6 months. Sunlight is lethal to the T. bacillus. In bovine T. infection is conveyed to the human host in infected meat and in milk. It has long been recognised that social and environmental conditions affected the spread of T., and that it was more prevalent where there was overcrowding and when standards of nourishment and living conditions were low. The epidemiological attack, therefore, had to be directed at eradicating sources of infection and improving social conditions. Treatment by prevention has in fact been the main principle of the attack on T. since the turn of the cent. That it has had success is shown by the statistics. The death rate from T. in 1900 was about 150 per 100,000; in 1950 it was 50. The last few years has seen a faster fall, and in 1954 the death rate was in the region of 17 per 100,000. Notifications, however, are still at the same level as pre-war. Except for rises during the 2 wars, when nutrition and environmental conditions were worsened, the decline in the death rate, therefore, has been steady. T., however, is still the principal killing and incapacitating disease affecting the population between the ages of 15 and 40, and there is little room for complacency.

Measures for eradicating bovine T. have consisted of eradicating, so far as possible, infected cattle. Tuberculin testing of herds is extensively practised, and milk from certified tuberculin-tested (T.T.) cows is now widely on the market. In Great Britain 60 per cent of the cattle are now attested. Pasteurisation of milk is almost universal. T. of the bones, glands, and intestinal tract has become far less common as a result. Apart from the various attempts at prophylactic

vaccination already mentioned, measures for eradicating the human type of T. have been directed, first, towards earlier diagnosis of the disease (and thus earlier discovery of sources of infection) and, secondly, towards better housing and working conditions, and increasing natural resistance. T. became a notifiable disease in 1913. Local authorities, through their medical officers of health, became the responsible bodies for T. prevention. Chest clinics for the examination of suspected cases were started and also sanatoria for segregation and treatment. Contacts of diagnosed cases were kept under observation and advised on the principles of prevention. The same methods are used to-day, but more extensively and under different administrative arrangements. Precision in diagnosing early T. has advanced with the advance of X-rays. It is too soon yet in this country to judge the contribution of B.C.G. vaccination to a lowered incidence of the disease in young people. In the U.S.A. where B.C.G. vaccination has been practised for some years, a lower rate of infection among adolescents is showing itself in the results of tuberculin tests on recruits for the armed services. In 1949 and 1950 10.6 per cent of the recruits joining the U.S. Navy and Marines were positive reactors, compared with 65.6 per cent of the National Servicemen in Britain. By 1954 the percentage of positive reactors among the American recruits had fallen to 4.6 per cent. One hopes that figures for Great Britain will follow the same pattern. A recent preliminary report (*British Medical Journal*, 1956, *i*, 413) to the Medical Research Council by its Tuberculosis Vaccines Clinical Trials Committee of a trial carried out on 56,700 British school children aged between 14 and 15 in London, Manchester, and Birmingham has shown that vaccination substantially reduces the risk of contracting T. in these children. Two types of vaccine were used, B.C.G., and one made from the vole tubercle bacillus.

Rest, fresh air, and a nourishing diet fortified with the fat-soluble vitamins remain the basis of the treatment of T. Measures such as artificial pneumothorax, phrenic crush, and thoracoplasty, which collapse and thereby put at rest an affected lung, have been in vogue and are still used in some cases. Pneumectomy, or complete surgical removal of the affected lung or part of it, has recently proved invaluable in suitable cases. The search for a chemotherapeutic agent specific against the tubercle bacillus was unrewarding for many years. The early sulphamidides and, later, penicillin were found to be ineffectual. In 1944, however, Waksman and his colleagues in the U.S.A. demonstrated the effectiveness of a new antibiotic, streptomycin, against T. The chemical substances isoniazid (isonicotinic acid or I.N.H.) and para-aminosalicylic acid (P.A.S.) have also been found to have a specific action against the *mycobacterium tuberculosis*. Bactericidal and bacteriostatic chemo-

therapeutic agents tend to suffer from the disadvantage that bacilli develop strains resistant to them, and streptomycin, I.N.H. and P.A.S. are no exceptions. But they represent a great advance in treatment, and have been responsible for arresting the disease in many young patients and rendering many older patients non-infectious (sputum negative). T. is now tending to become a chronic more than an acute disease. In military T. and tuberculous meningitis they may be life-saving, and experience has shown that if streptomycin is used in combination with one or other of the chemotherapeutic substances resistant bacterial strains are not so likely to develop. Although advances in treatment have greatly reduced the mortality of T. the number of notifications of new cases has not dropped in proportion. This is partly due to a large increase in the use of mass radiography (see RADIOLOGY), and consequent discovery of symptomless, unsuspected cases, which might have escaped attention otherwise. Further improvement in morbidity statistics must depend on medical advances, on the intensifying of social and administrative measures, and last, but by no means least, an increased sense of individual social responsibility. Tribute must be paid to the National Association for the Prevention of Tuberculosis (N.A.P.T.) for, among other things, its educative work among the public. See W. G. Savage, *Prevention of Human Tuberculosis*, of *Bovine Origin*, 1929; F. Heat and N. L. Rusby, *Recent Advances in Pulmonary Tuberculosis* (4th ed.), 1948; J. Myers, *Tuberculosis among Children* (3rd ed.), 1951; J. Maxwell, *The Care of Tuberculosis in the Home* (2nd ed.), 1947; S. H. Gloyne, *Social Aspects of Tuberculosis*, 1944; *Prophyl Tuberculosis Survey*, 1948; *Report of Joint Tuberculosis Council* (Cmd. 9566, H.M.S.O., London) 1955.

Tuberculosis, in Cattle, see CATTLE.

Tuberoze, see POLIANTHERS.

Tubes. Steel T. for a wide variety of engineering uses can be classified in 2 main headings: seamless or weldless, and welded. The first step in the manu. of seamless T. is the introduction of a mandrel or point over which the billet is rolled to form a cylindrical shell. The operation is known as piercing. The pierced billet is reheated to bring the metal to a forging temp. and passed to a plug rolling mill, where the diameter and wall thickness are further reduced while the length is increased. In making pipes over 18 in. in diameter the rolled tube after being reheated is delivered to the rotary mill. In this mill the diameter is increased and the wall thickness reduced to approximately finished dimensions before delivery to the rolling mill, which burnishes the inside and outside surface and tones up the tube, which is slightly oval in shape as it leaves the plug rolling mill. In the sizing mill the pipe, either cold or reheated if necessary, is passed over 2 or more sets of sizing rolls where the final reduction gives a uniform diameter and roundness throughout the pipe length.

The pipe is now cooled off, strengthened if necessary, inspected, and finally cut to the required lengths.

Welded tube is produced from flat strips of the thickness of tube wall required and of just slightly greater width than the circumference of the finished product. The strip is reheated to a welding temp. and bent round by specially designed rolls and the 2 ends compressed together so that they weld up into a tube. Welded tubing has the advantage that a more uniform wall thickness can be obtained, free from drawing marks. The manuf. of welded T. is quicker and less expensive than the production of weldless.

Although the largest tonnages of steel tube are made from steel containing about 0.06-0.10 per cent carbon, 0.35 per cent manganese, sulphur, and phosphorus below 0.05 per cent of the running type, steels of 0.30-0.55 per cent carbon are also used, and where greater strength is required a high carbon-nickel steel can be supplied. It is now possible to obtain commercial tubing of high tensile strength for automobile and aircraft purposes in a wide range of alloy steels. These steels include nickel, nickel-chromes, chromium, stainless, etc.

Tubes, Pneumatic, used for the conveyance of documents, letters, telegrams, or small parcels. The object to be conveyed is placed in a gutta-percha or steel cylinder which is driven to its destination by suction or compressed air. The systems range from those used in departmental stores, in Post Offices, and other public services, to every type of industrial organisation. The pneumatic tube has become one of the most economical and quickest means of transmitting both documents and quite heavy articles (tubes and containers of special design can be made to users' requirements) from one depot to another over considerable distances.

Tübet, see **TIBET**.

Tübingen, Ger. tn in the *Land of Baden-Württemberg* (q.v.), in the Neckar (q.v.) valley, 18 m. SSW. of Stuttgart. It was once a free city of the empire. There are many picturesque streets and fine old buildings. The massive castle of the Counts Palatine dates from the 11th cent., and the collegiate church and the *Rathaus* from the 15th cent. T. Univ. (1477) is famous, in particular for its 19th-cent. school of theology (see **BAUR**). The tn also has a hospital for tropical diseases. There is a publishing industry, and there are manufs. of surgical instruments. Pop. 44,000.

Tubize (Flem. *Tubeke*), tn in the prov. of Brabant, Belgium, 13 m. SSW. of Brussels. It has important manufs. of artificial silk, locomotive-works, and brick-kilns. Pop. 9100.

Tucker, Sophie (1884-), Amer. actress and entertainer. She first appeared as a singer in her father's café in Hartford in 1905, then went into cabaret and variety in New York. Her first Music Hall engagement was on 116th Street, New York, in 1906 as a 'black face' act. She toured with a troupe known as 'The Gay

Masqueraders' and, after more variety (or vaudeville), went into revue at the *Jardin de Paris*, New York, in *The Ziegfeld Follies of 1909*. After many successes she became famous in vaudeville, and visited England for the first time in 1922, as a cabaret singer and music-hall artist. Soon she was a star in both London and New York. She became tremendously popular as a 'Red Hot Momma', singing her songs with great force and drive and immense attack, and few people to-day know how to 'put over' a song better than she does. She is equally at home in sentimental numbers like 'Yiddisher Momma' and in songs like 'The Lady Is a Tramp'. A woman of great personality and expansiveness, she is popular on and off stage.

Tucson, co. seat of Pima co., Arizona, U.S.A., and the largest city of the state. T. has grown with great rapidity during recent years. It is an important rail and trading centre, particularly for local farming products. The climate is dry, and irrigation farming is carried on. Cotton, alfalfa, and grain are produced. T. manufs. tiles, bricks, electronic equipment, iron products, paint, and plumbing materials. Mining is an important industry. Here are situated the univ. of Arizona, founded in 1891; the State School for the Deaf and Blind; and U.S. mining, botanical, and agric. stations. T., owing to its dry climate, is a favourite resort for winter visitors. Nearby is Davis-Monthan Air Force base. Pop. 45,450.

Tucumán: 1. Prov. of NW. Argentina. The W. part is mountainous and covered with forest. There are mines of gold, silver, and base metals. The chief products are sugar, cereals, fruit, and tobacco. Area 10,430 sq. m.; pop. 740,530.

2. Cap. of the above prov., has a cathedral in which is still preserved the cross used at the founding of the city in 1565, a univ. founded in 1914, and Jesuit college. It is the busiest tn in the N. of Argentina and is chiefly engaged in sugar refining and distilling. It is connected by rail with Córdoba, and Rosario, and with Bolivia. Here in 1816 was held the first Congress of the Rep., when the independence of Argentina was declared. Pop. 205,000.

Tudela (anc. *Tutela*), Sp. tn in the prov. of Navarra, on the Ebro. It has a fine Romanesque-Gothic church, formerly a cathedral, and a trade in agric. produce, timber, and wine. Pop. 14,100. See **IMPERIAL CANAL OF ARAGÓN**.

Tudor, see **TODI**.

Tudor, surname of an Eng. dynasty, founded by a Welshman, Owen T., who is said to have married Catherine, widow of Henry V. By her he was the father of Edmund, Earl of Richmond, who married Margaret, great-granddaughter of John of Gaunt. The son gained the crown after defeating Richard III at Bosworth, and as Henry VII reigned from 1485 to 1509. The other T. monarchs were: Henry VIII (1509-47), Edward VI (1547-53), Mary (1553-8), Elizabeth I (1558-1603).

Tudor Architecture, see ENGLISH ARCHITECTURE.

Tuesday, the third day of the week, from *Ty* or *Tyr*, the Mars of the North-men, because the first hour of T. was supposed to be ruled by the planet Mars—hence the Fr. *mardi* for Tuesday.

Tufa, Calcareous, see CALCAREOUS.

Tuff, term which includes the finer kinds of volcanic detritus. Beds containing large blocks are called agglomerates.

Tug, any small craft equipped to tow larger vessels or trains of barges. A T. must have good manoeuvrability, and tends therefore to be a shortish vessel, often with twin screws. She must have power adequate for her duties, and in the interests of propulsive efficiency usually has a comparatively large slow-turning propeller giving a good grip on the water. Reciprocating steam engines were formerly the rule, but nowadays geared diesel engines are common. The appearance of the Thames T. 80–120 ft long, is typical, but in other parts of the world local needs have given rise to vessels of very different appearance; on the Rhine and Mississippi, for example, where long barge trains are towed for distances taking days to cover, tugs must have sufficient superstructure to provide accommodation for the crew. The onerous duties of salvage T.s require them to be especially seaworthy and powerful; they are fitted with heavy towing gear, pumps, and fire-fighting equipment. The Dutch have an international reputation for this kind of work. In Britain the Admiralty T.s of the 'Bustler' class, with geared diesel machinery of 4000 b.h.p., carry out much work under charter by commercial salvage and towage concerns. See also SALVAGE, *Salvaging Ships*.

Tugela, riv. of Natal, S. Africa, has its source in the Drakensberg Mts, flowing in a SE. direction, past Ladysmith and Colenso, to empty its water into the Indian Ocean. At Isandhlwana and Rorke's Drift on the T., actions were fought in the Zulu war (1879).

Tuileries, Palace and Garden of the, ancient residence of the Fr. sovereigns in the centre of Paris. It was begun by Philibert Delorme (q.v.) in 1564, at the order of Catherine de' Medici, in a place once a tile-works. It was the seat of executive authority during the Revolution, and the Emperor's residence during the Empire. It was burned by revolutionaries during the Commune of Paris (q.v.), and afterwards demolished. The gardens, planned by Le Nôtre (q.v.), still exist. See monograph by G. Lenotre, 1933.

Tuke, Henry Scott (1858–1929), painter, b. York, son of Daniel Hack Tuke, physician and great-grandson of W. Tuke, the Quaker philanthropist. He settled in Cornwall, and was one of the later members of the 'Newlyn School' of artists. Elected R.A. 1914. He painted mostly youthful nudes against a marine background.

Tuke, William (1732–1822), philanthropist and Quaker, b. York. Pioneer in the humane and scientific treatment of the insane, he induced the Society of

Friends to take this matter up, and in 1796 the York Retreat was opened. See D. H. Tuke, *Chapters in the History of the Insane*, 1882.

Tula: 1. Oblast in Central Russia, S. of Moscow, situated on the Central Russian upland, with some mixed forests in the N. and black-earth soil in the S. It has lignite (see MOSCOW COAL BASIN) and iron ore deposits. Area 9400 sq. m.; pop. c. 1,900,000, Russian. There are metal-working (since 16th-cent.), coal-mining, and chemical industries, grain and potato growing, cattle and hog raising. Chief tns are T. and Stalinogorsk.

2. Cap. and econ. centre of the above, main industrial centre of the Moscow Coal Basin, 120 m. S. of Moscow. There are large metallurgical (local ore) and engineering works (arms, machine-tools, transportation equipment); there are also other metalworking industries based on old iron-mongering crafts (*T. samovars*). It is an important railway junction (5 lines). The famous country house of L. Tolstoy—Yasnaya Polyana—is near by. Pop. (1956) 320,000 (1917, 157,000; 1920, 128,000; 1926, 155,000; 1939, 272,000). Known since 1146, it belonged to Ilyazan' principality, was Muscovite from 1503, and was often raided by Crimean Tatars; it was the prov. cap. from 1775. T. is an old centre of metalworking industry (arms supply to Muscovite gov. since 1595), largest in Russia until overtaken by the Urals in the 18th cent. It was the second largest town in Central Russia till the 1920s. German troops approached T. in 1941, but were thrown back.

Tulcán, tn of Ecuador, cap. of Carchi prov., and Customs station, near the Colombian frontier, 100 m. N.E. of Quito at an altitude of nearly 9000 ft above sea-level. It is the centre of an important stock-raising and field crop dist. Manufs. include wool, carpets, and ponchos. T. is on the new motor highway to Quito or Ibarra. Pop. 10,000.

Tulip, *Tulipa*, family Liliaceae, genus of over 50 species of Europe, temperate Asia, and N. Africa. *T. sylvestris*, wild T., has naturalised in Britain. The beautiful range of garden T.s are held to stem from *T. gesneriana*, and now include early-flowering groups (Duc van Tol, Medel, single and double forms); mid-season (Triumph); and May-flowering (Cottage, Breeders, Darwin, Rembrandt, and Parrots). *T. clusiana*, Lady T., *T. greigit*, *T. kaufmanniana*, Water-lily T., and others are notable species. Holland, Channel Is., and Lincs are commercial growing areas. Planting is done in Oct. and Nov.

Tulip Tree, or *Liriodendron tulipifera*, tall Amer. tree (family Magnoliaceae) bearing large fragrant flowers which superficially resemble those of the tulip; has sev. varieties. Source of the Amer. White Wood.

Tull, Jethro (1674–1741), agric. writer, b. Basildon, Berks. He tried out many ideas collected on his travels abroad and invented the first corn drill of note. In 1733 his major work, *Horse-Hoeing Husbandry*, was pub. in which he dis-

coused the advantages of hoeing crops grown in rows. Many of his interesting theories on soils and fertilisers were completely erroneous.

Tullamore, co. tn of Offaly, Rep. of Ireland. It is on the Grand Canal and is a busy mkt centre for a fertile agric. dist. Industries include wool-spinning, distilling, and brewing. Pop. 6200.

Tulle, Fr. tn, cap. of the dept of Corrèze. It is the seat of a bishopric, and has a 12th-cent cathedral. There is a military school, and also a gov. armament factory. It gives its name to the fabric called 'T.' Pop. 18,200.

Tullius, see **CICERO**, **MARCUS TULLIUS**; **CICERO**, **QUINTUS TULLIUS**.

Tullius Servius (reigned 578-534 bc) sixth King of Rome. The account of the early life and death of S. T. cannot be regarded as a real historical narrative. His mother, Oerisla, was one of the captives taken at Corniculum, and became a female slave of Tanacuil, the wife of Tarquinius Priscus. He was born in the king's palace, and was brought up as the king's son, since Tanacuil, by her powers of divination, had foreseen the greatness of the child; and Tarquinius gave him his daughter in marriage, and entrusted him with the gov. The sons of Ancus Marcius, fearing lest he should deprive them of the throne which they claimed as their inheritance, procured the assassination of Tarquinius; but Tanacuil by a stratagem preserved the royal power for Servius. Three important events are assigned to his reign by tradition. First he gave a new constitution to the Rom. state. This constitution gave the plebs political independence, and assigned to property that influence in the State which had previously belonged to birth exclusively. Secondly, he extended the pomerium, or hallowed boundary of the city, and completed the city by incorporating with it the Quirinal, Viminal, and Esquiline hills. Thirdly, he estab. an alliance with the Latins by which Rome and the cities of Latium became the members of one league. By his constitution S. T. incurred the hostility of the patricians, who conspired with L. Tarquinius to deprive him of his life. According to the legend, Tullia, one of the daughters of Servius, an ambitious woman, who had paved the way for her marriage with L. Tarquinius by the murder of her former husband, Aruns, and of her sister, the former wife of Tarquinius, was one of the prime movers in this conspiracy. At her instigation Tarquinius entered the Forum arrayed in the kingly robes, seated himself in the royal chair in the senate-house, and ordered the senators to be summoned to him as their king. Servius hastened to the senate-house, and ordered Tarquinius to come down from the throne. Tarquinius seized the old man and flung him down the stone steps. Covered with blood, the king hastened home; but he was overtaken by the servants of Tarquinius, and murdered. Tullia drove to the senate-house, and greeted her husband as king; but her joy struck even him with horror. He bade her go home; and as

she was returning, her charioteer pulled up and pointed out the corpse of her father. She commanded him to drive on; the blood of her father spurted over the carriage and on her dress; and from that day forward the street bore the name of the Vicus Sceleratus, or Wicked Street. Servius had reigned 44 years.

Tullow, prin. tn of the E. of the co. of Carlow, Rep. of Ireland, on the R. Slaney. The Father John Murphy memorial statue stands in the mkt square. Pop. 1700.

Tulsa, second largest tn of Oklahoma, U.S.A., and co. seat of T. co. on the Arkansas R. It was founded by the Creeks, who named it after their former Alabama cap., Tallasi. Its great oil boom began on 25 June 1901, when oil was struck by prospectors from Pennsylvania. It also produces iron, steel, and brass products, glass, aircraft, automobile parts, furniture, chemicals, textiles, plastics, paint, bricks, tiles, clothing, and packed meat and other food products. T. is the seat of the Univ. of T. and the Spartan College of Aeronautical Engineering. Pop. 182,470.

Tulsi Das (1532-1623), Brahmin poet and religious reformer. He is said to have been abandoned by his parents as an infant and to have been picked up by a wandering sadhu, from whom he learned the story of the *Rāmāyana*. After his marriage he became an ascetic himself and lived at Ayodhya, where legend has it that Rama told him, in a dream, to write the story of the *Rāmāyana* in the language of the common people. His version of the *Rāmāyana*, 'Ram-charit-manas', was the first of his great works, and it estab. him as the greatest poet in Hindi literature and the one who has brought the epic story to the masses. Without professing to do so, he has thus exerted a deep and lasting influence on the Hindu masses, especially in N. India. A trans. of his *Ram-charit-manas* has been made by F. S. Growse, 1935.

Tumaco, tn and port of Colombia, standing on an is. near the entrance to T. Bay almost at the most southerly part of the W. coast. Being less than 2° N. of the Equator it has a hot, unhealthy climate. It is in steamship communication with Buenaventura (170 sea m.) and Panama, and exports cacao, tobacco, and tagua. Gold is mined inland. The old wooden tn was largely destroyed by fire in 1947, but has been rebuilt. Pop. 35,000.

Tumbes: 1. Prov. of N. Peru, lying between the S. shore of the Gulf of Guayaquil and the Cerros de Amotane, bordering on Ecuador. It has an area of 1580 sq. m.; pop. 31,550.

2. Cap. of the above, is situated on the R. Tumbes, 70 m. NW. of Loja. Tobacco-growing and charcoal-burning are carried on. Pizarro is said to have landed here for his invasion of Peru. T. is the point from which the Pan-Am. Highway begins. Pop. 8000.

Tumbrel, or Tumbrel, ducking-stool used to punish scolding women in olden times. It consisted of a stool or chair at the end

of a long pole, which could be swung over a pond and lowered. It was also used to punish transgressing bakers and brewers. The same name was applied to carts constructed with a tipping body, especially dung-carts, to the covered carts for tools, etc., in a train of artillery, and also to the execution carts used in the Fr. Revolution.

Tummel, riv. and loch in Perthshire, Scotland. From the E. end of Loch Rannoch, the R. T. broadens into Loch T., $\frac{1}{2}$ m. wide and 7 m. long. $1\frac{1}{2}$ m. E. of the loch are the picturesque T. Falls, where the riv. joins the Tay, 7 m. NNW. of Dunkeld, the Garry having joined it at the falls. In 1945 a plan was made to divert and impound the Rts. Garry and T., Errochty Water, Bruar Water, and Loch T. to produce hydro-electric power.

Tumour, swelling, more particularly a new growth that is not the result of inflammation. The term was originally applied to any enlarged condition of a structure, but scientifically, a T. is a mass of cells, resembling those normally present, but differently arranged, and proliferating at the expense of the organism without serving any useful purpose. The cells of typical T.s resemble those of the parent mass of cells; those of atypical T.s may be so modified that it is difficult to trace their origin. The cause of such proliferation is not yet known: little can be said beyond the hypothesis that the normal processes of cell growth are disturbed by local conditions not occasioned by bacterial invasion or any extrinsic influences. T.s are broadly classified into *non-malignant*, *innocent*, or *benign*, and *malignant* or *cancerous*. The essential characteristics of non-malignant T.s are that they grow and divide without destroying or invading the surrounding cells which are simply pushed aside as the mass of the T. grows. A thin layer of fibrous tissue forms a definite boundary to the extent of the T., and if the growth be excised completely no recurrence can take place. Malignant T.s, on the other hand, tend to invade the surrounding tissues. There is no definite boundary, and the cells infiltrate into neighbouring tissues and replace the normal cells. Cancer (q.v.) cells may also be disseminated by means of the lymph channels to other parts of the body, giving rise to secondary or metastatic T.s. When the original T. has been excised there is great probability of the growth recurring, and it is difficult to say at any time how far its influence has extended. Powell White classified T.s. as organomata, histiomata, and cytomata, according to whether they consist of organs, tissues, or cells. These groups are subdivided into connective-tissue T.s and epithelial T.s, and still further as fibromata, myomata, osteomata, chondromata, etc., according to the nature of the structures involved. Adami has introduced a classification based on the embryological development of the cells. See also CANCER.

Tumult, see RIOT.

Tumulus (from Latin *tumere*, to swell), an ant. grave-mound. See BARROWS.

Tun (weight), see METROLOGY.

Tunbridge, see TONBRIDGE.

Tunbridge Wells, royal municipal bor. and health resort of Kent, England, 5 m. S. of Tonbridge (after which it is named) and 35 m. from London. Its mild chalybeate springs, discovered in 1606 by Lord North, made it a popular resort in the 17th and 18th cents. Places of interest are the covered promenade called The Pantiles, at the end of which are the springs; and the par. church of King Charles the Martyr. Since 1909 the tn has been entitled to incorporate the word 'Royal' in its title. The tn was also famed for its local industry of Tunbridge Ware (wood-mosaic). A co. cricket week is held here, and there are golf links and other games facilities. T. W. sands is the name given to a subdiv. of the Wealden Beds of the S. of England, varying in thickness from 150 to 400 ft. Pop. 38,397. See Margaret Barton, *Tunbridge Wells*, 1937; J. C. M. Given, *Royal Tunbridge Wells—Past and Present*, 1946.

Tundra, term applied to a geographical region in N. Russia and Siberia, but now generic for all such regions, e.g. the barren lands of Canada. Primarily, it is a region which by reason of high lat. and consequent inclement climate is almost destitute of trees. The soil is completely frozen, except for a depth of a ft or two during summer, at which season the surface water forms pools, lakes, and marshes, the formation of which has been largely determined in the larger features by the ice cap extending over it during the glacial age. The vegetation is stunted and scanty, consisting of mosses, lichens, dwarf birch, and willow, and an 'Alpine' flora. Except for the reindeer or caribou and musk-ox, the fauna consists of small furred animals, whose skins are sought by hunters and trappers.

Tung (or Chinese Wood) Oil is obtained from the nut kernel of 2 trees, *Alcurites Fordii* and *Montana*, indigenous to SE. China, Indo-China, and the Shan States of Burma, and now cultivated in many parts of the world, notably the Fordii variety in the U.S.A., Argentina, Paraguay, and Brazil. The Montana variety has also been widely planted in Nyasaland. Oil content of the kernels is: Fordii, 40–58 per cent; Montana, 51–67 per cent. China is the prin. source of T. O., where production is by expression by primitive methods from fruit gathered from wild trees. In the U.S.A. and S. America the kernels are dried, crushed, and pressed without cooking, chiefly in continuous screw presses or 'expellers' to produce oil of very high quality. T. O. is generally pale yellow in colour, but also appears on the market in various grades ranging from clear or 'white' for best quality to yellow, red and black, etc., for the lower grades; it has a characteristic odour and is thick and viscous. Like linseed oil, it is used almost exclusively in the manuf. of paints, varnishes, proofed fabrics, etc. It is unique among drying oils in containing a very high percentage of alpha-elaeostearic acid, a conjugated

triene acid, which makes the oil polymerise very rapidly by autoxidation or when subjected to heat. The Montana variety contains less than Fordii, and is less valuable commercially. If used as the sole drying oil in a paint it forms a wrinkled film, due to its high rate of drying and peculiarities of volume change; consequently it is used mainly in conjunction with other oils, usually linseed oil, and is cooked with soya-bean and other semi-drying oils to improve their drying properties. When heated either alone or in the presence of phenolic resins varnishes are produced that give clear films on drying. They are still somewhat sensitive to an impure atmosphere, however, giving wrinkled films—a phenomenon known as 'gas checking'. The formation of a wrinkled film on drying is sometimes made use of in the production of paints to give a 'crinkle' or 'crackle' finish. Component fatty acids of the oil are—saturated: total 3-7 per cent; unsaturated: oleic 1-16 per cent; elaeostearic 75-85 per cent. The press cake is poisonous, and is only used as a manure.

Tungshan, see HSUCHOW.

Tungsten, symbol W, atomic number 74, atomic weight 184, a metallic element which occurs in nature as wolframite (iron tungstate), scheelite (lead tungstate), and wolfram ochre (T. trioxide). The metal can be obtained by reducing the trioxide on charcoal with hydrogen. It is a hard grey metal (melting point about 3390° C., sp. gr. 19.3). It forms 3 oxides: WO_3 , basic and a reducing agent; W_2O_5 , blue in colour; and yellow WO_2 , which gives rise to the tungstates when treated with alkalis. Tungstic acid, H_2WO_4 , is made by the action of acids on tungstates. The chlorides of the element are decomposed by water. T. is used largely for electric-lamp and thermionic-valve filaments. These filaments may be made: (a) by drawing tungsten rods at 2000° C.; (b) by compression of a mixture of T. powder and an organic compound, carbonising, heating, and then shaping into the required form; (c) by heating a carbon filament in the vapour of T. oxychloride and hydrogen, when T. deposits on the carbon centre. Compounds of T. are also used for making ceramic glazes, and fire-proofing.

Alloys. T. alloys well with aluminium and with chromium. Well-known steels containing T. are characterised by being very strong and hard, and not losing the 'temper' when heated. They are especially valuable for high-speed cutting tools. Such steels contain T. 15-20 per cent.

Tungurahua. 1. Prov. of central Ecuador, crossed by the E. Cordillera of the Andes, bordered by the provs. of Chimborazo, Bolívar, León, and Oriente. The cap. is Ambata. Area 1685 sq. m.; pop. 204,620.

2. Active volcano of Ecuador, in the S. of T. prov. It rises to 16,700 ft among the Andes (q.v.). In Aug. 1949 the volcano erupted and the prov. was severely shaken by an earthquake, which

struck the tns of Ambato, Guano, Pelileo, Patate, and Pillare.

Tungus (or **T.-Manchu**) **Languages**, group of related languages spoken in E. Asia. They include those of the Evenki (q.v.), a number of small peoples in the Russian Far E., and the Manchurians. T. L. belong, together with the Turkic and Mongol languages, to the Altaic family. See URAL-ALTAIC LANGUAGES.

Tunhuang, see CAVES OF A THOUSAND BUDDHAS.

Tunic (Lat. *tunica*, corresponding to the Gk *chiton*), a long, white shirt-like garment with short sleeves, worn by the ancient Romans; in female attire it reached to the ankles, but for men it was somewhat shorter. Over it men wore the *toga* (q.v.) on formal occasions, and women the *palla*. The ornamented *tunica palmata* was worn by the gen. at his triumph. Senators wore the *tunica laticlava*, with a double purple stripe down the front; the *tunica angusticlava* of knights was similar, but had single narrow stripes, and came into common use. The word T. is now applied to any tight-fitting jacket, particularly to that of the military uniform.

Tunica, co. of Mississippi, U.S.A. Its Negro pop. is 85½ per cent of the whole, the highest of any co. in the U.S.A. Pop. 21,700.

Tunicata, class of protochordate animals consisting of about 700 species, all of which are marine. At some stage in their life, gill slits are developed and the larvae usually have a tail supported by a notochord. The class consists of the Aspidiacea, sea-squirts; Larvacea, appendicularians; and the Thaliacea. The ascidians are sessile creatures, attached to rocks, weeds, etc., with a pharynx divided by gill-clefs which open into an atrium with an upper exhalant aperture. There is a free-swimming, tailed, larval (tadpole) stage. The Larvacea are tailed, pelagic tunicates which live in a remarkable house fitted with an elaborate filtering mechanism for straining off very small planktonic organisms which are their food. The Thaliacea are also pelagic and are divided into the Pyrosomada, Dolioidea, and Solpida. The Pyrosomada are colonial tunicates with the zooids embedded in a hollow, gelatinous tube closed at one end. The tubes vary in length from an inch or so to sev. ft. The colonies are highly phosphorescent. The dolioids and salps are transparent, gelatinous, cylindrical, or barrel-shaped tunicates with a branchial and an atrial chamber. They swim by means of the contractions of muscle bands which encircle the body and which force out jets of water. See also LARVACEA, ASCIDIACEA, and PYROSOMA.

Tunicle (Lat. *tunicella*), less ornate form of the dalmatic (*tunica dalmatica*) (q.v.), worn by sub-deacons as a liturgical vestment over the alb.

Tuning-fork, small instrument in the form of a fork with 2 long prongs invented in 1711 by John Shore. It not only retains pitch very accurately, but gives out a very pure sound free from harmonic

upper partials. It is often tuned to A above middle C which is used by orchestras as their fundamental tuning-note.

TUNING FORK

Tunis, cap. of Tunisia, stands on a bay of the same name, surrounded by lakes and marshes, 10 m. from the sea, and 275 m. NW. of Tripoli. Its port is Goletta, but a channel opened in 1893 has made

D. McLeish

TUNIS

The 11th-century mosque of El Ksar

T. directly accessible to ocean vessels. T. is a walled tn, and its harbour is well defended. In the centre of the old tn is the Medina, the focus of trade and industry, built mainly from the ruins of the tns of Thunes, Carthage, and Utica. The

new tn is European and E. of the Medina, and is rather unhealthily situated. Velvets, silks, linen, and fez caps are manufactured. There are many mosques, with a Mohammedan univ. in the Great Mosque, and the houses are nearly all built of stone. Pop. (1946): Muslim, 189,393; Jews, 34,193; French, 66,422; Italians, 46,629; Maltese, 4312; others, 23,644. Total 364,593.

Tunisia, Republic of, in N. Africa, lies on the Mediterranean Sea between Algeria on the W. and Tripoli on the E., with an area of 48,253 sq. in., including that portion of the Sahara lying E. of the Beled Djerid, extending towards Gadamès. The pop. is estimated as follows: 239,549 Europeans (exclusive of armed forces), divided between 143,977 French, 84,935 Italians, 6459 Maltese, and 4178 others: 2,903,949 natives, comprising 2,832,978 Arabs and 70,971 Bedouins. As no census has been taken since 1946, natural increase as well as political factors require these figures to be treated with reserve. The surface is mountainous in the interior. The region in the neighbourhood of the Mediterranean coast is fairly well watered and fertile, but towards the central table-land, bordering on the Sahara, the soil is very poor, and the dry climate makes cultivation difficult. The climate is continental. The greater part of T. is useless for agriculture, but the rest is fertile and the natives are hard-working. The chief industry is agriculture, the prin. products being wheat, barley, oats, maize, sorghum, chick-peas, potatoes, dates, almonds, oranges, lemons, shaddock, alfalfa grass, cork, pistachios, and henna. Much wine is made, and olive oil is produced. Though the native wool is of an inferior quality, the Algerian sheep have been acclimatised. The breed of horses is steadily improving, and pigs are profitable. The mineral resources are being developed, and lead ore, zinc ore, phosphates, the output of which increases yearly, and iron are worked. Lignite and particularly manganese mines are developing rapidly, and bronze is manuf. Phosphates and marble are also worked. The chief ports are Tunis, Sfax, and Bizerta, while there is good harbourage at Gabès and Susa. The native industries include spinning and weaving wool for garments, leather embroidery, saddlery, pottery, slipper making, and matting. The fisheries (tunny, sardines, anchovies) are also important, being mainly in the hands of the Tunisians, Greeks, Maltese, and Italians. T.'s import and export trade is done largely with France. France took 60 per cent of all Tunisian exports in 1954, and 70 per cent of total imports were from France. A customs union with France was signed in 1955. The official language is Arabic. The chief tns are Tunis, Bizerta, Sfax, Sousse, Kairouan, and Gabès (qq.v.).

History. (For the beginnings of Tunisian hist. see CARTHAGE; PHOENICIA.) Modern T. is roughly co-extensive with the Rom prov. of Africa as first constituted after the third Punic War. This prov. was created c. 146 BC; it was

bounded on the W. by Numidia, on the N. and E. by the Mediterranean, and on the S. (approximately) by the 35th parallel. It was extremely fertile, and soon became one of the prin. sources of the Rom. corn supply. There were many flourishing towns, of which the chief were Utica, Hadrumetum, and Thapsus. The old Punic language was retained by the native pop., but in other respects the prov. was quickly Romanised. Between the date of its foundation and the reign of Septimius Severus (AD 193-211) its boundaries varied considerably from time to time. Together with most of Rom. Africa it was overrun by the Vandals in 439, but became part of the Byzantine Empire when recaptured by Belisarius (q.v.) in 533-4. It was lost in the next cent. to the Arabs, who completed their conquest in 698 after repeated attacks over 50 years. Latin and Christian civilisation was soon displaced by that of Islam. In the early history of Latin Christianity the prov. was more important than Italy (see AUGUSTINE; CYPRIAN; TERTULLIAN).

For the next 900 years T. was ruled in effect by the Berbers of the hinterland (who had never been christianised and who were early converted to Islam) nominally under the Arabs. The Fatimite (q.v.) dynasty of Arabs extended their rule along the whole of N. Africa from 909 to 1171. In the mid-11th cent. a quarrel between the Berber ruling house in T. with the Fatimites, resulted in the latter letting loose upon N. Africa a great horde of Bedouins, whose violent and predatory habits became endemic in the area for hundreds of years. There was an interregnum of Norman rule from 1148 to 1160, when the Almohade Arabian dynasty, successors of the Fatimites, drove out the Normans, to be succeeded in 1336 by the Hafside, a Berber, dynasty. The spread of Turkish power brought the dynasty to an end in 1575, and descendants of a 17th cent. Turkish ruler remained beys of T. until it became a rep. Intermittent hostility with Algeria marked the rule of the beys, and moreover, T. became a pirate state, deriving most of its public revenue from depredations upon shipping in the Mediterranean. The cessation of piracy early in the 19th cent. had a profound effect upon the economy, and governmental inadequacy was such that only a mere fraction of fertile land was under cultivation.

Meanwhile T. had become a centre of European interests and rivalries: Italy had been sending colonists, the French were interested because it lay next to Algeria, and there was the possibility of a Brit. protectorate when the bey turned to Great Britain in the 1870s. The country had gone bankrupt in 1869, and a triple control—Brit., It., and Fr.—was set up over the finances. The It. purchase of the Brit. railway line exacerbated Franco-It. rivalry, and under the pretext of punishing certain tribes the French, by military action begun in 1881, forced the bey to recognise a Fr. protectorate which was formally estab. in 1883. The ad-

ministration was reformed; but throughout the hist. of the protectorate the French have had to deal with nationalist movements. T. was an important theatre of operations in the Second World War (see NORTH AFRICA, SECOND WORLD WAR, CAMPAIGNS IN). In the confused period following the Allied victory in N. Africa the French deposed the bey, whom they accused, without proof, of collaboration with the Axis powers, and placed a member of his family on the throne. Nationalist agitation was resumed. In Mar. 1956 France recognised the independence of T. by protocol. Following a general election, a Constituent Assembly met for the first time on 18 April, and elected as president and Prime Minister Habib Bourguiba, leader of the nationalist Neo-Dastur party. T. was proclaimed a rep. on 25 July 1957, and Bourguiba became head of state with the title of President, thus bringing to an end the Husseinite dynasty, which had reigned since the beginning of the 18th cent. In the early months of 1958 tension considerably increased between T. and the Fr. military command in Algeria, following on the bombing of the Tunisian vil. of Sakiet in Feb.

Monmarché, *Algérie-Tunisie*, 1927; W. B. Worsfold, *France in Tunis and Algeria*, 1930; A. Viollet, *Notre Tunisie*, 1939; L. Laitman, *Tunisia Today*, 1954.

Tunja, tn. of Colombia, cap. of the dept of Boyacá about 100 m. NE. of Bogotá at an altitude of 2525 ft above sea-level. It is one of the oldest Sp. tns of the New World and contains some buildings of colonial days of which the 17th-cent. church of Santo Domingo is a fine example. It is connected by rail and road with Bogotá and is an agric. and mining community. Pop. 27,380.

Tunkers, see DUNKERS.

Tunnelling. The technique of T. in rock has advanced considerably during the last few decades, particularly in methods of blasting, debris loading, and lining. The difficulties naturally increase with the size, length, and depth of tunnel, but with the mechanical appliances now available no serious limitations are imposed. Granite or other hard rock presents little difficulty to modern power drills. The old method of hand drilling is now almost entirely superseded by power drilling in all tunnels of any appreciable length.

An important preliminary operation is the survey work. The centre-line of the tunnel is ranged out on the surface and a series of shafts are sunk, from 100 to 300 yds apart along the line. To transfer this line underground, 2 marks are made in the cross-timbers, in the centre-line, at the bottom of each shaft and prolonged in both directions when the tunnel is being opened out. When the tunnels are of great length, such as those of the Alps, and can only be driven from the ends,

the setting out is much more difficult. In this case the centre-line is determined by a triangulation survey, and ranged out from marked bases.

Small-section tunnels are usually driven from one end to the other at their full dimensions. Large-section tunnels are often driven in 2 stages: a pilot heading is excavated in advance which is afterwards enlarged to the full section of the main tunnel.

The normal procedure in T. in rock is as follows. Power drills are used to bore successive rounds of holes in the face. Each round is fired and the broken rock removed by hand shovels or mechanical loaders. The section is trimmed to its proper size by further blasting or by pneumatic picks, and timber or steel supports erected. Sometimes side and top lagging boards are required. In loose ground the top laggings are driven in advance of the last supporting set (fore-polling) before the debris is removed. In sand or gravel the problem is one of support rather than excavation, and fore-polling is necessary. The poling pieces are driven along the sides and top of the tunnel to protect the men from sudden falls or 'runs' of ground.

T. in heavily watered rocks or clay is sometimes done with the Greathead shield. This consists of a ring of steel which is forced forward by hydraulic rams, the piston heads bearing against the cast-iron lining previously set behind. Gravel and sand are usually drained before excavation. The cementation process has been employed successfully for dealing with water from rock fissures. The process consists in injecting liquid cement, at high pressure, through advance boreholes into the water-bearing fissures. The holes radiate outwards so as to intersect fissures on the outside of the tunnel area. After the cement has set and the water been sealed off the tunnel is excavated and lined in the ordinary way. A second length is then cemented, excavated, lined, and so on until the water-bearing deposit has been passed.

In hard rock blasting is necessary to break down the material. The blasting holes are usually from 6 to 8 ft long, but in some recent tunnels, 14-ft and 15-ft lengths have been adopted. The explosive often used is 60 per cent low-freezing gelatine and sometimes stronger up to 80 per cent. Liquid air or liquid oxygen has been used as an explosive, and has the advantage of leaving no blasting fumes. The recently introduced *delay action firing* for T. work, possesses many advantages over ordinary electric firing. The various shots in the tunnel face, constituting the complete round, explode either instantaneously or with a time lag of 2, 3, or 4 sec. according to their position in the rock face. Delay-action firing produces a large heap of well-broken rock which can be efficiently dealt with by power loaders. Ventilation is provided by means of a 15-, 18-, or 20-in. forcing fan delivering through air tubes to the tunnel face. The vol. of ventilation required depends upon the length

and size of tunnel and the presence of harmful gases or fumes. The problem of dust suppression is also given close attention on account of the danger of lung ailments, such as silicosis. Wet boring is done in practically all dry tunnels and the broken rock is copiously sprayed during loading.

Rings of reinforced concrete are gradually superseding cast-iron rings as tunnel supports. The concrete segments are bolted together as with cast-iron segments, but the former possess the advantage of being lighter.

In rock T., the average advance ranges from 4 to 8 ft per cut or blasting round and from 25 to 100 ft drive per working face per week, though these rates have in cases been much exceeded. The Florence Lake tunnel (15 ft diameter), California, constructed in 1920, is 13 m. long; there were 6 working faces, the blasting holes were 18 ft long; the average travel at each face was 125 ft a week, so the total travel was 750 ft a week or nearly 7 m. a year. Among recent Brit. tunnels, that of the Lochaber power scheme, completed in 1930, was 15 m. in length. It was excavated through igneous rock from 22 working faces, and the maximum weekly advance at any face was 91 ft. The Mersey tunnel is one of the largest underwater roads for traffic in the world. It was commenced in Dec. 1925 and completed in 1934.

The Channel Tunnel Scheme, see CHANNEL TUNNEL.

See R. W. Richardson and R. S. Mayo, *Practical Tunnel Driving*, 1901; W. T. Halcrow, *A Century of Tunnelling* (Thomas Hawksley Lecture), Inst. Mech. Engineers, 1942.

Tunney, 'Gene' (real name, **James Joseph**), (1897-). Amer. boxer. At Philadelphia, 23 Sept. 1926, in view of the largest crowd ever gathered at a boxing contest, he defeated Dempsey, holder of the world-championship, in ten rounds. He defeated Dempsey again, not so decisively, at Chicago in 1927. In 1928 he defeated Heeney at New York, married, and retired from the ring.

Tunny (*Thunnus thynnus*), large teleostean fish of the family Scombridae, allied to the mackerel. It is abundant in the Mediterranean, where its fishery has been an industry since ancient times, and is also found in the Indian, Pacific, and Atlantic oceans. It attains a length of 12 ft and a weight of 1500 lb., and T.-fishing is a popular, but expensive, sport. T. is used for food.

Tunstall, Cuthbert (1474-1559), Eng. bishop and scholar. He studied at Oxford, Cambridge, and Padua. He held sev. livings, was Master of the Rolls, dean of Salisbury, Bishop of London (1522), then of Durham (1530), and keeper of the Privy Seal (1523). He was employed by Wolsey and Henry VIII on various diplomatic missions abroad, and was a friend of Erasmus. T. was a traditionalist in religious matters and although he accepted Henry VIII as head of the Church in England, he was opposed to the eccles. changes under Edward VI.

He was imprisoned and later deprived of his see. This was restored to him under Mary, but he refused to take the oath of supremacy to Elizabeth, and was deprived again, 1559. He wrote numerous religious works.

Tunstall, formerly tn of Staffordshire, England, $\frac{3}{4}$ m. from Newcastle under Lyme, and now joined to the co. bor. of Stoke-on-Trent (q.v.) since 1910, with important manufs. of pottery and china.

Tupi-Guarani, 2 important tribes of S. Amer. aborigines, extending from the Amazon to the Lower Paraguay and the Peruvian Andes. At one time there were numerous Jesuit missions, especially among the Guarani. A corruption of the Tupi language is spoken as the trade medium in the Amazon region. The Tupian tribes surpassed the other Brazilian aborigines in culture and civilisation. The Indians of Paraguay belong to the linguistic family of the T.-G., which is believed to have originated in the basin of the Paraguay and to have spread from the centre over much of S. America E. of the Andes. The Guarani make up most of the coastal people of Brazil to-day; and even well in the interior of the Amazon country tribes speaking this same language are to be found. The Guarani language is still the popular language of Paraguay, and many of the place-names of this part of S. America, including S. Brazil, are Tupi or Guarani words. See P. E. James, *Latin America*, 1950. See also GUARANI.

Tupper, Sir Charles (1821-1915), Canadian statesman, b. Amherst, Nova Scotia. He studied medicine at Edinburgh and practised in his native tn. He was premier of Nova Scotia in 1864-7, and in that role played a leading part in bringing his prov. into the confederation. Bad feeling between him and Joseph Howe drove the latter into opposition to confederation. But T., as a member of Macdonald's first dominion Cabinet, drew the sting from Nova Scotia's secession by persuading Howe to join the dominion gov. T. was minister of revenue and then of customs, 1872-3, and minister of public works in 1878. He was sent to London, 1884, as 'Canadian High Commissioner,' but was treated more like a colonial agent. In 1896 he became Prime Minister of Canada, succeeding Sir Mackenzie Bowell, holding that office for 6 months. He pub. *Recollections of Sixty Years*, 1914. See life by E. M. Saunders, 1916.

Tupper, Martin Farquhar (1810-89), versifier, b. London. Educ. at Charterhouse and Oxford, he studied law but turned to writing. His *Proverbial Philosophy*, 1838, had a great vogue, especially in America, where a million copies were sold. It is a collection of commonplace observations put in rhythmical form, and has long since lost its undeserved popularity. T. wrote some 40 works, including a biography, *My Life as an Author*, 1886. See studies by R. Buchman, 1941, and D. Hudson, 1948.

Tura, Russian settlement in the Krasnoyarsk Kray of Siberia, on the

Lower Tunguska R., cap. of the Evenki (q.v.) Nat. Dist. Pop. (1956) 2000.

Turanian, *Tūrān*, Iranian term, was the name given by the Persians to the region situated to the N. of Amu-Darya (Oxus), roughly corresponding with modern Turkestan, which means 'the country of the Turks.' Medieval Arab geographers from the 11th cent. onwards used the name Tūrān to indicate the region of contemporary Turkestan and its inhab.; in much later cents. the same term was employed by Europeans not only for Turkestan, but also for all Central Asia. In the 19th cent., the term 'Turanian' as an ethnical and philological term, was applied to the Turks and Mongolians, and their languages, as well as to Scythians, Huns, Avars, Finns, Estonians, Hungarians, and Bulgarians, and others. Thus, roughly speaking, the term 'Turanian languages' became synonymous with the Ural-Altaic (see URAL-ALTAIC LINGUISTIC FAMILY), consisting of the Finno-Ugrian and the Altaic linguistic sub-families (see LINGUISTIC FAMILIES). The term 'Turanian' is now obsolete.

Turba, see TARBES; TEHUEL.

Turban, head-dress of males of Muslim races, of very ant. origin, consisting of long pieces of fine linen, muslin, taffeta, or silk, coiled and twisted round the head, a fez (q.v.) or tarbush sometimes forming the foundation. It is worn by all classes and varies in size and material according to the occupation, rank, or country of the wearer.

Turbary. In law, *common of Turbary* is the right which a tenant enjoys of digging turf from the waste lands of a manor (see COMMON, RIGHT OF).

Turbellaria, see PLATYHELMINTHES.

Turberville or Turberville, George (c. 1540-1610), poet, b. Whitechurch, Dorset. Educ. at Winchester and Oxford, he became secretary to Thomas Randolph, ambas. to Russia. In 1567 he pub. *Epitaphes, Epigrams, Songs and Sonets*. He also wrote *The Booke of Faulconrie* and *The Noble Art of Venerie*, 1575, and was one of the first to use blank verse.

Turbine, Gas see JET PROPULSION AERO-ENGINES.

Turbines, Hydraulic, see HYDRO-ELECTRIC POWER.

Turbines, Steam. The turbine differs fundamentally from the reciprocating engine both in thermodynamical and mechanical action. In the reciprocating engine it is the pressure of the steam that constitutes the main driving force on the piston in the cylinders, and the steam leaves the cylinder at atmospheric or condenser pressure. The fact that in the expansive engine the steam is allowed to expand towards the end of the stroke does not invalidate the statement. In the turbine the steam expands in the nozzle before reaching the moving part, the blades, and part of the total heat content, or enthalpy, is converted into kinetic energy, i.e. the steam acquires velocity and streams at high speed into the blades, where it is deflected by the shape of the blade, thus suffering a change in momentum, equivalent to an impulse imparted

to the blade, which is the driving force. Sometimes a further expansion takes place in the blade (see below *Impulse-Reaction Turbines*). In the reciprocating engine, again, the pressure acting alternately on one side or the other of the piston generates a linear to-and-fro motion which has to be transformed into rotation, for driving a machine, by connecting-rod and crank pin, and the pull or push of the connecting-rod does not produce a uniform torque (turning momentum) on the shaft; a flywheel is necessary for carrying the rotation over the dead points and for smoothing the motion. Moreover, complicated valve-gear is required for directing the flow of steam alternately to one end or other of the cylinder. In the turbine, steam is admitted at a uniform rate to the blades fixed on the rotor, and a very smooth rotary motion is immediately produced. No flywheel is required, and the consequent reduction in weight of the complete engine is important in all applications; the absence of reciprocating motion is another factor making for lighter foundation work.

THEORY. Let the total heat (enthalpy) of 1 lb. of steam entering the nozzle be J_1 , lb. ft, where J is Joule's equivalent (778.3 in recent steam tables). If the steam expands, with loss of heat to a value I_1 , on leaving the nozzle, the heat converted into kinetic energy is $J(I_1 - I_2)$ lb. ft. If the initial velocity of the steam is negligible in comparison with the final velocity v , which is usually the case, the kinetic energy generated is $\frac{1}{2}mv^2 = J(I_1 - I_2)$

and the steam velocity is

$v = \sqrt{2gJ(I_1 - I_2)}$. If the pressure and temperature of the steam is known, the

deflection in the blade determines the blade speed (Fig. 1). The latter therefore depends on nozzle and blade design, and the most efficient blade speed is a certain fraction of the steam velocity, whose value varies for different types of turbine. When the initial and final pressure and the temperature of the steam are known, the work done by the turbine per lb. of steam can be calculated, assuming adiabatic expansion, and, evaluating the external heat applied to generate the steam, the theoretical thermal efficiency can be found. For these calculations the Mollier diagram is convenient, though use of the steam-table numerical data gives a more accurate result.

FIG. 2. IMPULSE TURBINES

FIG. 1. TURBINE BLADING

A, impulse; B, impulse-reaction.

velocity can be calculated from data given in steam tables or from the Mollier entropy-enthalpy diagram. In a simple impulse turbine the velocity works out at about 3500 ft/sec. Now the steam does not flow out of the nozzle tangentially to the rotor periphery, but at an angle to the tangent, and the impulse due to de-

Impulse Turbines. In the simple impulse turbine there is one set of nozzles fixed on the inner surface of the cylinder or casing, and one rotor carrying a single row of blades as shown in the left half of the developed diagram (Fig. 2). The nozzles usually converge into a throat from which they widen out to the exit. The steam pressure falls in the nozzle to exhaust pressure, the steam enters the blade at high speed, is deflected, and thereby gives an impulse to the blade, issuing with a 'leaving' velocity which is about $\frac{1}{2}$ of the initial value. This represents a loss of energy of 11 per cent, the energy being proportional to (velocity)². The loss can be partly recovered by passing the leaving steam through a set of redirecting fixed blades (Fig. 2) into a second row of blades on the rotor, which is then commonly known as a 2-row wheel. The 'leaving loss' may thus be reduced to 2 per cent. Sometimes a 3-row wheel is used with 2 sets of guide vanes, but the 2-row wheel is more efficient. The simple impulse turbine (de Laval) has a very high speed, up to 30,000 r.p.m., and is usually employed with reduction gearing. The most efficient blade velocity is about $\frac{1}{2}$ the steam velocity, but as the expansion takes

place in one set of nozzles, the steam velocity is very high, about 3500 ft/sec. and the max. practicable blade speed is about 1400 ft/sec. The 2-row velocity compounded (Curtis) turbine is also a high-speed engine, but its efficiency is higher than that of the simple turbine. The most efficient blade speed is about $\frac{1}{2}$ of the steam velocity. Velocity-compounding is often incorporated in other types of turbine. In the pressure-compounded impulse turbine the expansion of the steam is divided between a number of 'stages,' sets of nozzles, or diaphragms, interposed between blade-carrying rotors. In this way the steam velocity is considerably reduced. The pressures of steam on the 2 sides of a diaphragm being different, there is a certain leakage loss. The Parsons and Marine Engineering Turbine Research and Development Association (Pametrad) has recently (1955) developed an impulse turbine using steam at much higher temperature and pressure in a single stage. This has made possible a 30 per cent reduction in weight, a 15 per cent increase in fuel efficiency, and a 15 per cent cut in cost. The weight of gearing is halved.

Impulse-Reaction Turbines. The pure-reaction turbine in which steam expands wholly in the moving element and issues at high speed from a nozzle, thereby imparting a recoil velocity to the nozzle, has never passed the experimental stage. The impulse-reaction turbine is often incorrectly called a reaction turbine. In the impulse-reaction (Parsons) turbine the nozzles are replaced by fixed blades similar in shape to the moving blades and equal in number (Fig. 3). Steam is

FIG. 3

FIG. 3. IMPULSE-REACTION TURBINE

admitted all round the circumference of the cylinder. The steam expands as usual in the fixed blades and enters the moving blades at high velocity, being deflected and giving an impulse to the blades; but a further expansion takes place in the moving blades, and the velocity thus generated imparts a recoil or reaction to the blades, and the driving force is the vector sum or resultant of the impulse and reaction components. Steam velocity is moderate and blade velocity is nearly equal to steam velocity. Owing to the pressure differences throughout the successive rows of fixed and moving blades, there is some leakage loss, especially at the high-pressure stages, and blade edges should be sharp and well-fitted.

Double-motion Turbines. In the Ljungström turbine the blades are arranged in concentric rows and fixed on separate disks. Instead of the first, third, etc.,

row being fixed, they are allowed to rotate in the opposite sense to even rows; the steam velocity may thus be doubled without any excessive speed being required by the blades to ensure high efficiency, since the relative velocity of one set of blades with respect to the other set is twice its absolute velocity.

Reheating. As steam expands through a turbine it first loses superheat, and then becomes wet. A small degree of wetness in the last few stages is unimportant, as the water has no time to separate out before it reaches the condenser. With a high degree of wetness, however, the unyielding drops of water strike the entering edges of the blades at a high relative velocity, and rapidly wear them away (erosion). Using steam at low or normal pressures, condensation can be reduced by adopting very high superheat temps.; but the materials employed in superheater and turbine construction, which rapidly lose strength above 500° C. (dull red heat), put a limit to this. With high pressure (500–1500 lb/sq. in.), even steam at red heat will not prevent condensation, and in sev. large modern turbines, therefore, steam is withdrawn after partial expansion and reheated in a resuperheater (combined with the boiler or separately fired) before being returned to the turbine. This eliminates condensation, and so enables high-pressure steam to be used. For reheating, multi-cylinder turbines are usual, the steam being reheated between the h.p. and l.p. cylinders.

Sources of Loss. (1) Friction. Steam passing through the blading and nozzles of a turbine at high speed is retarded by friction, and the full theoretical velocity is not obtained. To minimise this loss, modern turbines have a large number of stages, and small steam velocities in each stage. Blades are made of stainless steel and finished smooth; any pitting or corrosion in service greatly increases frictional losses. (2) Eddies are set up at the blades if the entering edges are eroded, or if the steam strikes them at a slightly wrong velocity or angle. This may occur if the boiler is not giving its full superheat temp. so that the calculated heat drop is not obtained; or, in the final stages, if the condenser circulating water is colder than usual (perhaps due to a frost). Eddies are so much wasted energy, as the steam velocity in them is dissipated in friction. Both friction and eddies make the steam slightly hotter and drier at each stage than it theoretically should be (friction being a transformation of mechanical energy into heat), and condensation in the turbine is thereby delayed. (3) Leakage of steam past the blade tips occurs only in reaction turbines (q.v.), and depends on how small the clearances between fixed and moving blades can be made; it can never be entirely eliminated. (4) Leakage of steam through the packing occurs at the high-pressure gland, where the shaft passes through the casing, and also (in impulse turbines) at each nozzle-plate, where it meets the rotor. At the low-pressure gland, the turbine is at condenser pressure

(sub-atmospheric), and consequently air leaks inwards. The air pump must therefore be made larger (see *Forms of Condenser* below), and so absorbs more power. (5) *Residual velocity.* The steam leaving the last row of blades has a certain velocity, corresponding to a small amount of energy in the steam; this is not transferred to the rotor, and so is counted as a loss. (6) *Supersaturation.* Steam passes so rapidly through a turbine ($\frac{1}{30}$ sec. or less) that water has no time to separate out at the condensation point, and the steam becomes super-saturated; in this state it is cooled below its normal temp., and so has less energy to impart to the blades. The lost energy is evolved later as heat in the condenser, where it is not wanted. A compensating advantage is that erosion is somewhat reduced. (7) *Radiation* is reduced by careful lagging of all parts. In land turbine plant of 3000 h.p. and over, these losses reduce the actual turbine efficiency to 80-85 per cent of the theoretical. With marine turbines, which work under less favourable conditions, and smaller land turbines (down to 300 h.p.), where the losses are greater in proportion, the efficiency may fall to 60 per cent of the theoretical.

THE EXHAUST FROM A TURBINE. Advantages of Condensing. There is almost as much energy in a lb. of steam expanding from 5 to 4 lb./sq. in. pressure as in a lb. of steam expanding from 500 to 450 lb./sq. in. a pressure drop 50 times as great. For, although the pressure is very low (sub-atmospheric), the vol. of the steam is enormous, and work done is measured by pressure \times vol. These large stores of energy cannot be used in reciprocating engines, as cylinders cannot be made large enough to deal with it (see *STEAM ENGINES (THEORY)—Sources of Loss*); but the final or low-pressure rows of turbine blades can be made as large as required; and if one row is insufficient the steam flow can be divided a few stages before exhaust, and made to pass through 2 or more low-pressure sections in parallel (multiple exhaust). The steam turbine is most efficient at the low-pressure end; at high pressures, a piston and cylinder may even be preferable. But these low sub-atmospheric pressures cannot be attained without condensing the exhaust steam, and the lower the exhaust pressure, the larger the condenser. Thus the condenser—a minor auxiliary in reciprocating steam engines—becomes a vital component in S.-T. practice, ranking in importance with the boilers and the turbine itself, and often occupying a greater space than the turbine it serves.

Forms of Condenser. These are usually of the surface type (see *STEAM ENGINES (FORMS)—Condensing Engines*), consisting of a large vessel of cast iron or mild-steel plate, closed at the ends by 2 tube plates (see Fig. 4); cold water (circulating water) passes through the tubes, on the outside of which the exhaust steam is condensed. The condensed water (condensate) drips off the tubes, and is withdrawn from the

bottom of the condenser by a small rotary or reciprocating pump, which delivers it to a hot well for feeding to the boilers. The air and other uncondensed vapours always present in steam, due to the leakage, etc.,

FIG. 4. CONDENSER

are extracted by a rotary air pump, or a steam or hydraulic ejector, through a separate outlet; the position of this varies in different types of condenser according to the direction in which the steam is required to flow. Steam always travels from the exhaust inlet, over the tubes to the air outlet, and this 'steam path' should be as short as possible, to reduce the pressure drop in the condenser. Without an air pump, the air would accumulate and mount up in pressure, and soon destroy the vacuum. The circulating water is forced through the condenser tubes by the circulating water pump; in land-turbine installations this water is usually obtained from, and passed back into, an adjacent river; in the absence of such, the circulating water, after traversing the condenser, is cooled in a cooling tower and used again. In marine practice sea-water is used. Condensers for S. T. give back pressures varying from 2 to $\frac{1}{2}$ lb./sq. in., corresponding to vacua of 26-29 in. (zero pressure = 30 in. vacuum).

Back-Pressure Turbines, etc. Low-pressure steam for process work or heating, which must be uncontaminated by oil, can safely be taken from the exhaust or intermediate stages of a turbine. Turbines from which a part of the steam is withdrawn before exhaust, the rest being expanded to condenser vacuum, are called pass-out or extraction turbines; where all the steam is used, they are called back-pressure turbines. A small amount of steam is often passed out or 'bled' from ordinary turbines at different stages for heating the boiler feed water.

GOVERNING (see also STEAM ENGINES, Governor). Turbines driving electric alternators require very sensitive governors to keep the frequency of the electric supply constant; but they must also be able to shut off steam rapidly and completely in the event of a failure on the electrical side, otherwise the turbine will 'run away' when the load is suddenly removed by the circuit-breakers. In most turbines the main steam valve is operated

by oil under pressure supplied by a pump on the end of the turbine shaft. The governor, of the horizontal spring-controlled type, controls the supply of oil, and thus varies the steam supply as required. In case of failure an emergency governor, set at a slightly higher speed than the main governor, trips an emergency steam valve, which is normally kept open, against a powerful spring by a trigger; once tripped, this cannot be reset until the turbine has stopped. In reheating turbines, further rise of speed trips a valve between the resuperheater and the low-pressure cylinder, since the steam in the former may be sufficient to raise the turbine speed to a dangerous value, even when the main steam valve is closed. A fourth line of defence is a vacuum-breaking valve on the condenser.

Steam is admitted to the turbine at the first stage, with provision for overload by admission of additional steam at the sixth stage. The large increase in blade height in the final stages is noticeable, as also the divided exhaust in the last 2 stages to increase the exhaust blade area yet further (see *Forms of Condenser*). Steam is 'bled' from 4 points in the l.p. cylinder for feed-water heating. A central-flow condenser is fitted, mounted on springs which take the weight but allow the condenser to expand with the turbine cylinder.

Reaction Turbines. A large modern reaction turbine, built by Parsons & Co. Ltd., of Newcastle, for driving a 20,000-kW alternator (= 27,000 h.p.), has a single cylinder in 2 sections bolted together, the h.p. end of cast steel and

C. A. Parsons & Co. Ltd

SINGLE CYLINDER TURBINE WITH DUPLEX EXHAUST

On the right is shown the low-pressure turbine blades (integral type with erosion resisting shield) as used in the turbine illustrated.

EXAMPLES OF STEAM TURBINES. Impulse Turbines. A large modern impulse turbine, built by the Metropolitan-Vickers Electrical Co. Ltd., of Manchester, for driving a 50,000-kilowatt alternator (= 67,000 h.p.), has 2 cylinders to minimise expansion stresses; these can be very large when one end of a cylinder is at the temp. of highly super-heated steam (450° C. or over), and the other at the temp. of the condenser (down to 30° C.). The two rotors are mounted on separate bearings, and are connected to each other and to the alternator by flexible couplings. The rotors consist of forged-steel disks pressed on a steel shaft, with blades of nickel steel or stainless steel. The high-pressure (h.p.) cylinder is of cast steel to withstand high temps. and pressures, while the low-pressure (l.p.) cylinder is of the cheaper cast iron. The h.p. turbine has 23 pressure stages, and the l.p. 18, without velocity compounding; this is a large number (some impulse turbines have only 4 pressure stages), but the modern tendency is to reduce the steam velocity by increasing the number of stages (see *Sources of Loss*).

the l.p. end of cast iron. There are 35 stages, of which the last 4 are duplicated (duplex exhaust); for overload, additional steam is admitted at the eighth stage; and steam is 'bled' at 2 points for feed-water heating. The rotor is a large, 1-piece steel forging, bored down the middle to reveal any interior flaws; the blades are of stainless steel, supported at their free circumference by a Monel-metal shroud ring. This is wider than the blades, and clears the adjacent blade rows by only a few thousandths of an in.; steam leakage past the blade tips is thus minimised. An adjustable thrust bearing is provided at the h.p. end of the rotor to adjust these clearances. The shroud ring is finished with a sharp edge, which, in case of fouling, merely becomes blunted without damaging the rest of the turbine. The end thrust on the rotor is balanced by 2 dummy pistons at the h.p. end; in large multi-cylinder reaction turbines the steam from the h.p. cylinder is often led to the middle of the l.p. cylinder and expanded in both directions, exhausting at the two ends into 2 separate condensers; thus the exhaust area is doubled compared with

a single-cylinder machine, and the l.p. rotor is balanced and needs no dummy pistons.

Double-rotation Turbines. A turbine built by Ljungström drives 2 25,000-kW alternators (= 67,000 h.p. in all) by 2 disk-shaped rotors, mounted face to face and rotating in opposite directions and connected in parallel. In the space between the rotors are 36 concentric rings or rows of reaction blading, attached alternately to each rotor by special expansion rings; there are also 4 ordinary rows of blades, 2 on each rotor, mounted in the usual manner. This may be called a 20-stage machine, with duplex exhaust in the last 2 stages. Steam is admitted to the centre of the turbine between the rotors, and expands radially outwards; for overload, additional steam is admitted at the sixth stage.

USES OF THE STEAM TURBINE. *Land.* Considered as a prime mover the steam turbine has the advantage over any reciprocating engine in that the motion of the moving parts is rotatory and the driving force is applied uniformly round the shaft. It is therefore possible with accurate design and good workmanship to ensure such perfect balance that the motion is barely perceptible. The torque exerted on the driven machine is thus uniform, and if the load on the turbine is constant over a period of time, the speed is constant. The steam turbine is therefore without rival as a prime mover for electric generators (*see* POWER STATIONS), centrifugal pumps, blowers in iron and steel works, and certain textile machines. The high speed makes it possible to develop large powers in engines of small size requiring little space and comparatively light foundations. All large thermal power stations are now equipped with turbo-generators of sizes up to 105,000 kW. As the only parts needing lubrication are the shaft bearings, there is not only considerable economy in lubricating oil, but the exhaust steam is uncontaminated by oil and needs no filtering before being passed to the condenser. Moreover, in factories where steam is used for heating or for various processes, the clean exhaust is immediately available. This is the case in laundries, paper mills, sugar refineries, cotton mills, and others. The steam turbine is thermodynamically efficient in large sizes, above 5000 h.p. Between 10,000 and 100,000 h.p. its efficiency is unsurpassed by any other heat engine. Careful tests on various turbines show a thermal efficiency of 30-35 per cent and in some cases slightly higher, especially at high pressures with reheat.

Turenne, see TRANI.

Turenne, Henri de la Tour d'Auvergne, Vicomte de (1611-75), Fr. soldier, b.

Sedan, a grandson of William the Silent. He was brought up as a Protestant. When he was 19 he entered the Fr. Army, and subsequently fought throughout the remainder of Thirty Years War. During the last 8 years of the war he was the leading Fr. commander, though superseded from time to time by his prin. rival, Condé.

During the Fronde disturbances, T. eventually sided with the court, and was the decisive factor in ensuring the final victory of the monarchy over its internal and external enemies. He inflicted crushing defeats on Condé and the Spanish, and was made marshal-general in 1661 by Louis XIV. In the war against the Dutch, 1672, he campaigned with all his usual brilliance, though his devastation of the Palatinate (1674) is a blot on an otherwise outstanding character, whose personal and military conduct was generally superior to that of his prin. contemporaries and rivals. He was killed at Sarbach, fighting Montecuccoli. T. became a Catholic in 1668, probably from motives of genuine conviction. His *Memoirs* were ed. by P. Marichal, 1909. *See also* life by M. Weyand (Eng. trans.), 1930.

Turf Agent, see COMMISSION.

Turf Laws, see HORSE RACING.

Turgenev, Ivan Sergeyevich (1818-83), Russian novelist. His chief works are *Sportsman's Sketches* (1847-52), a series of stories about Russian peasants which made a deep impression on the educated classes of Russia by the vigour of its attacks upon the vices of serfdom (its impact has been compared with that of *Uncle Tom's Cabin*); and the novels *Rudin*, 1856, *A House of Gentlefolk*, 1859, *On the Eve*, 1860, *Fathers and Children*, 1862, *Smoke*, 1867, and *Virgin Soil*, 1877, depicting the intellectual searchings and the psychology of Russian society in the 1830s-1870s from a liberal standpoint. After 1855 T. lived mostly in Germany and France. In Paris, where he lived after 1870, he became exceedingly popular, and it was through the medium of Fr. trans. that his works first became world-famous. T. was indeed the first Russian author to acquire an international reputation. For his influence on the development of the novel in Europe generally *see* NOVEL. *See* his *Works*, trans. by Constance Garnett (14 vols.), 1894-9; and studies by A. Yarmolinsky, 1926; E. Garnett, 1927; D. Magarshack, 1954.

Turgot, Anne Robert Jacques, Baron de l'Aulne (1727-81), Fr. statesman and economist, b. Paris. After holding various minor appointments he was, in 1761, appointed intendant of Limoges, a prov. whose prosperity was then non-existent. His reforms resulted in dramatic improvements there. On the death of Louis XV he was rapidly raised to the position of comptroller-general. By a series of enactments, some of which were repealed immediately after his removal from office, he aimed at making taxation more equitable, destroying the servitude of the peasant class, and removing the

disabilities under which the townsfolk suffered. But all the classes that had benefited from their previous exemption from taxation combined against him, and Louis XVI was too weak to resist. In 1776 he was dismissed.

He pub. sev. works on economics and literature, including *Lettres sur la liberté du commerce des grains*, 1770, and *Réflexions sur la formation et la distribution des richesses*, written in 1766 and pub. in *Ephémérides du citoyen*, 1769-70. His complete works were pub. by Dupont de Nemours, 1809-11. See lives by G. Shelle, 1909, and C. J. Gignoux, 1946.

Turi Language, belongs to the Sudanic linguistic family; see NEGRO-AFRICAN LANGUAGES.

Turla, see GUADALAVIAR.

Turiaso, see TARAZONA.

Turin (It. Torino): 1. Prov. of Italy, in W. Piedmont (q.v.). It is generally high lying, and has lofty ridges of the Alps (q.v.) in the W., where it is bounded by France. It is watered by the Po (q.v.) and its tribs. the Dora Riparia and the Dora Baltea. The prin. ts include T., Pinerolo, Ivrea, and Chivasso (qq.v.). Area 2690 sq. m.; pop. 1,510,000.

2. (Anct *Augusta Taurinorum*). It. city, cap. of Piedmont and also cap. of the prov. of T. It stands at the foot of the Alps, at the junction of the Po and the Dora Riparia, in a position commanding road and rail routes between France and Italy. It was a duchy of the Longobards (q.v.), and eventually became an important possession of the House of Savoy (q.v.). In Fr. hands from 1506 to 1562, and again in 1640, 1706, and 1798. It was annexed to France after the battle of Marengo (q.v.) in 1800. It was the cap. of the kingdom of Sardinia (q.v.) from 1814 to 1860, and of united Italy from 1861 to 1865. During the Second World War the tn suffered severely in air raids in Nov.-Dec. 1942 and July 1943. T. is regularly laid out, and has an anct castle, sev. fine 18th-cent. palaces, and a 15th-cent. archiepiscopal cathedral standing on the site of a 4th-cent. basilica. There are Rom. remains and notable museums, picture galleries, and academies. Its univ. (1404) ranks next in Italy to those at Naples and Rome. The tn is a great industrial and commercial centre: it has engineering (particularly motor-car), textile, paper, chemical, foodstuff, wine (Vermouth), and publishing industries. Pop. 720,000.

Turina, Joaquín (1882-1949), Sp. composer, b. at Seville, son of a painter of It. descent. He early studied religious and popular music. A gifted pianist, he became a pupil of Vincent d'Indy at the Schola Cantorum in Paris in 1905. Most of his work consists of piano music and songs; his other works include: *Procesión del Rocío*, a brilliant orchestral study; the operas *Margot* and *Jardín del Oriente*; a string Quartet and piano Quintet, etc. His *Enciclopedia Abreviada de la Música*, pub. in Madrid in 1917, expounds his aims in teaching music.

Turkana, a Nilo-Hamitic people of the deserts of N. Kenya. They are fierce and

nomadic cattle-keepers, without centralised gov., and are closely related to the Jie and Karamojong. See P. H. Gulliver, *The Family Herds*, 1955.

Turkestan: 1. Tn in the S. Kazakhstan oblast (prov.) of Soviet Union rep. of Kazakhstan. It contains a large cotton-ginning estab. Pop. includes many Uzbeks, for whom it has strong historical associations.

2. An obsolescent name for a vast area embracing: (a) Russian Turkestan, occupying the ter. now divided up between the Turkmen, Uzbek, Kirgiz, and Tadjik Socialist Soviet Reps.; (b) Chinese Turkestan or the Chinese prov. of Sinkiang; and (c) Afghan Turkestan or the NE. provs. of Afghanistan. See CENTRAL ASIA; SINKIANG; AFGHANISTAN.

Turkey. The rep. of T. comprises parts of E. Thrace in Europe, including Istanbul (Constantinople) and Edirne (some 9000 sq. m. in all), and in Asia the whole of Asia Minor from the Aegean Sea to the frontiers on the W. of the U.S.S.R. and Persia and from the Black Sea in the N. to the frontiers of Syria and Iraq in the S.

Geography. The total area of Turkey, with T. in Europe, is 299,891 sq. m., including swamps, marshes, and lakes. Asiatic T. is practically restricted to Anatolia, the great plateau of Asia Minor (q.v.), and the dists. of Kars, Ardahan, and Batum (excluding Batum port). The chief rvs. are the Kizil Irmak (Halye), Euphrates (Firat), Sakarya, Murat, and Tigris (Dicle). The Bosphorus, which guards the approach to the Black Sea from the Sea of Marmora, and is at the same time the focus of all maritime trade between the Mediterranean and Russia, etc., as well as of the overland routes from Europe into Asia Minor, has fitly been likened to a tortuous riv. valley over whose wooded banks are scattered forts and towers, cities and vils., castles and parks. The S. gate of the sea of Marmora is the Dardanelles, which gives an opening into the Aegean.

Agriculture. The production of tobacco (117,795 metric tons in 1955) is the chief item in Turkish agriculture. Cotton is also cultivated: 60,645 metric tons were exported in 1954. Other products are cereals, figs, silk, olives and olive-oil, dried fruits, liquorice, almonds, nuts, mohair, skins, hides, furs, wool, gums, canary seed, linseed, and serums. The chief tobacco dist. is Samsun, other dists. being Bafra and Izmir (Smyrna). Bursa is the prin. centre for silk production. Olive-oil is chiefly confined to the Vilayet (Il) of Aydin. The wheat yield in 1954 was over 4,900,000 metric tons, and that of barley 2,400,000 tons; agriculture is still primitive where railways are lacking, but the peasant is adapting himself to the more modern methods, especially in the Aydin, Adana, and Mersin Vilayets. In 1945 a Land Reform Act gave the landless peasants large tracts of land for subsistence. Live-stock (1953) included 27,287,000 sheep (wool output 36,144 metric tons), 16,094,000 goats and 4,869,000 Angora goats (mohair 7535 tons); cattle 10,759,000.

Minerals are still undeveloped, yet there is every reason to believe that iron, lead, and other metals exist in plenty. T. is one of the main chrome exporters of the world, and there are also exports of copper ore, manganese, zinc, and borax, while the total production of coal is some 5,700,000 tons. There are silver and gold mines.

Turkish Embassy

ANATOLIA: SHEEP ON A FARM NEAR ANKARA

Industry. Since the estab. of the Turkish Rep., in 1923, Turkish industry has made rapid advances. Under the first Five Year Plan (1934), industrial machinery was imported, first from the U.S.S.R., later chiefly from W. Europe. Iron and steel, textile, mining, paper, glass, sugar, and cement works were estab. as staple industries. In 1936 a second Five Year Plan was prepared, dealing primarily with the mining industries and increase of electrification. Total electricity produced in 1954 was 1,387 million kW. A beginning has also been made to utilise the vast resources of hydro-electric power, estimated at 2,200,000 kW. About 12 per cent of the pop. is now employed in industry. In 1939 the first blast furnace was lit at Karabuk, and the output in 1953 included 113,377 metric tons of fluid metal, 99,146 tons of pig iron, 162,641 tons of ingots and steel for casting, and 136,158 tons of rolled-steel products. Hand-loom cotton weaving is still important, there are silk factories in Istanbul, and some traffic in shawls, leather, and the world-famous carpets.

The chief exports are tobacco, cocoons, mohair, figs, raw silk, barley, and opium; whilst the imports are rice, linen, petroleum, woollen stuffs, cashmere, and machinery. In 1955 Turkish exports to

the U.K. were valued at £T65.1m., being mainly figs, raisins, mohair, wool, tobacco, and nuts. Turkish imports from the U.K. in 1955 were valued at £T109.3m., these imports consisted chiefly of aeroplanes, iron and steel, and finished cotton, linen, and woollen goods. In 1955 T. exported £T136.2m. worth of goods to the U.S.A. (of which tobacco-leaf constituted the largest single commodity) and imported goods worth £T311.6m. T. has resumed trading with Germany, and in 1955 exported goods valued at £T137.6m, and imported £T224.7m. The merchant marine (1955) had a gross tonnage of 702,000.

Internal Communications. At the end of 1953 T. possessed 15,710 m. of roads. Under a programme drawn up jointly by the Turkish Gov. and the Amer. Aid Mission in T. roads and highways of a total length of 14,316 m. were to be rebuilt or radically repaired by the most modern methods in 3 3-yearly periods beginning in 1949. T. had 4820 m. of railways at the end of 1955, 2203 m. of this having been built since 1923. All railways are State-owned. The prin. tns and cities in T. are linked by the State Airways Administration. T. is connected to all the prin. caps. in the world by air. There is a large modern air-port at Istanbul.

Defence. Military service is compulsory for all men over the age of 20, and liability for service lasts for 26 years thereafter. Service is for 2 years, which may, in emergency, be increased to 3 years. The ann. contingent of men liable to service is about 175,000. The strength of the active army in 1938 was 20,000 officers and 175,000 men, but during the Second World War the strength rose to 11 army corps of 23 divs., an armoured brigade, fortress commands, and cavalry. More than 2,000,000 men can be mobilised. During the Second World War T. received equipment from the Allies, and since the end of the war the military forces have been extensively re-equipped with modern arms. The land forces contain 22 infantry, 6 armoured, and 3 cavalry units. The Navy includes the battle cruiser *Favuz* (the old *Ger. Goeben*); (see GOEBEN AND BRESLAU), launched in 1911 (23,000 tons); 8 minelayers, 23 minesweepers, 10 destroyers, 12 submarines, and 100 miscellaneous vessels. The air force has been increased by Brit. and Amer. aid, and now possesses more than 1000 aircraft. 70 per cent of the machines are of Amer. manuf. The air defence system is being equipped with types of modern radar gear.

Population. A general census (the first in Turkish hist.) was taken in 1927, and the total pop. was found to be 13,648,270. The census of 1955 showed a pop. of 24,111,778. T. is divided into 63 ils. The cap. is Ankara, pop. 453,151 (1955), but the largest city is Istanbul, pop. 1,214,610. Other important tns are Izmir (Smyrna); Adana; Bursa; Eskişehir; Gaziantep; Konya; Kayseri; Erzurum; Diyarbakir; Sivas; Samsun; Urfa; Maras; Zonguldak.

Constitution and Government. On 29 Oct. 1923 T. was proclaimed a rep. and the constitution was promulgated on 20 April 1924. By the Constitution of 20 Jan. 1921 it was declared that all sovereignty belonged to the people, all power, executive and legislative, passed to the Grand National Assembly, a single chamber, as being the sole representative of the people. The members were originally elected for 2 years, and later by the Constitution for 4 years. Army officers may not sit in the Assembly. In 1934 women were given the right to vote and to be elected as deputies. In June 1946 the Assembly altered the Constitution so as to permit all Turkish men and women to vote in legislative elections at the age of 22, and to become deputies at the age of 30. The Electoral Law of 1946 substituted first degree for second degree elections, and provided for secret ballot, and public counting; this law was further revised in 1948 and took its final form in 1950 with the introduction of supervision of the secret ballot, and public counting by judicial election councils. The President, who may not vote, is chosen from among the deputies constituting the Assembly, and his term of office is identical with the life of the Assembly. The Assembly delegates its executive powers to the President and 'to a cabinet chosen by his appointee, the President of the Cabinet.' By the Constitution, local gov. was centralised, the largest administrative area being the il, and under the municipal law of 1930 both men and women have the right to vote and to be elected at municipal elections. In 1937 the Assembly agreed to the estab. of the principles of the Republican People's party, viz. nationalism, democracy, evolutionism, laicism, 'étatisme' (State ownership or control of industries and communications) as part of the Constitution. This meant, in practice, a recognition of only one party in the State and estab. State Socialism. The formation of other parties was, however, authorised before the 1946 elections, the prin. being the Democratic party. Party gov. has begun to evolve, its peaceful estab. being, to a large extent, the work of President İnönü.

İnönü's republican party gov. ruled without effective opposition from 1923 until May 1950, when the electorate returned a gov. of the Democratic party under Celal Bayar, who was elected President in the same year. Bayar's party differs from the Republicans, not so much on account of its greater liberality, but in that it represents *laissez faire* capitalism as opposed to a régime which had retained traces of authoritarianism.

Justice. The old religious courts and the former Courts of Appeal were abolished in 1924, and much of the Ottoman civil code discarded. In 1926 a new penal code was estab. adapted from the It. Code, and new civil and commercial codes, borrowed from Switzerland and Germany respectively. Judges are independent in trying and deciding all cases, and their

judgment is final in all cases. For the training of jurists there are faculties of law at Ankara and Istanbul.

Education. On 3 Mar. 1924 the Muslim religious schools were abolished and replaced by State schools in which, or in community schools or private schools, primary education is compulsory. There are over 17,680 primary schools and over 470 secondary schools. There are univs. at Ankara and Istanbul (founded 1800), and a technical univ. at Istanbul: there are (1953) over 30,000 univ. students, men and women. Religious instruction, hitherto prohibited under the Rep., was made optional in May 1948. In 1948 there was estab. a Brit. Institute of Archaeology at Ankara. By a law of 1 Nov. 1928 everyone between the ages of 16 and 40 was obliged to attend school to learn in place of the Arabic script, a Lat. alphabet incorporating various modifications of all the vowels except *e*, and omitting *q*, *v*, and *x*. There is a state broadcasting system, operating on 3 wavelengths.

History. It was by military conquests that the Ottomans secured a European foothold, and it was thus that the empire reached such splendid dimensions in the 16th cent. In the 7th cent. the Turks first emerge from other tribes of the Turanian stock, and their story opens with the significant fact of their conversion to the Mohammedan faith. Little of consequence is told about them after this until Togrul Beg, the leader of a branch of Tatar invaders, always known as the Seljuk Turks, captured Bagdad in 1058. This led directly to the foundation of imperial power by the Turks in Asia, a power which subsisted almost unimpaired up to the First World War. Cairo and Jerusalem fell before the successors of Ertogrul Beg, and soon the Turks were in possession of Asia Minor and the greater part of Syria. But the Seljuks could not maintain the integrity of their empire against the assaults of the Crusaders, and their place was taken by the stronger and nearly related tribe of Ottomans. The latter overran all the Asiatic provs. that had once been within the confines of the Rom. empire, and made some headway in Europe. Adrianople submitted to their sultan, Murad I (1360-89), in 1361, and soon the city of Constantinople and a few outlying and scattered dependencies were all that were left of the once mighty empire of Constantine.

When Murad died he was succeeded by his son, Bayazid I (1389-1403), who also proved a great conqueror. In 1396 he gained a great victory at Nicopolis (in Bulgaria) over the allied armies of Germany, Hungary, and France. The victory alarmed W. Europe, and Constantinople seemed doomed. Indeed, Bajazet had actually begun the siege of that city when the victories of Tamerlane (Timur) forced him to cross the straits in haste to save his Asiatic dominions from this new aggressor. The issue was decided on the field of Ankara (1402), where Bayazid suffered defeat. But the advent of Tamerlane only deferred and

could not stave off the downfall of Byzantium. In 1421 the Ottomans made an unsuccessful assault, and finally Mehmet II stormed the city in 1453.

Greece was annexed by the Ottomans between 1456 and 1460. Serbia had been subjugated in 1389 after the battle of Kossovo, Bulgaria in 1396, and Macedonia in 1430. Thus the Ottomans absorbed the E. empire, but it had not yet reached their farthest limits. Mehmet II succeeded in penetrating into Italy, and for 1 year (1480) the city of Oranto (in Calabria) was under Ottoman

death of Suleyman in 1566 there were only 2 fresh acquisitions of importance, namely Cyprus, which was wrested from Venice in 1571, and Crete, which finally passed into Turkish hands in 1669.

From the last quarter of the 16th cent. dates the gradual but steady decline of the sultan's supremacy. Already, however, the commonwealth of Venice on the Adriatic and northward the kingdoms of Hungary and Poland had proved strong buffers between Christendom in the W. and the lands of Islam in the E. As early as 1456 John Huniades of Poland had

Turkish Embassy

THE BOSPHORUS AND DOLMABAHÇE MOSQUE

sway. Selim the Inflexible (1512-20) overran the is. of the Archipelago, took possession of the whole of Syria (1515), obliged the Abbasside Caliph of Cairo to surrender his jurisdiction, and finally annexed Egypt after defeating the Mamelukes (1516). Probably the empire attained its period of greatest splendour during the reign of Suleyman the Magnificent (1520-66). This warrior-king captured Belgrade in 1521, and in the following year expelled the Knights of St John from Rhodes. In 1526 he inflicted an overwhelming defeat on the Hungarians, and in 1529, after humiliating Vienna by a protracted blockade, he marched with a huge army against Germany, but retired on the advance of the Imperial Army. Charles's brilliant seizure of Tunis (1535) was a serious check to Ottoman influence in the S. After the

repulsed the Turks from Belgrade, but the first serious disaster which overtook them was the annihilation of their fleet in the Gulf of Lepanto (1571) by the combined squadrons of Philip II of Spain and the Venetians. This victory ended Ottoman encroachments in the Mediterranean. Most of the Turkish wars continued to be waged with Hungary and Venice, and in 1683 the Turks were once more at the gates of Vienna. This time the cap. was rescued by the opportune arrival of John Sobieski, King of Poland, and the Duke of Lorraine. The peace of Carlowitz, which concluded this war (1699) confirmed the Venetian conquest of the Peloponnesus, securing Hungary for the Austrians. Herzegovina was ceded by Leopold to T. A second struggle between the House of Hapsburg and the Porte was terminated by the peace of Passarowitz (1718), when

the former received Belgrade and part of Bosnia and Wallachia. T. had won back the Peloponnese in 1716, and Belgrade was recovered in 1739.

By this time Russia was pressing hard upon the N.E. frontiers of the Empire, and the long series of the Russo-Turkish wars began in 1730. By the peace of Kuchuk-Kainardji (1774) the sultan relinquished his suzerainty over the Tatar Khans of the Crimea, and Russia secured the approach to the Black Sea. The treaty of Jassy (1792), which closed a second war, was equally favourable to Catherine, for the N. boundary of the Ottoman empire was pushed back to the Dniester. In 1807, the year of the treaty of Bucharest, this boundary was put still farther S., as far as the Pruth. Twenty-one years later Nicholas I of Russia declared a fourth war, concluded by the peace of Adrianople (1830), the chief provision of which was the recognition by the Porte of the complete independence of Greece. Nicholas had timed his invasion so as to profit from the sultan's embarrassment consequent on the Grecian insurrection.

The Crimean war of 1853-6 grew out of Tsar Nicholas's ambition to parcel out the Turkish empire, and so secure the major share, the Balkan peninsula, himself. England and France, however, supported T. At the Peace of Paris (1856) the integrity of the sultan's empire was maintained, and the Christian subjects were put under the aegis of the Great Powers instead of that of Russia.

The whole 19th cent. was marked by a series of revolts. In 1798 Napoleon had easily overcome the Mamelukes of Egypt, who were nominal vassals of T., but it was not till 1879, the year of the estab. of the dual control of France and England, that Turkish overlordship in Egypt finally came to an end. During the Gk war of liberation, and afterwards, great barbarities were inflicted by the Turks on sev. groups of Christians, culminating in the atrocities perpetrated against the Armenians in 1895 and repeated in later years. In connection with this familiar chapter of Turkish hist., it is to be borne in mind that in 1877-8 Russian policy was to encourage the formation of a separate Armenian state under Russian supremacy. Russian intrigues to that end were directed from those Armenian dists. which had previously passed to Russian possession and which included Echmiadzin, seat of the Armenian catholikos. These intrigues combined with revolutionary nationalist conspiracies among Armenian exiles to exacerbate Turkish feeling which, it is alleged in Turkish circles, was still further outraged by Armenian treachery towards the families of Turkish pilgrims.

In 1877 Russia once more adopted the leadership of a Pan-Slavonic movement, and came forward as the defender of the Christians. Once more foreign interference alone stayed the Russian advance on the cap., and the short campaign was brought to an end by the famous Berlin treaty (1878), which was drawn up by the Great Powers acting in concert. By this

agreement the independence of Bulgaria, Serbia, Rumania, and Montenegro was formally acknowledged. Bosnia and Herzegovina were occupied by Austria, and Cyprus handed over to Brit. control. E. Rumelia, whilst being retained by the sultan, was given an 'administrative autonomy' under a Christian pasha. Serbia, it should be noted, had been more or less free since 1807, and the Montenegrins had been virtually free from the Ottoman yoke since 1896. Moldavia, with Jassy, and Wallachia, with Bucharest as its cap., had coalesced into the single kingdom of Rumania in 1861. Cyprus demanded union with Greece as early as 1895; and in 1908 Crete, which was evacuated by Turkish troops in 1898, declared its affiliation with the same state.

The next stage was the movement of the Turks towards reform and the adoption of W. gov. and practice (see ATATÜRK). As long ago as 1839 a body of progressive measures, entitled the 'Hatt-i-Sherif', was promulgated, and Christians were at last admitted to office in 1849. Idiots in the cap. extorted from the sultan another and enlightened political constitution in 1876, and Midhat Pasha (d. 1884) devoted a strenuous life to the furtherance of liberal ideas and progress. But the new constitution remained in abeyance until the Liberal party rose and demanded its restoration. The growing abuses of the gov. resulted in the formation of what is known as the 'Young Turk' party, which included in its ranks some of the most influential men in T. The movement was partly suppressed in 1901. Seven years later the 'Young Turks' again agitated with more effect, as the sultan opened a new Parliament, with Ahmed Riza, one of the leaders of the movement, as president. In 1909 the sultan was deposed, and his brother was called to the throne as Mehmet V. There had previously been trouble with France over the hinterland of Tripoli and with Bulgaria in regard to the 'liberation' of Macedonia. In 1908 Bosnia and Herzegovina were annexed by Austria, and in 1909 Bulgaria's claim to independence was accepted. In 1911 Italy forcibly seized Tripoli, and after a year's desultory fighting T. was obliged to sue for peace, as fresh trouble was brewing near home (see BALKAN WARS). The first Turkish Parliament was dissolved in 1912, and a fresh cabinet was formed the same year. The treaty of London, signed on 30 May 1913, left T. with only a small strip of ter. in Europe, extending from Midia on the Black Sea to a point near Central Ibrige on the Aegean. T., however, took advantage of the Second Balkan War to take back Adrianople (July 1913).

In 1914 Enver Bey, later Enver Pasha (q.v.), became minister of war, and he was under the influence of Germany, represented in T. by a military commission under Gen. Liman von Sanders, who was appointed commander-in-chief of the Turkish Army. On 8 Sept. T. declared the capitulations to be abolished, and following Turkish naval attacks in the

Black Sea, Russia and then England and France declared war on T. Enver Pasha became a virtual dictator, but at the outset Turkish troops met with disaster in the Caucasus (q.v.). In the Allied attempts, however, to force the Dardanelles and take Constantinople the Turks held their own and saved the cap. (see DARDANELLES). The Turks were also fighting on the Mesopotamian front and were at first successful against the Brit. Army beleaguered in Kut al Amara (q.v.). Ger. influence was able to bring about an entente between T. and Bulgaria, but on 21 Aug. 1915 Italy declared war on T. In 1916 the situation did not materially change, although T. was embarrassed by a revolt of the Arabs, who, led by Hussein (see HUSSEIN IBN 'ALI), declared the Sherifate of Mecca independent. In 1917 Sir Stanley Maude conducted brilliant operations on the Tigris, Bagdad being taken on 11 Mar. In Feb. a change of cabinet brought in Talaat Bey as Grand Vizier, Enver Pasha remaining war minister. When the U.S.A. entered the War, relations with T. were severed, but there was no declaration of war. With the defeat of Bulgaria and in spite of T.'s advantageous peace with Russia at Brest-Litovsk (q.v.) in 1918 T. had no hope of victory. On 3 July 1918 Mehmet V d. and was succeeded by his brother, Prince Vahided-Din, who became Mehmet VI. In Oct. Enver resigned and Talaat was succeeded as Grand Vizier by İzzet Pasha. An armistice with the Allies was signed with T. on 30 Oct. 1918 at Mudros.

The 'Young Turk' party (the Committee of Union and Progress, as it was called) had abandoned Constantinople, where in 1919 a feeble Liberal Entente Gov. was in power with Damad Ferid Pasha as Grand Vizier. A movement, however, towards the regeneration of T. began in Anatolia, where Mustapha Kemal (see ATATÜRK) and his right-hand man, Rauf Bey, a former naval commander, convoked a Turkish Nationalist Congress at Erzerum on 23 July 1919. 'The Anatolian and Rumelian League for the Defence of National Rights,' or simply the 'National Organisation,' resulted. On 4 Sept. 1919 a second congress was called at Sivas, and a party programme was drawn up. The Nationalist party under Kemal, being regarded as rebels, chose Ankara, an impregnable tn, as its HQ, while a Nationalist army was also formed out of local militias, with Kara Bekir Kâzım Pasha and Ali Fuad Pasha as commanders-in-chief of E. and W. Anatolia respectively. On 5 Oct. 1919 Damad Ferid fell from power in Constantinople. A new gov. was formed under Ali Rıza Bey, and at the ensuing election the Nationalist party found itself legitimised by its strong representation. Moreover, in Jan. 1920 the Turkish National Assembly accepted the 'National Pact,' a declaration of Turkish independence, promulgated from Ankara. Two months later, however, the Parliament was dispersed by Allied forces under Gen. Milne, martial law was proclaimed, and

Damad Ferid Pasha reinstated. The old Parliament, now outlawed, reassembled at Ankara, strongly 'Nationalist' in sympathy. On 20 Jan. 1921 the Law of Fundamental Organisation was drawn up at Ankara, placing the sovereign power in the hands of the Turkish people.

E.N.A.

MUSTAFA KEMAL (ATATÜRK)

Meanwhile the Nationalist party was further strengthened by Turkish protests against the Gk occupation of parts of Anatolia. The situation rapidly developed into war, of which the first phase in 1920 was favourable to the Greeks, but in 1921 and 1922 the Gk offensives were terminated by Turkish victories, of which the last was complete (see GRAECO-TURKISH WAR). Gk aspirations in Asia Minor were ended, and all Thrace as far as the Maritza lt. was restored to T.

A treaty of peace was signed at Lausanne on 24 July 1923 and ratified by Great Britain 15 April 1924 (see LAUSANNE, TREATY OF). The treaty settled T.'s international relations for some time following, territorial differences with Soviet Russia and the estab. of an overland route between Moscow and Ankara (made possible by the creation of the Soviet Reps. of Armenia, Erivan, and Georgia) having been previously arranged by a treaty of 16 Mar. 1921. By this treaty the dists. of Kars, Ardahan, and Batum (excepting Batum port itself) were assigned to T., and in the ensuing diplomatic struggles with Great Britain and

the actual war with Greece T. could count on the tacit support of Russia.

In July 1922 Rauf Bey, who with Kemal had been mainly instrumental in causing the Nationalist Revolution, became Prime Minister. On 1 Nov. 1922 the sultanate was declared to be abolished. The National Assembly then elected the cousin of the deposed sultan, Abdul Mejid Efendi, to be plain caliph, the Commander of the Faithful, but with no temporal powers. This 'spiritual' caliphate (*sec* CALIPH.) was finally abolished in 1924.

Meanwhile, on 2 Oct. 1923, the foreign occupation of Constantinople (now Istanbul) terminated, and on 29 Oct. T. was declared a rep. Mustapha Kemal, the (Ghazi, or the Conqueror, was elected as president. The rep. took the form of a powerful oligarchy led by a dictator and depending on a censorship of the Press. The Kurdish rebellion in 1925 aggravated the Mosul Question, which arose out of the conference to determine the boundary between T. and Iraq. Eventually, on 6 June 1926, almost the whole vilayet of Mosul (q.v.) was given by treaty to Iraq. In Mar. 1927 T. signed a commercial treaty with Russia, but later this was offset by frontier trouble with another neighbour, Persia. The general election of Oct. returned the Kemalists to power, and Mustapha Kemal was re-elected president by the new Assembly, which met in Nov. The Persian trouble was settled by a pact, 15 June 1928, and a Turco-Ir. Pact was ratified in Nov. On 10 April 1928 Mohammedanism ceased to be the State religion, although it has remained the religion of almost all Turks. According to the census in 1935 Muslims numbered 15,840,000. There were 125,000 belonging to the Gk church, 11,000 Armenian Christians, and 80,000 Jews. Religious instruction in the schools was forbidden, but in 1948 it was made optional. The work of 'westernising' T. being almost completed, the Ghazi relaxed his methods of dictatorial reform, but the position of the man who had created the New T. always remained unassailable.

Atatürk (Kemal) restricted the new Turkish State to the area actually inhabited by Turks, exchanging, at the same time, the Gk minority from Asia Minor with Turks domiciled in Greece and other Balkan countries. In 1934 the economic Five-Year Plan provided for a number of large State factories, the machinery being imported from Russia and W. Europe. In the new economic system the State reserved the right to plan the general economic course and, while allowing private enterprise, owned the leading industries and supervised and co-ordinated the activities of private concerns (*étatisme*). In 1934 T. joined in a regional pact with Greece, Yugoslavia, and Rumania for mutual guarantee of their respective frontiers, and in the same year, by the Pact of Saadabad, T. strengthened her political co-operation with Iraq, Persia, and Afghanistan.

In the field of foreign policy, following the restoration of Turkish sovereignty

over the Dardanelles in 1936 and the retrocession of Alexandretta (q.v.) or Iskanderun in 1938, Turkish relations with the W. democracies became closer: an Anglo-Fr. guarantee against aggression was given to T. in May 1939, and this was followed on 19 Oct. by an Anglo-Fr.-Turkish pact of assistance, effective for 15 years. T.'s position, however, became difficult as the Second World War spread to the Balkans; from the time when Ger. victories in the near E. brought a semicircle of Axis forces round her W. boundaries T. became the victim of great pressure from Berlin, and in June 1941 the Turkish Gov. had little option but to sign a 'Treaty of Friendship' with Germany 'within the limits of the then existing commitments of both countries.' The Turks, however, throughout the negotiations kept the Brit. Gov. informed of progress. It transpired later that Italy urged Germany in 1941 to pass through T. and attack Brit. troops in the Middle E., but that the Germans had preferred to postpone this operation till after the removal of the Russian danger which they hoped to effect in a few weeks. But the situation changed with the great victories at Stalingrad and El Alamein; and Turkish neutrality, which till then was favourable to the Allies, began to be profitable to the Axis. In Feb. 1943, however, by a unanimous vote the Turkish Parliament decided to declare war on Germany and Japan. That step was a consequence of the decision taken by the Allies at Yalta that nations at war with the Axis before 1 Mar. would be qualified to enter into association with the original U.N. In 1945 Russia denounced the treaty of friendship which she had made with T. in 1925, and in the following year made a demand unacceptable to the other parties thereto, for a revision of the 1936 Montreux convention by which T. had gained the right to remilitarise the Straits. This marked the end of a distinct phase in Turco-Russian relations: the post-Revolutionary friendship between the 2 countries, with the economic co-operation that had accompanied it, gave way once more to the traditional grouping of T. in the W. European sphere of influence. America recognised the important position which T. holds as a barrier against the spread of Communism into the Middle E. and Asia, and made substantial loans in order that T. could utilise to the full her economic resources and strengthen her defences.

Until 1945 the Republican People's party tolerated virtually no opposition parties; but after that date genuine opposition parties were allowed to be formed. The leading one was the Democratic party, which gained power in 1950 under its leader Adnan Menderes (b. 1899) who became Prime Minister. In the elections of 1954 it virtually obliterated all the other opposition parties. Since 1950, there have been sporadic complaints which have indicated that the present regime has shown intolerance towards its opponents; but T.'s foreign policy, based on co-operation with W. Europe, has remained unchanged.

In 1951 T. became a member of N.A.T.O. and in 1953 signed a treaty of friendship with Yugoslavia and Greece. Since the end of 1953 Græco-Turkish relations have suffered a steady deterioration, owing to their different approaches to the Cyprus question, reaching a low point in 1955, when serious anti-Gk rioting broke out in T., causing substantial damage and loss of life. In 1956 T. announced her acceptance in principle of the Radcliffe proposals on Cyprus, which suggested a partition of the is. into Gk and Turkish areas. T.'s treaty in 1954 with Pakistan was really the foundation stone of the subsequent Bagdad Pact (1955); but the practical value of this was largely nullified (at least temporarily) by events in Egypt and other Middle E. Arab states at the end of 1956. T.'s relations with Britain and France, however, remained markedly friendly in spite of radical differences on the Suez question. After the general election in 1957 the Democrats remained in power, but their majority over the People's Party was considerably reduced. Tension built up in 1957 between T. and Syria, Syria accusing T. of aggressive designs on her ters, bordering on T., accusations which T. vehemently denied.

Literature. Like early Lat. poetry, the literature of the Ottomans is almost wholly one of imitation, and just as Terence and Plautus sought inspiration from the old Gk writers of comedy, so the primitive Ottoman poets were much influenced by Persian verse. From Persian poets they borrowed their forms, their style and their theme. Ahmed Pasha (d. 1496), a vizier of Mehmet II, freely plagiarised the popular 'ghazels' of the Persian Nevayi (d. 1500). Fuzuli of Bagdad (d. 1555), one of the first of Ottoman poets, is admired above all for the tender beauty of his *Divân* or collection of ghazels, and it was this vehicle (the ghazel) which the versatile Nâbi (d. 1712) chose when he wished to reproduce the didactic and philosophical strain of the Persian Sâib (d. 1677). The brilliant panegyrics of Nefî of Erzurum (d. 1634), are expressed in the form of the 'kasîda' or lyric of Arabia. Both the ghazel and the kasîda were adopted from Persian literature. In style again Ottoman writings reveal the merits and demerits of their Persian prototypes. They are mannered and insincere, and tainted with that artificiality which invariably infects a court literature.

The same thoughts are apparent in the prose hist. of Sa'd-ud-din (d. 1599), entitled the *Crown of Chronicles* (*Tâj-ut-Tevârikh*), where the excess of rhetoric palls and where that favourite embellishment known as the 'sej' which consists in rhyming the last words of successive clauses, produces a jingle which falls unpleasantly on W. ears. Finally, the imitation of Persian models is equally apparent in subject-matter. Ottoman poets, like their masters, never sang the song of battle, though they belonged to a race pre-eminently war-like, but devoted themselves rather to composing love-

lyrics and odes to the joys of nature. In the last cent. a revolution was effected in literature as in the political world. W., and especially Fr., modes of thought filtered into the cap., and modern writers have gone back to a simplicity and naturalness of style more suited to their modern outlook.

Art. Conquest influenced Turkish art between the 11th and 17th cents. The Turks proved extremely susceptible to artistic influence from the countries that they conquered, absorbing and adapting much that they found, so that their buildings became quite different from the simple structures of primitive Muslim culture. During the Seljuk era (c. 1073-1306) art remained fairly plain,

Turkish Embassy

THE SULEYMAN MOSQUE, EDIRNE

although the frequently used geometric decoration became more involved towards the end of the period. Under the Ottomans, with the growing wealth and power of T., all branches of art became increasingly ornate. Examples of this are found in the cupolas and minarets of Edirne. Byzantine influence can be traced in the elaborate, rich detail. After the fall of Constantinople in 1453 Byzantine influence reached its zenith: in converting the church of St Sophia into a mosque, many tricks of Christian craftsmanship appear to have been absorbed, which were incorporated into the style of the Suleyman Mosque in Edirne (1570-4). The mosque remained the centre of Turkish life until after the estab. of the Rep. in 1923. Most artistic developments are therefore found in religious buildings, but domestic architecture of the period

shows the frequent use of elaborate trellis-work and carving. In the 19th and still more in the 20th cent., Turkish art copied W. European and N. Amer. styles. From this, however, a certain individuality of detail is now beginning to evolve. There are also many buildings within the area of modern T. belonging to the civilisations which the Turks conquered: the Byzantine remains at Iznik were largely destroyed during the Gk-Turkish war in 1921, but Istanbul contains a number of Byzantine buildings, chief among which is the former church of St Sophia.

Turkish music has evolved a distinct style of its own, setting it apart from the musical culture of other Arab states. A great contribution was made by the Derivish communities in the 15th cent. They produced a large amount of inspired religious music such as *Hymns* (Ilahi), *Prayers of the Prophet* (Teveih), and *Songs of the Derivishes* (Ayn Charif). Modern developments are wholly influenced by W. European and N. Amer. styles.

Turkey (*Meleagris*), name for 2 Amer. species, the largest of the game birds, once believed to have come from Turkey. *M. gallopavo*, the origin of the domesticated varieties, formerly occurred throughout the N. Amer. continent, and was abundant in the U.S.A., in parts of which it is still hunted with greyhounds. The wild birds are both larger and more ornate than domesticated T.s, which, however, have been improved by introductions of wild blood. The largest of the domesticated varieties is the Amer. mammoth bronze, the plumage of which is a beautiful dark bronze with a red metallic lustre. Among other varieties are the white, buff, slate, and black. *M. ocellata*, the other species, occurs in Honduras, and has plumage of great brilliancy with ocellated tail feathers. See also POULTRY.

Turkey-buzzard, see VULTURE.

Turkey Oak, *Quercus gerris*, is common in the SE. countries of Europe. It has deciduous, short-stalked leaves and bristly cups for the acorns.

Turkey-red, see DYE.

Turki Runes, see OIKHON INSCRIPTIONS.

Turkistan, see TURKESSTAN.

Turkmenia, or Turkmen S.S.R., constituent rep. of the U.S.S.R., bordering on Iran, Afghanistan, the Uzbek and Kazakh reps., and the Caspian Sea. It is mountainous in the S. and W. and a plain in the N. As a result of the hot climate, 80 per cent is desert or semi-desert, but irrigation of the Kara-Kum (q.v.) is being effected from the Amu-Darya R. and subterranean supplies. There are oases, nourished by the waters of the mt streams. Cotton (including a special long-fibred variety), wheat, and cattle are the main agric. products. Silk cultivation and carpet-weaving have been revived. Since 1925 chemical and other industries have been estab., and a new oil tn, Nebit-Dag; there are deposits of salt, oil, potassium, gypsum, magnesium, and coal. Research institutes number about 50. The pop. consists of Turkmen (78 per cent) with Russians and Uzbeks, etc., the first being Mushms. The cap. is Ashkhabad; other tns include Mary (Merv), and Krasnovodsk, a seaport and the terminus of the Transcaspiian railway. Administratively the rep. is divided into the Ashkhabad, Mary, Tashauz, and Chardzhou oblasti (provs.). Area 189,400 sq. m.; pop. 1,290,000. See also CENTRAL ASIA.

Turkomans, more properly Turkmen, a Turkic people mainly inhabiting the Turkmen S.S.R. of the Soviet Union. Many thousands of them live in N. Persia and N. Afghanistan. They first appeared in the present habitat in the 11th cent. during the great Oghuz migration from the regions N. of the Syr Dar'ya R. The Turkmen dynasties of the 15th cent. had considerable power, and they retained some kind of independence until they were subdued by Russia 1831-5. Their

language is classed as W. Turkish and is closely related to the language of Turkey. There is a Turkmen community of some thousands in the Stavropol' Kray in the Caucasus.

Turks, or Turkic Peoples, are terms without any racial significance which can, however, be applied to the peoples linguistically and historically related to the 'Tu-Kiu,' the name given by Chinese chroniclers to a nomad people first mentioned in hist. in the 6th cent. AD. Apart from the T. of the Turkish rep., the T. P. have no common characteristic other than language; but the Turkic languages have a remarkable inter-resemblance, the Uygur spoken in W. China being similar to the Turkish spoken by Muslim communities in Yugoslavia. The total number of so-called Turks is about 40,000,000, of whom about 18,000,000 are in Turkey and 17,000,000 in the U.S.S.R. (the Volga region, Caucasus, and Central Asia). Of the remainder about 3,000,000 are in China and 2,000,000 in Persia and Afghanistan, with some small scattered communities elsewhere in Asia and Europe. Linguistically, the T. may be divided into 2 groups, the W. including the T. P. of Europe and of W. Asia, and the E., including the peoples of Kazakhstan, Turkmenistan, Uzbekistan, and Kirgizia, of the Chinese prov. of Sinkiang, and some scattered elements in E. Siberia. For further information see TURKEY; CENTRAL ASIA; KAZAKHIS; KIRGIZ; TURKOMANS; UZBEKS; TATARS.

Turks and Caicos (or Cayos, or The Keys) Islands, group of is. lying to the S. of the Bahamas, W. Indies, administered jointly since 1874 as a dependency of Jamaica. The group consists of 8 inhabited is. and sev. uninhabited rocks numbering about 30 in all. The total area is 166 sq. m. The largest, Grand Caicos, is 25 m. long by 12 broad. The seat of gov. is at Grand Turk, 7 m. long by 2 broad. (Pop. 1800.) The inhabited is. are wooded and fairly fertile, but the climate is enervating. The chief industries are the exportation of salt, sponges, and turtle-shell, the cultivation of sisal hemp (on W. Caicos), and fishing. There is an important cable station on Grand Turk; also a weather bureau, a guided-missile observer station, and an oceanographic measurement station are operated by the U.S. Gov. Turks Is. were discovered about 1512, but no attempt at occupation was made until 1678, when their value for the production of salt was recognised by the colonists of Bermuda. The first royal regulations for the gov. of the salt ponds show that down to 1781 no permanent settlement or idea of fixed property in the ponds was entertained. There existed a 'head right' system by which one-third of the ponds was reserved for gov. expenses while the remainder was shared among the inhab. Every adult was entitled to a full share, children being allotted tenths in proportion to their height. Some of the public officials and ministers of religion received their salaries in bushels of salt, which

recalls the anct *salarium* or salt allowance of the Rom. soldier. Towards the end of the 18th cent. the Bahamas Gov. laid claim to the T. and C. Is., and despite the vigorous protests of the Bermuda salt-rakers, it was determined by order in council in 1804 that the legislation of the Bahamas Gov. should extend to them. At the end of a struggle lasting 50 years, in which it was eventually recognised that conflicting interests and communication difficulties rendered common legislation impossible, a further order in council placed T. and C. Is. as an independent administration under the supervision of the governor of Jamaica. Meanwhile the 'head right' system was replaced by a leasehold system. Caicos Is., which in 1848 were appended to Turks Is. for governmental purposes, were formerly occupied by loyalist refugees from Georgia after the declaration of independence by the U.S.A.; but the white owners, owing to losses and destruction from hurricanes and insect pests, lost heart and departed, abandoning their lands to their slaves. After incorporation the exploitation of the group for salt production was mooted, and in 1850 Cockburn harbour was laid out in salt ponds on more modern lines than those of Grand Turk or Salt Cay. The hurricane of 1866 left both the gov. and the pond owners in a state of financial embarrassment and, after sev. years of hopeless struggle, the export tax on salt was abolished, drastic retrenchment effected, the elective system of legislation abrogated, and the is. became a Crown colony and a dependency of Jamaica. To-day there is a legislative board for the T. and C. Is. comprising 4 official and 8 elected members with the commissioner as President; its ordinances require the assent of the governor of Jamaica. Pop. (estimated) 6315.

Turksib, short for **Turkestan-Siberia Railway,** important railway in Russia, connecting the Trans-Siberian (q.v.) and the Orenburg-Tashkent line. It runs through Novosibirsk Oblast, Altay Kray, and SE. Kazakhstan (see KAZAKHSTAN). It was built 1913-30 and hailed by Communists as the first achievement of the Five Year Plan.

Turku (Abo), important tn in Finland, and formerly cap., situated on the Aura-joki R. not far from its mouth. Its univ. founded in 1640, was removed to the present cap., Helsinki, after the disastrous fire which destroyed its buildings and most of the tn in 1827. It has important shipbuilding, textile, and machine industries, and timber trade. Pop. 74,000.

Turku-Pori, co. of Finland, on the Gulfs of Finland and of Bothnia, with numerous lakes. Mining, fishing, cattle-rearing, and engineering are carried on; there are shipyards, and manufs. of paper, leather, tobacco, wood, and metal products, also distilling and brewing industries. The cap. is Turku (q.v.); Rauma and Pori are the prin. tns. Area (land) 8500 sq. m.; pop. 647,100.

Turmeric (*Curcuma longa*), plant with long leaves and a spike of pale cream

flowers, a native of Ceylon, and extensively cultivated in India for its rhizomes, which when dried and ground yield a yellow dye. It is also used as an ingredient in curries, and has various uses in Hindu medicine. T. paper is an unsized paper dipped in an alcoholic solution of T., and is used as a test for alkalis, with which it gives a brown colour turning violet on drying.

Turn, see under ORNAMENTS, MUSICAL.
Turnbull's Blue, blue pigment which is precipitated by the action of potassium ferricyanide on a ferrous salt. Its composition is identical with that of insoluble Prussian blue, viz. ferric ferrocyanide,

which is formed on the addition of a ferric salt to a ferrocyanide. See DYK.

Turnebus, Adrianus (properly, **Adrien Turnebe**) (1512-65), Fr. classical scholar, b. Les Andelys, Normandy. In 1547 he was appointed prof. of Greek and Latin at Paris. He wrote theological and critical treatises and trans. a number of classical authors.

Turner, Sir Ben (1863-1942), trade unionist, b. Holmfirth, Yorks, his parents being hand-loom weavers, worked at a mill as a half-timer. For some time he was a delegate to the Trades Union Congress and a member of its General Council, and in 1927-8 was chairman of the Council, becoming president of the T.U.C. in 1928. For 20 years from 1902, he was unpaid general secretary of his trade union and also dist. secretary of the heavy woollen branch of the workers organisation. In 1922, following an amalgamation of unions, he became President of the National Association of Textile Workers, being at the same time President of the National Associations of Unions in the Textile Trade. He was elected M.P. for the Batley and Morley Div. in 1922, but lost his seat in 1924; he was re-elected in 1929, and again defeated in 1931. In 1929 he was made secretary for mines, but resigned a year later to resume his trade-union work. T. was knighted in 1931.

Turner, Charles Tennyson (1808-79), poet, b. Somersby, Lincs, brother of Alfred, Lord Tennyson (q.v.). Educ. at Louth Grammar School and Cambridge, he took orders and became vicar of Grasby, Lincs. He collaborated with Alfred in *Poems of Two Brothers*, 1827. In 1830 he changed his name to T. on inheriting the property of a great-uncle. His *Collected Sonnets, Old and New* appeared in 1880. See H. Nicolson, *Tennyson's Two Brothers*, 1947.

Turner, Cyril, see **TOURNUR.**

Turner, Frederick Jackson (1861-1932), Amer. historian, b. Portage, Wisconsin. Educ. at the Univ. of Wisconsin and Johns Hopkins, he was prof. of history at Harvard from 1910 to 1924. In 1893 he wrote a notable paper which became the chief essay in his book *The Frontier in American History*, 1920, and had a profound effect on Amer. historical thought. Others of his works are *The Rise of the New West*, 1906, *The Significance of*

Sections in American History, 1932, which was awarded the Pulitzer Prize, and *The United States, 1830-1850*, 1935.

Turner, Joseph Mallord William (1775-1851), landscape painter, b. London, son of a barber. His general education was limited, but early experience as a copyist in the house of the art collector Dr Monro (where he became intimate with Girtin) enlarged his view of painting and drawing. In 1789 he entered the Royal Academy schools, and in 1798 exhibited sev. pictures at the Royal Academy. Four years later he was made an academican. In 1807 he began the pub. of his *Liber Studiorum*, consisting of a series of Eng. landscapes, many of them engraved by the master himself. In 1828 he travelled in France and Italy, and in 1831 he visited Scotland, having been asked to illustrate a new ed. of Sir Walter Scott's poems. The following year he lived at Venice, and in 1836 he went a second time to France; but the closing years of his life were spent mainly in London, and he d. there. He was buried in the crypt of St Paul's Cathedral, and, in accordance with his will, the National Gallery acquired a large array of his oil-paintings and over a thousand of his sketches. In the Glasgow Art Galleries are also a number of his works, and there is a fine collection of his water-colours in the National Gallery of Scotland. T.'s earlier paintings are sober in colouring, bluer greys, and browns predominating; the pictures of his middle and late period are remarkable for their splendour of colouring and brilliance of light effects, as exemplified in 'The Fighting Temeraire' and 'The Sun of Venice Going to Sea'. T. possessed the gift of capturing and rendering transitory effects of light, and also in colour and romantic composition is one of the greatest figures in the hist. of landscape painting. The most important study of his art is that embodied in Ruskin's *Modern Painters*. See also W. G. Rawlinson, *Turner's Liber Studiorum*, 1906, and *The Engraved Work of Turner*, 1908-13; W. Bayes, *Turner: A Speculative Portrait*, 1931; B. Falk, *Turner, the Painter*, 1938. See lives by G. W. Thornbury, 1877; Sir W. Armstrong, 1902; A. J. Finberg, 1939.

Turner, Walter James Redfern (1889-1946), Brit. poet, novelist, and music critic, b. Melbourne, son of an organist. Educ. at Scotch Collège, Melbourne, he came to London at the age of 17, and later studied at Vienna, Dresden, and Leipzig. During the First World War he served in the Royal Garrison Artillery. He was music critic of the *New Statesman* from 1916 to 1940, and literary critic of the *Spectator* from then till his death. Much of his verse is exotic, with rich and flowing language; vols. include *The Hunter*, 1916, *The Dark Fire*, 1918, *Paris and Helen*, 1921, *Landscape of Cythera*, 1923, *The Seven Days of the Sun*, 1925, *New Poems*, 1928, *Pursuit of Psyche*, 1931, *Songs and Incantations*, 1936, and *Fables, Parables, and Plots*, 1943. Among his novels are *The Man Who Ate the Popomack*, 1922, *The Aesthetes*, 1927, and *The Duchess of*

Pocotapell, 1939. His musical pubs. include *Variations on the Theme of Music*, 1924, and biographies of Beethoven, 1927, Wagner, 1933, and Mozart, 1938.

Turner Valley, dist. of Alberta, Canada, 35 m. SW. of Calgary. There is a vast subterranean oil pool which has been developed since 1936 and now produces 2 per cent of the Canadian output of petroleum. The field was discovered (1912) by C. W. Dingman; a further oil boom took place in 1929. The valley was named after the Turner brothers who took out homestead rights in 1886.

Turnhout, tn in the prov. of Antwerp, Belgium, 25 m. ENE. of that city. It is the economic cap. of the Kempen (Campine) region. T. is famous for its paper industry, and its coloured papers and playing-cards are largely exported. There are also printing-works, iron-foundries, mills, brick-kilns, and manufs. of lace, pottery, chocolate, and gingerbread. Pop. 34,000.

Turnip, or *Brassica rapa*, biennial cruciferous plant grown for its thick, fleshy root both as a garden and a farm crop. T.s are classified according to their shapes, Long, Tankard or Spindle, Round or Globe, and Flat. Another classification is according to the colour of the flesh. White-fleshed varieties are of rapid growth and produce much bulk in a short time, but their feeding value is low, and they are liable to be injured by frost. The yellow-fleshed varieties are of slower growth, but are of superior feeding value and keep better during winter. They are probably hybrids between the T. and the Swede (*Brassica napus*), which is distinguished by its neck or collar.

Turnour, Cyril, see TOURNEUR.

Turnovo, see TYRNOVO.

Turnpike Roads, see TOLLS.

Turnsole, see HELIOTROPE.

Turnstone, or *Streptilas interpres*, shore bird allied to the plovers and so called from its habit of turning over stones and shells on the seashore in the search for marine insects and small crustacea. It is widely distributed, but breeds chiefly on Scandinavian coasts, and only visits Britain in the winter. It is about 9 in. long. The upper parts are chestnut with black spots, and the lower parts white, except on the breast.

Turntable Ladders, see FIRE BRIGADES AND FIRE FIGHTING, *Fire 'Escapes' (Ladders)*.

Turnu-Severin, city of Rumania, at the exit of the Iron Gates, prov. of Craiova, on the l. b. of the Danube. The present tn, built on Rom. and medieval foundations, was founded 1835-41. It trades in live-stock, cereals, and petroleum, and has shipyards and repair shops. It was captured by the Austrians in 1916, and by the Russians in 1944. Pop. (1948) 31,296.

Turnus, son of Daunus and Venilia, and king of the Rutulians, was inspired by Hera to oppose Aeneas, and was slain by him.

Turpentine, is obtained by distillation from the oleoresinous exudation of pine-trees, and is obtained from America, France, India, Portugal, and Spain.

Chemically, oil of T. is a mixture of various terpenes in somewhat variable proportions and is a colourless liquid of sp. gr. 0.86. It has a boiling range from 160° to 170° C. It is insoluble in water, but is an excellent solvent for phosphorus, sulphur, and iodine. The oil is used in medicine externally as a counter-irritant. It is also a solvent for paints (q.v.) and varnishes (q.v.). In the latter fields, however, its place has steadily been usurped by white spirit, a much cheaper petroleum fraction (often called T. substitute) which can, nevertheless, replace T. in most paints without detriment to the product. T. is also used in the preparation of polishes, leather dressings, and synthetic camphor. See also ALK.

Turpentine Tree, see L'ISTACIA.

Turpin, Richard (Dick) (birth variously stated as 1705, 1706, and 1711; hanged 1739), highway robber whose fictitious exploits on his mare 'Black Bess' have secured for him almost legendary fame. T. was the son of an Essex inn-keeper, and began his career by cattle-stealing when apprenticed to a butcher. He was in reality entirely without scruples or mercy, and was ultimately convicted at York of horse-stealing and hanged.

Turquoise, or *Callaita* ($Al_2O_3.P_2O_5 + 5H_2O$), blue or bluish-green mineral which is in great favour as a gem. It is reniform or stalactitic, never crystallised, has a waxy lustre, and is feebly translucent or opaque. (Hardness 6, sp. gr. 2.7.) The blue or green colour is due to copper phosphate. On placing in hydrochloric acid the colour disappears. The best specimens for gems are obtained in Persia, others in India, Tibet, Arabia, Australia, the U.S.A., and Saxony.

Turres, see PIROT.

Turriff, burgh of Aberdeenshire, Scotland, 35 m. NW. of Aberdeen. Originally known by the Celtic name of Turbrud, the tn was founded in the 6th cent. It is an agric. mkt tn and egg-packing centre, and agric. engineering and implement-making are the chief industries. Pop. 3000.

Turtle, aquatic reptile of the tortoise family (*Chelonidae*). T.s differ from land tortoises in having the feet modified into paddles. They resort to the sandy shores to lay their eggs. The green T. (*Chelone mydas*) is used for turtle soup. The hawksbill turtle (*Chelone imbricata*) yields tortoise shell. See also CHELONIA; TERAPIN; TORTOISE.

Turtle Dove, or *Streptopelia turtur*, summer visitor to Europe and Britain, which it leaves about Michaelmas to winter in Africa. It is from 12 to 13 in. long, with a long, much-rounded tail. The plumage is greyish brown, with yellow on the sides of the head and pink on the neck and breast. The back of the neck and crown are greyish blue, and the legs and toes are red. Two pure white eggs are laid in a rough structure of twigs placed in a tree near the ground. The male assists the female in incubation, and their devotion is proverbial. Another species is the collared T. (*T. risoria*),

which is often kept in captivity. This latter species is about 10 in. long; has a short tail; general colour grey, tinged with red, upper parts greenish-brown, with black collar on back of neck.

HAWKSBILL TURTLE

Turton, tn and urb. dist. of Lancs, England, 4 m. from Bolton. It is largely rural in character, and consists of 7 wards, with a few cotton-bleaching, finishing, and printing mills in the dist. T. Tower, a 16th-cent. mansion, is now a civic centre and museum. Pop. 11,000.

Turukhansk: 1. Obsolete name of a vast ter. in N. Siberia along the lower Yenisey (Krasnovarsk Kray), annexed to Russia in the early 17th cent. The ter. is rich in mineral resources; from the 19th cent. an area of banishment, it now has forced-labour camps (see NORK'SK; IGARKA; MANGAZEYA; TAYMYR; EVEN-KI).

2. (Formerly **Monastyrskoye**), vil. at the confluence of the Yenisey and the lower Tunguska. Pop. (1940) 3000. Before 1917 it was the centre of the T. banishment area.

3. (1672-1782 **Novaya Mangazeya**, now **Staryy T.**), vil., former tn, near (2), founded in 1607, from 1672 a tn, the administrative and fur-collecting centre of T. ter.

Tuscaloosa, city of T. co., Alabama, U.S.A., on the Black Warrior R. It is the seat of the univ. of Alabama, and has cotton manufs., lumber mills, and coal mines in the neighbourhood. Pop. 46,400.

Tuscan League, see FLORENCE.

Tuscan Shrew (*Suncus etruscus*), small mammal, measuring from snout to tail less than 3 in. The head and body actually measure only 1½ in. Its fur is ashy red above, and lighter beneath, the tail clothed with short hairs with rings of longer white hairs; ears moderate and projecting from the fur. It is found in the S. of Europe from S. France to the Black Sea and in N. Africa.

Tuscany (It. *Toscana*), region (*compartimento*) of central Italy, comprising

the provs. of Massa e Carrara, Arezzo, Florence, Grosseto, Leghorn, Lucca, Pisa, Pistoia, and Siena (qq.v.). It is bounded N. by Emilia-Romagna, W. by the Ligurian and Tyrrhenian Seas, S.E. by Lazio, and E. by Umbria (qq.v.). It is mostly in the N. Apennines (q.v.), is watered by the Arno (q.v.), and contains the Maremma (q.v.). T. is roughly co-extensive with the anct Etruria (q.v.). Since the rise of the Medici (q.v.) in Florence, the region has been dominated by that city. On the extinction of the Medici in 1737, T. passed to the House of Hapsburg (q.v.). It was invaded during the French Revolution, the grand duke, Ferdinand III (q.v.), being forced to flee. By the Peace of Lunéville (q.v.) in 1801 T. was given to Spain, but in 1807 it was ceded to Napoleon I (q.v.). On Napoleon's downfall in 1814 Ferdinand III returned, and in 1848, under his son, Leopold II, a constitution was granted. However, a revolution broke out, and Leopold maintained his position only with the aid of Austrian troops. In 1859 Leopold was expelled by the Florentines and T. voted for annexation to Sardinia (q.v.), becoming part of united Italy in 1861. The contribution of T. to It. culture has been very great, and the Tuscan dialect has become the literary language of Italy (see ITALY, *Language and Literature*). The region has copper, iron, lignite, and manganese deposits, marble is quarried, and cereals, vines, tobacco, and olives are grown. Area 8861 sq. m.; pop. 3,209,000. See Zobi, *Storia Civile della Toscana*, 1850; J. A. Ross, *Old Florence and Modern Tuscany*, 1904; A. M. and J. W. Cruikshank, *The Smaller Tuscan Towns*, 1912; E. Hutton, *A Wayfarer in Unknown Tuscany*, 1925; D. Patmore, *Italian Pageant*, 1950.

Tuscaroras, tribe of N. Amer. Indians. Driven out of Carolina by the whites, they became one of the tribes of the Iroquois (q.v.) Confederacy. To-day there are about 800, in Canada and New York State.

Tusculum, anct tn of Latium, 15 m. S.E. of Rome, said to have been founded by Telegonus, son of Odysseus. The modern Frascati is close to the site. When Octavius Mamilius, Tarquin's son-in-law, was driven out of Rome, he took refuge in T., whence he led the Lat. allies of Lars Porsena against the Romans, but perished in the great battle of Lake Regillus (497 bc). From that time till the Lat. war of 340 bc, T. remained faithful to Rome. Cato the Censor, was b. there. Its proximity to the cap. and the beauty of its situation made it a favourite summer resort of the Rom. nobles. Cicero had a villa at T., which he frequently mentions under the name of Tusculanum.

Tuskegee, tn of Alabama, U.S.A., about 50 m. due E. of the cap. Montgomery. It is noted for the T. Institute, a Negro univ. and the next oldest to Hampton (Virginia), which was founded by Booker T. Washington and is notable for the scientific work done in its laboratories by Dr George Washington Carver. Most of the students, who numbered nearly 2000 in

1953, are from the Lower S., and the student body is 99 per cent Negro; there are a few Amerindians; the faculty is exclusively Negro. Pop. 6700.

Tussauid, Madame Marie (1760-1850), foundress of the waxwork exhibition in London. b. Bern, Switzerland. She studied art under her uncle in Paris, and was appointed drawing-mistress to the ill-fated family of Louis XVI. Coming to England in 1802, she settled in London, where her exhibition, first shown at the Lyceum in the Strand, became, and still is, one of the most popular sights of the city. The building was destroyed by fire in 1925 and re-opened in 1928. During the Second World War it was damaged by a bomb in 1940, but is now re-opened. See L. Tussauid, *The Romance of Madame Tussauid's*, 1937, and Sylvia Martin, *I. Madame Tussauid*, 1957.

Tusser, Thomas (c. 1524-1580), poet and writer on agriculture, b. Rivenhall, Essex. Educ. at Eton and Cambridge, he held the post of musician to Lord Paget. He wrote *A Hundreth Goode Pointes of Husbandrie*, 1537, giving instruction in farming in rude but lively verse, and later *A Hundreth Good Pointes of Huswifery* or Housewifery. The two works were afterwards reprinted together. Despite his shrewd advice to others, he died in prison as a debtor.

Tussilago Farfara, see COLTSFOOT.

Tussock Moths (*Dasychira*), genus of moths, 2 species of which occur in Britain, the rare dark T. M. (*D. fascelina*) and the pale T. M. (*D. pudibunda*), a common moth of a greyish colour. Its caterpillar, which has a number of tufts or tussocks of hair, sometimes causes considerable damage to hops and forest trees.

Tutankhamen, Egyptian king of the 18th dynasty, son-in-law and successor of Akhnaton (q.v.). He came to the throne at the age of about 10 as Tutankhaton, being married to Akhnaton's third daughter Ankhesenpaaton, and d. aged about 18, Smenkhkara, who had married the eldest daughter, having d. about the same time as Akhnaton. The religious reformation had left much dissatisfaction in the kingdom, and orthodox proving too strong, T. had to re-adopt the worship of Amen and move the court from Akhetaton back to Thebes, changing his name to Tutankhamen. An unimportant king who d. prematurely, he owes his fame to having been buried in a small tomb which was concealed by the soil from digging the larger tomb of Rameses VI near by; so that his came to be the only royal tomb of Egypt to survive almost intact until 1922, when it was discovered by Howard Carter (q.v.). The sarcophagus, with the golden coffin, is still in the tomb, but the other contents fill most of the upper floor of the Cairo Museum, and are now one of the wonders of the world, although artistically verging on decadence and but a fraction of the magnificence with which the greater pharaohs must have been buried.

The tomb had been entered by thieves and sealed again by the inspectors of

Rameses IX. The antechamber, a small room 26 ft. by 12 ft. was filled with furniture, etc., including 4 chariots, 3 gilt couches, a wonderful throne covered with gold and inlaid, a statue, a casket containing robes, other boxes, stools, vases of stone and faience, etc., and 2 life-size statues of the king flanking the doorway to the painted burial chamber, about the same size, and filled to within 2 ft. of the wall by a shrine containing 3 other shrines. Between the shrines and the walls were various objects, including emblems of Anubis, 11 magic oars, and a silver trumpet. Each shrine was overlaid with gold, and between it and the next were stacked vases, sticks, bows, etc. The second shrine was sealed, showing that the actual burial had never been disturbed. The last shrine exactly fitted the quartzite sarcophagus, with a goddess in high relief at each corner. Within were 3 coffins, all in the form of the king as Osiris, the first two covered with gold and the third of solid gold. Inside was the mummy with a mask of beaten gold; with many amulets and ornaments were 2 daggers, one with blade of iron and the other of gold. In a room off the burial chamber was a shrine of Anubis, and a shrine over the canopic chest containing the royal viscera and guarded by 4 statuettes of goddesses, caskets, over 400 *shabti* figures, a lock of Queen Ti's hair in a miniature coffin, statuettes of divinities, model boats, etc. A fourth room contained much other furniture and provisions. See Howard Carter and A. C. Mace, *The Tomb of Tut-Ankh-Amun*, 1923-33; Penelope Fox, *Tutankhamun's Treasure*, 1951.

Tutbury, tn of Staffordshire, England, on the Dove, 4 m. from Burton-on-Trent and 140 m. from London by rail. T. has a ruined castle, in which Mary Queen of Scots was imprisoned. There is a parish church built in 1083, which is notable for its Norman doorway. The tn has an agric. trade, and old glass-cutting works famed throughout England. Pop. 2274.

Tutela, see TUELA.

Tuthmosis, see THOTHMES.

Tuticorin, tn on the sea-coast in SE. of Madras State, India. There is no harbour, but it is a port for steamers to Colombo, Ceylon. Founded by Portuguese in 1540, it was captured by the Dutch in 1658, and finally by the British in 1825. There is an old Dutch cemetery and a large Rom. Catholic church built by the Portuguese.

Tutor, in Scots law, the guardian and legal representative of the person and the administrator of the estate of a pupil, i.e. a male child under 14 and a female child under 12. T.s are either: (1) *nominate*, i.e. he who is named by the father or mother in a will or other document; (2) *of law*, i.e. he who succeeds by mere operation of law in the absence of nominate T.s (seldom resorted to); or (3) *dativo*, i.e. he who applies where no T.-of-law demands the office.

Tutulla, see SAMOA.

Tuva, autonomous Oblast in S. Siberia, bordering on Outer Mongolia. It is a half-forested mountainous area (66,100

sq. m.) traversed by the Upper Yenisey, with gold, coal, and salt deposits. Pop. (1956) 168,000, mostly T. (a Turkic-speaking people) and Russians (since 19th cent.). Sheep, goats, and cattle are raised, and there is some industry. The cap. is Kyzyl. T. was Chinese 1757-1912, became a Russian protectorate in 1914, a 'People's Rep.' in 1921, and was annexed by the U.S.S.R. in 1944. See W. Kolarz, *The Peoples of the Soviet Far East*, 1954. **Tuxtla Gutiérrez**, cap. of Chiapas state, Mexico, 265 m. SE. of Vera Cruz, and 50 m. SW. of San Cristóbal, convenient for the painted ruins of Bonampak. There is mining and fruit-growing in the dist., which also produces sisal, coffee, cattle, and tobacco. Tanning and indigo industries are carried on. T. G. is a modern city on the Pan-Am. Highway. Pop. 15,900.

Tuymazay, industrial settlement in the Bashkir Autonomous Rep. (Russia), 110 m. W. of Ufa, centre of the Tatar-Bashkir oilfields (oil extraction since 1937) and the starting point of a pipeline to Omsk.

Tuzla, tn in Bosnia-Herzegovina, Yugoslavia, or the Jala. It is a spa, an important rail junction, and a growing commercial tn. with coal, salt, textile, and timber industries. Pop. 31,250.

Tvardovskiy, Aleksandr Trifonovich (1910-), Russian poet. During the Collectivisation of Agriculture (q.v.) he reported it for local papers; in the Second World War he was a war correspondent. His best long poems, written in the Nekrasov tradition, spring from these experiences. *Murav's Country*, 1936, depicts the longing of the peasant for his own plot of land; *Vasilii Terkin*, 1946, is a brilliant portrait of the Russian private soldier. As editor of the *New World* (foremost literary magazine in Russia) he took the initiative in 1953 in starting the post-Stalin 'thaw' in letters by publishing chapters of his poem *Far Distances*, in which he exposed the mechanism of ensuring authors' conformity under the Communist regime (see COMMUNIST PARTY OF THE SOVIET UNION; SOCIALIST REALISM; STALINISM), and sev. nonconformist articles by young critics, including a programmatic one 'On Sincerity in Literature' which substituted the criterion of sincerity for that of the 'party spirit.' T. was dismissed in 1954 but remains a leading figure in the intellectual opposition.

Tver, see KALININ.

Twaddell, see SPECIFIC GRAVITY; HYDROMETER.

Twain, Mark, see CLEMENS.

Tweed, riv. in the S. of Scotland, draining most of the E. portion of the Scottish lowlands. It rises in the Tweedmuir Hills in SW. Peebles-shire and flows in a NE. direction, through the N. of Selkirk and Roxburgh to form the boundary between Berwickshire and Northumberland before entering the N. Sea at Berwick-on-Tweed. It drains an area of 1870 sq. m., and is one of the best salmon rivs. in Scotland, though the fisheries have declined in importance. The traffic on

its waters is chiefly confined to Berwick, and the riv. is navigable only in its last 6 m. Length 97 m.

Tweed, woollen fabric, manufactured in Scotland, T. and Ireland, and extensively worn. The Harris and Donegal tweeds are notable. The name seems to be a corruption of 'tweel', or 'twill', used for materials with parallel diagonal lines over the surface of the cloth.

Tweeddale, John Hay, Second Earl and first Marquess of (1626-97), soldier and chancellor. He fought alternately for the royalist cause and for the parliamentarians: he fought for the king in 1640, and on the side of parliament at Marston Moor (1644); 4 years later he was again with the Royalists at Preston. In 1656 he was a member of Cromwell's parliament, and, in 1663, president of the Scottish Council, and, in 1664, extraordinary lord of session, but was dismissed for mitigating the harshness of proceedings against the Covenanters (1664). Eight years later, however, he was again a member of the Council. From 1692 to 1696 he was lord chancellor of Scotland, but was dismissed for giving his support to the Darien scheme.

Tweeddale, see PEEBLES.

Tweedmouth, part of bor. of Berwick-upon-Tweed (q.v.), Northumberland, England. It has a dock, and its industries include timber saw-mills and joinery works, a canning factory, and a bakery. Pop. 4600.

Tweedsmuir, Baron, see BUCHAN, JOHN 1st Baron TWEEDSMUIR.

Twelfth-Day, see EPIPHANY.

Twelve-note Music, a new system of composition on which the later works by Schoenberg and the music of some of his disciples (e.g. Berg, Křenek, Pisk, Webern) are based. It abolishes keys and with them the predominance of certain notes in a scale (tonic, dominant, subdominant, and mediant), using instead the 12 notes of the chromatic scale, each of which has exactly the same importance as any other. This rules out any feeling of tonality and also discards the resource of modulation, so important to musical structure in the classical sense. In order to take care that no note assumes an even temporary predominance, the rule has been estab. that a musical theme must invariably consist of all the 12 notes of the chromatic scale, and that each note must appear only once in its course (transposition into any octave being allowed); this does not mean that all melodic patterns of T. M. are necessarily of the same length, for these may be given any rhythmic shape the composer desires, and these shapes may be varied throughout a work, though the order of the notes, once determined at his desire, may not. By way of change, however, 2 or more of the 12 notes may appear simultaneously instead of successively. Moreover, 3 ways of achieving melodic as distinct from rhythmic or harmonic variety are open to the composer. He may (1) restate his theme inverted (i.e. turned upside down); (2) in reverse or *canonians* (i.e. turned backwards); or (3) inverted and reversed at

the same time. That this very severely limits the composer is not disputed by the advocates of T. M., but they contend that some rules must be imposed if music is not to become merely chaotic. Adversaries hold that to establish new rules more tyrannical than those which are rejected can only result in some kind of musical mathematics, to which the defence would retort that there is much beauty in mathematics. It is too early to decide whether T. M. is likely to establish itself permanently, but it seems certain that it will never do so exclusively, as the major-minor diatonic system did establish itself in Europe for at least 3 cents. For the moment one may reasonably decide that, while obviously bad T. M. is no better than any other bad music, the best examples of it so far have shown that the system imposes some kind of mental discipline on a composer that may result in work of character and power, in spite of the evident fact that its ingenious devices, fascinating to the eye on paper, remain quite undiscoverable to the ear in performance. The final test, then, as in all music, must be sought, not in technique but in a composer's inspiration, and whether many composers in the future will be inspired by this system remains to be seen.

Twelve Patriarchs, Testaments of the, a series of writings purporting to give the dying speeches of the 12 sons of Jacob. Each speech develops into an exhortation to avoid some particular sin or practise some special virtue. It is a Jewish work of the 2nd cent. BC, but early underwent Christian interpolation. It is referred to by Tertullian and Origen.

Twelve Tables, The (Rom. law). The Duodecim Tabulae or T. T. was the earliest code of Rom. laws, and was mainly the work of the decemvirate formed expressly for the purpose of evolving such a code (451-449 BC). Prior to the promulgation of this code, law making was an exclusively patrician function, and the general body of the people had no means of ascertaining the state of the law. The T. T. were not a comprehensive exposition of law but merely a written statement of those aspects which dealt with everyday problems requiring adjudication. They provided a practical written code which incorporated those elements of customary law which were essential for the proper administration of justice. The T. T. formed the basis of later Rom. law which inspired many modern Continental legal systems.

The contents of the T. T. included such topics as the procedure in civil actions, contracts, recovery of debts, the powers of a *paterfamilias*, inheritance, property rights, *delicts* (i.e. crimes), and the prohibition of intermarriage of patricians and plebeians. In the study of Rom. law the fragments of the T. T. which are extant, together with the writings of Gaius (q.v.) and Cicero, and of other jurists such as Ulpian, are of the highest value in enabling us to ascertain the essential features of the private Rom. Law

at a period before it had become moulded to a more matured culture. See Livy, iii. 31-7; Cicero, *De Leg.* 11; *Rep.* ii. 37, 63; Gaius, *Dig.* x. 1; xlvii. 22, etc.; L. Schoell, *Legis Duodecim Tabularum; Reliquiae*, 1866; H. J. S. Maine, *Ancient Law*, 1861; W. A. Hunter, *Introduction to Roman Law*, 1950.

Twickenham, municipal bor. of Middx, England, on the N. bank of the Thames, opposite Richmond. Created a bor. in 1926, it was enlarged in 1937 to include the urb. dists. of Teddington, Hampton, and Hampton Wick (qq.v.). T. appears in the second oldest Middx charter (704), when the land was granted to the Bishop of London. Houses for the nobility began to be built here in the late 16th cent., and it became fashionable in the 17th cent. Among its residents have been Bacon, John Gay, Fielding, Lady Mary Wortley Montagu, Kitty Clive the actress, Dickens, and Tennyson. York House (late 17th cent.), now the municipal offices, was once owned by James II when Duke of York (but its name appears to derive from an earlier owner); Queen Anne lived there as a child. Kneller Hall, built 1709-11 and since altered, was the house of Sir Godfrey Kneller, and is now the H.Q. of the Royal Military School of Music. But T. is chiefly noted for its associations with Pope and Horace Walpole. Pope's Villa, where he lived from 1719 until he d. in 1744, and where many celebrities met, was pulled down in 1807. Walpole settled in a cottage here in 1747, and in 1750 began to reconstruct it in Gothic style, progressively enlarging it with the help of several architects until the huge mixture of mansion and castle was completed in 1776. Strawberry Hill, as he named it, has had some influence on architectural taste. It is now a Rom. Catholic training college for teachers. The oldest surviving building in T. is the 15th-cent. tower of the par. church, retained when the church was rebuilt 1714-5. Pope is buried there. T. returns 1 member to parliament. Pop. 104,700.

Twilight. The diffused daylight which precedes and follows the passage of the sun above and below the horizon respectively is due to refraction, reflection, and scattering of the light of the sun by the atmosphere, chiefly by means of dust and water particles. Its brightness varies with these conditions, but mostly with the distance of the sun below the horizon; when the sun is well below the horizon the light may have been reflected many times. Two limits of T. are recognised: *civil twilight*, when the sun is more than 6° below the horizon and the light is considered insufficient for outdoor work; and *astronomical twilight*, which was determined in the 11th cent. as when the sun is more than 18° below the horizon. Beyond the Arctic and Antarctic circles T. increases according to season, extending over many weeks in the spring and autumn. Owing to the increasing angle at which the sun approaches the horizon towards low lats., the duration of T. decreases; it decreases also with altitude.

At Quito in Ecuador it is no more than 20 min.

Twilight Sleep, see HYOSCINE; OBSTETRICS.

Twill, woven fabric in which the warp is raised 1 thread and depressed 2 or more threads for the passage of the weft.

Twin Falls, city, cap. of Twin Falls co., S. Idaho, U.S.A., near Snake R. It is a processing and shipping centre for an agric., dairying, and stock-raising area. It produces canned fruit, meat and dairy products, flour, beet sugar, and beverages, and manufs. overalls, cement pipe, and farm machinery. Falls in nearby gorge (500 ft) of Snake R. have been diverted for hydro-electric power.

Twinkling, or **Scintillation**, of stars, is due to the refraction of their light rays in various directions by the earth's atmosphere. The air near the earth's surface is frequently in commotion owing to warm currents rising from the comparatively warm ground, cold currents descending, and horizontal movements of layers of different densities. There are also pockets in the atmosphere which act as lenses—concave and convex—dispersing and collecting rays of light, and as these pockets are moved by the wind, stars seen through them are never steady. T. is much more common with the stars and small planets, e.g. Mercury, because they do not present an appreciable disk to the eye, the light emanating from them like a ray, whereas the planets in general send bundles of light from the various portions of their disks. In the case of the larger planets the refraction effects of individual rays cancel each other out in the sum total of light reaching the eye, unless they are close to the horizon, when the atmospheric disturbances are considerable, and in such circumstances Venus, in particular, can frequently be observed twinkling. Like the planets in general, the Moon shines with a steady light, but if its disk is almost completely obscured by a fixed object as far away as convenient from the observer (the head being held steady) so that only a minute portion of the Moon's edge is exposed to view, T. will be noticed under suitable atmospheric conditions.

Twins generally denote 2 individuals produced at 1 birth. The term is used also to describe 2 similar and equivalent objects, e.g. twin crystals. In its strictest sense, however, the word denotes the result of the div. of an organism or of an organ into 2 equivalent organisms or organs. In consequence, although 2 animals may be developed and born at the same time, they are T. only if they are the products of the div. of a single fertilised ovum. Human 'twins' resulting from the synchronous development of 2 fertilised eggs are not true T. True T. are always of the same sex. Not infrequently one individual is larger than the other. Twins may be conjoined (see under STAMINE TWINS). Comparatively few early stages in the development of human T. from a single egg have been observed, but evidence shows that T. may develop in one of 3 ways: (1) The fertilised

ovum divides to form a mass of cells, the blastula. This may divide into halves which develop separately. (2) From the blastula, 2 gastrulae may be formed and develop into 2 individuals. (3) Early in development fission may occur along the axis of the embryo and so give rise to 2 partially or completely separate individuals. There is some evidence to show that the tendency to beget T. is inherited by males.

Two Sicilies, Kingdom of the, see SICILY.

Two-stroke Engine, see MOTOR CYCLES.

Two-toed Sloth, see SLOTH.

Tyburn: 1. Trib. of the R. Thames, England, now running completely underground, formed originally by the confluence of 2 streams from the Hampstead heights. It entered the flood plain of the Thames near the W. end of St James's Park, then divided into 3 mouths, 2 of them forming the is. of Thorney on which Westminster Abbey was built.

2. The historic Midx gallows, known as T. Tree, which stood at the W. end of Oxford Street. The first recorded execution took place in 1196, the last in 1783, when the place of execution was moved to Newgate (q.v.). A permanent gallows stood at the junction of Oxford St and Edgware Road from 1571 to 1759. Among those executed here were Perkin Warbeck and Jack Sheppard. In the 16th and 17th cents. numbers of Eng. Catholics were executed at T. See also ST MARLEBONE; OXFORD STREET; PADDINGTON. See Alfred Marks, *Tyburn Tree, its History and Annals*, 1908; A. S. Foord, *Springs, Streams, and Spas of London*, 1910.

Tycho, see BRAHE, TYCHO.

Tye, Christopher, (c. 1500-1573), composer, b. probably at Ely. He may have been a chorister at King's College Chapel, Cambridge, where he was lay-clerk in 1537. In the early 1540s he became choir-master at Ely Cathedral, but resigned in 1561, was ordained and given a living at Doddington nr. Ely, where he d. His works include masses, motets, services, anthems, settings of metrical versions of *The Acts of the Apostles*, *In Nomines* for viols, etc.

Tydesley, urb. dist. of Lanes, England. The chief industries are cotton spinning and coal mining. Pop. 18,096.

Tyler, John (1790-1862), Amer. statesman, tenth president of the U.S.A., b. Charles City co., Virginia. He was called to the Bar in 1809, and in 1811 he was elected a member of the Virginia House of Delegates. In 1817-21 he was a member of the national House of Representatives, and in 1825-7 governor of Virginia, becoming a senator in 1827, when he showed his hostility to a high tariff policy. In 1840 he was elected vice-president, succeeding on Harrison's death to the presidency, in which capacity he stood as it were midway between the 2 great parties, without the support of either, for though he frequently showed himself in sympathy with the Whigs, he was never wholly one of their number; the Whigs themselves refused to acknowledge him as a member of their party. Besides the

Ashburton Treaty, the most important act of his administration was the annexation of Texas in 1845. His last years were devoted to the Confederate cause. See L. G. Tyler, *Letters and Times of the Tylers*, 1884-96.

Tyler, Royall (1757-1826), Amer. playwright and novelist, b. Boston, his original name being Wm Clark Tyler. Educ. at Harvard, he studied law, and was admitted to the Bar in 1780. In 1787 he wrote *The Contrast*, which is notable as the first comedy written by a native American and produced by a professional company, and the first play using local Amer. dialect for comic purposes. He also wrote *The Algerine Captive*, 1797, a fine picaresque novel, and sev. poems.

Tyler, Wat (fl. 1381), (Wat the tiler), leader of the men of Kent in the rebellion of 1381 in Richard II's reign. He is said to have killed a tax-collector for gross insult to his daughter, and the incident brought discontent in the SE. to a climax. The rebels marched on London, releasing John Ball (q.v.) from Maidstone Gaol on the way. They burnt Southwark Prison, plundered Lambeth Palace, broke into the Tower, and killed the Archbishop of Canterbury and Sir Robert Hales. At length T. and his men met the king at Smithfield, where the lord mayor of London, Sir William Walworth, killed T.

Tyler, city in Texas, U.S.A., 100 m. E. by S. of Dallas. It has various manufs., and is situated in a prosperous agric. region. Pop. 39,000.

Tyler, Sir Edward Burnett (1832-1917), anthropologist, b. London. One of the founders of modern anthropology, he was interested especially in the origins of religion and magic and propounded the theory of Animism, according to which primitive and early men attributed a soul to both animate and inanimate objects, this leading to a later belief in gods. His more important works are *Researches into the Early History of Mankind*, 1865, *Primitive Culture*, 1871, *Anthropology*, 1881.

Tympanites, see HOOVE.

Tympanum, in anatomy, the membrane between the external and the internal ear, sometimes called the drum of the ear. See under EAR.

Tympanum, in architecture, either: (i) in Classic buildings, the triangular space enclosed by the horizontal and raking cornices of a pediment (q.v.); or (ii) in Romanesque buildings, the semicircular space enclosed between the arch and the lintel of an arched doorway; or (iii) in pre-Reformation churches, a light screen of wood or lath-and-plaster (generally painted with a picture of the Last Judgment) filling the space between the rood-loft and the chancel-arch. See SCREEN.

Tynan, Katharine (1861-1931), poetess and novelist, b. Clondalkin, co. Dublin. A Rom. Catholic, she was educ. at Siena Convent, Drogheda. In 1883 she married Henry A. Hinkson, a lawyer. Her first book of poems, *Louise de la Vallière*, was pub. in 1885. Others are *Ballads and Lyrics*, 1891, *The Wind in the Trees*, 1898,

Innocencies, 1905, *Experiences*, 1908, and *Irish Poems*, 1913; her *Collected Poems* appeared in 1930. The first of her pleasant and sentimental novels was *The Way of a Maid*, 1895, and she wrote over a hundred, including *Dear Irish Girl*, 1899, *A Daughter of Kings*, 1905, *A Midsummer Rose*, 1913, and *The Infatuation of Peter*, 1926. She also pub. a series of autobiographical works, beginning with *Twenty-Five Years*, 1913, and ending with *Memories*, 1924. A well-known figure in the Celtic Revival, she was a close friend of Alice Meynell (q.v.).

Tyndale, William (c. 1490-1536), translator of the Bible, a native of Gloucestershire. In 1521 he became the chaplain and tutor in a household at Old Sodbury in Gloucestershire, but his sympathy with the new learning aroused suspicion and he removed to London; but finding it impossible to complete his trans. of the N.T. in that city, he went to Hamburg and ultimately to Cologne, where in 1525 he began printing the work. In 1528 he pub. *Parable of the Wicked Man* and the *Obedience of a Christian Man*, and was for a time in Henry VIII's favour, but having pub. *The Practice of Prelates* in 1530, he lost the king's goodwill. He was burnt as a heretic at Vilvorde, Netherlands. His fame rests upon his trans. of the Bible, consisting of N.T., Pentateuch, and Jonah. See lives by R. Lemaus, 1871, 1886; W. B. Cooper, 1924; J. F. Mozley, 1937.

Tyndall, John (1820-93), physicist, b. Leighlin Bridge, co. Carlow, Ireland. In 1848-50 he studied at the univ. of Marburg under Bunsen. In 1854 he became prof. of natural philosophy at the Royal Institution and was elected P.R.S. in 1852. He made important investigations in the Penrhyn slate quarries and in the Alps with Huxley, the result of their labours appearing in *The Glaciers of the Alps*, 1860. In 1859 he began his researches on radiation, and later studied the acoustic properties of the atmosphere. He was president of the Brit. Association at Belfast in 1874, and for some years was scientific adviser to the Board of Trade and to the lighthouse authorities.

Outside scientific circles, T. is remembered chiefly for his challenging address, before the Royal Institution, of which he was appointed superintendent in 1867, *The Influence of Material Aggregation upon the Manifestations of Force*, 1853, in which he claimed for matter the promise and potency of every form of life. Others of his works are: *Heat as a Mode of Motion*, 1863, *Fragments of Science*, 1871, 1879, *Floating Matter in the Air*, 1881, *Lectures and Essays*, 1903. See life by A. S. Eve and C. H. Creasey, 1945.

Tyndaris, see PATRI.

Tyne, riv. of N. England, formed by the junction of the N. and S. Tyne near the vil. of Hexham, Northumberland, flowing E. to the N. Sea at Tynemouth. Its total length is 45 m., and its prin. trib. is the Derwent. Newcastle, Gateshead, Wallsend, Jarrow, and South Shields are among the tns on its banks. The N. Tyne rises in the S. Cheviots, and the S. Tyne has its source near Crossfell in

Cumberland. The lower reaches form an important industrial area, especially for shipbuilding; depression in this latter industry during the 1930s caused great distress in the area. The riv. is navigable for ocean-going vessels to Newcastle.

Tyne Tunnel, see under JARROW.

Tynemouth, municipal, co., and parli. bor., seaport, and market of Northumberland, England, on the R. Tyne. An important seaside resort, its sands are overlooked by picturesque cliffs. Within its boundaries is the important ship-repairing and fishing port of North Shields (q.v.). During the trade slump after the First World War the dist. suffered acute distress. To avoid the recurrence of this the W. Chilton Trading Estate has been estab. by the Council, and it includes among its industries those of plastics, clothing, die-casting, confectionery, light engineering, and furniture. T. and the adjoining vil. of Cullercoats are almost entirely residential areas. Pop. 46,900.

Tynwald, legislative body of the Is. of Man, which, with the Lieutenant-governor, the Council, and the House of Keys constitute the gov. The Tynwald Court controls the surplus revenue and appoints boards to manage the harbours, highways, education, local gov., and asylums, subject to the approval of the lieutenant-governor.

Type, in chemistry, system used for indicating the structure of certain organic compounds, which were regarded as derived from sev. simple inorganic bodies by the introduction of various radicals. Gerhardt referred almost all substances to 4 typical molecules, viz. hydrogen, H₂; hydrogen chloride, HCl; water, H₂O; and ammonia, NH₃. Kekulé added a fifth T., methane, CH₄. Williamson introduced condensed T.s and Frankland from the T. theory was led to the theory of valency (q.v.). The term is now obsolete.

Type, in theology, see ANTITYPE.

Type and Typefounding. As in the earliest days of most handicrafts the craftsman made his own implements and apparatus, so in the inception of typography the printer was his own typefounder; in fact, it was not until the 17th cent. that the arts of printing and letterfounding were separated. In the second vol. of *Mechanick Exercises*, by Joseph Moxon (1683), is a very full and practical account of the making of type in his day, and the process remained much the same until the introduction of machinery for the purpose in the middle of the 19th cent., and with some modifications in the mould is still to a minor extent in use for the casting of small quantities of seldom-used sorts. Before describing the mould it will be necessary to give a description of the matrix, from which the face of the type is cast, and the punch, by means of which the letter is stamped into the matrix. The punch is a rod of steel about 2 in. long by $\frac{1}{4}$ in. square for pica and smaller sizes, and upon the end of this the letter has to be engraved after the face has been ground true on an oilstone. The outlines having been marked out, the

counters are struck in with counter-punches; as the work proceeds impressions are taken in smoke on a smooth paper and compared with the model; this refers to hand-cut punches, but towards the end of the last cent. machinery was introduced which quickly produces the punches with an accuracy impossible in hand work. The matrix is a small oblong piece of copper, on one side of which and near one end an impression of the die is struck, after which the matrix requires careful adjusting that the impression may be of the correct depth and be in exactly the right position and in perfect alignment with the rest of the fount. In original hand casting the mould was made in 2 equal sections, of wood lined with iron, and each size of body required a different mould, though the width could be regulated to the width of letter required. When the sections of the mould were joined in position, with the matrix in its place, a small chamber was left, having for its base that portion of the matrix on which the letter had been struck, and at its top a small hole with a funnel-shaped opening, into which the metal was poured as each type was cast, when, with a peculiar jerk of the left hand, which held the mould, the metal was sent right home to the deepest point in the matrix. When, on the metal cooling, the mould was opened, releasing the type with a tag of metal at the foot—the small quantity which was in the funnel-shaped opening of the mould—this had to be broken away, and afterwards a groove was cut across the bottom of the type where the tag had been. (For type-casting by machinery, see TYPE-CASTING AND TYPE-SETTING MACHINES.)

The principal element in type metal is lead, varying from 89 per cent in Moxon's formula to 55 per cent in some modern ones, but the proportion is made to suit the size and character of the type to be cast. The other principal ingredients are tin and antimony, besides which copper, nickel, cobalt, iron, and bismuth have been used.

When it is considered that a small type may run as many as 24 lines to 1 in., it will be seen what accuracy must be maintained in the moulds to get the body of each type to the standard size, and in the matrices that the alignment of the face and the thickness of line may be constant. Moxon gives only 10 sizes of type, and of these there are 2 groups of 2, of which one is the double of the other, and 1 group of 3. English, 2-line English, and great Cannon, where the latter equals 4-line English, but there is no correspondence between the various groups. By the introduction from America of the point system a method was adopted showing the relative sizes of all types, the point coming out at approximately $\frac{1}{2}$ in., and sizes named by the number of points, thus effecting the standardisation of the depth of the types. Point size refers to the depth of a type body measured columnwise. Set size, or thickness, is the width of a type body. The varying set of different letters is inherent in the alphabet we use; i and w must be cast on different

thicknesses of body, but these are now being made proportional. It is to be noted that in typefounders' parlance each portion of a single type has its own special name.

There are now two standardised sizes of different types in use in the various countries of the world. One is the American 'point' system in use in America and the English-speaking countries; the other is the French 'Didot' system in general use on the European continent. The table below gives the traditional 'English' names and the measurements of the point system:

In considering the beauty of type and its legibility there are various things to be taken into account: the correct placing of the line on the body, so that the beard may be deep enough for the descending letters, and in the lower case that the face of the short letters should leave just the right proportion of space for the ascending letters; that the italic or any other face to be used with the roman should be in exact alignment with it; that the main strokes and hair lines should bear a due proportion to one another; and in the curved letters there should be that 'sweet driving of the fats and the leans

English	Point	Inch	Lines to 6 Picas (approx. 1 in.)	Corps (Didot)	Milli-metres	Inch	Lines to 6 Picas (approx. 1 in.)

The Didot body (*corps*) is smaller than its point equivalent, e.g. *corps* 6 has 11.21 lines to 6 picas (approx. 1 in.).

Type Design. The names of the various parts of the face of type are shown in the diagram on page 291.

into one another' of which Moxon speaks; and this letter characteristic should also be found in the joining of the serifs to the main stroke. Fonts of type used for bookwork may be classed as the *old face*, the *old style*, of somewhat lighter face and

more regular appearance, and the *modern face*; and with the roman of each of these faces there is the corresponding *italic*. Besides these faces used for bookwork there are very many 'fancy' faces used for jobbing work, such as circulars, bill heads, cards, and advertising purposes; and the above-mentioned, as well as the fancy faces, are made not only to the standard set or thickness, but extended or condensed. The standard thickness is judged by placing the whole alphabet, *a* to *z*, in line, when they should measure about 12½ ems of their own body. Again,

NAMES OF TYPE FEATURES

A, Front (of body); B, back (of body); C, shank; D, feet; E, face (of letter); F, nick; G, counter; H, beard; J, bevel; K, shoulder; L, groove; M, point size; N, set width; O, height to paper (distance from the surface on which the feet of the type rest to the face, i.e. the surface which takes the ink and prints the paper) equals 0.918 in. (Britt. standard); P, pin mark.

besides the letter faces of type there are chess and draught faces, playing-card and dice faces, music faces, shorthand faces, and many others. The system of logotypes, or types bearing a combination of letters frequently occurring in conjunction, has been tried, notably that under the patent of Henry Johnson, which was adopted by *The Times* in 1782, but apparently was not found to be so great a success as was anticipated. Indeed, unless such a combination occurs more frequently than the least used of the letters, it cannot be a time-saving device. The logotypes actually in use are *fl*, *ff*, *fi*, and *ff*.

Thomas, *Type for Print* (2nd ed.), 1950; H. E. Waite, *Alternative Type Faces* (2nd ed.), 1951. See also bibliography of TYPOGRAPHY.

Type-casting and Type-setting Machines.

When machinery was introduced for type-casting, it was necessary to find some means of forcing the metal into the matrix, which in hand casting had been done by a jerk of the hand after the metal had been poured into the mould from the ladle, and the pump was introduced for this purpose in the early part of the 19th cent. It was also obvious that if any speed was to be maintained it was necessary to cool the mould by some artificial means; the expansion of compressed air was recommended for this purpose by Brunel, but at the present time water is generally used. The earliest machines for casting type followed closely the hand method, in that the mould was in 2 parts and was made to approach the nozzle of the pump, to recede from it when the metal had been delivered, to open and eject the type, repeating this action for each type cast. Such machines are still in general use, with the mould working on a pivot to and from the pump, with various cams to effect the opening and closing of the mould and the delivery of the type when cast. They were originally worked by a hand wheel, but now are made to use power, the various actions being controlled by springs. The type turned out by the hand machines, moreover, needs finishing after delivery. The improved pivotal machines, worked by power and water cooled, now turn out the finished type ready for use at the speed of 3000 ems per hour for pica or 12-point, or 1000 ems for nonpareil or 6-point; of course, with the larger sizes of type the production is much slower, as the type in the mould takes longer to cool. The Wicks Rotary Type-casting Machine was a vast improvement on any previous type-caster, and was constructed on an entirely different principle. Its chief characteristic is the mould wheel, working on a vertical shaft, and having 100 radial moulds. The type was cast in these moulds and ejected on to a delivery chain. According to the size of the type to be cast the speed of this machine varied from 30,000 to 60,000 per hour. The 'Super Caster' is the latest development of type-casting machinery, the product of which is not confined to casting type, for on it may be cast leads and rules in continuous strip, automatically cut to desired lengths, quotations, furniture, single or continuous borders, and much other material used by the compositor.

TYPE-SETTING MACHINES. These may be classified as: (a) those that set type that has been cast by some other machine; (b) those that cast their own type in the order in which it is required for printing the special work in hand; and (c) those that assemble the matrices for a complete line and then cast that line in a single slug. Dr W. Church invented in 1822 the

first type-setting machine. It belonged to type (a). Then followed a dozen or more proposals, among the more important being those of Bessemer, 1838, Young and Decambre, 1840, Hattersley, 1857, and Kastenbein, 1870, used at *The Times* from 1872 to 1905, when it was replaced by the Monotype machine. This type has been superseded by machines of the other 2 types. Of the second class of type-setting machines Monotype machinery may be taken as an example.

Monotype. These consist of 2 separate parts, a keyboard, which perforates rolls of paper (a translation of the copy into a series of perforations), and a caster, which these perforations guide in its automatic working. The keyboard is similar to that of a typewriter, and the characters are arranged on the same plan, but it is double and contains 301 keys, an arrangement of different colours indicating whether they belong to roman or italic; caps., small caps., or lower case; figures or sorts (special or unusual characters). Above the keyboard is a roll of paper which is

STANDARD MONOTYPE KEYBOARD

fed from one spool to another $\frac{1}{4}$ in. at the completion of each letter. Behind the keybanks is a series of 31 punches, and a combination of the positions of perforations from 28 of these punches is used to represent the different letters and spaces. Depressing a key actuates valves to

liberate compressed air, which sets in motion the required punches. Whilst the perforations for a line of type are being made a device is registering the thickness of every letter composed and counting the number of spaces, and at 4 ems before the completion of a line a bell rings, so that the operator may see if he can complete the word in hand or whether he shall

MONOTYPE CASTING MACHINE

divide it, or if the word is completed whether the next will come in complete or divided. Having included all that the line will contain, the line will need justifying. As the line approaches completion, the justifying drum rotates until it shows, by means of 2 figures one above the other which 2 keys are to be used to effect the justification of the line, which is accomplished on the caster by the setting of 2 wedges which divide the surplus space over the number of spaces in the line. The perforated ribbon is now ready to go to the caster, where it is paid in from the end and works backwards, for it is necessary that the justification wedges should be adjusted first, or the spaces would not be cast to the correct width.

The matrix case on the caster consists of a frame carrying 255 matrices, arranged in 15 rows with 17 matrices in each row, and each matrix is brought to casting position by the influence of compressed air passing through the combination of 2 or more corresponding perforations.

The ribbon perforated at the keyboard is transferred to the caster, and is fed to a take-up spool in a direction reverse to that in which it was perforated. The ribbon is led step by step beneath a tracker bar, and intermittently clapped over a series of 31 holes above 31 corresponding pipes. Where perforations occur the compressed air is conducted to beneath stop pins arranged in 2 groups at right angles to each other, so that a stop pin will rise on each block. Working over each group of stop pins are 2 sets of tongs, which reciprocate during each

revolution of the caster. The first pair of tongs causes a pair of jaws to contact the raised stop pin, at the same time taking a stop rack with it. This rack is immediately locked, and as the second pair of tongs meet, the jaws connected to them bring the matrix case up to the position indicated by the stop rack. The stop rack is then released ready to be taken to the next elevated stop pin.

In the meantime, as the matrix case is brought to position, a wedge is moved to a corresponding position for the purpose of limiting the distance to which the mould blade may be withdrawn, so that the type next to be cast will be correct to size. The matrix case then descends towards the mould, and a coned pin clamps the required matrix on to the mould in its exact required position, and a piston then pumps the metal into the mould, producing a type body with the characters shaped at the head. A trickle of water through the mould causes the metal to be instantly solidified. The matrix case then leaves the mould, permitting the type to be ejected, leaving the mould ready for the next cast to be made.

The types are ejected into a narrow channel, one by one, until the line is complete, and the justification perforations at the end of the next line are reached. These cause 2 further wedges to be adjusted, so that all the spaces in the next line will be cast true to size to make the line correct in width, and the casting of the next line is then proceeded with in similar manner. The types may be cast at the rate of 140 a minute for 12-point up to 180 a minute for 6-point or smaller, and the width of line may be cast up to 60 cms picas. The Monotype principle has been applied to film-setting or photo-composing (q.v.) under the name Monophoto. See also LANGTON, TOLBERT.

Linotype. Of the third class of machine the 'Linotype' may be taken as typical. It creates lines of metal, known as slugs, which can be used for direct printing, or, as in newspaper work, for making papier-mâché moulds from which stereotype plates are produced. Each of these lines of metal or slugs is the length and width of a line of type, and has on its upper edge the necessary type characters to print an entire line. Several lines of slugs produce the same appearance as lines of type which are composed of single types and serve exactly the same purpose. After use these slugs are melted down and used for recasting into other slugs.

The dominant feature of the Linotype is the individual freely circulating matrix. A matrix consists of a flat plate which has on its vertical edge a die or dies of a character, and has in its upper portion a series of teeth which are used for selecting and carrying it to its proper place in the magazine or container. This container has a series of grooves or channels along which the matrices slide on their edges and from its lower end they drop one by one when released by the depression of a key button.

A keyboard is used for assembling these various matrices in the order required

for making words. When the operator depresses a key it releases a matrix from the container or magazine above. The matrix falls down on a constantly revolving belt into a box, which represents the 'stick' of the hand compositor. After each word, a spaceband is inserted by depressing a key. When the matrices and spacebands have been assembled to fill a line the operator raises the whole line by depressing a handle on the right. Thereafter the entire operation of casting the line and returning the matrices to their original places is effected mechanically, and the operator can therefore begin to assemble the next line. The line is transferred to the front of the mould, which is slotted from the front to the rear and is of a size determined by the body and length of slug to be cast. While the line of matrices and spacebands is in front of the mould, the spacebands, which are double wedge-shaped, are spread upwards until the line is spaced out to the required measure. At this moment the slot in the mould and the dies of the row of matrices are filled with molten metal to produce a slug. The molten metal is contained in the pot behind the mould wheel, and is kept in a molten state within by a bunsen gas flame or by electrically heated elements. The molten metal is forced into the mould and the matrices by a plunger, which pumps the metal up the delivery mouth into the mould, where it solidifies and forms a slug.

After casting, the mould wheel containing the slug revolves and brings the slug into a vertical position, where it is pushed by an ejector through 2 parallel trimming knives into a tray or galley. At the back of the mould wheel is a knife which trims the bottom of the slug. While the slug is being trimmed and ejected, the matrices and spacebands, having finished their work, are returned for use to their original places. The matrices are first lifted vertically to an intermediate channel, thence they move laterally to the right until their teeth engage in the ribs of the bar which has descended to receive them. This bar then rises and lifts the whole line of matrices to the distributor mechanism at the top of the magazine. In the meantime the space bands, which have remained behind (because they have no teeth to engage in the bar), are transferred by a grabber to their original position in the box for use again.

The method by which each matrix is returned to its proper channel in the magazine is as follows. Each matrix has a number of teeth in the V formed by its top portion. These teeth are not the same in every matrix, but are arranged in a particular order or combination according to the characters they bear. Every character differs in its combination from a matrix bearing a different character, and the teeth play an important part in effecting the return of the matrices to their respective places. A rigid notched bar is fixed in position above the open ends of the magazine mouth, and is so made as to engage the teeth and hold them in suspension. The ribs of the bar vary in

number and continuance along its length. The matrices are pushed on the bar at one end and carried along it over the mouths of the channels. Each matrix is engaged by its teeth on the bar until it arrives over its proper channel, where the combinations of teeth allow the matrix to disengage so that it falls into its own channel. The matrices are carried along the bar by means of longitudinal screws, which lie below the bar in such a position as to engage the edges or lugs of the matrices and carry them along the bar. It is this system of the circulation of matrices and the fact that the operations of assembling them in one line, casting from them in another, and carrying them back to the magazine are concurrently effected without interference, that enables the machine to be operated at a speed beyond that hitherto attainable in type composition. The makers of the Linotype have developed a film-setter or photo-composer (q.v.) with the name Linofilm. See also MERGENTHALER, OTTMAR.

Another type of machine in this class is the *Intertype*, which resembles other line-composing machines only in general appearance and operating principles. One operator on an Intertype composes and casts type matter of all descriptions, ready for printing, in sizes from 5-point to 60-point, as well as rules and all kinds of decorative and spacing material. As many as 586 characters are available from one Intertype keyboard, and up to 12 'faces' or styles of type. The type is cast, a line at a time, from brass matrices. Up to 20 matrices of each letter or character to be composed are stored in magazines and released mechanically one at a time by the operator's touch on the keyboard. The released matrices are conveyed in correct order to an assembler (resembling the compositor's 'stick'), with wedge-shaped spacers between the words. When the complete line is assembled the operator releases it to the casting portion of the machine, where it is automatically justified against a mould of correct size and molten metal is pumped into the mould and matrices to form the line. The latter is then trimmed to dimensions accurate to within $\frac{1}{1000}$ in., and in its turn assembled on a galley in column or page form. Meanwhile, the machine automatically 'distributes' the used matrices and spacers back to their respective magazines ready to be used over again. The complete cycle of machine operations as here described happens 7 times each min. The outstanding feature of the Intertype is its simplicity when compared with other machines of its class. Included in the Intertype series is the *Intertype Photo-setter*, which sets type photographically as distinct from the setting and casting of type by means of the hot metal machine. See under FILM-SETTING; see also RIDDER, HERMAN.

The Ludlow System of Composition. This is essentially employed for the casting of display lines, with a comprehensive range of type faces in sizes from 6-point to 96-point. The units of the Ludlow

which make it a complete composing-room system are the machine, cabinets that each hold 20 fonts of matrices, spaces, and sticks. The complete necessary equipment can be contained in a floor area of only 10 ft by 6 ft. With the Ludlow system of composition, individual brass matrices are set or 'gathered' by a hand compositor from the matrix cabinet, and placed face downwards in a special stick, rectangular in shape with a screw clamp at the end. The 'gathering' of matrices is much quicker than picking up one type or one matrix at a time. This stick or matrix holder is then inserted in the machine, which ejects a certain amount of molten lead alloy through a mould into these matrices. The character contained on the working face of the matrix is faintly embossed on the back, together with an identification line, so the compositor can check the line.

Whatever the face size required, type lines may be cast on the Ludlow without mould, magazine, or other machine changes, since any variation in face-size is provided for by an overhang cast on both sides of the slug shank. This overhang is of ample thickness and strength, and is further reinforced by blank slug underpinning. From end view the Ludlow slug is T-shaped.

The machine is 4 ft wide, 3 ft 6 in. high and 3 ft from back to front, and has an electrically heated and automatically fed metal pot. The metal usually used is an alloy of 4 per cent tin, 12 per cent antimony, and 84 per cent lead, with a working temp. about 55° F. The machine is driven by a 1-h.p. motor, which also drives a small water pump circulating the water through the mould, keeping the mould relatively cool, and enabling repeat castings for as long as required at the rate of 6 slugs a min. In general practice only 2 body sizes of moulds are used, 6-point and 12-point, both 24 cms in length (see LUDLOW, WASHINGTON I.) The Haderg film-setter (q.v.), a photo-composer, has been claimed as a 'Ludlow' representation of this development.

Type Metals can have the following compositions: electrolyte, 94 per cent lead, 3 per cent tin, 3 per cent antimony; stereotype, 81 per cent lead, 6 per cent tin, 13 per cent antimony; Linotype, 84 per cent lead, 4 per cent tin, 12 per cent antimony; Monotype, 78 per cent lead, 7 per cent tin, 15 per cent antimony; Foundry type, 70 per cent lead, 10 per cent tin, 20 per cent antimony. *Electrotype* metal has the lowest tin and antimony content, since it is not required to resist wear and is used only as a backing to the copper sheet replica electroformed over the surface to be printed. *Stereotype* metal is cast in large plates against a fibre impression of the surface to be printed. Good castability is needed, but, unlike electrolyte, stereotypes are used directly for printing; hence they are harder, necessitating higher tin and antimony contents. *Linotype* is die cast by machines where speed is essential for the composition of newspaper type. Low melting point and short temp. range

during solidification are required. *Mono-type* metal is also die cast by machine, but as only one character is cast at a time, a rapid cooling rate is possible, permitting harder alloys of higher melting range to give a high resistance to wear. *Foundry type* metal is used exclusively for cast type for hand composition, and requires the hardest and most wear-resistant alloy that it is practical to use.

Typewriter writing machine operated by means of a manual keyboard for producing characters similar to those of printing. In 1714 a London engineer, Henry Mills, applied to the Brit. Patent Office for a patent for a writing machine, but nothing is known about this machine. In 1784 a Fr. invention appeared of a T. for the blind. The T. in its modern commercial form was invented in 1868 by 3 men, Scholes, Glidden, and Soule, working together, their experiments being financed by Denamore. Glidden and Soule retired from the experiments, and afterwards Yost was called in to express an opinion as expert mechanic. Acting on his advice, Denamore and Scholes in 1873 sold the rights to the Remington Arms Company for \$12,000. In 1829 the first Amer. machine was patented; and in 1833 the first Fr. machine. In 1843 Charles Thurber's T. was patented, but it was not practical. In England Sir Charles Wheatstone, in about 1845, invented several kinds of T. (see his models in the S. Kensington Museum). These attempts were followed by numerous others, particularly in the U.S.A.

All T.s for letter writing are alike in having keys which are depressed by the finger, thereby setting in motion certain levers and causing a letter to make an imprint on paper or other material. The imprint is made by the type striking an inked ribbon interposed between it and the paper. In some early machines, for example the Yost, an inked pad was used in place of the ribbon, the type rested on this and when the key was depressed carried sufficient ink on its surface to leave an impression on the paper. This method is now obsolete. The paper is fed round a cylinder called the platen, between it and small feed rolls. The letters all strike one spot, so the platen must move after each letter is used. It must also move to allow a space between words. This is done by the space bar, situated between the lowest row of keys and the frame of the machine. The platen is mounted in a carriage which is made to move in the direction of its length, and the platen revolves on an axle in the carriage, thus allowing the paper to be moved up at the commencement of a new line. The movement of the carriage is automatic and is caused by a coiled spring retained in a housing or drum to which is attached a fabric or cord drawband, this in turn being connected to the end of the carriage. By means of a ratchet attached to the centre spindle the spring may be wound to give the desired tension. A toothed rack running the length of the carriage engages a pinion which, by means of an escapement wheel and rocker, en-

sures that the carriage moves precisely one space on the operation of key lever or space bar. The revolving movement of the platen is made by the action of the lever provided to return the carriage to the position to commence a new line. The mechanism causes the platen to revolve a certain fixed distance, and this distance determines the space between the lines. Usually there are 3 of these fixed distances or spacings, single, double, or triple.

Modern T.s are all front-stroke machines, and most of them employ a type-bar, which is threaded on to a fulcrum wire passing through a shaped segment, the centre bars being almost straight and the angle of the heads becoming more acute as the bars at each end are reached. In this way it is possible to get the 45 or so bars necessary to give all the characters required in a comparatively small arc. Some machines, now obsolete, had the type on a drum, or alternatively a semi-circular band of metal, the key action causing this to move until the letter depressed was opposite the platen and in position for a comparatively short stroke on to it. These drums and bands were, on some makes, easily changed enabling one to have various style types on the same machine. Another method, as in the Oliver, employed inverted U-shaped bars in plain bearings, the bars being arranged in banks each side of the machine and being drawn down by a central writing point by the action of the key levers. Yet another method still in use to-day is for each typebar to have a small ball-race at the fulcrum point, the lower part being fixed by screws and plates to a vertical piece of metal running across the machine.

A modification of the front-stroke machine is the Noiseless, which, as its name implies, is designed to operate with the minimum sound possible. This is achieved by arranging that steady pressure exerted on a key brings the bar up just short of the point of impact; when the key is struck staccato a weighted cam causes the bar to continue its travel after the actual finger pressure has reached its limit and so impresses the type, through the ribbon, on the paper.

Various methods have been tried to ensure the correct alignment of type, for not only is it necessary to have the letters equidistant, but they must also be 'on feet,' that is give an even impression over the whole of their surface, and the base of each letter must be in line with its fellows, with the exception, of course, of those which in the small characters extend below the line. To-day the general practice is to employ a type fork or guide into which the neck of the typebar enters just before the bar reaches the writing point.

The ribbon is mounted on 2 spools and passes through a guide behind the type fork. The spool that is driving is connected to the mechanism so that it moves the width of 1 letter each time a key is depressed, thereby causing the type to strike a different place each time. T.s

are now fitted with an automatic ribbon reverse so that when the spool on the right-hand side of the machine is full the drive is transferred to the left, and vice versa. Thus a ribbon fitted to a machine will continually travel to and fro while the machine is being operated. The ribbon guide rises each time a key is struck, and on the typebar resuming its rest position, falls back so that the letter is immediately visible. Most machines now are fitted with a 1-in. ribbon, and by means of a 3-position switch it is possible to type in 1 of 2 colours. The third position, stencil, as its name implies, is used when cutting stencils for reproduction work. When the switch is in this position the type strikes directly on to the stencil material, so destroying its ink-insulating properties and allowing ink to pass through when the stencil is fitted to the duplicator. In some cases the ribbon drive is out of gear when the stencil switch is used; this makes for more even wear, and consequently gives the ribbon a longer life.

The letters on the keyboard are not arranged alphabetically, but an arbitrary grouping has been adopted whereby the letters most used are in the middle and therefore directly under the fingers. The one now generally adopted for Eng. machines is as follows:

q w e r t y u i o p
a s d f g h j k l
z x c v b n m

Continental keyboards follow this arrangement with one or two changes of position. The numerals, punctuation marks, fractions, etc., vary slightly on different makes, although the tendency is now to standardise keyboards. Experiments have been made in alternative arrangements of the keyboard so as to bring those letters which are most commonly used underneath the fingers which are strongest. It has been found in practice, however, that this is neither faster nor easier for the typist to operate in spite of practice, and it seems unlikely therefore that the standard arrangement will be upset.

The earliest machines had only one set of type, capitals. Later models (from 1877 onwards) were fitted with another set of bars carrying the small letters; this necessitated, of course, a double keyboard, making a very unwieldy instrument. These were succeeded by the shift key T, where for 3 characters are fitted to each bar and the shift mechanism moves the carriage in order to bring the paper into the correct relation with the letter required. A more modern design is the segment shift. In this case the type bar segment moves up and down instead of the carriage. The advantage is that the carriage is rigidly attached to the machine, and in consequence fewer links and connections are required; this arrangement also makes possible the interchangeable carriage which is a feature of some machines.

The general design of the T. seems to be fairly settled, but small improvements are constantly being made. All standard

office machines are fitted with a variable line spacer, which consists of a clutch inside the platen ratchet wheel. This is released by pressure on a boss protruding from the platen knob, and enables the platen to be turned independently of the ratchet, thus making it a simple matter to write exactly on lines. Tabulators increase the speed of operation when it is necessary to arrange work in columns for accountancy and general statistical purposes. On early machines this was done from a tabulator stop rack, calibrated in

Remington-Rand Ltd.

TYPEWRITER

Operating Parts. 1, Space bar; 2, shift keys (left and right); 3, shift lock (left and right); 4, back-space key; 5, keyboard margin control (left and right); 6, tabulator clear key; 7, tabulator bar; 8, ribbon reverse; 9, key-release lever; 10, carriage return and line-space lever; 11, snap-off top plate; 12, platen knob (right and left); 13, variable line spacer; 14, line space regulator; 15, carriage release lever (right and left); 16, ratchet detent or release lever; 17, removable platen brackets (right and left); 18, adjustable paper side guide; 19, paper-centring scale; 20, card holder (right and left); 21, aligning scale; 22, type guide; 23, paper bail; 24, paper-release lever; 25, paper-ball release; 26, carriage scale; 27, ribbon indicator; 28, personal touch regulator; 29, tabulator set key; 30, margin-release key.

spaces corresponding to the spaces on the machine and numbered for easy setting up. Tabulator stops or pegs were slipped to the rack where it was desired to begin a column. By pressing the tabulator key the carriage moved freely until contact was made with a stop. Some machines have a set of tabulator keys, so that by operating a particular key the machine will stop in the position required, passing over others until reaching the stop controlled by the key used. Another variation using 10 keys makes it possible to arrive at the correct position by using

only one key when typing figures, instead of using the old method of tabulating to the unit position and back-spacing to the required column for tens, hundreds, etc. The latest T.s have key-set tabulators. This method renders loose stops obsolete and enables the operator to set up the stops by means of a key on the front of the machine. The portable T.s were first introduced in 1912; nowadays all the leading makes of T.s have their portable products. There have always been a variety of type faces available for different kinds of T.s so as to produce different impressions. For the most part, however, the type faces were elite (12 characters to the in.) or pica (10 characters to the in.). The latest development is the introduction of shaded-face type, which again resembles printing, and this used in conjunction with a device for variable letter spacing can produce work which is almost indistinguishable from that of the printer.

Another development in T.s is the all-electric T. In this machine all functions are controlled from the keyboard. The carriage returns and is turned up the required number of spaces by the pressing of a key. The shift (which is of the basket type), as well as the type bars, is mechanically assisted. The keys are pressed, rather than struck by the finger, the key dip being only about $\frac{1}{4}$ in., from which point the bar is assisted up through the guide and on to the paper. Generally this is done by means of a rubber-covered roller situated underneath the machine. When the power is switched on this constantly revolves, and the action on depressing a key is to bring a serrated cam in contact with it. The roller flicks the cam over, which in turn brings the type bar up. The impression may be varied by altering the speed of the motor and consequently the driving roller. The advantages of this machine are greater speed, less fatigue, and perfect evenness of impression, as the action is purely mechanical and does not depend on the typist's touch.

A recent refinement in T.s is the introduction of mechanism to enable a piece of typescript to be produced with even margins on both sides of the paper. In the past it has only been possible to have a straight left-hand margin, and the right-hand margin has depended entirely upon the length and number of words. In printing, however, this is overcome by variable spacing between the letters, resulting in a solid block of type. The latest development in the T. makes it possible to compensate for incorrect spacing and so produce a piece of typescript laid out in the manner of printing. T.s are also modified for any language, special arrangements having to be made in the design for those (i.e. Hebrew, Arabic, and other Semitic languages) whose characters are written from right to left; for typing accents by means of dead keys; etc. Even Chinese has been attempted; an electric T. with 5400 ideographic type faces has been developed in America, on which a speed of

40-45 Chinese words per minute can be attained, the characters being arranged on a cylinder in 3 groups according to frequency of use, and the machine being operated by a keyboard with 43 keys. T.s are also manufactured for special requirements, allowing the typing of almost any sign or symbol used in business (£, \$, etc.), and the various accent marks (d, á, ù, ü, é, etc., etc.) used in many languages.

See R. T. Gould, *The Story of the Typewriter: from the Eighteenth to the Twentieth Centuries*, 1949; M. Crooks and F. Dawson, *Dictionary of Typewriting*, 1949.

Typha, genus of aquatic plants (family Typhaceae), with sword-shaped leaves and long cylindrical brown spikes of female flowers, surmounted by a slender deciduous spike of male flowers. *T. latifolia*, great reed mace, cat's-tail, or 'bulrush', is a large and handsome plant. *T. angustifolia*, the lesser reed mace, is less common.

Typhoid Fever, see ENTERIC FEVER.

Typhon, or **Typhoeus**, a monster with a hundred heads buried by Zeus in Tartarus under Mt Aetna, the workshop of Hephaestus, though Homer places it under the country of the Arimi, lashed by Zeus with flashes of lightning. T. was the youngest son of Tartarus and Gaea, and by Echidna became the father of the dog Orthus, Cerberus, the Lernaean hydra, Chimera, and the Sphinx; also of the dangerous winds, and the Harpies.

Typhoons, name of Chinese origin, meaning 'great wind,' now restricted to tropical revolving storms in the China Seas. They are essentially the same as the cyclones in the Indian Ocean or W. Indian hurricanes, and are formed in low lat. at all times of the year, but mainly in the late summer and early autumn; they move north-westwards, curving N., and finally move away north-eastwards before dissipating among the westerly disturbances. Although they move comparatively slowly, the winds circulating round are very high, and it is impossible to give an estimate of the maximum speed attained because the registering instruments are often destroyed by the wind. The lowest pressure ever recorded at sea level, 887 mb., was in the centre of a T. in the Pacific Ocean on 18 Aug. 1927. T. are notable for the patch of clear blue sky in the central calm area, which is nevertheless dangerous to sailing vessels; these are unable to keep way in the midst of great waves, and may be struck again at any moment from any direction as the storm travels on. The rapid fall of the barometer gives short warning of approach, but the navigator may be sure in his calculation of wind direction and find the safest path. To sailing vessels T. are very dangerous, but modern steamers can negotiate all but the most severe. They can be of sufficient violence to give rise to 'tidal waves,' which are destructive to ports and shipping. See CYCLONE; HURRICANE; TORNADO.

Typhus Fever (Gk *typhos*, mist or stupor), or **Jail Fever**, acute infectious

contagious virus disease, characterised by a high fever, severe nervous symptoms, and a peculiar rash. T. has been known in Europe since the 11th cent. The mode of its transmission was a discovery of the 20th cent. It was in 1909 that Nicolle and his colleagues showed it to be a louse-borne disease, and in 1916 Rocha-Lima demonstrated the aetiological agent, *Rickettsia prowazekii*. The conditions predisposing to it are bad sanitation, overcrowding, starvation, etc. The disease is most frequent in war-time, especially among prisoners and refugees and in invaded territories, as was exemplified during the First World War in Serbia, Rumania, and Poland, and during the occupation of Italy at the end of the Second World War. T. is chiefly confined to cold and temperate climates, notably Russia, Poland, and N. Africa. This incidence is not referable to mere cold, but to the overcrowding endemic in those countries, coupled with the greater possibilities for dissemination by infected lice. It is most frequent and characteristic in adults, but children are by no means exempt, though it usually assumes with them a milder form. The mortality has been estimated at about 18 per cent of cases, but the rate varies greatly according to whether the means of proper treatment are or are not available. The period of incubation is usually from 7 to 10 days, during which only a slight general debility is observed. The fever is ushered in with rigors, after which the temp. rises to 103° or 105° attaining a maximum about the seventh day, when it remains steady or gradually becomes lower. The tongue is first of all coated with a white fur, which afterwards becomes yellow or brown. The teeth are coated with sordes. There is usually a degree of constipation and the urine is scanty. At the fourth or fifth day the characteristic eruption appears. This consists of spots or blotches of rose colour, appearing chiefly on the abdomen and flanks; they are for the most part petechial in character, that is, they consist of subcutaneous effusions of blood. The patient is very feeble and generally in a state of wakeful stupor, staring with contracted pupils and diminished capacity for perception. The crisis occurs about the fourteenth day, and if favourable is marked by a fall in temp., free perspiration, and amelioration of the distressing symptoms. Fortunately the synthetic antibiotic drug chloramphenicol has a rapidly curative effect on typhus and its related rickettsial infections. An effective prophylactic vaccine was produced in the Second World War, and this was found to confer a high degree of immunity to troops serving in T. endemic areas. Destruction of lice by 'D.D.T.' insecticide controlled the 1st epidemic previously mentioned. See S. B. Wolbach, and others, *The Etiology and Pathology of Typhus*, 1922; J. D. Rolleston, art. 'Typhus Fever', in *Dictionary of Practical Medicine* (ed. Sir M. Morris), 1921; H. Zinsser, *Rats, Lice, and History* (5th ed.), 1943; Manson's *Tropical Diseases* (14th ed.), 1954.

Typography. The term formerly embraced the whole craft of printing, but is to-day customarily used in the narrower sense to signify type designing. The quality of T., both in the design of the typefaces themselves and in their lay-out had declined in the second half of the 19th cent., and William Morris, drawing on Renaissance sources re-affirmed the principles of good book T. that are alive to-day.

The essence of typographic design is fitness to purpose, and T. which hinders the reader's understanding of the printed message is bad. In advertising choice and arrangement of typefaces can suggest the quality of the advertised product, or simply draw attention to it as forcefully as possible. The typography of books serves other needs. Fiction, poetry, books of reference, and children's literature are some of the more important categories which have their individual problems calling for different treatment, the first aim being readability in its widest sense. Book T. should not obtrude itself on the reader. Its basic principles are strongly traditional, and the designers' scope for initiative lies more in the title page and other preliminary matter rather than in the treatment of text pages. The policy of the manufacturers of modern type-setting equipment in reviving the best typefaces cut by printers of the past has been a major contribution to good typography to-day. See *PRINTING*.

See also D. B. Updike, *Printing Types, Their History, Forms and Use*, 1937; S. Morison, *Four Centuries of Fine Printing*, 1925, *The Typographic Arts*, 1949, and O. Simon, *Introduction to Typography*, 1954.

Tyr, son of Odin, and a god of war. His right hand was sacrificed in battle with the monster Fenriswolf, son of Loki, in the great fight between the good and evil principles. He slew Garm, the hound of the Gnipa cave, but was mortally wounded in the conflict. From his name comes the word "Tuesday", through the A.-S. *Tiwes daeg*, Tyr's day.

Tyrant (Gk *tyrannos*), name given by the anc. Greeks to a man who availed himself of the discontent of a people to win popularity and then to overthrow the existing gov. and possess himself of the sole authority. Where a T. did not abuse his power, the people often fared better under a 'benevolent despot', while a tyranny often encouraged new developments in the State. Such tyrannies arose most commonly in the 7th and 6th cents BC, and many of the T.s of this time have earned a high reputation by the impetus they gave to trade and commerce, and by their encouragement of the arts. The dislike of monarchs in general, however, led men to associate the name of T. with the idea of a cruel and arbitrary ruler, and its modern meaning is also largely due to the ultra-constitutionalists of the 4th cent. in Athens, to whom the democracy of Pericles was the ideal of gov.

Tyras, see BELGOROD-DNESTROVSKY; DNESTER.

Tyrconnell, Richard Talbot, Earl of (1630-91), Irish soldier and administrator. A zealous Catholic, he was made lord-deputy of Ireland by James II in 1687. After the raising of the siege of Limerick by Wm III in 1690, T. followed James to France, but returned in the following year with a Fr. officer, St Ruth, who took supreme command of the Jacobite army.

Tyre (Modern Sur), anct tn of Syria, built partly on an is. and partly on the mainland and said to have been founded in the 15th cent bc. It was the prin. seaport of the Phoenicians, and as such known to the Greeks. It was originally a colony of Sidon, divided between the mainland and the is., which were linked by a causeway. As an is. fortress T. withstood many sieges, but was sacked by Alexander in 332 bc and did not recover. It was, however, a flourishing port under the early Rom. emperors, and a place of considerable importance in medieval history, especially as the stronghold of the Crusaders (1124-1291). But after the fall of Acre the Christians deserted the city, which was then destroyed by the Muslims. In Rom. and earlier times, it was famous for its silk and purple dye. The modern city is now a seaport in the Lebanese Rep. Pop. 6000.

Tyres, Rubber, are fitted to the wheels of road vehicles and aeroplanes to absorb shocks and to provide controlled steering behaviour. Pneumatic T. possess unique properties in these respects and also with suitable tread patterns provide road adhesion, and traction and 'floatation' for farm tractors and implements in soft ground conditions.

The pneumatic tyre was first invented by R. W. Thomson, a Scotsman, in 1845; his tyre was fitted experimentally to horse-drawn carriages of his day, but achieved little commercial success. In 1888 J. B. Dunlop, also a Scotsman, practising as a veterinary surgeon in Belfast, reinvented the pneumatic tyre. He used it to equip bicycles, where it was very successful in reducing the effort needed to propel these machines. The virtues of the pneumatic tyre gave a great impetus to the pastime of cycling, and led to tyre manufacture on a large scale. The successful development of the motor car was made possible by the manufacture of pneumatic car tyres, first made in 1895 by the Michelin Company in France. Pneumatic T. for aeroplanes were first made by the Dunlop Company in 1910; for heavy commercial vehicles in 1917, and for agricultural tractors in 1932, both by American companies.

The basis of the pneumatic tyre is an impermeable flexible container for air under pressure. This container is restrained from bursting by a non-extensible casing made from rubberised cords. These are usually of cotton, rayon, nylon, or steel wire. The casing is, in turn, protected from wear by a layer of tread rubber specially compounded to resist abrasion. The tyre tread usually has a form or pattern specially designed for the particular conditions of usage. T. are

supplied either with an inflatable rubber inner tube to retain the air or are tubeless; in the latter instance the air is sealed by a layer of rubber of low permeability bonded to the inside surface of tyre casing and by a tight compression seal of the tyre beads on the rim.

The first T. for mechanically propelled vehicles were made from layers of square woven canvas stuck together with rubber material. Such T. soon failed in service, due to the threads chafing against each other where they crossed. The use of a wettless parallel-cord construction brought about a great increase in tyre life. Covers are made with layers of these cord plies, varying from 2 to more than 30 in number. The cords in alternate plies cross those above or below at carefully chosen angles, usually in the range of 50-80°, and each cord is separated from its neighbours by a film of rubber. This arrangement gives a balanced stress distribution throughout the cover, with consequent freedom from fatigue failure. Another important milestone in the manufacture of pneumatic T. was the discovery that the addition of carbon black to the tread rubber compound considerably increases its resistance to wear. Carbon black was first used in pneumatic tyre treads in 1904 by S. C. Mote, an Englishman. Amer. makers followed this up by discovering that a special form of carbon black, made by burning natural gas, produced an even greater resistance to wear. This peculiar effect of carbon black on rubber is known as 'reinforcement'; further advance has been made by producing a range of 'furnace' blacks of very fine particle size by controlled combustion.

An important part of the pneumatic tyre is the bead construction, which serves to hold it on to the wheel. J. B. Dunlop's early T. of 1888 were wrapped on to the rim with a bandage of canvas. In 1890 C. K. Welch invented a cover with a completely inextensible bead, made by moulding steel wires into the bead structure. This construction almost completely supplanted the extensible beaded-edge type invented by W. E. Bartlett in the same year.

More recent trends in tyre development concern the use of alternative materials, largely of synthetic origin, alternative types of tyre construction and tread-pattern design, and an increasing need to make T. for special purposes as the variety and performance of pneumatic-tyred vehicles increase.

Intensive development work during the Second World War led to the large-scale production of various synthetic rubbers with properties from the tyre point of view largely complementary to those of natural rubber, hitherto exclusively used for tyre manufacture. A large proportion of the total rubber consumption by the tyre industry is now of synthetic rubber. Tyre cord materials are now almost exclusively of synthetic origin in place of cotton, from which tyre cords were originally formed. The prin. cord materials are high-tensacity rayon, specially designed for use in T., or nylon where

extra strength is required (such as in aeroplane T.).

Notable changes in tyre construction include the wide adoption of tubeless T., particularly for motor cars: a prime advantage of the tubeless tyre lies in the ability to retain air pressure for long periods even when punctured by a nail or similar object. Some T. are made with restraining layers of cord under the tread, to give extra stiffness and consequently better tread wear and road adhesion, though with some sacrifice in ride comfort. Tread patterns have become more complex, with intricate arrangements of moulded serrated grooves, slots, and 'knife cuts'; road adhesion, particularly

The inflation pressure used in T. varies from 300 lb. per sq. in. for some aeroplane T. down to 10 lb. per sq. in., or less where low tyre-to-ground contact pressure is needed, for travelling on loose sand or mud.

Whilst it is usually permissible to adjust inflation pressure by a small amount to cope more effectively with particular service conditions, it should be remembered that it is the air which mainly carries the load and that inflation pressure must be maintained within specified limits to ensure reliable tyre performance.

As a highly specialised engineering development, each particular type of

Photo: Dunlop Rubber Co.

STEP DOWN DIAGRAM OF CAR TYRE

in the wet, is improved, whilst running silence is maintained by making patterns basically of continuous rib design with non-repeating pattern elements (of irregular pitch) round the tread periphery.

Special-purpose T. include speed T. for fast cars, racing T. and T. for endurance records. Pneumatic T. were used for John Cobb's world speed record run in 1947, when a speed of 400 m.p.h. was attained. Speed T. are also made for fast buses and coaches.

T. with treads for use in ice and snow conditions are available for cars and buses. In the commercial vehicle field a wide variety of T. is made for differing conditions of service and terrain. 'Off the Road' T. range from special T. for lawnmowers to large T. for earth-moving equipment, which may be 8 ft in diameter and carry up to 20 tons load per tyre. The universal adoption of pneumatic T. for farm tractors and agric. machinery has accelerated the world-wide trend towards mechanisation in farming.

tyre represents a compromise between many often conflicting properties, and it is rarely possible to accentuate particular features, such as comfort or cornering stability, without adversely affecting other properties. This situation is causing an increasing number of special ranges of T. to be designed.

Tyrnovo, tn of Bulgaria, cap. of T. prov. (formerly Gorna Oryakhovitsa prov.), near the Yantra R., 120 m. E. by N. of Sofia (q.v.). It was cap. of the Bulgarian kingdom which was proclaimed here in 1186. The Bulgarian constitution was drafted here in 1879, and it was here that Ferdinand I (q.v.) declared the complete independence of Bulgaria in 1908 (see BULGARIA, History). There are sev. medieval buildings, and there are textile industries and an agric. mrkt. Pop. 17,000.

Tyrol, see TIROL.

Tyrone, Hugh O'Neill, Earl of (c. 1540-1616), Irish chief and rebel. He was brought up in England at the house of

Sir Henry Sidney. After 1594 he was engaged in frequent intrigues against Elizabeth, and he was defeated by Montjoy at Kinsale (q.v.) in 1602 while supporting the Spaniards who had landed there. He made his peace with James I. but, suspected of planning a revolt, fled from Ireland with the Earl of Tyrconnell (the 'Flight of the Earls') in 1607. He d. at Rome.

Tyrone, co. in the prov. of Ulster, N. Ireland, bounded W. by Donegal, S. by Monaghan and Fermanagh, E. by Lough Neagh and Armagh, and N. by Londonderry. It is hilly in the N. and S., the prin. ridges being the Sperrin Mts (2240 ft) in the NE. and the Slieveveagh (1255 ft) in the S. It is traditionally called 'T. among the bushes' from its well-wooded valleys. The prin. rvs. are the Strule and its tribs., of which the chief is the Derg, the Blackwater, which forms its SE. boundary, and the Foyle, which bounds it in the NW. In the W. is a fertile plain, and agriculture flourishes. Oats is the chief grain crop, and potatoes, flax, and turnips are grown; a considerable area is occupied by pasture, and cattle are reared in large numbers; poultry and pigs are also kept. Sheep are raised in the valleys, and meat and eggs are exported to England. Coal is found at Coalisland, near Dungannon, but it is no longer mined. Linens and coarse woollens (including blankets), rayons, stockings, soap, candles, chemicals, earthenware, and other products of light industries are manufactured. T. returns 5 members to the N. Ireland Parliament, and with Fermanagh returns 2 members to the U.K. Parliament. There are sev. interesting ruins in the co. Omagh is the co. tn, and Clogher, formerly of eccles. importance, has a cathedral dating from the 18th cent. Its rvs. are famous for salmon and trout fishing. Area 1280 sq. m.; pop. 132,000. See Sean O'Faolain, *The Great O'Neill*, 1943; *Some Ancient Monuments in State Charge* (H.M.S.O.).

Tyrrhell, George (1861-1909), divine, b. Dublin, of a Protestant family. He entered the Rom. Catholic Church and became a novice in the Society of Jesus. He was ordained priest in 1891, but came into conflict with the Church for upholding modernism. Following an open letter he was dismissed from the Society of Jesus and suspended from the administration of the Sacraments in 1906. In Oct. 1907 he was excommunicated, but received absolution on his deathbed. He formed a close friendship with Baron von Hügel (q.v.) in 1897, which lasted until T.'s death. His best-known writings are: *Novæ et Veteræ*, 1897, *The Faith of the Millions*, 1902, *Hard Sayings*, 1904, *Through Scylla and Charybdis*, 1907 (wherein he evolved his idea of revelation as experience), *Mediævalism*, 1908, *Christianity at the Crossroads*, 1909. See his *Autobiography and Life* (arranged by Maud Petro), 1912; A. Lolsy, *Tyrrhell et Henri Bremond*, 1936; life by J. Stam, 1938.

Tyrrhell of Avon, William George Tyrrhell, first Baron (1866-1947), diplomat, son of William T., a judge of the High Court of India. Educ. in Germany and at Balliol College, Oxford, he entered the Foreign Office in 1889, and was private secretary to Sir Edward Grey during the critical years leading up to the First World War. In 1925 he was appointed permanent under secretary of state for foreign affairs and was one of the ablest members of the Foreign Office and diplomatic service of his time. In 1935 he was appointed President of the Brit. Board of Film Censors. He was raised to the peerage in 1929.

Tyrrhenian Sea (anc. Tyrrhenum Mare), name given to that part of the Mediterranean Sea which lies between the W. coast of Italy and the is. of Corsica, Sardinia, and Sicily (qq.v.).

Tyrtæus, Gk poet of the 7th cent. BC. He was probably a Spartan, and wrote military and elegiac poems. Fragments of his work are printed in E. Diehl, *Anthologia Lyrica Græca*, 1949. See C. M. Bowra, *Early Greek Elegists*, 1938.

Tyrwhitt, Thomas (1730-86), classical commentator, b. London. He pub. eds. and emendations of classical authors, but his prin. work was the rediscovery of the rules of Chaucer's prosody. His linguistic attainments enabled him also to detect the Rowley forgeries (1777).

Tyumen': 1. Oblast in W. Siberia traversed by R. Ob', extends through tundra, forest, and wooded steppe zones. It has natural-gas deposits. Area 526,300 sq. m.; pop. (1956) 1,088,000, chiefly Russian (since 16th cent.; also Tatar in the S., Khanty, Mansi, and Nenets (qq.v.) in the N.). There are dairy and grain farming in the S., hunting, fishing, and reindeer raising in the N. There are also timber and food industries. The prin. tns are T. Tobol'sk. Area of banishment and labour camps.

2. Cap., econ. and cultural centre of the above, the oldest Russian tn in Siberia. Its industries include shipbuilding for the Ob' basin, woodworking, tanneries, and food industries. It is an important riv.-railway transfer point. Pop. (1956) 123,000 (c. 1914, 50,000; 1926, 50,000). T. was founded in 1586 on the ruins of a Tatar tn, and was the 'Gate to Siberia' until the construction of the Trans-Siberian Railway.

Tyutchev, Fëdor Ivanovich (1803-73), a great Russian poet. He was a diplomat and censor, wrote magnificent metaphysical poems (*Silentium!*, 1833), and later political poems of nationalist and Panslavic tendencies.

Tzetzes, Joannes (c. 1110-c. 1180), Byzantine scholar, b. Constantinople. His enormous industry found cause for lament in all the numerous literary subjects upon which he wrote, as well as in his letters and commentaries. The *Allegory on the Iliad and Odyssey* is ed. by P. Matrangola in *Anecdota Græca* I, 1850, and the *Chiliads* (a poetical miscellany) by Th. Kiessling, 1826.

U

U, twenty-first letter of the Eng. alphabet, and the last of the 5 vowel sounds, is intimately connected with *v* and *w*. In the N. Semitic alphabet, which, like all Semitic alphabets, was purely consonantal, there was a letter *w(aw)*, occupying the sixth place in the alphabet. When the Greeks took over the Semitic alphabet, one form of the *waw* became the Gk *digamma* (see *F*), while another form of it was taken into use as the vowel *upsilon* and placed at the end of the Gk alphabet, following *tau*. In the Etruscan alphabet, which was a descendant of the Gk and the ancestor of the Lat. alphabet, the vowel *u* was written *V*. Also the Romans wrote *V*, which had the value either of the vocalic *u* or the consonantal *v*. In the early Middle Ages both the forms *V* and *U* were used indifferently for both the consonantal and the vowel sound, the sign *U* being used in hands current at this time. In the late Middle Ages *U* was mainly employed for the vowel *u*, but it still was interchangeable with *v* until the spelling settled down at the end of the 17th cent. The original sound of M.E. short *u* is preserved in such words as *put* and *pull*, while provincial pronunciation retains it more widely. For the pronunciation of *u* the breath passage is wider than for that of any other vowel, and hence its tone is low and vibrant. See **ALPHABET**.

Ubangi-Shari, ter., of Fr. Equatorial Africa, lying to the N. of the Middle Congo, cap. Bangui. It includes all the regions drained by the right-hand affluents of the middle Ubangi and also by its affluent, the M'Bomou, all of which affluents form the frontier with the Belgian Congo. It also comprises the basin of the Haut-Shari trib. of the Tchad. U.-S. is a succession of grassy plateaux cut with belts of forest which mark the valleys of numerous water-courses. Bangui is linked by regular steam-boat service with Brazzaville. There are over 300 m. of roads suitable for motor traffic in the colony. The products include palm kernels and palm oil, rubber, coffee, cocoa, ginger, sugar-cane, and rice. Cotton is the most important crop. The ter. is administered by a governor under the governor-general of Fr. Equatorial Africa. Area about 240,000 sq. m.; pop. (Africans) 1,066,000; (European) 1544 (1955).

Ubeda, Sp. tn in the prov. of Jaén. It has sev. fine churches, a palace, and Moorish walls and gateways. There is a large trade in oil. Pop. 30,450.

Uberaba, tn of Brazil, in the state of Minas Gerais, on the Rio da Prata, 300 m. N. of São Paulo, with which it is connected by rail. It trades in cattle and processes sugar and cotton. Pop. 43,900.

U-Boat, see **SUBMARINES**.

Ucayali, riv. of E. Peru, unites with the Marañon to form the prin. stream of the Amazon, 900 m. from its source. It is

navigable throughout for small craft. Its estimated length is 1000 m.

Uccello (c. 1397-1475), name given to the painter and sculptor, Paolo di Dono, from his love of painting birds. He was b. in Florence, trained as a goldsmith, and assisted Ghiberti on the doors of the Florentine Baptistery. *U.* is famous for his study of perspective. His 'Rout of San Romano' (1432) in the National Gallery, London, is a masterpiece of both fancy and formal design. See *M. Salmi, Paolo Uccello*, 1938.

Uccle (Flem. *Ukkel*), suburb of Brussels, Belgium. S. of the city. Near by are the Royal Belgian Observatory, built in 1883-91, and the park of Wolvendael, a remnant of the anct forest of Soignes. *U.* has breweries, bleacheries, and manufs. of electrical instruments. Pop. 64,600.

Uckfield, par. of Sussex, England, on the R. Ouse, 8 m. N.E. of Lewes. Pop. 4032.

Udad, see **BARBARY SHEEP**.

Udaipur, former princely state of India, then part of Rajasthan State, of which the city became cap. The Maharana of *U.* is recognised as the foremost in rank of all Rajput princes. *U.* is a particularly fine city, situated on Lake Pichola in which the many is. are distinguished by marble-topped buildings. The city was founded in 1567, and parts of the imposing palace go back to that date.

Udal, see **ALLUDIUM**.

Udall, or **Uvedale**, John (c. 1560-92), Brit. Puritan divine, who was prosecuted (1586) and deprived (1588) of his living at Kingston-on-Thames for his tracts against episcopacy. In 1590 he was condemned to death on a charge of complicity in the Marprelate tracts, but was pardoned in 1592. He wrote *The Key of the Holy Tongue*, a Heb. grammar and dictionary (pub. 1593).

Udall, Nicholas (1505-56), dramatist and scholar, b. Hampshire. Educ. at Corpus Christi College, Oxford, from 1534 to 1541 he was headmaster of Eton, and in 1554 became headmaster of Westminster. He is best remembered for his *Ralph Roister Doister* (†1552), the first Eng. comedy, an unpolished but lively piece, of which there are eds. by W. H. Williams and P. A. Robin, 1901, and by W. W. Greg, 1935.

Uddevalle, seaport tn of Götterbörge, Sweden. It has shipbuilding, wool and textile industries, wood-pulp mills, and sugar refineries. Pop. 27,491.

Udet, Ernst (1896-1941), Ger. airman, b. Frankfurt on Main. In the First World War he was one of Germany's most famous aces, with a record of 62 air victories. Later he took a major part in the development of the Luftwaffe.

Udine: 1. Prov. of Italy, comprising the greater part of Friuli-Venezia Giulia (q.v.). It is bordered on the N. by Austria, and is mainly in the Alps (q.v.).

but has a plain in the S. with a deeply indented coast-line on the Gulf of Venice (q.v.). It is watered by the Tagliamento (q.v.) and its tribs. Livestock, cereals, wine, flax, silk, and hemp are produced. The prin. tns include U. Codroipo, Cividale, and Aquileia (qq.v.). Area 2825 sq. m.; pop. 800,000. See **FRUILLI**.
 2. It. tn, cap. of the prov. of U., and chief tn of Friuli-Venezia Giulia, 285 m. N. by E. of Rome. It is built on a hillside, and is overlooked by an anct. castle, now a museum. The 13th-18th-cent. archiepiscopal cathedral has paintings by Tiepolo (q.v.). There was severe damage during the Second World War. The tn has textile, chemical, iron, and bell-founding industries. Pop. 76,000.

Udmurt Autonomous Republic lies in the E. of European Russia, between R.s. Kama and Vyatka, in a hilly plain partly covered with coniferous forests. There are engineering, metallurgical (since 18th cent.), and timber industries; coarse grain and flax are grown, and dairy farming is practiced. The prin. tns are Izhevsk (cap.), Votkinsk, and Sarapul. The area belonged partly to the medieval Volga Bulgarian state and the Kazan' Khanate, partly to the Vyatka rep.; from the 15th to 16th cents. it was Muscovite. Votyak Autonomous Oblast was formed in 1920, and renamed U. in 1932. It has been a rep. since 1934. Area 16,200 sq. m.; pop. (1956) 1,285,000, mostly Udmurts and Russians (since 15th cent.).

Udmurts (formerly **Votyaks**), Finnish-speaking people (see **FINNS**) in Russia, living in the Udmurt Autonomous Rep. (q.v.) and adjacent areas, and numbering 606,000 in 1939. They are Orthodox Christians, mostly peasants, now collectivised. See W. Kolarz, *Russia and her Colonies*, 1952.

Ufa, city in the Urals, cap., econ. and cultural centre of the Bashkir (q.v.) Autonomous Rep. It is one of the main industrial centres of the Urals, with engineering (aircraft engines, electric and oil-industry equipment), oil refining (pipelines from Tuymazy and Ishimbay fields), wood-processing, and diverse light and food industries. It is also an important transportation centre. U. is the residence of the religious head of the Muslims of European Russia and Siberia (since 1788). It has a branch of the U.S.S.R. Academy of Sciences. It was founded in 1574 as a Russian fortress, has been a tn since 1586, and served as a fur-collecting centre: it has been prov. cap. since 1862, and during the 19th cent. was the centre of a growing trade in agric. products. The tn has had some industry since the 1870s, but there has been rapid industrial development since the 1930s and particularly since the Second World War. The Bolsheviks were overthrown in U. by the Socialist Revolutionaries in 1918, and soon U. Directory (q.v.) was formed. U. was taken by the Red Army in 1919, and in 1922 was included in the Bashkir Rep. against the will of the Bashkirs and made its cap. It was cap. of U. Oblast within the Bashkir Rep. 1952-3 (abolished).

Pop. (1956, with Chernikovsk, q.v.) 471,000 (4th in the Urals; c. 1914, 103,000; 1920, 98,000; 1935, 195,000; 1939, 246,000), mainly Russian.

Ufa Directory, anti-Bolshevik Gov. in Russia, set up in 1918 at the State Conference in Ufa which had been called by the Committee of Members of the Constituent Assembly. It was soon overthrown by Adm. Kolchak (q.v.). See also **CIVIL WAR, RUSSIAN; CONSTITUENT ASSEMBLY; UFA**.

Uffington White Horse, see **WHITE HORSES AND HILL FIGURES**.

Uffizi and Pitti Galleries. The U. and P. palaces of Florence contain 2 of the greatest collections of pictures in the world. Lorenzo the Magnificent was the virtual founder of the U., though it was left to Francis I, Ferdinand II, and Cosimo III to make the collections what they are to-day. The U. gallery takes its name from the Palazzo degli Uffizi, or Palace of the Offices, where the municipal gov. was carried on. The special pictorial treasures of the U., after the examples of earlier It. painting, from Cimabue, through Giotto, to Fra Angelico, are the 'Holy Family' of Michelangelo; the 'Adoration of the Magi' by Leonardo da Vinci (unfinished); the 'Baptism of Christ,' by Verrocchio; many paintings by Botticelli; Piero della Francesca's portraits of the Duke and Duchess of Urbino; and many famous paintings by Raphael, Titian, and Giovanni Bellini. Botticelli's paintings include the 'Primavera,' 'The Calumny of Apelles' (painted as a tribute to Savonarola), 'Judith and Holofernes,' 'Pallas and Mercury,' 'The Birth of Venus,' and the 'Madonna of the Magnificat' depicting the boy Lorenzo and his brother Giuliano. Other popular favourites are Fra Lippo Lippi's 'Madonna and two Children' and Raphael's 'Madonna of the Goldfinch.' Also requiring mention are Luca Signorelli's 'Madonna and Child,' Bronzino's portraits of the later Medici, Correggio's 'The Repose in Egypt,' Titian's 'Madonna of the Roses,' Bellini's 'Sacra Conversazione,' and a wealth of other paintings by Titian, Bellini, and Giorgione which afford unrivalled opportunities to study the work of these artists in the Venetian room at the U., where they are concentrated. Among foreign works there are paintings by Rogier van der Weyden, Hugo van der Goes, Memling, Rubens, Van Dyck, Jordaens, and Gerard van Honthorst; while the Ger. school is represented by Cranach and Dürer. A section of special interest is that devoted to portraits of painters which has grown from the nucleus formed by Cardinal Leopold de Medici into a Pantheon of art. Like the U. collections, that of the palace of Luca P. was formed by members of the Medici family. The U. collections represent all It. art, but with special emphasis on Tuscan. The P. paintings, on the other hand, belong largely to one period, the mature period of It. art, when Raphael was dominant. Here are Raphael's 'Madonna del Granduca' (the Grand Duke Ferdinand III) and the 'Madonna della Sedia' (both known everywhere

through coloured reproductions), and also the same master's 'La Donna Velata' or 'The Fornarina' (baker's daughter and the artist's betrothed), his portrait of Pope Leo X and his 'Vision of Ezekiel'—all in one gallery of the P. Also famous is Giorgione's 'Concert'—sometimes attributed to Titian. Tintoretto is represented by some fine portraits, and Titian's works here include one known as 'The Young Englishman' (said to be the Earl of Arundel). Among other artists at their best in the P. are Andrea del Sarto, Fra Bartolommeo, whose masterpiece 'The Deposition' is here, and Filippino Lippi. Among foreign artists represented in the P. are Van Dyck, Rubens, and Sustermans. Smaller but also important galleries of Florence are the Accademia and the Museo di San Marco. One of the most popular pictures in the Accademia is Fra Bartolommeo's 'Vision of St Bernard'; others are Michelangelo's 'David' and the 'Prisoners.' In the Museo di San Marco are notable works by Fra Angelico.

Uganda, Brit. Protectorate in E. Africa, mostly within the basin of the Upper Nile, extending from 1° S. lat. to the N. limits of the navigable waters of the Albert Nile at Nimule. It is bounded by the Sudan, Kenya, Tanganyika, Ruanda-Urundi, and the Belgian Congo. The E. boundary runs from Mt Zulia on the Sudan border along the Turkana Escarpment to Mt Elgon (14,178 ft) and thence follows the Malawa and Sio Rs. to the NE. waters of Lake Victoria. On the W. side are the Nile-Congo watershed, Lake Albert, the R. Semliki, the Ruwenzori Mts (16,800 ft), and Lake Edward. The area of U. is 93,981 sq. m., of which 13,680 sq. m. are water. The extreme distance from E. to W. is 350 m., from S. to N. 400 m. The Protectorate forms part of the central African tableland, the greater part having an altitude between 3500 and 4500 ft above sea-level.

PHYSICAL FEATURES AND CLIMATE. U.'s continental situation and its character as an inland plateau of very varying altitudes account for its climatic regions, and its general elevation explains the absence of the more enervating conditions usually associated with equatorial coastlands. Climatically U. may be divided into a number of distinct zones, which, however, merge gradually at their borders: (i) The mt and hill zones, in which the vegetation varies with altitude. Above 14,200 ft there is perpetual snow, and the descent from these mts lies through stretches of alpine meadow, bamboo forest and bracken, and savannah. Then gradually upland conditions prevail, like those of the general plateau level. The chief peaks (besides Mt Elgon) are the 3 volcanoes of the Mufumbiro Mts. (ii) The wet N. and W. margins of Lake Victoria, with an average rainfall of 50 in. In this region is the Mabira Forest (120 sq. m.). (iii) The dry Ankole and Masaka grasslands, with a relatively low rainfall. (iv) The W. rift valley: this is thinly populated. The valley is occupied by a series of lakes and rivers,

Lakes Edward, George, and Albert; the Albert Nile and the Semliki R. (v) The Karamoja region, a land of small ann. rainfall and without permanent rivs. Deep wells provide water in the dry season. It carries a meagre pop. of semi-nomadic pastoralists. (vi) The plateau of tree savannah which has sufficient rainfall for agriculture on a large scale. Its chief feature is the Victoria Nile with its associated labyrinth of shallow waterways. There are many shallow lakes. The Kagra R., headwater of the Nile, touches the Protectorate's S. boundary. For the most part, however, the many rivs. of the U. plateau are sluggish vegetation-covered swamps; such are the Mpologoma, Sezibwa, and Kafu. Only in hill regions and on the slopes to the W. rift valley are clear-running streams commonly found. Despite U.'s apparent wealth of lakes and waterways, the need of water conservation is a problem which occupied the gov.'s attention for many years.

POPULATION AND RACES. Three racia groups, Bantu, Hamitic, and Nilotic, comprise the African pop. of U., the Bantu constituting three-quarters of the total. They occupy the S. and E. portion of U., excepting the Teso country in the E. Prov. and some areas along the Kenya border. The Hamitic group (approximately 300,000) is represented by the Teso and by isolated units along the Kenya boundary. The N. and W. part is the home of the Nilotic tribes. The estimated number of Africans in U. is approx. 5,500,000. The European pop. is 7000 and the Asian 50,000.

PRODUCTION AND COMMERCE. U. is essentially an agric. country, and, except for the Karamojong in the NE. and the Bahima in the grasslands of the SW., who live chiefly by cattle-raising and trading, the natives are mostly peasant proprietors. There is, however, a demand for labour by non-native and African employers, mainly in Buganda and the E. Prov., in the cultivation of economic crops and in the seasonal occupation of cotton ginning. The mining areas of Ankole in the W. Prov. and the timber workings and sisal estates in Bunyoro also absorb a large amount of labour. Central U. is a densely populated country, fertile and capable of producing a large variety of crops, chiefly cotton, coffee, sugar, and tea. The prin. native food crops are plantains, millet, and sweet potatoes; maize, rice, sugar-cane, chillies, yams, groundnuts, sim-sim (sesame), and a little wheat are grown. There are some non-native estates, those owned by Europeans being engaged in the production of coffee and tea, while sugar and sisal estates are in the hands of Asians. Nearly 200 cotton ginneries, 2 sugar factories, and a distilling factory for the manuf. of power alcohol have been estab.; there are coffee-curing factories at Kampala, Masaka, and Bubulu. There are indications that a wide range of minerals exists, including gold, tin, tungsten, oil, wolfram, tantalite, bismuth, and mica. There are large deposits of salt in the Katwe and

Kasenyi crater lakes. U. has not yet exploited its mineral potentialities. Cotton is the main export (70,982 tons in 1954 valued at £20,877,232), followed by coffee (£13,477,528). Total exports, £40,574,810; imports (1954) £24,849,805. The U.K. is the prin. country of origin of imports (1954, 45 per cent); exports to U.K. 27 per cent, to India 23 per cent. Kenya and U. now constitute a single unit for the purposes of customs; virtual freedom of trade exists between the 2 ters. To a considerable extent the external

90,000 kW, which can be expanded to 150,000 kW. A 5-year Capital Development Plan was pub. in 1954 to cover the period 1955-60, envisaging a capital development expenditure of £30m. U. has received allocations of approximately £3m. from the U.K. under the Colonial Development and Welfare Acts.

LAW. The civil law is based on Eng. and Indian law, as is the criminal law which has been codified. Native law and custom is recognised in local courts which have limited jurisdiction. There

CATTLE IMPROVEMENT IN UGANDA

Improved feeding, including sweet potatoes with concentrates, has been largely responsible for an increased milk yield from the Ngander cows, one of which is shown in foreground.

trade of each is operated through common mercantile and transportation services, and the great bulk of both import and export business is handled at Mombasa, which functions as the main collecting and distributing centre of E. African trade.

INDUSTRIAL DEVELOPMENT. The gov. has estab. the Uganda Development Corporation Ltd., with an authorised capital of £8m. (£5m. issued 1956) to develop the resources of U. and to assist and encourage private enterprise in the estab. of new enterprises. Mineral deposits are likely to be developed by the corporation in partnership with private enterprise, and the opening up of copper and cobalt mining at Kileleshwa. In 1954 the Owen Falls Dam at Jinja was completed and is capable of an output of

is a High Court presided over by the Chief Justice and 4 puisne judges. The Court of Appeal for E. Africa hears appeals from the High Court of Uganda.

DEFENCE. Internal security is in the hands of the local police, who have some military training. In 1955 the strength was 3479. There is a garrison at Jinja usually composed of one battalion of the King's African Rifles (q.v.).

RELIGION AND EDUCATION. The Protestant and Rom. Catholic churches have been working in U. for over 80 years and now have 1,250,000 adherents between them. (See also HISTORY.) There are also sev. hundreds of thousands of Muslims. The remainder of the pop. is pagan, though the desire for education brings many more into the orbit of the missions each year. The demand for

education seems insatiable, and £2,618,426 was allocated by the gov. in 1954. Nevertheless, the bulk of education is still provided by missionary societies. At the end of 1954 there were approx. 231,000 children in primary schools and 116,000 in secondary schools. Makerere College, Kampala, has achieved Univ. College status. There are 38 teacher's training colleges.

COMMUNICATIONS. The Kenya and Uganda Railway, which since 1 May 1948 has been amalgamated with the Tangan-

resolution was passed by a majority endorsing the introduction of common-roll elections in 1961 as the council's policy. This policy had already been announced by the governor in the Legislative Council in April 1956. At the time of the passing of these motions, the Legislative Council comprised 60 members, 30 members on the gov. side and 30 on the representative side, of whom 18 were Africans and 12 were Europeans and Asians; the African representative members were elected indirectly.

EDUCATION IN UGANDA

African boys emerging from their classroom on their way home from the primary school provided by the owners of the nearby Kirwa Wolfram Mine.

yika Railways to form E. African Railways and Harbours, extends to Kampala and is being further extended some 200 m. to Kasese at the foot of the Ruwenzori Mts (see EAST AFRICAN RAILWAYS). There are 3000 m. of all-weather roads under the public works dept, and about 8000 m. of other motorable roads maintained by the native administrations. Public transport by bus is well organised. U. is well served by local and international air services.

CONSTITUTION AND ADMINISTRATION. In the U. Legislative Council on 8 Aug. 1957 a motion was carried unanimously, asking the gov. at Westminster to introduce direct elections throughout U. for 18 African representative members of the council in 1958. Early in Oct. a further

Until full self-gov. is attained in U., certain powers are reserved for governors. In practice, they are rarely used. For instance, the governor's assent must be obtained before a bill has any legal effect. Three courses are open to the governor when a bill is presented for assent. Subject to certain exceptions, he may give assent whereupon the bill becomes law; he can veto the bill, i.e. refuse assent; he can reserve the bill for Her Majesty's pleasure, which means that the matter of assent becomes the responsibility of the secretary of state whose duty it is to advise the sovereign. The sovereign also retains a general ultimate power to disallow colonial laws, even after a governor may have assented to them, though instances of disallowances are

extremely rare. Reserve powers are also possessed by the governor, and can be used at his discretion. Normally these powers are used only in an emergency, and are exercised only when necessary in the interests of public order, or other essentials of good gov.

HISTORY. In 1862 Speke and Grant were the first Europeans to reach the cap. of Mutesa, King of Buganda, near the present Kampala. In 1872 Sir Samuel Baker arrived at the H.Q. of the young King of Bunyoro, Kabarega, and proclaimed the formal annexation of Bunyoro on 14 May 1872, but friction ensued, culminating in the battle of Masindi on 8 June. Baker then retreated to Fatiko. Stanley visited U. in 1875, the first Eng. Protestant missionaries arrived in 1877, and in 1879 came Fr. Rom. Catholics. Christianity made headway up to the time of Mutesa's death in 1884, but his son, Mwanga, persecuted and massacred the missionaries' adherents, and was driven from his throne. In the same year control of the Brit. sphere in E. Africa had been assigned by Royal Charter to the Imperial Brit. E. Africa Company, and when the Anglo-Ger. Agreement of 1890 confirmed the inclusion in the Brit. sphere of present-day Kenya and U., Capt. (later Lord) Lugard (q.v.) was sent to establish the Company's influence in U. He found Mwanga restored with the help of his fugitive Christian subjects, and made a treaty with him, whereby the Company acquired a right to intervene in the internal affairs of his kingdom and assumed the responsibility for the maintenance of order. Meanwhile the Company, crippled by the cost of occupation, gave notice of its intention to evacuate U., and Sir Gerald Portal was sent out as Imperial Commissioner to make proposals for future governance. On 1 April 1893 he assumed on behalf of the Brit. Gov. the responsibilities of the Company in Buganda. The formal estab. of a protectorate over Mwanga's kingdom was postponed until 18 June 1894. In the meantime Bunyoro Prov. was conquered and its ruler, Kabarega, driven out. In 1896 the protectorate was extended to most of the other regions which are now included within the present U., and this term was thereafter applied to the whole ter., Mwanga's kingdom, which is the Buganda Prov. of to-day, being referred to as Buganda.

In the years following 1894 there was little development of the Brit. administration, whose resources were quite inadequate for the gov. of a vast ter. which extended as far E. as Nalvasha. In July 1897, however, certain chiefs in Buganda were plotting a revolt, and on 14 Aug. 1897 Mwanga's infant son, Daudi Chwa, was proclaimed king with a regency of 3 leading chiefs. A few months later the very existence of the protectorate was threatened by a mutiny of the Sudanese troops. The heavy and unproductive expenditure in U. led the home gov. to reorganise the administration. This was done under Sir Harry Johnston, who went out as special commissioner at the end

of 1899. The affairs of Buganda were settled by the U. Agreement, 1900, and the foundations were laid of the present administrative system. Sir Daudi Chwa, kabaka of Buganda, died in 1939 and after a period of regency of 3 years, his son, Mutesa, succeeded to the throne. For subsequent hist., see the article **UGANDA**. For more recent history of U. see under the subheading **CONSTITUTION AND ADMINISTRATION**.

Ugolino della Gherardesca (d. 1289), It. soldier, immortalised in Dante's *Inferno* as Count Ugolino, attempted to usurp the gov. of Pisa. The Archbishop of Pisa, Roger de' Ubaldini, formed a conspiracy against him in 1288; and attacking U. in his palace, defeated and took him prisoner. He was eventually starved to death.

Ugrian Languages, group of 3 related languages including the Magyar and those of 2 small Siberian peoples, the Khanty and the Mansi (q.v.). U. L. are related to the Finnish group, and are often considered together with the latter as one Finno-Ugrian family.

Uheimir, El, see KISH.

Uhland, Johann Ludwig (1787-1862), Ger. poet and literary historian, b. Tübingen. He studied law at Tübingen Univ. 1802-8. With J. Kerner he was at the centre of the famous circle *Der Schwäbische Dichterkreis*. In 1815 a first collection of U.'s poems was pub., and various fragments and essays followed. After a short stay in Paris (1810-11) to study medieval Fr. and Ger. literature, he became a solicitor in Tübingen. Three books, consisting mostly of national verses, pub. between 1815 and 1820, made him famous all over Germany, and he rapidly became a political leader in the fight of the people for their ancient and often promised rights. Politics drew him away from poetry for nearly 15 years. There is only one book during this period, about the Ger. medieval poet, *Walter von der Vogelweide*, 1822. He took a keen interest in literary research, and in 1829 the univ. of Tübingen made him a prof. of Ger.

language and literature. His poems included mostly ballads, romances, and a few folk songs.

A collection of U.'s works was pub. by H. Fischer in 1892; T. Hartmann ed. his diaries (1893) and his correspondence (1911-16). See lives by K. Mayer, 1867; H. Fischer, 1887; A. Hartmann, 1912; H. Schneider, 1920; A. Hübscher, 1938. See also A. Thoma, *Uhlans Volkslied-sammlung*, 1929.

Uhlans, Tatar name for a particular type of soldier, and adopted in Poland to denote cavalymen employed in reconnoitring, outpost duty, etc. The name was later particularly applied to Prussian cavalry regiments armed with the lance, first formed in the 18th cent. and used for reconnaissance.

Uigurs, Uygurs, or Uighurs, the name now given to the Turkic element constituting the majority of the pop. of the Chinese prov. of Sinkiang, now known as the Sinkiang-Uigur Autonomous Region. There are also over 50,000 U. in the Soviet rep. of Uzbekistan and some thousands in Kazakhstan and Kirgizia. The name Ugur is found in the early hist. of the Turkic peoples, and U. were ruling Mongolia in the 8th cent. The Ugur empire was destroyed by the Kirgiz in 840, and the U. were thenceforward split into 2 kingdoms, one in Kansu and the other in Bishbalik and Karakhoja. Their later hist. is obscure, but the Ugur script was in use in Kansu until the beginning of the 18th cent. See 'Turks' in *Encyclopaedia of Islam*.

Uinta, mt range in NE. Utah and SW. Wyoming, U.S.A. The highest points are Gilbert Peak (13,422 ft), Emmons Peak (13,428 ft), and Kings Peak (13,498 ft). The Green R. and Uinta R. have out deep gorges in the range, which includes the High Uintas Primitive Area (381 sq. m.), set aside (1931) by the U.S. Forest Service.

Uintatheres, Eocene mammals belonging to the Dinocerata. They were large and ponderous, with short limbs, and pairs of horn-like swellings on the skull.

Uist, 2 is. of the Outer Hebrides, Inverness-shire, Scotland.

1. N. U. lies 8 m. SW. of Harris, and is separated from Skye by the Little Minch. It is 18 m. long, and from 3 to 14 m. wide, hilly in the centre and S.E., the highest peak being Mt Eaval (1138 ft). The E. has the 2 sea lochs of Eport and Maddy. Most of the pop. resides in the N. and W. where there are long stretches of arable land, with good grazing. There is a carding, dyeing, and spinning mill on the is. Lochmaddy is the chief vil. Pop. 2800.

2. S. U. is situated 7 m. S. of N. U., Benbecula lying between, and has a maximum length and breadth of 22 and 8 m. It is connected with Benbecula by a bridge. The prin. sea lochs, Boisdale, Skipport, and Eynort, are on the E. coast and provide good trout fishing. There is a seaweed factory for alginate products. Lochboisdale is the chief vil. Benbecula has an airport. Pop. 4800.

Uitenhage, tn in the dist. of U., Cape Prov., the centre of an agric. dist. It was named after Jacob Abram U. de Mist, who was sent out by the Dutch Gov. in the mid-18th cent. as Commissary-General to set up a new gov. The opening of the railway to Port Elizabeth made U. prosperous. Apart from railway workshops there are a tyre factory, a wool factory, tanneries, and car assembly plant. U. has a Dutch Reformed church with a massive bible inscribed by De Mist. Features of U. are the King George Monument, Maggenis Park, and Swartskops Valley. Pop.: (whites), 15,500; (Bantu), 16,918; (coloureds), 7161; (Asiatics), 373.

Ujiji, tn of Tanganyika on the E. shore of Lake Tanganyika, formerly a slave-trading centre. Pop. (African) 10,000.

Ujjain, tn of Madhya Bharat State, India. U. is one of the 7 sacred Hindu cities, and every twelfth year is the scene of the great bathing festival, the Kumbh Mela. It was once the cap. of Malwa. Maharaja Scindia of Gwalior has a palace here.

Ukelele ('the jumping flea'), Hawaiian guitar, introduced to the Sandwich Is. by the Portuguese in 1877 and more recently into Europe as a popular instrument. It has 4 gut strings and can be played from a notation resembling the old lute tablature.

Ukerewe, a group of is. N. of Speke Gulf in Lake Victoria, E. Africa. See VICTORIA, LAKE.

Ukkel, see UCCLE.

Ukraine, The (Ukrainian *Ukrayina*), constituent rep. of the U.S.S.R., lying in the SW. of European Russia, N. of the Black Sea and the Sea of Azov, and bordered on the W. by Rumania, Hungary, Czechoslovakia, and Poland. It takes second place in the U.S.S.R. (after the R.S.F.S.R., q.v.) in pop. (40,600,000 in 1956), and third place (after the R.S.F.S.R. and Kazakhstan, q.v.) in size, having an area of 232,000 sq. m. It is divided into 26 Oblasts. The cap. is Kiev. The U. lies largely on the Russian plain, which here forms the Poles'ye, Dnieper, and Black Sea lowlands, and the Volhynia-Podolia, Dnieper, and Donets uplands. In the W. lie the Carpathians and in the S. the Crimean Mts. The U. has rich deposits of iron ore (see KURCH; KRIVYI ROG), manganese (see NIKOPOL'), coal (see DONETS BASIN), natural gas (see DASHAVA; SHEBELINKA), oil (see DROGOBYCH), mercury, salts, etc. The main rvs. are the Dnieper, Dniester, S. Bug, and Severskiy Donets, a trib. of the Don. The soils and vegetation form 3 latitudinal zones: mixed forests in the N. (see POLES'YE), wooded steppe with beech and oak woods, and steppe—the wooded steppe and the steppe having mostly fertile Black Earth soils. The Carpathians and the Crimean Mts have vertical vegetation zones. The climate of the U. is moderately continental, much warmer than that of central Russia. The S. shore of the Crimea has a Mediterranean climate.

Population. The density of pop. in the U. is slightly less than that of the Moldavian Rep., but higher than in the rest of the U.S.S.R. It is highest in the industrial Donets Basin, followed by the wooded steppe belt, the Poliss'ye, and the steppe zone. Ethnically the pop. consists largely (75 per cent.) of Ukrainians, an E. Slav people closely related to the Great Russians and Belorussians. They are followed by Great Russians and Jews, both living in the U. throughout the U.; outside the U. the Russians live mostly in the Crimea (where they form the majority), the Donets Basin and other areas bordering the R.S.F.S.R., and in the S. Oblasts. Jews, and the minority of Poles in the W. U., were much more numerous before the Second World War. There were also large Ger. and Czech colonies which have disappeared, but there are still small colonies of Bulgarians and Greeks in the S. In the W. live some Moldavians (Rumanians) and Hungarians (in Transcarpathia). The Tatars of the Crimea were deported to Central Asia in 1944.

Economy. Both industry and agriculture are well developed in the U. Among the branches of industry, engineering occupies the first place, followed by metallurgy, chemicals, coal mining, and the sugar industry. Wheat, barley, rye, and oats are the main grain plants, and sugar beet and sunflowers are widely grown. The cultivation of rice and cotton on the shores of the Black Sea is a completely new departure in agriculture. Orchards are very common. Animal husbandry is mainly concentrated on pigs, cattle, and poultry. There is a dense transportation network, railways being by far the most important means of transport. Five main areas with different economic specialisation can be distinguished in the U.: (1) the SE.—Stalino, Lugansk, Dnepropetrovsk, and Zaporozh'ye Oblasts—with coal mining, metallurgy, chemical industry, and heavy engineering (see DONETS BASIN; SOUTHERN INDUSTRIAL REGION); (2) the NE.—Khar'kov, Poltava, and Sumy Oblasts—with a large and varied engineering industry; (3) the S.—Odessa, Nikolayev, Kirovograd, Kherson, and Crimea Oblasts—mainly agric., with food industries, agric. engineering, large seaports, and shipbuilding; (4) the Central—Kiev, Chernigov, Zhitomir, Cherkassy, Vinnitsa, and Khmel'nitskiy Oblasts—with diverse agriculture, particularly sugar-beet cultivation, sugar and other food and light industries, and varied engineering; (5) the W.—Rovno, Volhynia, Ternopol', Lvov, Droboych, Stanislav, Chernovtsy, and Transcarpathia Oblasts—with diverse but comparatively less-developed industries (food and light industries, oil and natural-gas extraction, and some engineering).

History. In antiquity the steppes of the S. U. were populated by Scythians (q.v.), on whose ter. Gk. settlers founded many colonies in the 8th–7th cents. BC (see BOSPORAN KINGDOM; CHERSONESUS), which later fell under Rom. domination.

In the 4th cent. AD the whole country was under the Goths, who were defeated here by the Huns when the latter began their onslaught on Europe. E. Slav (Russian) tribes—Polyane, Severyane, Drevlyane, Volhynians, etc.—inhabited the forested and wooded steppe zones from the early Middle Ages. After a short period of Khazar (q.v.) domination they were in the 9th cent. included in the Kievan state (see KIEVAN RUSSIA), whose cap. and most other main centres were here. The steppe remained the home of the nomadic Pechenegs and Cumans (q.v.). After the break-up of Kievan Russia, and particularly after the Tatar conquest (see GOLDEN HORDE) in the 13th cent., the centre of gravity shifted to the W. (see GALICIA AND VOLHYNIA, KINGDOM OF). By the middle of the 15th cent. most of the U. was under Lithuania, while in the SE. the Crimean Khanate (q.v.) was formed. The Lithuanian-held ter. became Polish in 1569, and soon the struggle of the local Russian Orthodox pop. against the Polish Catholics began both in the religious and cultural (see BRATSTVO) and in the social and economic spheres. Particularly militant were the Cossacks (see COSSACKS; SICH), who in the mid-17th cent. rose and won independence from Poland for the central U. (see KHMEL'NITSKIY; UKRAINIAN BETMANS), and brought about a union with Muscovy of 1653. The U. W. of the Dnieper remained Polish until the partitions of Poland in the 1790s. The Black Sea shores were captured by Russia from Turkey during the 18th cent. (see NEW RUSSIA; and for the hist. of Bukovina, Crimea, Galicia, and Transcarpathia see relevant articles).

During the 14th–16th cents. the pop. of the U. had developed a separate identity and a certain degree of national consciousness, distinguishing themselves from the Russians of Muscovy (q.v.; 'Muscovite' is still the Ukrainian colloquialism for Great Russian). A romantic literary Ukrainian movement began early in the 19th cent. The most celebrated Ukrainian poet was T. G. Shevchenko (q.v.). Pubs. in the Ukrainian language were forbidden by the Russian Gov. after the Polish uprising in 1863, and only the revolution of 1905 (q.v.) removed this prohibition. At the beginning of the 20th cent. a nationalist trend appeared which favoured autonomy for the U. This autonomy was granted, after the Feb. revolution (q.v.) in 1917, by the Provisional Gov. (q.v.), which recognised the authority of the Ukrainian Central Rada (Council) over the central U. After the seizure of power by the Bolsheviks (see OCTOBER REVOLUTION) the Rada, headed by Hrushevs'kyi (q.v.), proclaimed the U. an independent rep. During the Civil war (q.v.) the U. was one of the areas most fiercely contested, and saw Ger. occupation and various Ukrainian nationalists (see UKRAINIAN DIRECTORY), White Russian (see DENIKIN; WRANGEL), Communist, and Anarchist (see MAKHNO) govts. and authorities. The Ukrainian Soviet Rep. was first proclaimed in Dec.

1917. When the Union of Soviet Socialist Republics (q.v.) was formed in 1922 it became one of the 4 original constituent reps. At first the Communists (see COMMUNIST PARTY OF THE SOVIET UNION) co-operated with the nationalists in carrying out a policy of 'Ukrainisation,' but since the late 1920s all real or suspected nationalists have been severely persecuted, particularly during the Great Purge (q.v.). However, 'bourgeois-nationalist deviation' persisted and received a new impetus during the Second World War, when the U. was occupied

Soviet Weekly

A GRAIN ELEVATOR IN THE UKRAINE

by the Germans. In the W. U., annexed from Poland in 1939, nationalist guerillas operated for sev. years after the Second World War (see BANDERA). The Ukrainian Soviet Rep. is separately represented in the U.N. See W. E. D. Allen, *The Ukraine; A History*, 1940; M. Hrushevsky, *A History of the Ukraine*, 1941; C. A. Manning, *Ukrainian Literature* (Jersey City), 1944, *The Story of the Ukraine* (N.Y.), 1947, and *Twentieth Century Ukraine* (N.Y.), 1951; W. H. Chamberlin, *The Ukraine*, 1945; J. S. Reshetar, *The Ukrainian Revolution, 1917-20* (Princeton), 1952; R. E. Pipes, *The Formation of the Soviet Union* (Cambridge, Mass.), 1954.

Ukrainian Directory, ephemeral nationalist gov. in the Ukraine 1918-19, headed first by the author V. Vynnychenko, then by S. Petlyura, commander of the Ukrainian nationalist troops. Composed of people of divergent political views, it soon disintegrated.

Ukrainian Hetmans. From late 16th cent. H. was the title of the highest officer of the Zaporozh'ye Cossacks (see SICH); 1648-1764 it was the title of the head of the Cossack state, with administrative authority. In 1918, under Ger. occupation, the title was re-established and Gen. P. Skoropads'kyy ruled the country as a H. for 7 months.

See also HETMAN; UKRAINE, THE, *History*.

Ulan Bator, see URGU.

Ulanova, Galina (1912-), Russia's leading ballerina. Originally a member of the Leningrad Theatre of Opera and Ballet, where she created the roles of Maria in the *Fountain of Bakhchisarai*, 1934, and Juliet in *Romeo and Juliet*, 1940, she joined the Bolshoi Theatre, Moscow, in 1944, where she created the title-roles in *Cinderella*, 1945. She led this company on its visit to London in 1956, when she was acclaimed as the greatest present-day interpreter of Giselle.

Ulan-Ude (formerly Verkhneudinsk), tn in SE. Siberia, cap. (since 1923), economic and cultural centre of Buryat-Mongol Autonomous Rep. (q.v.). It is situated in W. Transbaikalia, on the Trans-Siberian Railway, and is a major industrial centre (since the 1930s—locomotives, glass, timber, and food industries). It is also the starting-point of the railway line to Ulan-Bator (Mongolia)—Peking. U. had been known since 1686 as a Russian fort, has been a tn since 1775, and had an annual fair attended by merchants from all Siberia. It was made cap. of the Far Eastern Rep. (q.v.) in 1920. Pop. (1956) 158,000 (1926, 29,000; 1939, 129,000), mainly Russians.

Ulbricht, Walter (1893-), Ger. politician. He joined the Communist party in 1919 and was a member of the Reichstag 1928-33. Subsequently he worked for the Communist party in Moscow, returning to Germany after the Second World War. He quickly became the most powerful figure in E. Ger. politics and since 1949 has been deputy Prime Minister of the Ger. Democratic Rep. His real authority rests, however, in his position as first secretary of the Politburo of the Socialist Unity party.

Ulcer, gradual destruction of tissue on the surface of skin or mucous membranes as a consequence of infection or injury. In most cases an U. is a healing process by which diseased tissue is gradually dissolved in an 'ichor,' while the area of the sore diminishes, a scar or cicatrix taking the place of the ulcerated surface. In some cases the toxic element is too powerful for the normal healing process, and the U. tends to spread. See VARICOSE VEINS.

Ulcinj (It. Dulcigno), tn in Montenegro, Yugoslavia, on the Adriatic. It was under Turkish rule until 1880. There are magnificent beaches and mineral springs. The tn is enclosed by forests and hills, and has Rom. walls and a medieval castle. It has a trade in fruit and agric. produce. Pop. 5000.

Uleåborg, see OULU.

Ulema (Arabic 'ulamā, a plural, learned men). The final authority in Muslim life is the scholar who knows the laws laid down in the Koran and the developments from them created by generations of canonists and accepted by scholars. These canonist-theologians are the U. pre-eminently, though the term is applied to all scholars collectively. In Egypt the heads of the 4 legal schools, the chief

judge, the head of the sheriffs (q.v.), and some others formed the council of the U., which could control the acts of the most arbitrary governors.

Ulex, genus of Leguminosae, found in W. Europe and N. Africa. *U. europaeus*, Furze, Gorse, Whin, *U. gallii*, and *U. nanus* occur in Britain.

Ulexite, mineral, hydrated sodium and calcium borate, occurring in fibrous rounded masses, known as 'cotton balls' in Nevada and California. It is also found in Peruvian and Chilean lake-deposits. From it are obtained borax and boric acid.

Ulinas, see **WULFILA**.

Ulianov, see **LENIN**.

Ulianosk, see **UL'YANOVSK**.

Ullasutai, tn of Outer Mongolia, at the confluence of the U. and Bogdo rivers, S. of the Khangai mts. It is a trading centre, particularly for cattle.

Ullage, vol. of available space in a container unoccupied by contents. Hence ullaging, a method of gauging the contents of a tank by measuring the height of the liquid surface from the top of the tank.

Ullapool, vil. of W. Ross, Scotland, on the E. side of Loch Broom. It is the major herring fishing port of the NW. Highland coast. Pop. 700.

Ullawater, James William Lowther, first Viscount (1855-1949), politician, educ. at Eton and Trinity College, Cambridge. Called to the Bar in 1879, in 1883 he was returned to Parliament as a Conservative for Rutland. He represented the Penrith div. of Cumberland, 1886-1921. In 1905, he became Speaker of the House of Commons. He was raised to the peerage in 1921.

Ullawater, second largest lake in England, between Westmorland and Cumberland, 8 m. long by $\frac{1}{2}$ m. broad and 210 ft deep. Aira Force (70 ft) falls on the W. side.

Ulm, Ger. tn in the Land of Baden-Württemberg (q.v.), on the Danube (q.v.) at its confluence with the Iller, 44 m. SE. by E. of Stuttgart. It is connected by bridges with Neu-Ulm on the r. b. of the Danube in Bavaria. U. was originally a settlement of the Alemanni (q.v.). It was razed in 1134, was rebuilt by the Hohenstaufen (q.v.), and was made a tn by the Emperor Frederick I (q.v.). In the Middle Ages it was an important mkt on the trade route to Italy and the Orient. Its prosperity declined during the Thirty Years' War (q.v.). In 1805 Napoleon defeated 60,000 Austrians under Mack (q.v.) at U. During the Second World War there was severe damage. U. has a magnificent Gothic cathedral (begun in 1377), the spire of which is 528 ft high; the building has 5 naves, and has fine carvings, frescoes, and stained glass. There are other notable churches, old towers and houses, a 14th-cent. **Rathaus**, and another **Rathaus** in late-Gothic and Renaissance styles. The tn is a centre of communications, and has machinery, textile, and leather industries. It was the bp. of Einstein (q.v.). Pop. 86,000.

Ulmaria, see **MEADOW SWEET**.

Ulmur Dog, see **GREAT DANE**.

Ulmic Acid, see **HUMUS**.

Ulmus, see **ELM**.

Ulna, inner and larger of the 2 bones of the forearm, running from the wrist to the elbow. It articulates with the humerus and the head of the radius above and the radius and carpus below.

Ulpilas, see **WULFILA**.

Ulpian, Domitius (c. AD 170-228), Rom. jurist, b. Tyre. He wrote many works, extracts from which form about one-third of Justinian's *Digest*.

Ulrich von Hutten, see **HUTTEN**.

Ulster, N. prov. of Ireland, anct seat of the O'Neills, comprising the cos. of Cavan, Donegal, and Monaghan (Rep. of Ireland), and Antrim, Armagh, Derry, Down, Fermanagh, and Tyrone (N. Ireland). Area 8553 sq. m. See articles on individual cos. for pop. and topography.

Ulster Constabulary, Royal, see **ROYAL ULSTER CONSTABULARY**.

Ulster King of Arms. The office of U. K. of A., which was formerly located in Dublin Castle, and the holder of which had jurisdiction over all Irish arms, as Principal Herald, was, in 1943, after the death of Sir Neville Wilkinson, U. K. of A., transferred to the College of Heralds (q.v.) in London and joined to that of Norroy King of Arms, who in consequence is now styled Norroy and Ulster King of Arms. Owing to the altered constitutional status of S. Ireland at that time, the jurisdiction of U. K. of A. had then to be limited to N. Ireland. The Eire authorities retained the original records of Ulster's office, but in 1943 sent certified copies of these records to the College of Heralds. In N. Ireland U. K. of A. has all the rights and powers and privileges of his predecessors in Dublin, with control of all arms of N. Ireland, and he continues to be the prin. officer of the Order of St Patrick.

Ulster Rifles, The Royal, a regiment formed in 1881, when the 83rd and 86th Regiments were joined to become The Royal Irish Rifles. The 83rd was raised in 1793, and gained its first honours under Wellington in the Peninsula. It then saw service at the Cape, in Ceylon, and America. During the Indian mutiny it served in Central India. The 86th was originally employed as Marines, but in 1799 went to India, where it served with distinction at Bhurtpore (1805). During the Indian mutiny it served in Central India, and later at the Cape. The R.I.R. went through the S. African War, 1898-1902. During the First World War it raised 21 battalions, which served in France, Flanders, Macedonia, Gallipoli, and Palestine. In 1922 its title was altered from The Royal Irish Rifles to The Royal Ulster Rifles. In the Second World War the R.U.R. fought in France in 1940, the Middle E., Burma, N. Africa, Sicily, Italy, and NW. Europe.

Ulster Transport Authority, a body estab. under the Transport Act (N. Ireland), 1948, of the Parliament of N. Ireland for the purpose of integrating road and railway services and putting

transport on an economic footing. The Minister of Commerce for N. Ireland appoints the members and designates the Chairman. When the Authority began business on 1 Oct. 1948 it had vested in it the passenger and freight services of the N. Ireland Road Transport Board and the railway and hotel undertaking of the Belfast and Co. Down Railway Company. The railway and hotels of the N. Cos. Committee, purchased from the British Transport Commission, were vested in the Authority on 1 April 1949.

open to traffic. Rail-freight services are at present operated over 185 route m., and in 1954 a total of 501,153 tons of merchandise and 208,896 head of live-stock were carried.

During the past few years services have been withdrawn from 140 route m. of railway which were not paying their way, including the 14 m. of narrow-gauge line between Londonderry and Strabane, which was closed in 1954. The line between Belfast and Bangor is believed to be the first section of railway in the

Central News

TREATMENT OF CHILDREN BY ULTRA-VIOLET LIGHT IN A SPECIAL CLINIC

The U. T. A. operates the public road-passenger and freight services throughout N. Ireland, with the exception of Belfast passenger transport, local operators carrying in Belfast and Londonderry, omnibus services in part of Co. Fermanagh, and certain ancillary haulage, mainly of specialised types. The U. T. A. owns and operates 185 m. of the railway system of N. Ireland, the balance being that part of the cross-border system of the Great N. Railway Board, which still operates as a separate entity.

The U. T. A. uses over 900 buses in providing services throughout N. Ireland, and in the road transport of merchandise and livestock nearly 800 motor lorries of various types are employed. Passenger-train services are provided over 138 route m. out of 185 m. of the Authority's system

U.K. to be completely changed over from steam to diesel traction for passenger traffic.

Construction and servicing of road and rail vehicles is carried on in the U. T. A.'s centralised workshops at Belfast, believed to be the first to be specifically designed for road and rail engineering work. The works extend over 15 ac., on which buildings covering 5½ ac. have been erected. *See also* CORAS IOMPAIR ÉIREANN; GREAT NORTHERN RAILWAY.

Ultra-short Waves, *see* FREQUENCY.

Ultra-violet Light, invisible to the naked eye, but rendered perceptible by the fluorescence it causes when allowed to fall upon a screen coated with certain substances (e.g. impure calcium sulphide, barium platino-cyanide, anthracene), consists of light waves of shorter wave-

length than those of the visible violet. They range from about 4000 to 2000 Angström units (i.e. 4×10^{-4} to 2×10^{-4} cm.). The fluorescent effect is used in modern 'strip' lighting. U. L. is employed in special microscopes, which require the use of quartz lenses; owing to its short wavelength, better definition is obtained than with ordinary visible light. *Infra-red light* has longer waves than the visible red part of the spectrum. It is utilised for therapeutic purposes and also in photography. (See also SUNLIGHT TREATMENT.) Physiologically U. L. is extremely powerful, producing sunburn and causing the formation of the anti-rachitic vitamin D. U. L. waves are strongly germicidal and, employed under suitable precautions, are very valuable therapeutically. They reach the earth in quantity from the sun, though much U. L. is cut off by a stratum of ozone in the upper atmosphere; and they may be produced artificially by mercury-vapour lamps and arc lamps. Treatment of children suffering from rickets by exposing them to U. L. has proved strikingly successful, while to the healthy person U. L. may act as a general tonic.

Ultra-violet Microscope, see under MICROSCOPE AND MICROSCOPY.

Ultra-violet Spectrum, see SPECTRUM AND SPECTROSCOPE.

Ultra Vires (Lat. 'beyond one's strength or power'), legal phrase used particularly with regard to the limitation of the legal or constitutional powers of a person, court, company, or corporation. In company law anything done by a company outside the powers given in the Memorandum of Association (see COMPANY) is U. V. and void; nor can the company make it valid, even if every member assents to it, because the rule is framed for the protection of future shareholders and the public at large who may have dealings with the company. Acts, however, beyond the powers of the *directors* only may be ratified by the shareholders; and acts U. V. the *Articles of Association* can be indirectly cured by simply altering the articles in the proper manner.

Ultramarine, name given to a substance of a fine blue colour, originally obtained by grinding lapis lazuli. It is now prepared artificially by heating Glauber's salt or soda with kaolin, charcoal, and sulphur, at first with exclusion of air. The dull green product is converted into the blue compound by heating with sulphur with access of air. The U. is made ready for use by washing and levigating. It is stable to light and air, but is decomposed even by weak acids. Aluminium, silicon, sodium, and sulphur are its chief constituents, but its exact composition is not clear. It is used as a pigment by artists and for colouring papers and in laundry work.

Ultramontane ('beyond the mts.' i.e. the Alps), term applied to Italy by countries N. of the Alps and transferred to the It. party in the Rom. Catholic Church, who attach great weight to papal supremacy. See GALLICANISM.

Ultrasonics, see ECHO; SOUND.

Ulverston, urb. dist., mrkt tn, and administrative cap. of the Furness dist. of Lancs, England. Industries include factories for the manuf. of medicinal antibiotic compounds, electrical accessories, light engineering, leather tanning, joinery, and clothing. U. is a holiday centre for Furness and the S. Lake Dist., and stands in an agric. area. Pop. 10,260.

Ulverstone, tn on the NW. coast of Tasmania, 76 m. from Launceston. U. is the centre of mixed farming country, a timber area, and also has expanding industries. Pop. 5000.

Ul'yanovsk: 1. Oblast in the E. of European Russia, traversed by the Middle Volga, and situated largely on the Volga upland of the r. b. There are wheat, sunflower, and potato growing, mrkt gardening, cattle breeding, and food, engineering, timber, and textile industries. Until the Russian colonisation the area was populated by the Mordva and the Chuvash peoples (qq.v.). Area 14,400 sq. m.; pop. (1956) 1,126,000, mostly Russians (since 16th cent.).

2. (until 1924 Simbirsk). Cap. and econ. centre of the above, on the Volga. It has engineering (automobiles, machine tools) and food industries. It is an important transportation centre (4 railway lines, riv. port), and also a local cultural centre. U. was founded in 1648 as a fort. tn and starting point of the Muscovite Simbirsk defence line. It has been a prov. cap. since 1780. It is the bp. of Lenin (Ul'yanov). Pop. (1956) 183,000 (1920, 77,000; 1923, 68,000; 1934, 74,000; 1939, 102,000).

Ulysses, Ulyxes, Ulixes (Gk *Odysseus*), hero of Homer's *Odyssey*, the son of Laertes (or, in later tradition, of Sisyphus) and Anticleia. He was King of Ithaca, husband of Penelope, and father of Telemachus. Homer makes him the model of a prudent warrior, acute, and always quick to devise means of avoiding or escaping difficulties, superior to all men in intelligence, in wisdom equal to the gods themselves, and in adversity courageous. Later poets sometimes represent him as cunning, and false. During the Trojan war he played the part of a gallant warrior and a bold and cunning spy. Some say he devised the stratagem of the wooden horse. The *Odyssey* tells of his 10 years' wandering after the fall of Troy. See M. P. Nilsson, *Mycenaean Origins of Greek Mythology*, 1932.

Uma, or **Parvati**, in Hindu mythology, the consort of Siva.

Umbelliferae, important and widespread family of Dicotyledons, contains about 1600 species. The flowers are characterised by their 5 free sepals and petals (often minute), 5 free stamens, and the inferior bilocular ovary formed from 2 carpels. The stalks of the flowers all spring from the top of the main stalk, so as generally to produce a flat flower-head, the 'umbel.' Important genera are *Aegopodium*, *Apium*, *Carum*, *Chaerophyllum*, *Coriandrum*, *Daucus*, *Eryngium*, *Ferula*, *Foeniculum*, *Meum*, *Myrrhis*, *Peucedanum*, *Sium*, etc.

Umbre, natural pigment, containing hydrated oxides of iron and manganese. The earthy pigment is washed and dried at 212° F. It then constitutes 'raw umbre,' which, calcined, becomes a rich brown colour—'burnt umbre.'

Umberto I. *Ranieri Carlo Emanuele Giovanni Maria Ferdinando Eugenio* (1844-1900), King of Italy (1878-1900), eldest son of Victor Emmanuel I. b. Turin. He succeeded his father as U. I., having previously married his cousin, Margherita Teresa Giovanna, princess of Savoy and daughter of the Duke of Genoa. His reign was generally uneventful. He had the reputation of being a fine soldier, and won popularity by his generosity and by his obvious interest in his people, who called him 'U. the Good.' Two unsuccessful attempts were made on his life, 1878 and 1879, but a third, by an anarchist named Bresci, at Monza, proved fatal. *See* E. Pedrotti, *Vita e regno di Humberto*, 1901.

Umberto II (1904-), King of Italy May-June 1946, son of Victor Emmanuel III, educ. at the military academy, Turin. He married Princess Marie José of Belgium in 1930. He was proclaimed king on the abdication of his father, May 1946, but a referendum in favour of a rep. the following month led to his retirement to Portugal, where he has since lived.

Umbilical Cord, *see* FETUS.

Umbra, in astronomy means either: (a) the darkest portion of the shadow-cone cast by the earth or moon in an eclipse; or (b) the dark central part of a sun-spot.

Umbrella (Lat. *umbra*, shade), portable protection from the sun or rain, is of great antiquity. Its use was known in China as early as the 11th cent. BC, and anc. sculptures of it have been discovered in Nineveh, Persepolis, and Thebes (Egypt). In the E. the U. was an emblem of rank. In anc. Greece and Rome U.s were regarded as effeminate and seldom used by men, but in the 12th cent. the Doge of Venice had an U. with the ceremonial significance of a canopy. In Eng. literature reference is made to the U. by Drayton (1620), Swift (*City Shower*, 1710), and Gay (*Trivia*, 1716). In the reign of Anne it was used only by women, the first man to carry it being Jonas Hanway (q.v.), the philanthropist. U.s with steel ribs, instead of the hitherto cumbersome cane, were first made about 1840. The manuf. of U.s is chiefly carried on in London, Glasgow, Manchester, Paris, and Lyons.

Umbrella Bird, or *Cephalopterus ornatus*, species of Cotingidae, which is peculiar on account of a large umbrella-shaped crest on its head. The bird itself is of a uniform black plumage.

Umbrella Plant, alternative name for *Cyperus* (q.v.), also a name for *Peltiphyllum peltatum*, a perennial waterside plant of the Saxifrage family.

Umbrella Tree, name given for an obvious reason to many plants, notably to *Magnolia fraseri*, *Paritium guineense*, and a species of acacia.

Umbria, region (*compartimento*) of central Italy, comprising the provs. of

Perugia and Terni (q.v.). It is bounded NW. by Tuscany, S. by Lazio, and NE. and E. by the Marches (q.v.). Anc. U. lay between Etruria on the W., the ter. of the Sabines on the S., Picenum on the E., and Gallia on the N. (q.v.). The Umbrians joined first with Etruria, and later with Etruria and Samnium (q.v.) against Rome, but became allies of Rome after 295 BC. The region has lignite deposits, and has steel and chemical industries. There are hydro-electric plants. The chief tn is Perugia. Area 3282 sq. m.; pop. 814,000.

Umbrian Dialect, *see* LATIN LANGUAGE AND LITERATURE.

Umbriel, satellite of Uranus (q.v.).

Umiak, Eskimo boat, resembling the kayak (q.v.) but of greater size and capacity.

Umlaut (from Ger.) has 2 meanings: (1) internal vowel change (as in Ger., *Hand* into *Hände*), usually caused by a vowel in the following syllable. It is common in Germanic languages, and traces of it remain in Eng., *man*, *men*; *mouse*, *mice*, etc. (2) The diacritic mark placed over a vowel to indicate such change: *a-d*, *u-u*, *o-o*. This diacritic mark is often replaced in Eng. by an *e* (*ae* = *d*, *ue* = *u*, *oe* = *o*).

Umpire, *see* ARBITRATION; CRICKET.

Umtali, dist. and township of the E. border of S. Rhodesia. The dist. is nearly 3700 ft above sea-level and lies about 170 m. SE. of Salisbury and 200 m. NW. of Beira. The dist. of U. is no longer an important gold-producing area, but in anc. times it most certainly was. The most productive mine in modern times, in the Penhalonga Mts., has been closed down. U. is becoming industrialised, and its fertile soil is well suited to citrus fruit, soft woods, and wattle. It is considered the most beautiful part of S. Rhodesia. U. is the gate of S. Rhodesia. The pop. of U. township is 7000 Europeans.. and 18,000 Africans.

Una, *see* SAVA.

Unalaska, *see* ALEUTIAN ISLANDS.

Unamuno, Miguel de (1864-1936), Sp. novelist and philosopher, b. Bilbao of Basque descent. He studied at the univ. of Madrid, and in 1891 became prof. of Gk at the univ. of Salamanca, and later rector. In 1897 he pub. his novel, *Paz en la Guerra*, and the following year *Amor y Pedagogia*. Vols. of essays on Sp. life and traditions appeared in the next few years, and their revolutionary nature compelled him to resign his rectorship of the univ. He continued to teach there, however, and to these years belong his outstanding works of fiction, *Niebla*, 1914, and *Tres novelas ejemplares y un prologo*, 1920. He also composed verse, his most famous poem being *El Cristo de Velazquez*, 1920. But it is for his essays and philosophical book that U. is best remembered. The purpose of most of U.'s writings was to reconsider the foundations of belief and conduct and to make men open themselves to new ways of thought. His originality lies in showing how doubt and spiritual uncertainty can become a source of energy. His greatest work was *Del*

sentimiento tragico de la vida, 1913, which foreshadows Existentialism, and is one of the profoundest books of its kind written in Spanish. See study (with bibliography) by M. Romera Navarro, 1928; E. Brenes, *The Tragic Sense of Life in Miguel de Unamuno*, 1931; J. B. Trend, *Unamuno*, 1951.

Unanimism, a minor movement in Fr. literature which took place about the turn of the 19th and 20th cents. Its beginnings were in the writings of *le groupe de l'Abbaye*, a number of young poets including Georges Duhamel (q.v.), Chen-nevière, and Vildrac. This group is described in Duhamel's *Pasquier* novels; another member, Jules Romains (q.v.) was the leading force of the Unanimist movement. Even he left it far behind when his true poetic spirit produced *L'Ode génoise* and *L'Homme blanc*.

Uncertainty Principle, see INDETERMINANCY.

Uncials, see PALAEOGRAPHY.

Uncinariasis, see ANKYLOSTOMIASIS.

Uncle Sam, the U.S.A. or rather the gov. of the States personified. The earliest recorded use of the nickname was in the *Troy Post* (7 Sept. 1813), where it is said to be derived from the initials 'U.S.' on gov. wagons during the war of 1812. A similar but earlier origin is given by some writers who mention one Samuel Wilson, inspector of Elbert Anderson's store on the Hudson R. in the days of the Amer. War of Independence. The goods bore the contractor's initials, being marked E.A.—U.S.—and the latter were jocularly read by the workmen as 'Uncle Sam.' Whichever be the true origin, the nickname began to appear after 1813 in New York newspapers. The earliest use of the name in a book was in *The Adventures of Uncle Sam*, 1816, by 'Frederick Augustus Fildaddy, Esq.', and some years later it was used in W. Faur's *Memorable Days in America*. Just before the Civil war it had found its way into dictionaries as the accepted sobriquet of the nation. The familiar costume of U.S. was taken from that of 'Major Jack Downing,' whom he superseded as the cartoonists' national symbol.

Unconformity. Where an overlying series of rocks rests upon the eroded edges of an older series, usually having a different dip, the beds are said to be unconformable, and the appearance is termed U.

Unconsciousness. While sleep may be regarded as an example of U., the latter term, in its usually accepted meaning, is reserved for conditions such as coma (q.v.), in which there is complete loss of consciousness. There is no voluntary movement of any kind, and the patient cannot be roused by shaking or calling or by any external or internal stimulus. Whereas sleep is a normal habitual phenomenon essential to health, the term U., in its usual application, implies an abnormal or pathological state. The depth and duration of a state of U. (which, incidentally, constitutes a prognostic index of some value) will vary with the cause, from a transient attack, such as occurs in syn-

cope or an epileptic fit, to the deep and prolonged forms associated with grave conditions like cerebral haemorrhage, profound toxæmia, or the destruction of brain tissue due to violence. The precipitating cause of U. is a disturbance of the cerebral circulation, and this, in turn, may be traumatic, toxic, or inflammatory in origin. The distribution of the accompanying signs and symptoms is of great value in diagnosing and localising the cause. Thus where the symptoms are unilateral and asymmetrical, the cause may be cerebral haemorrhage, embolism or thrombosis, cerebral tumour or abscess, or cerebral compression due to extracerebral haemorrhage. Where they are bilateral and symmetrical, on the other hand, the causative condition may be concussion, sub-arachnoid haemorrhage, post-epileptic coma, uræmia, diabetes mellitus, insulin hypoglycaemia, poisoning by opium, alcohol, barbiturates, etc., meningitis, acute encephalitis, encephalitis lethargica, cholaemia, cerebral malaria, heat-stroke, the terminal coma of typhoid, typhus, cholera or cancer, or anaphylactic coma, etc. See also STUPOR.

Unction, see EXTREME UNCTION.

Undercliff, The, succession of cliffs and terraces sloping towards the sea on the S. coast of the Is. of Wight, England, and extending from Dunnoose past Ventnor to Blackgang Chine, which seem to have been formed by landslips. The dist. extends for about 7 m., and is from $\frac{1}{2}$ to $\frac{1}{4}$ m. in width.

Underground Dwellings, see SOUTHERN RAINS.

Underground Movements, see GUERRILLAS; RESISTANCE MOVEMENTS.

Underground Railroad, secret system formed in the N. States of America before the Civil war in order to assist fugitive slaves to reach Canada, where they were safe from recapture. Guidance, shelter, food, and clothing were provided by the sympathisers.

Underground Railways of London. The Underground Electric Railway Company of London, Ltd., was registered in 1902, when it absorbed the Metropolitan Dist. Electric Traction Company (registered in 1901 to electrify the Metropolitan Dist. Railway). The company constructed the Charing Cross, Euston and Hampstead, Great Northern, Piccadilly and Brompton, and Baker Street and Waterloo Railways, which were all amalgamated as from July 1910 as the London Electric Railway Company. In 1912 the company acquired control of the London General Omnibus Company, and in 1913 the City and South London Railway Company and the Central London Railway Company. Under an Act of 1915 the City and South London, Central London, London Electric, and Metropolitan District Railway Companies and the London General Omnibus Company, in all of which the Underground Electric Railway Company was largely interested, entered into a pooling agreement. In 1928 was acquired control of the London and Suburban Traction Group. In 1933 the whole group of underground railways, together with the

L.G.O.C. and Tramways Companies, were transferred to the London Passenger Transport Board, estab. to provide a co-ordinated system of passenger transport for the London Transport area as defined in the Act creating the Board. Under the Transport Act, 1947, on 1 Jan. 1948, the undertaking was vested in the British Transport Commission (q.v.), and thenceforth the functions of the former London Passenger Transport Board were transferred to the London Transport Executive (q.v.) as agent of the Commission. See PARIS METRO; ROME; MOSCOW; RAILWAYS.

Underhill, Evelyn (1875-1941), Brit. poetess and mystic. She was educ. at King's College for Women, London, of which she became a Fellow, and in 1907 she married Herbert S. Moore. In 1921 she was appointed lecturer on the philosophy of religion at Manchester College, Oxford. Her works include *Mysticism*, 1911, *The Mystic Way*, 1913, *Practical Mysticism*, 1914, *The Essentials of Mysticism*, 1920, *The Life of the Spirit*, 1922, *Man and the Supernatural*, 1927, *The House of the Soul*, 1929, and *The Golden Sequence*, 1932. Her *Letters* were pub. in 1943.

Underpinning, see SHORING.

Undersea Archaeology, see ARCHAEOLOGY, *Undersea Archaeology*.

Under-sheriff, see SHERIFF; LOCAL GOVERNMENT.

Understanding, in philosophy, a term used in 2 somewhat different senses. By the older Eng. philosophical writers, such as Locke and Hume, it is used to denote the human mind in general and the human intellect in particular, in opposition to the faculties of emotion and volition. It is now more used in the sense given it by Kant and developed by Hegel. In this sense U. is the lower faculty of the mind which deals with phenomena, while reason is the higher faculty dealing with noumena or universals.

Underwriter, see INSURANCE.

Undeveloped Land Duty, see LAND TAXES.

Undines, name given in the system of the Paracelsists to the elementary spirits of the water. They are of the female sex. Among all the different orders of elemental spirits they intermarry most readily with human beings, and the Undine who gives birth to a child under such a union receives with her babe a human soul. But the man who takes an Undine to wife must be careful not to go on the water with her, or at least not to anger her while there, for in that case she will return to her original element.

Undset, Sigrid (1882-1949), Norwegian novelist, b. Kalundborg, Denmark. She was educ. at Christiania (Oslo) Mercantile College, but her father's death forced her to take up clerical work at the age of 16. Her first success was with the novel *Jenny*, 1912, Eng. trans. 1927, in which she wrote as the champion of family life against the dull, cheerless existence of a business career. She did not write in the style of her time, which treated 'art' and 'love' as separate concepts from house

and home, but advocated a natural and social love between man and woman. She became a Rom. Catholic after the First World War, and wrote a remarkable trilogy of historical novels, *Kristin Lavransdatter*, 1920-2, Eng. trans., 1923-7. She received the Nobel Prize for literature in 1928. Other novels trans. into Eng. are *The Cross*, 1927, *The Arc*, 1928, *The Snake Pit*, 1929, *The Son Avenger*, 1930, *The Wild Orchid*, 1931, *Ida Elisabeth*, 1933, *Gunnar's Daughter*, 1936, *Images in a Mirror*, 1938, and *Madame Dorothea*, 1941. See A. Gustafson, *Scandinavian Novelists*, 1940; N. R. Anker *Min tenn S. Undset*, 1946.

Royal Norwegian Embassy

SIGRID UNDET

Undue Influence. In law a contract to which a party has been induced to give his consent by the exercise of U. I. on the part of another is voidable. So also a will can be attacked by interested parties on the same ground. Presumptions of U. I. arise generally in connection with gifts. It is entirely a question of fact whether in any particular case U. I. was used. The law will not presume U. I. until it is first proved that the relationship between the parties was or is such that one of them was likely to be able to exercise his influence over the other, and then it is open to the defendant to rebut the inference from such relationship. The relations of solicitor and client, parent and child, guardian and ward, trustee and beneficiary are all presumed to give the former in each case influence over the latter. But the strength of the presumption depends entirely on the intimacy of the relationship, e.g. that of a doctor and his patient is in most cases not

nearly so close as that of a guardian and ward. U. I. is not in any way a doctrine specially connected with defective will-power, though such fact, if present, may be a strong element for the consideration of judge or jury.

Undulant Fever, see MALTA FEVER.

Undulatory Theory, see INTERFERENCE; LIGHT; OPTICS; SOUND; WAVE.

Unemployment, term applied technically to the condition of those willing and able to work for wages and registered for employment in industry but unable to secure either full or partial employment. A state of 'full employment' does not, however, mean that there is no U. If the number of vacant jobs is greater than the number of unemployed persons, U. at any one time will be due to the interim period while the individual is passing from one job to another. Even if the number of unemployed at times slightly exceeds the number of vacant jobs, there may still be a state of full employment. U. in such conditions being seasonal or frictional but hardly at all structural. Frictional U. is simply the result of temporary readjustments between the labour supply and demand, and may be met by increasing the mobility of workers or by ensuring that the workers available to industry in any one place have the qualifications required. Such frictional U. is unavoidable, and indeed desirable, in a dynamic progressive economy in which new methods of production and even whole industries are continually replacing old ones. Structural U., on the other hand, is more fundamental. U. is due to the demands on an industry slackening so that the economic life of the locality in which the industry is situated appears to be permanently affected. Lord Beveridge considered that a state of 'full employment' could be said to have been reached when 3 per cent of the working population was not at work (i.e., in the labour market after the Second World War, about 750,000).

From the reign of Queen Elizabeth I, when the vagrant or vagabond class had increased so as to require legislative attention, the only remedy the State had to offer was the Poor Law system, and in extending outdoor relief the policy of the Poor Law ignored all distinctions between the destitute through trade depression and the congenital loafer or 'unemployable.' The recognition of the differences between the class of unemployed who are of good character and can show good industrial records, the aged, infirm, or inefficient unemployed, and the morally defective unemployed, has at least resulted in an endeavour to meet these different classes with different remedies. (See EMPLOYMENT EXCHANGES; LABOUR COLONIES; NATIONAL INSURANCE ACT.)

During the period between the two World Wars, U. assumed the importance of an acute world-problem. The chief causes were: (1) disorganisation of the labour market; (2) a surplus of available labour, together with a surplus of manufactured goods; and (3) under-consumption. Other contributory causes include

excessive wages. Tariffs, too, are theoretically a potential cause of U. where they lead to restricted markets, though in Britain a large section of the pop. in the 1930s came to believe that Britain's continuance of free trade when other countries had adopted protection was making her a dumping ground for cheap foreign goods, and thereby causing vast U. among British workers.

In the U.K. industrial depression began to cause U. soon after the end of the First World War, and by 1921 the number of unemployed had risen from about 700,000 to over 2,000,000 (excluding those idle through industrial disputes). The number continued above the million mark, but during the twenties was confined mainly to the coal trade and to a limited number of other industries dependent on overseas markets in which there was a decreasing demand for Brit. goods. The General Election of 1929 was largely fought on the U. issue, and resulted in a Labour victory, due to the hope of increased employment and a more generous administration of the U. Insurance Acts, which had hitherto debarred from benefit any classified as 'not genuinely seeking work.' The economic depression of 1931 followed, and by 1932, U. had reached its highest total with 2,947,000 or 22 per cent of the insured working pop. Legislation during the thirties was aimed at developing new industries in what came to be known as the 'special' or 'development' areas, where U. was heaviest. The problem persisted, however, until 1939, when with the coming of war it ceased.

The total working pop. available for civilian employment in Great Britain was 19,750,000 in June 1939 (14,656,000 men and 5,094,000 women). In June 1948 and June 1949 it was over 23,000,000, and continued at this figure into the 1950s, including approximately 16,000,000 men and 7,000,000 women.

U. in the U.S.A. Workers are insured under State U. insurance laws, which require contributions from employers at statutory rates. Employers are also taxed under the Federal U. Tax Act, which assesses the rates in accordance with the amounts contributed under State laws.

During the 10 years 1930-9 the average number of unemployed was 8,500,000 out of a total working pop. of over 51,000,000. The post-war working pop. has increased to over 60,000,000, and the number of unemployed declined to 2,000,000-3,000,000 until the recession of 1958, when it rose to over 5,000,000.

See B. S. Rowntree and B. Lasker, *Unemployment: A Social Study*, 1911; J. M. Keynes, *General Theory of Employment, Interest, and Money*, 1936; W. H. Beveridge, *Unemployment, A Problem for Industry*, 1930, and *Full Employment in a Free Society*, 1944.

Unemployment Benefit, see NATIONAL INSURANCE ACT.

U.N.E.S.C.O. (United Nations Educational, Scientific, and Cultural Organisation). The purpose of this organisation, which now includes over 70 member states according to its Constitution (16 Nov.

1945) is 'to contribute to peace and security by promoting collaboration among the nations through education, science, and culture in order to further universal respect for justice, for the rule of law, and for the human rights and fundamental freedoms which are affirmed for the peoples of the world, without distinction of race, sex, language, or religion, by the Charter of the United Nations.'

U.N.E.S.C.O. came into operation in Nov. 1946. Commissions were estab. to cover the following subjects amongst others: economics and employment; transport and communications; statistics; human rights; social studies; the status of women; narcotic drugs; population; and aid to war-devastated countries. One of U.N.E.S.C.O.'s duties would seem to be to conduct preliminary investigations of such problems which the member nations must solve for themselves. See J. Huxley, *U.N.E.S.C.O.: Its Purpose and its Philosophy*, 1946.

Unfunded Debt, see PUBLIC DEBT.

Ungaretti, Giuseppe (1888-), It. poet, b. Alexandria. He studied in Paris, where he was influenced by the work of Mallarmé and Valéry. U. became the chief exponent of the *poesia pura*; he believed that the poet's aim should be to convey an immediate impression by means of words and sounds. This type of poetry is necessarily obscure in its symbolism and imagery; it is a poetry for the few. U.'s theories had a great influence on younger poets in the second quarter of the cent. Among his works are *Il porto sepolto*, 1916, *Le guerre*, 1919, *Sentimento del tempo*, 1933, *Il dolore*, 1947. See F. Flora, *La poesia ermetica*, 1938.

Ungava, former dist. of Labrador, Canada, occupying all the interior of the peninsula now known as the Territory of U. It was annexed to Quebec in 1912 under the Quebec Boundaries Extension Act. Area 351,780 sq. m. It contains numerous lakes and is watered by many small rivs. Fort Chimo is the chief port. Furs are obtained, and iron, lead, copper, and other minerals are found. The working of the rich iron-ore fields of U. by the Iron Ore Company was the outstanding event in the Prov. of Quebec's mining industry in 1954. This development, which necessitated an initial expenditure of \$250m., is the largest undertaken in the hist. of Canadian mining. A 360-m. railroad, linking Seven Islands on the St. Lawrence R. with Knob Lake, was inaugurated in July 1954, when the first shipment of iron ore was made. The search for new iron-ore deposits on mining property is still going on in U. According to reports supplied by the companies concerned, proven deposits in U. were estimated at over 418,000,000 tons of ore grading more than 59 per cent iron.

Unguent, see OINTMENT.

Ungulata, terrestrial, mainly herbivorous mammals with the terminal phalanges generally invested with horny hoofs. The old mammalian order is now split up into separate orders: Artiodactyla, even-toed, hoofed mammals; Perissodactyla, odd-toed, hoofed mam-

mals (*Ungulata vera*); Proboscidea, elephants; and Hyracoidea, *Hyrax*.

Ungvár, see UZHGOROD.

Uni (Unni, Unno, or Huno), St (d. 936), Benedictine of New Corbie, Saxony, became Bishop of Bremen-Hamburg in 917. He was successful in the evangelisation of Denmark and Sweden. His feast is on 17 Sept.

Uniat, oriental Christian in communion with Rome. U.s keep their own liturgy and anct rites, with married priests and communion in both kinds. See MARONITES; MELCHITES; NESTORIAN CHURCHES.

Unicorn, fabulous Indian animal, referred to by Gk and Lat. writers, resembling a horse and having one straight horn 1½ cubits long on its forehead. The U. was later confused with the rhinoceros. The A.V. uses the word (see Deut. xxxiii. 17) as a trans. of 'wild ox.' The figure is used in heraldry. The horn of the sperm whale may have originated the idea. See O. Shepard, *The Lore of the Unicorn*, 1930.

Uniflow Engines, see STEAM ENGINES.

Uniform (Military). *Army*. Military U.s were first introduced into England by the Tudor kings, whose first political act on attaining the throne was the abolition of the feudal armies which had fought the wars of the Roses. These retainers of great lords were distinguished not so much by their whole dress as by the badges of their employers. The legislation of Henry VII restricted the wearing of livery to domestic servants, and specifically forbade the wearing of badges. This prohibition remained under Henry VIII, who formed the Yeomen of the Guard, whose U. is the oldest extant in England.

Until the end of the 17th cent. the army was clothed either as household troops (at first only the Yeomen of the Guard), whose U. was wholly or partly red, or as line regiments raised by officers under royal licence. The latter were both clothed and paid by the officer who raised the regiment, and thus clothing was usually uniform within a regiment (the cloth having been bought in bulk by the colonel or his agent), but there was no uniformity outside these limits. At the outbreak of the Civil war neither side had uniformity of dress, and this led to considerable confusion in the earlier engagements. When the Parl. forces were reorganised in the New Model in 1645 all regiments composing it were clothed in red. This colour was subsequently adopted for the Commonwealth forces as a whole, and continued in use after the Restoration. During the later Stuart and early Hanoverian reigns an attempt was made to reduce the diversity of clothing details to a system, and by 1756 there was a generic type of U. common to all units of an army: all infantry were in general dressed alike, with different facings for each regiment, and distinctive articles of dress for grenadiers and fusiliers.

Regional costume has played some part in the design of U.s, for instance in the kilts and hose of the Highland regiments and in the latter-day caubren and green plume of Irish regiments. But items of

foreign uniform have been adopted either because new arms have been introduced from abroad or because the military prestige of a certain power has induced others to imitate its U. Thus the full-dress (which is the 19th-cent. active service dress) of lancers and hussars is of Polish and Hungarian origin respectively, and the 'rifle green' of Brit. rifle and light infantry regiments was copied from the *Jäger* regiments of various Ger. principalities.

The beret, which by 1945 had become almost universal in the Brit. Army, was borrowed from the Fr. *Chasseurs Alpins*, and the forage cap which preceded it had a wide vogue on the continent, being ultimately of Austrian origin. This is an example of imitating a *defeated* power which was followed in 1949 by the tentative introduction into the Brit. Army of an active-service dress which included a greatcoat of distinctly German cut and a variety of the Ger. *Einhelmstutzen*, a peaked cap originally worn by the Austrian *Kaiserjäger*, then by Ger. mt troops, then by the *Afrika Korps*, and finally by all Ger. infantry.

Since 1900, when protective colouring was adopted on a large scale as a result of experience in S. Africa, considerations of utility have predominated; all armies have introduced a 'drab' fighting garb, and as arms and equipment become ever more expensive, there has been a tendency to save money by discarding parade dress. Where it has been retained it has become increasingly archaic, because for the same reasons of economy the field service dress of yesterday becomes the last word in utility as opposed to smartness, and has become a 'walking-out' U., and in a modified form has long been used for ceremonial parades, with its severely practical belt, once designed as the main support of 'fighting order' equipment, now stripped of its webbing shoulder straps and pipe-clayed and burnished into an article of pure adornment. In recent years a No. 1 dress has been adopted for the Army and is increasingly seen. It is of dark blue (the scarlet of the past 3 cents. has been abandoned except in the case of Guards), and the facings are those traditionally associated with the various regiments.

For illustrations of badges of rank and appointments in the Brit. Army, see ARMY.

See also RANK.

See *A Representative of the Clothing of . . . all the Forces upon the Establishment of Great Britain and Ireland, 1742*; W. Richards, *Her Majesty's Army, 1888*; C. C. P. Lawson, *A History of the Uniforms of the British Army to 1760, 1939-41*; R. M. Barnes, *History of the Regiments and Uniforms of the British Army, 1950*.

Navy. Throughout the Middle Ages seamen wore ordinary clothing, but in the reign of Richard II (1385) a sea gown was worn, and this lasted until the days of the Stuarts. During the Tudor period the colours were green and white, changed in the reign of Charles I to red and yellow. They so remained for officers until the

estab. of a proper naval U. in 1748, for which George II decided that the colours of the Duchess of Bedford's riding habit (blue faced with white) should be adopted. Meanwhile, a certain uniformity in seamen's attire had begun in 1628, due to the issue of 'slop' clothing on repayment. It was for long the custom of captains to dress their boats' crews and even ship's companies in special rigs. U. proper was not introduced for ratings, until 1857, and consisted of the blue cloth jacket and trousers, from which has developed their rig to-day. The sailor collar dates its origin from the time when sailors wore 'pig-tails,' and prevented the latter from soiling their uniform. The change in officers' U. followed that of contemporary fashion, the present monkey jacket replacing the blue tunic in 1879. Hats were not mentioned in the regulations until 1825, when a cocked hat to be worn fore and aft was ordered. Caps were introduced in 1833. Mess-dress and undress were regularised in 1891, as well as white U. for tropical wear. Gold stripes as an indication of rank were first authorised in 1861, and in 1918 all officers were allowed what was previously the 'executive' curl to the top stripe. The purple and white stripes that formerly distinguished officers of the Engineering and Supply branches have now been abolished.

Royal Air Force. The U. is blue-grey in colour, and the 2 main types are: a best dress, known as No. 1 (Home) Dress, consisting of jacket with brass buttons and trousers, worn on ceremonial occasions and for walking out; and No. 2 (Home) Dress (formerly known as battle, or war service, dress), consisting of blouse and trousers, which is the normal working dress. In overseas commands the tropical U. of khaki drill is worn in hot seasons. Peaked caps are worn with No. 1 (Home) Dress, and a beret, which replaces the once-familiar field-service cap, with No. 2 (Home) Dress.

Royal Air Force U. (with the exception of No. 2 (Home) Dress) has remained substantially the same in design since the formation of the R.A.F. in April 1918, although until the end of the First World War it was made of army khaki cloth. Before the Second World War a full dress U. (of which a plumed cap, ornamented with black fur, somewhat similar in design to a hussar's full-dress headgear, was a conspicuous feature) was worn by officers, but this is now obsolete.

Uniformitarianism. The principle of U. was first formulated by the geologist James Hutton (q.v.). It states that the structural and petrological evolution of the earth's crust during the whole extent of geological time has been controlled by physical processes of types which are still in action to-day. The principle of U. can be summed up in the phrase 'the present is the key to the past.' It contrasts with the old catastrophic theory, which postulated the occurrence in the course of geological time of events radically different from anything going on at the present day.

Uniformity, Acts of, series of Acts passed by Parliament for the regularising of public worship in England. The Act of 1549 directed the clergy to conform to the new prayer-book of that year. The new prayer-book of 1552 was accompanied by an Act which prescribed its use by laity and clergy. The Act of 1559 imposed the Elizabethan prayer-book on the whole kingdom, and required all persons to attend their par. church. The best-known Act, however, is that of 1662. This required the revised Liturgy of that year to be used in all churches and places of worship.

Union, see TOKELAU.

Union, or Workhouse, see POOR LAWS.

Union, Irish. The U. of Great Britain and Ireland was effected on 1 Jan. 1801 after being rejected by the Irish Commons the previous year by only one vote. The 'bigoted fury of Irish Protestants,' the attitude of the Irish Parliament during the disputes over the regency, and the fact that it was only by 'hard bribery' that the Eng. Gov. could secure their co-operation in the simplest measures of administration, all conspired to convince Pitt at the end of the 18th cent. of the absolute political necessity for U. The Irish Parliament, whose members all belonged to the Church of Ireland, passed the Bill after a liberal distribution of peerages and pensions had been made to its members. Moreover, Pitt had promised to link this measure with one of Catholic Emancipation (q.v.).

But George III refused to sanction Catholic Emancipation. The Irish Catholics therefore came to regard the Act of Union as yet another example of Eng. perfidy—and the circumstances of its passage into law considerably strengthened the bond between Irish separatism and Catholicism. The Act provided that 100 Irish members should become part of the House of Commons at Westminster, and 28 temporal with 4 spiritual peers, co-opted for each Parliament by their fellow peers, should represent Ireland in the House of Lords. Commerce between the two countries was to be free from all restrictions, and the trading privileges of each were to be freely extended to the other, while there was to be a proportional distribution of the burden of taxation between the two nations.

The U. was dissolved in 1921, when the agreement setting up the Irish Free State (q.v.) was concluded. *See IRELAND, History.*

Unión, La, see LA UNIÓN.

Union Bank of Scotland Limited, The, was founded in Glasgow in 1830 under the title of The Glasgow Union Banking Company with a paid-up capital of £400,000. A vigorous policy of expansion was pursued from the outset, and by 1843 the bank had absorbed the majority of Scotland's prin. private banks. In 1843 the title of The Union Bank of Scotland was adopted. In the same year the paid-up capital was increased to £1m., and it remained at this amount until 1930, when it was raised to the present (1949) figure of £1,200,000. The first London office was

opened in 1878 at the corner of Cornhill and Bishopsgate, and 3 other London branches have since been opened. The head offices are in St Vincent Street, Glasgow, and in George Street, Edinburgh, and there are 200 branches in Scotland.

Union-Castle Line, The. This shipping line was formed in 1900 by the amalgamation of the Union Line (founded 1853) and the Castle Line (founded 1862). In 1857 the Union Line inaugurated the Cape Mail service by the dispatch of the R.M.S. *Dane*, a vessel of 530 tons, from Southampton to Cape Town. The direct mail service was extended to Port Elizabeth in 1864; to East London in 1876; and to Durban in 1887, the mail contract having been renewed in 1863 and again in 1868. The Castle Line, founded by Donald Currie (1825-1909, knighted in 1881) in 1862, entered the S. African trade in 1872, and quickly estab. an important position in the S. African service. In 1876 the Castle Line shared the mail contract with the Union Line. The Castle Line vessels sailed from Dartmouth, but were later (1891) to embark the Cape mails at Southampton—the port of departure of the Union liners—although passengers joined the ships in London. There was very keen competition between the 2 companies. At the time of the amalgamation in 1900 both fleets were of approximately equal size, the Union Line having 19 vessels totalling 104,107 tons, and the Castle Line 20 vessels totalling 108,886 tons. In 1956 the Union-Castle Fleet consisted of 27 vessels and one under construction, aggregating well over 400,000 tons, and operating mail, passenger, and cargo services between the U.K. and S. and E. African ports, Mauritius, etc. The largest ships of the line are the *Pretoria Castle* and the *Edinburgh Castle*, both of 28,705 tons; *Capetown Castle*, 27,002 tons; *Athlone Castle*, 25,567 tons; *Stirling Castle*, 25,554 tons; *Carrarmon Castle*, 20,148 tons; and the *Winchester Castle*, 20,001 tons.

Union City, city of Hudson co., New Jersey, U.S.A., on Hudson R., opposite New York. It manufs. embroideries, silk, clothing, handbags, soap, lamps, toilet preparations, and paper products. The city was formed in 1925 by the amalgamation of the tns of Union and W. Hoboken. Pop. 55,537.

Union Group, see TOKELAU.

Union Jack, see FLAG.

'Union Jack' (newspaper), see ARMY NEWS SERVICES.

Union of Churches, a movement to reunite Christendom by bringing together various Christian denominations. It must be distinguished from the Church Union (q.v.). In the 19th cent. the disunity of Christians came to be seen as contrary to the Will of God, a stumbling block to effective missionary work, and a wasteful overlapping of Christian resources. The movement has gathered momentum in the 20th cent. Canada provides a remarkable example. Nine different unions of Presbyterian bodies were effected between 1817 and 1875, and 16 Methodist bodies united between 1820 and 1884. In

1925 the Methodists, nearly all the Congregationalists, and about two-thirds of the Presbyterians merged in the United Church of Canada. In Scotland the union of the United Free Church of Scotland and the (Presbyterian) Church of Scotland was effected in 1929. In England the Wesleyans, United Methodists, and Primitive Methodists united in 1932 to form the Methodist Church. Greater difficulties arise when attempts are made to unite bodies which differ on fundamental questions of church order, e.g. the Church of England, which holds episcopacy to be integral to the structure of the Church, and bodies which consider it to be no more than one among several possible forms of church gov. Nevertheless, the Church of England is eager to promote the U. of the C. The 1920 Lambeth Conference (q.v.) issued an Appeal to All Christian People, towards this end. In 1946 the Archbishop of Canterbury (Dr. Fisher) preached a sermon suggesting that the way forward was by a process of growing together and assimilation rather than by federation or constitutional union, and asking non-episcopal churches to consider ways in which they could take episcopacy into their own systems. The interest aroused by this has led to exploratory conversations between Anglican theologians and theologians both of the Methodist Church and of the Church of Scotland (1957). Anglicans have also played a major part in the most outstanding example of re-union of the 20th cent., that of the Church of S. India, which was inaugurated in 1947, where 4 Anglican dioceses united with Presbyterian, Congregationalist, and Methodist bodies. The Church of S. India accepts the historic episcopate, its first bishops having been consecrated by Anglican bishops. Re-ordination of ministers not episcopally ordained in 1947 was not required, but since then all ordinations have been by bishops. Similar negotiations are proceeding (1956) in N. India and in Ceylon, but with the intention of unifying the whole ministry when the new churches are inaugurated. The Rom. Catholic Church has officially proved adamant on the subject of re-union. Cordiality was shown in the informal conversations at Malines in 1921 between Anglican theologians and Rom. Catholic theologians led by Cardinal Mercier, but they came to nothing, and subsequently the Pope has banned all doctrinal discussions of this kind. There seems no immediate prospect of Rome's union with any other churches except on the basis of their submission to the Papacy. See H. Martin, *A Christian Plea for Re-Union*, 1941; Vincent McNabb, *The Church and Re-Union*, 1937 (from the Rom. Catholic view-point); Lord Halifax (ed.), *The Conversations at Malines, 1921-5*, 1930; G. K. A. Bell (ed.), *Documents on Christian Unity* (4 vols.), 1920, 1930, 1948, 1953; Lambeth Conference Reports, especially those of 1920, 1930, and 1948; G. F. Fisher (Archbishop of Canterbury), *A Step Forward in Church Relations* (Cambridge Sermon), 1946.

Union of South Africa, see SOUTH AFRICA.

Union of Soviet Socialist Republics (abbr. U.S.S.R.), official name of the Russian state. It was adopted in 1922 at a congress of representatives of the 4 Soviet reps. in existence at the time—the R.S.F.S.R., the Ukraine, Belorussia, and Transcaucasia—when the U.S.S.R. was officially founded as a federal state. The name was deliberately chosen to avoid any national association, since the U.S.S.R. was meant to embrace ultimately the whole world. Two more constituent reps. were admitted in 1925, Turkmenia and Uzbekistan, formed as a result of the so-called 'national demarcation' on Central Asia in 1924. Later sev. Autonomous Reps. were raised to the status of constituent reps. of the U.S.S.R. (Tadzhik, 1929, Kazakh and Kirghiz, 1936, Karelian and Moldavian, 1940). The Baltic States (q.v.) of Estonia, Latvia, and Lithuania, annexed in 1940, were also transformed into constituent reps. of the U.S.S.R. The Karlo-Finnish Rep. was again transformed into the Karelian Autonomous Rep. in 1956. Although there are some differences in the law of individual reps., the federal structure of the U.S.S.R. is largely fictitious, because the real authority lies throughout the U.S.S.R. in the hands of the strictly centralised Communist party of the Soviet Union (q.v.). See also under RUSSIA; SOVIET, and the individual reps. See W. Kolarz, *How Russia is Ruled*, 1953; R. Pipes, *The Formation of the Soviet Union* (Harvard, Mass.), 1954; M. Fainsod, *How Russia is Ruled*, 1954.

Union Pacific Railroad. This system was chartered under an Act of Congress in 1862, when it was considered necessary to have more railways, primarily for the purposes of pursuing the Civil war. Today the system embraces 9182 m. of railway, running through 13 states. The connection of the railroad with the Central Pacific at Promontory, Utah, 50 m. W. of Orden, in May 1869, completed this the first transcontinental railroad. In the main it covers the ter. from Council Bluffs and Kansas City in the E. to the great Pacific coast cities of Los Angeles, Portland, and Seattle, serving Denver, Cheyenne, Salt Lake City, Tacoma, and Olympia.

Unionist, see CONSERVATIVE PARTY; POLITICAL PARTIES.

Uniontown, city of Pennsylvania, U.S.A., the co. seat of Fayette co. It produces bituminous coal, coke, metal products, clothing, beverages, dairy products, lumber, and limestone. The city has a memorial to Gen. Edward Braddock on the site of his death and burial following defeat by the French and Indians (1755). Pop. 20,470.

Unit, see METROLOGY; PHYSICAL UNITS. Unit Trust, or Unit Investment Trust, a device which enables the small investor to spread his risks with relative safety. The investments are entrusted to a manager (or group of managers) whose powers and obligations are set out in a Trust Deed. The first Brit. U. T. was

formed in 1931. The movement was favoured by the steep rise in ordinary share values following the boom in gold shares in 1932-3 and thereafter. The bulk of the holdings of the U. T.s were in the ordinary shares of well-established companies, and by the end of 1938 over 80 Trusts were managing investments of about £100m. In the U.S.A. most U. T.s formed in the first years of the movement were operating on a fixed panel of a score or so equities, but later Trusts operated in wider fields.

In view of the growth of the U. T. movement in Britain, the Prevention of Fraud (Investments) Act of 1938 was passed to protect shareholders by outlawing 'share-pushing.' As in the U.S.A., Brit. Trusts, which at first were generally Fixed Trusts, have widened the scope of their investments. But the principle of spreading the risk has (usually) been maintained by limiting investment in any one company to some 5 per cent of the portfolio. After the Second World War lively interest in the U. T. did not revive till the middle 1950s. In 1954 Municipal and General Securities' 'Thrift Plan' enabled individuals to participate not only by lump-sum investments but also by periodic (monthly or quarterly) payments. In 1956 the London and Manchester Insurance Company based its pension scheme for self-employed persons on a U. T. In 1957 a company was formed to run 2 U. T.s especially designed for pension funds, charitable funds, institutional trustees (banks, etc.). The Church and other large investors began to show interest in U. T.s, and new methods of distribution for small investors ('across the counter', etc.) were begun.

Unitarianism. The term, in its strict and literal sense, denotes simply belief in one God, and when thus understood is a generic term applicable not only to Christianity but also to Judaism, Mohammedanism, and every form of monotheism. But it is almost invariably used as the designation of the belief held by certain Protestants who, while rejecting the scheme of orthodox theology as a whole, nevertheless acknowledge the pre-eminent position of Jesus Christ in the world's hist. as a teacher of religion and a prophet of righteousness. A modern summary of the Unitarian faith enumerates the Fatherhood of God, the Brotherhood of Man, the Leadership of Jesus, the Victory of Good, the Kingdom of God, and the Life Eternal. The Eng. Unitarians trace their descent from those congregations, mainly Presbyterian, whose ministers were ejected in 1662, many of whose chapels are now in Unitarian hands. Many Amer. Congregationalists are also Unitarian in belief. U. has continued in England under such leaders as Priestley, Martineau, Thom, Spears, Drummond, Wicksteed, Stopford Brooke, Estlin Carpenter, and through the influence of the Americans W. E. Channing and Theodore Parker. Its ministers are trained chiefly at Manchester College, Oxford, the Unitarian College, Manchester, and the Presbyterian College, Carmarthen. In 1928 was formed

the 'General Assembly of Unitarian and Free Christian Churches.' The Assembly has about 250 ministers, 325 churches and other places of worship in Great Britain and Ireland. There are some 300 churches in the U.S.A., nearly half in Massachusetts; the membership numbers 90,000. See S. A. Elliot, *Heralds of a Liberal Faith*, 1910; J. E. Carpenter, *Unitarianism: a Historic Survey*, 1923; R. M. Wilbur, *Our Unitarian Heritage*, 1926, *A History of Unitarianism: Socialism and its Antecedents* (2nd ed.), 1946, and *A History of Unitarianism in Transylvania, England and America*, 1953; R. V. Holt (ed.), *A Free Religious Faith*, 1945; W. G. Tarrant, *Story and Significance of the Unitarian Movement*, 1948; A. Hall, *Beliefs of a Unitarian*, 1948.

United Arab Republic. a state proclaimed on 1 Feb. 1958 by the presidents (Presidents Nasser and Kuwaty) of Egypt and Syria (q.v.) uniting their countries under a presidential, democratic system of gov., with the executive authority resting in the head of the state (who would have ministers responsible to him), and a unicameral legislature. On 21 Feb. a plebiscite confirmed the U. A. R. and declared Col. Nasser to be first president. In March the Yemen (q.v.) joined the U. A. R.

United Brethren in Christ. This denomination resulted from the religious awakening of Philip William Otterbein, Martin Boehm, and their collaborators, the church itself having its inception at a meeting held about 1768 near Lancaster, Pennsylvania. The church was formally organised in Frederick Co., Maryland, in 1800. In 1946 the U. B. C. merged with the Evangelical Church to form the Evangelical United Brethren Church (q.v.).

United Free Church of Scotland. Scottish Presbyterian body, formed in 1900 by the union of the United Presbyterian Church and the Free Church of Scotland (q.v.). This union was the result of a long series of negotiations prompted by a strong and general desire for reunion, but the minority of the Free Church, who had refused to join the union, lost no time in testing the legality of the Act of the majority in entering it. In 1929 the U. F. C. of S. united with the Church of Scotland (see SCOTLAND, CHURCH OF). See also UNION OF CHURCHES.

United Irishmen. society founded in Belfast in 1791 by Theobald Wolfe Tone (q.v.), mainly in order to secure the political emancipation of Rom. Catholics and Dissenters. It was strongly influenced in its organisation and aims by the Fr. Revolution. In 1795 it became a secret, oath-bound society, and it pursued revolutionary aims which culminated in the risings of 1798 (see IRELAND, History). Among its members were Tandy, Emmet, and Lord Edward Fitzgerald (q.v.). See R. Madden, *The United Irishmen*, 1858; R. J. McHugh (ed.), *Carlton in '98*, 1949.

United Kingdom. comprises the political entity of England, Wales, and Scotland.

The title, prior to the Irish Treaty of 1921, was the 'United Kingdom of Great Britain and Ireland.'

United Methodist Church, *see under* METHODISM.

United Nations, Charter of the, instrument for maintaining peace which the great powers offered the world in place of the covenant of the League of Nations at the conference of the U.N. held in San Francisco. (On the origins of the charter *see* SAN FRANCISCO CONFERENCE.)

The main purposes of the C. of the U.N. are the maintenance of peace on the basis of justice and the promotion of friendly relations and co-operation in all matters; but the U.N. are also committed to the collective encouragement of 'respect for human rights and for fundamental freedoms for all without distinction as to race, sex, language, or religion.' The principles recognise the sovereign equality of all Member-States of the organisation (U.N.) and bind Members to fulfil their obligations under the Charter in 'good faith,' and to settle their disputes in such a way that neither peace nor justice are endangered. The organisation is to ensure that states which are not members observe the same principles, as far as is necessary for maintaining peace. It is expressly stated that the organisation has no power to interfere in the internal affairs of a state except in so far as this may be necessary when the Council is taking action to compel the settlement of a dispute. The Charter provides that all Member-States shall be represented in the General Assembly by not more than 5 delegates. The Assembly may discuss all matters relating to peace and security and make recommendations *except* when the Security Council is dealing with an international dispute. In that case the Assembly must not make any recommendation on the subject unless the Security Council asks it to do so. On all other matters (e.g. international law, health, and social questions), the Assembly shall 'initiate studies' and make recommendations. Under the Charter the Assembly apportions the expenses of U.N. and approves its budget. The Security Council consists of 11 Member-States, 5 of whom shall be Britain, China, France, the U.S.A., and the U.S.S.R. These are permanent members. The other 6 are elected by the Assembly and serve for 2 years. The Council acts on behalf of the whole U.N. in the settlement of disputes. It must seek peaceful settlement, by methods specifically laid down in the Charter. At any stage of a dispute which the parties are trying to settle peaceably, the Council may recommend a means of settlement. The disputing parties are obliged, in any case, to refer the dispute to the Council if they fail to reach agreement. The course of action of the Council when it decides that there is a threat to peace or an act of aggression, is also laid down: *inter alia*, it may call on members of the U.N. to interrupt economic relations, to stop communications, and to sever diplomatic relations with any state or states, and if these and

other prescribed methods fail, it may call for a demonstration of force or for actual military operations by some or all Member-States. For this purpose each Member-State must agree with the Council, by a separate treaty, upon the nature and extent of the forces it can supply on call. Each Member-State also undertakes to hold an air-force contingent, of an agreed strength, in readiness for immediate action. In all plans for collective action and for the strategic direction of joint operations, the Council will have the assistance of a Military Staff Committee. All Member-States keep the right of self-defence if attacked with armed force before the Council deals with the situation. An additional responsibility of the Council is to make plans for the reduction of armaments, and in this it will be assisted by the Military Staff Committee. Voting on the Council is as follows: all decisions will require an affirmative vote of at least 7 out of 11 members. There is no other stipulation for 'matters of procedure,' but in all more important decisions all the 5 permanent members must be agreed. A state, however, which is a party to a dispute must abstain from voting if the dispute is under consideration for peaceful settlement. The Charter does not preclude regional arrangements between groups of states for the purpose of maintaining peace. Member-States who are parties to such arrangements should use them for the peaceful settlement of local disputes, reporting all measures to the Security Council; but no 'enforcement action' should be taken under a regional arrangement except with the authorisation of the Council, or in the case of attack by one of the states who have been enemies of the U.N. in the Second World War. Provision is made for setting up an Economic and Social Council of 18 Member-States elected in the Assembly for a term of 3 years at a time. Its general objects are to promote higher standards of living, full employment, the solution of international, economic, social, and health problems, universal respect for the observance of human rights and fundamental freedoms. The Charter also provides that Member-States which administer colonial empires subscribe to the principle that the interest of native inhab. is paramount. Under this chapter of the Charter an International Trusteeship system has been estab. for the administration and supervision of existing mandated ters., ters. which thereafter might be detached from enemy states as a result of the Second World War, and ters. which might be voluntarily placed under the system by their administering states. Provision is made for an International Court of Justice to be set up by a special Statute, to be the main judicial organ of the U.N. and to give an advisory opinion on all legal matters as well as adjudicating in justiciable disputes. All Treaties must be registered with the Secretariat of U.N. and pub. by it, otherwise they will not be recognised by the U.N. Obligations under the Charter over-ride any other treaty obligations for Members of the

U.N. Amendments of the Charter require a two-thirds majority of the Assembly, including all the Great Powers, providing the votes are ratified by the Governments in each case.

Achievements of the United Nations. As late as 1949 virtually all the acute political problems before the Security Council and other organisations remained in a state of deadlock, chiefly as a result of what was styled the Russian 'peace offensive.' Fundamental differences existing between W. and E. had further diminished the effective working of the Security Council in its subsidiary bodies in all but active conflicts, but for this very reason added weight was now given to the position of the General Assembly.

The most revolutionary concept in the C. of the U.N. is the use of majority voting to decide matters of substance. The risks of the majority procedure, however, were limited by giving each of the permanent members of the Council the right of veto and by restricting the powers of the Assembly to discussion and recommendation. To some extent these prudent precautions have been stultified by the disputes between Russia and the W. Furthermore, the abuse of the veto by Russia in the Council has imposed a correspondingly greater burden on the Assembly than it was ever intended to bear.

It was never foreseen that the Assembly would be asked to give decisions, as opposed to recommendations, nor was it foreseen that it would be invited to decide on such complex problems as Palestine and the It. colonies. The dangers of this development were not apparent to the W. Powers, because on most issues the majority of the Assembly were always on their side against the Soviet Union and its satellites. But by the end of the fourth Assembly it was evident that there were other majorities: a majority of small powers against great powers, of powers without colonies against colony-owning powers, and a majority of non-European powers against the older nations of Europe. As more nations were admitted to U.N., these groupings of powers became more obvious, the most significant new group being, by 1956, the so-called 'Afro-Asian' group, which, when united, could outvote the W. powers.

The first supreme test of the efficacy of the U.N. organisation in resisting aggression came in June 1950, when the Security Council decided (27 June) to invoke the provisions of the Charter for the use of military sanctions against the N. Korean Communist-directed attack on the Rep. of S. Korea. As a measure of collective security the council's action was unprecedented. The 7 affirmative votes in the council all came from the W. States, but in a few days some 40 nations had endorsed the action taken. According to the Charter, Russia, one of the 5 permanent members of the Council, should give a concurring vote in any decisive recommendation. Owing to Russia's boycott of the Council, however, a convention had evolved (acknowledged in the past by Russia itself) under which the abstention

of a permanent member at the time of voting should not be counted as a 'veto' against the vote, and it seems to be assumed that in this context 'abstention' is the same thing as 'absence.' Subsequently the Russian deputy foreign minister (Gromyko) denounced the Amer. intervention as inspired by aggressive plans and as an unwarranted intervention in the domestic affairs of Korea. The Korean crisis burst on the world on 25 June. The first American troops landed in Korea to help to defend the rep. on 30 June. In July MacArthur was appointed supreme commander of all U.N. forces in Korea (*see further under KOREAN WAR*). A truce was not finally signed until July 1953, and though this left the way open for a settlement involving the eventual reunion of N. and S. Korea, this was not followed up. In practice, the truce restored the boundaries virtually as they had been before N. Korean aggression started. But the authority of U.N. had been successfully asserted; without armed intervention it is reasonable to suppose that S. Korea would have been permanently occupied by the Communists. However, in assessing the significance of the Korean episode in U.N. hist. it is important to note that action took place on U.S. initiative. Whether effective action could have taken place in any other circumstances is doubtful.

Subsequent hist. suggests that U.N.'s effectiveness is very limited on major issues unless, as in Korea, it has the active backing of one or more of the great powers, or is putting pressure on a state or states whose susceptibility to domestic and foreign public opinion gives it a moral obligation to concur. For example, resolutions passed on allowing free Israeli passage through the Suez Canal or on the Kashmir problem have been ignored by the states concerned.

In Oct. 1956 Israel forces invaded Egyptian terr. and after an ultimatum, demanding the Egyptian and Israeli forces to stop fighting, had expired, Anglo-Fr. forces began an aerial bombardment of Egyptian military targets, followed by troop landings (Nov.). This, it was stated, was done solely to separate the combatants and to safeguard the Suez Canal. France and Britain had already (Oct.) used the veto in the Security Council to defeat a resolution calling upon Israel to withdraw behind the armistice line of 1949. Their military action was, however, condemned by the U.N., the U.S.A. taking a leading part in achieving this, and subsequently Fr. and Brit. troops withdrew, leaving a U.N. force made up of small contingents from sev. countries (including Danes, Yugoslavs, Swedes, and Norwegians) to restore order in the area. The U.N. was also to supervise the clearing of the Suez Canal blocked by Egypt early in the fighting; but subsequently it was not clear whether U.N. was either prepared to try to settle the Arab-Israeli problem on a permanent basis or whether, indeed, it had the capacity to do so.

The Fr. and Brit. action in complying with U.N. resolutions demanding their withdrawal is in contrast to the attitude of Soviet Russia, who, called upon by the General Assembly on 8 Nov. 1956 to withdraw her troops from Hungary, entirely ignored the request. The sov. U.N. resolutions on Hungary were useless in preventing the crushing by force of the Hungarian revolution by Soviet troops; for Russia felt under no moral compulsion to regard them, and no major power was prepared to risk a world war by taking active and immediate action as it had in Korea 3 years previously.

Rosenthal, *The United Nations: its Record and Prospects*, 1954; U.N.O., *Everyman's United Nations* (5th revised ed.), 1956; *Annual Review of United Nations Affairs* (periodical).

United Nations Educational, Scientific, and Cultural Organisation, see U.N.E.S.C.O.

United Nations Organisation (U.N.O.), see under UNITED NATIONS, CHARTER OF THE.

United Nations Relief and Rehabilitation Administration (U.N.R.R.A.), formed in 1943, to meet what were expected to be 2 broad needs after the termination of hostilities, viz. immediate relief and assistance in economic rehabilitation. U.N.R.R.A. was compelled, by the conditions it found, to concentrate primarily on the former. Its function was, moreover, limited to helping those war-ravaged countries which lacked the foreign-exchange resources to meet their own import requirements. The administration's major operations were virtually completed by the earlier half of 1947, but its activities had by then estab. the foundation for the future measures to be taken in the direction of world economic well-being.

The first shipload of U.N.R.R.A. supplies was sent in Mar. 1945. By the close of its operation, U.N.R.R.A. had delivered about \$3000m. worth of supplies, in volume 25,000,000 long tons, to 17 different countries.

United Nations War Crimes Commission, international corporation estab. in Oct. 1943 at a meeting of the representatives of 17 nations held at the Brit. Foreign Office. Originally the Commission was intended to 'investigate and record the evidence of war crimes' and to 'report to the Governments concerned'. . . . But it was eventually decided that it should also be charged 'with advising the Governments concerned upon matters of a technical nature, such as the sort of tribunals to be employed for the trial of war criminals, the law to be applied, the procedure to be adopted, and the rules of evidence to be followed.' It was not, however, empowered to make any decisions which would be binding upon the govs. for the guidance of which it made recommendations. Early in 1944 the Commission recommended to the allied

govs. that the retributive action of the U.N. should not be restricted to what was traditionally considered a war crime in the technical sense, i.e. a violation of the laws and customs of war, particularly embodied in The Hague and Geneva Conventions. Their proposals had much influence on the conclusion of a Four-Power Agreement dated 8 Aug. 1945, establishing the International Military Tribunal, in particular on its provisions for the punishment of 'crimes against humanity', which include murder, extermination, enslavement, deportation, and other inhuman acts committed against any civilian pop. before or during the War. The Allied govs. also accepted the view of those of the members of the Commission who held that in the state of International Law as it existed in 1939 the initiation of an aggressive war was not only illegal but criminal. This view was included in the Four-Power Agreement and was upheld in the judgment at the Nuremberg Trial (q.v.). The Commission also recommended that measures should be taken against the members of criminal organisations, such as the Gestapo. A unanimous resolution of the General Assembly of U.N.O. in 1946 approved the principles in the Nuremberg judgment. It remains to be seen whether those principles will be applied in practice in international law. See also CRIMES, WAR.

United Presbyterian Church, see SCOTLAND, CHURCH OF.

United Press Association, Amer. news service using cables, telegraph, radio, and telephone, was founded in New York in June 1907 by the combination of 3 older organisations. It was decided at the start that it should be non-exclusive in principle. In other words, it would sell its news service in any city to as many newspapers as desired to buy it. To maintain absolute independence in the presentation of news, it was also decided that it would make no news-exchange arrangements with any of the so-called 'official' news agencies so common in Europe. This added greatly to the expense at the start, as it necessitated setting up its own bureaux in all the leading European countries. It started business with a nucleus of 247 newspapers in the U.S.A.; in 1908 it secured its first customers in Japan; in 1916 it made important arrangements in S. America; in 1919 it started serving both morning and afternoon papers; and in 1921 it invaded the European sales field. In 1956 it was furnishing news to 1865 newspapers in 71 different nations and ters, and printed in 48 languages. In 1939 Scripps News was merged in the U.P.A. News is distributed in Great Britain and the Brit. Dominions by the Brit. United Press (originated in 1922). United Feature Syndicate, a subsidiary of the U.P.A., supplies feature material, such as articles by well-known columnists, feature writers, and comic artists. Another subsidiary, Ocean Press, transmits world news by radio to ships at sea. The U.P.A. maintains a hundred-and-one bureaux distributed in every important world news

centre, from which staff correspondents send out news messages by cable and wireless. In London is situated the divisional office for all Europe, and from there news goes to all the Brit. Commonwealth.

United Provinces of Agra and Oudh, see UTTAR PRADESH.

United Service Institution, see ROYAL UNITED SERVICE INSTITUTION.

United Society for Christian Literature, undenominational and international organisation engaged in promoting, publishing, and distributing Protestant Christian literature in many parts of the world. It began as the Religious Tract Society in 1799, united with the Christian Literature Society for India and Africa in 1935, and later included committees in London and Scotland associated with the Christian Literature Society for China.

United States Air Force. ORGANISATION AND MISSION. The Dept. of the Air Force was estab. within the Dept. of Defense under the terms of the National Security Act of 1947 as co-equal with the Depts. of the Army and the Navy. The Air Force was activated on 18 Sept. 1947 with the appointment of Stuart Symington as first Secretary of the Air Force. The U.S.A.F., under the administrative control of the Dept., came into being at the same time, and Gen. Carl Spaatz was appointed the first Chief of Staff.

The Air Force has primary responsibility for the air defence of the U.S.A., strategic air warfare, defeating enemy air forces, furnishing close combat support to the Army, and interdicting enemy land power. To accomplish these missions, it is organised into 18 major commands on a functional basis, of which 3, the Air Defense, Strategic Air, and Tactical Air, are combat commands. The support commands are Air Material, Air Proving Ground, Continental Air, Air Research and Development, Air Training, Air Univ., Military Air Transport Service, Air Force Academy, Air Force Finance Div., U.S.A.F. Security Service, and H.Q. Commands located overseas are the Pacific Air Forces, the U.S.A.F. in Europe, the Alaskan Air Command, and the Caribbean Air Command.

History. On 1 Aug. 1907, nearly 4 years after the Wright Brothers succeeded in flying a powered heavier-than-air aircraft, the U.S. Army estab. an Aeronautical Div. in the Office of the Chief Signal Officer. It was not until Mar. 1911 that Congress made the first regular appropriation of \$125,000 for the fledgling air force. In July 1914 Congress estab. the Aviation Section of the Signal Corps, and earmarked \$600,000 for aeronautical development. In its first field operations on the Mexican Border, in the spring of 1916, the Aviation Section's performance was not impressive. Its aircraft broke down under combat conditions against Pancho Villa, and had to be abandoned or condemned. This experience showed the need for higher-powered aircraft.

The First World War. Following the U.S. declaration of war in 1917, Congress voted the sum of \$640m. for military aeronautics. During its participation in the War the U.S.A. produced about 11,000 planes at home, and purchased about 5000 more abroad. Army aviators made about 13,000 pursuit flights, 6800 observation flights, and 215 bombing missions. On these missions they dropped 275,000 lb. of explosives. Combat losses totalled 289 planes, as opposed to confirmed enemy losses of 781 planes. In May 1918 aviation was removed from the Signal Corps and set up as the Air Service under the Secretary of War in order to meet the need for greater operational flexibility. At the close of hostilities in Nov. 1918 Air Service personnel numbered about 185,000, but the post-war demobilisation brought this figure down to less than 10,000 by June 1920. At that time the Air Service became an arm or line of the Army, and increased its regular personnel authorisation to 17,500 officers and enlisted men. The Air Corps Act of 1926 changed the name of the Air Service to Air Corps, and emphasised its major role as that of maintaining a strike ability rather than merely performing auxiliary services for other branches of the Army. During the 1930s military air power in the U.S.A. languished, as it did among the other W. democracies. The renaissance, spurred as much by Hitler's rise to power as by any other factor, quickened interest in the U.S.A. sufficiently to permit the estab. of the G.H.Q. Air Force in 1935. Military air power was for the first time given a mission beyond that of supporting ground forces.

The Second World War. The astonishing successes reaped by the Luftwaffe in Poland in Sept. 1939 and in W. Europe in May-June 1940 spurred an all-out armament programme to the point where the President called for production of 50,000 planes a year. Before Pearl Harbor, in 1941, the U.S. Army A.F. was created to co-ordinate all relevant air matters, and in Mar. 1942, following the U.S. entry into the war, the U.S. Army A.F. was elevated to co-ordinate status with the Army Ground Forces and the Services of Supply within the War Dept. The U.S. Army A.F. achieved practical autonomy, which it maintained throughout the War. It experienced the greatest expansion within the U.S. military establishment during that period. Its ann. appropriation was increased from about \$75m. at the beginning of the War to \$20,000m. in 1945. Between Pearl Harbor and the end of the War, U.S. Army A.F. personnel rose from just under 150,000 to 2,411,000, and the number of aircraft from 4000 to 80,000. The U.S. Army A.F. made a great contribution to victory in the Second World War. In the fight against Germany it reached a peak of more than 13,000 combat planes, operated by 619,000 men. More than 750,000 bomber sorties and 1,000,000 fighter sorties were flown. The U.S. Army A.F. dropped 1,500,000 tons of

bombs and destroyed more than 35,000 enemy aircraft, while losing about 18,000 aircraft. Against Japan it flew more than 869,000 sorties, the 20th Air Force alone accounting for about 40,000. More than 500,000 tons of bombs were dropped on Japan and its islands, and more than 10,000 Japanese aircraft were destroyed, while U.S. Army A.F. losses amounted to about 4500. On 6 and 9 Aug. 1945, 2 U.S. Army A.F. B-29s dropped single atomic bombs on Hiroshima and Nagasaki, respectively, marking the first use of atomic energy for military purposes. The detonations caused over 100,000 casualties, and over 50 per cent of the built-up areas of both cities were destroyed. Japan sued for peace, and the War officially ended with the surrender aboard the U.S.S. *Missouri* on 2 Sept. 1945.

1945-1950. As it did after the end of the First World War, the strength of the military air arm dropped precipitately, from 2,250,000 in Sept. 1945 to 734,000 on 1 Jan. 1946, 5 months later. By 1947, the U.S. Army A.F. personnel strength reached its ebb, barely exceeding 300,000. The ann. appropriation fell to \$2000m. Aircraft fell from a wartime high of 80,000 to about 40,000, and in June 1947 only 11 of 38 groups manned were considered operationally effective. In its post-war planning the U.S.A.F. had developed the 70-group goal as a minimum peace-time force, but reductions of its appropriations and troop bases did not permit expansion to this goal. Meanwhile, the Soviet Union erected what Winston Churchill called an 'Iron Curtain' between E. and the W. In the face of growing Russian intransigence, the W. remained in a state of virtual demobilisation. The U.S.A.F., which had developed an atomic capability and the long-range bombers to deliver these weapons on target, decided to retain the striking integrity of the Strategic Air Command within the 48-group programme limitations imposed upon it. This capacity for swift atomic retaliation proved to be the greatest single deterrent to major Communist aggression. Then, on 12 June 1948, the Russians clamped a land blockade on the city of Berlin, which became dependent on airlift for the necessities of life. U.S.A.F. aircraft went into action immediately, and within 5 days large-scale operations began, the daily haul rising to 6000 tons on many occasions. By the end of 1948 the combined U.S.-British airlift (which included U.S. Navy and R.A.F. transports) had exceeded 700,000 tons, or more than the total flown over the 'Hump' from India over the Himalaya Mountains into China during the Second World War. On 12 May 1949 the Russians lifted the land blockade, and the airlift gradually declined, ceasing entirely on 30 Sept. 1949. In 15 months 1,783,826 tons of supplies had been flown into Berlin, and the Russians had suffered a damaging blow to their prestige. 'Operation Vittles', as the Berlin airlift was called, was the nation's first important peace-time use of air power as an instrument of national policy.

The Korean War. The U.S.A.F. began operations in Korea on 27 June 1950, 2 days after the N. Korean Communists invaded the Rep. of Korea. During the 3 years of the conflict, ending when the Armistice was signed on 27 July 1953, U.S.A.F. air action destroyed more than 1000 enemy aircraft, including 838 of the Russian-built MIG-15s, and put out of action some 81,000 supply vehicles, 10,000 railway cars, and 1300 tanks. In addition, an estimated 180,000 of the enemy's troops were killed or wounded.

The Korean War had far-reaching effects on the nation and the U.S.A.F. The full realisation of Communism's aggressive intent in world affairs pointed the necessity of maintaining strong military forces in constant readiness for long periods of time. Entering the Korean War with only 48 wings, the U.S.A.F. embarked upon an expansion programme which went through a series of progressive changes—from 48 to 95, and to 143. The end of the Korean War brought about a reappraisal of the nation's military posture, and in the autumn of 1953 a new goal of 137 wings was set for the U.S.A.F., to be achieved by 30 June 1957.

1953-1957. The U.S.A.'s and subsequently the U.N.'s response to the aggression in Korea had been able to cope with the immediate threat. In the long term, on the basis of identity of interest, the sovereign nations around the rim of the Atlantic Ocean had been impelled to seek a relatively permanent mechanism for the pooling of their resources, and this evolved, beginning in 1949, as the North Atlantic Treaty Organisation. Obviously, air power would play a leading role in this mutual defence structure. To this end, in addition to building up its active force, the U.S.A.F. also planned to rely upon numerous forward overseas bases to improve its combat capability, including a number in the United Kingdom. In Mar. 1951 construction had begun at Thule, Greenland; and this base in the Far N. had become operational in Sept. 1952. Also in 1951 the U.S.A.F. had initiated construction of bases in Fr. Morocco, and in Sept. 1953 the U.S.A. and Spain signed an agreement permitting Amer. forces to utilise Spanish air and naval installations, which became operational in 1957. In Oct. 1953 Greece also gave the U.S.A. permission for joint use of several air and naval bases. Similar agreements were made with Iceland for use of the airfield at Keflavik, with Denmark for air bases in Greenland, and with Portugal for the use of air bases in the Azores. Meanwhile, in step with technological development, the U.S.A.F. began the long transition from planes to missiles for some of its missions. In 1954, 2 units of B-61 Matadors, a tactical guided missile, were assigned to Germany for duty with the N.A.T.O. defence forces. The intercontinental ballistic missile (I.C.B.M.) with a range of 5500 miles was given the highest national priority in Nov. 1955, and the U.S.A.F. was assigned the responsibility of developing and plac-

ing it into operation. In Nov. 1956 the Air Force was given operational responsibility for the intermediate-range ballistic missile (I.R.B.M.) with a range of 1500 miles. Until such missiles have become available in quantity, and have achieved an acceptable degree of reliability, however, the U.S.A.F. places its main reliance upon manned aircraft to perform its missions. Three B-52 jet bombers, for example, in Jan. 1957 completed a round-the-world flight which covered some 24,325 miles in 45 hrs and 18 min., a dramatic example of Strategic Air Command's retaliatory capability. In the fiscal year starting in July 1957 the Air Force manned its 137-wing structure with 919,331 military personnel, and a budget of nearly \$16,000m. An additional \$900m. was appropriated for the construction and improvement of bases. The bulk of these funds was earmarked for modernising the long-range bomber force, improving the capability of the day fighter and interceptor force, and increasing the reliability of the guided-missile systems. With assets of over \$70,000m., the U.S.A.F. had become the largest single business enterprise in the U.S.A., spending 1 out of every 2 defence dollars and 1 out of every 4 tax dollars.

United States Architecture, see AMERICAN ARCHITECTURE.

United States Army, formally created on 14 June 1775, when the Continental Congress authorised an army to defend the rights of the Colonies. Three weeks later, on 3 July 1775, Gen. George Washington assumed command of the motley colonial militia units besieging Brit. troops in Boston. The character of the first commander, his brilliant field leadership, clear-sighted insistence on high standards of training and discipline, courage under fire, perseverance in the face of adversity, and unquestioning recognition of the supremacy of civil authority over the nation's military forces, left an indelible mark on the Army. Gen. Washington was also responsible for the first clear expression of sound Amer. military policy. He recognised the need for a deterrent force to man the ramparts of freedom wherever they might be. He urged the estab. of a professional school for officers, and the creation of a well-trained, well-organised reserve force. Congress at first ignored Washington's recommendations, and in 1784 the Army was reduced to 80 men. But the depredations of the Indians soon forced expansion. Some untrained units were defeated by the Indians, until Gen. Anthony Wayne created a disciplined force that he led to victory at Fallen Timbers in 1794, bringing peace to the frontier.

In 1802 the founding of the U.S. Military Academy at West Point fulfilled one of Washington's recommendations. In 1803, following the Louisiana Purchase, the way to the Pacific was explored by an Army expedition under Capt. Meriwether Lewis and Lieutenant Wm Clark.

When war with England came again in 1812 the nation's failure to adopt Washington's recommendations for trained

active and reserve forces resulted in defeats and the unnecessary loss of life that accompanies military incompetence. Fortunately, however, 4 gens. understood the need for training and discipline. Gen. Wm H. Harrison at the battle of the Thames assured continued Amer. control of the NW. Ter.; Gens. Jacob Brown and Winfield Scott trained troops which outfought Brit. regulars along the Niagara Riv. frontier; and Gen. Andrew Jackson's victory at New Orleans sealed Amer. control over the Mississippi.

After the War of 1812 a much-reduced army continued to protect settlers against the Indians and to explore the W. During this period, Army engineers began to construct the great network of railroads which played so important a part in the growth of the nation.

In the Mexican War (1846-8) the small but well-trained Regular Army, augmented by volunteers, overcame larger Mexican forces solely because of higher standards of leadership, training, and discipline. Mexico was forced to cede territory, which increased the size of the U.S. by about one-third; though this greatly increased the Army's responsibilities, its strength was reduced to 16,000 men.

The Amer. Civil war proved to be one of the monumental conflicts of world history. It was a long, costly, bloody war in which troops and leaders on both sides displayed great valour and, after experience in battle, great ability. The Civil war, historically, was the first really modern war. Both sides made significant use of the telegraph and railways, and developed greatly improved weapons of all types. After peace was re-established the Army was reduced again in size—this time to 25,000—and its attention turned again to peace-time activities, mostly protecting settlers against Indian depredations. The Indian wars, so important in the heritage of the Army, finally ended in 1898. That same year saw the beginning of the conflict with Spain. The Army, transported to Cuba and the Philippines by the Navy, quickly and decisively defeated Sp. ground forces. The Army's accomplishments, during and after the Sp.-Amer. War, in controlling tropical diseases won world-wide renown, and also facilitated the building of the Panama Canal by Army engineers.

In 1914 the First World War began, and in 1917 the U.S. joined the Allies. By Nov. 1918, 2,000,000 men were in France. These Amer. reinforcements helped to tip the balance of military power and ensure Allied victory over Germany.

Although neglected and reduced after the First World War, the Army was perhaps better prepared for the Second World War than for any previous war. At last it had reserve forces of the kind Washington had recommended—the National Guard and Organised Reserve Corps—and the Army was able to expand rapidly and efficiently after initial reverses at Pearl Harbor and in the Philippines. The keynote of the Second World War was the teamwork of ground, air, and naval forces. This was

particularly significant in the amphibious operations which formed the basic pattern of the war against Germany and Italy, as well as against Japan. It was a war of movement, with the infantry-armour-artillery team carrying the burden on the ground, and airborne units giving the Army great strategic mobility.

Rapid demobilisation after the Second World War hampered the Army's effectiveness in carrying out U.S. policies and commitments throughout the world. This weakness was exploited by the Russians. In June 1950 the Russian-sponsored N. Korean Army invaded S. Korea. After a rapid initial success, the N. Koreans were finally stopped and then completely routed by U.N. forces. Communist China then entered the war in overwhelming strength, forcing U.N. troops to withdraw into S. Korea. A U.N. counter-offensive drove the Communists back into N. Korea before the front became stabilised as a result of truce negotiations.

With the purpose of reinforcing the will and ability of other nations to resist communism, the Army's military missions and aid groups are to be found in 44 countries, from Korea to N. Europe. In this effort some 200 foreign divs. are being strengthened. Owing to the U.S. Army's assistance, many of the smaller and weaker nations are developing confidence in their ability to defend themselves. U.S. military men are at the potential trouble spots of the world; their presence is a reassurance to other nationalities that the U.S. accepts its share of responsibility in the fight for peace. The major effort of the U.S. Army is to help to deter war in any form, from a guerilla campaign to a nuclear conflict. The Army must be prepared to fight any type of war in any climate or terrain. It must so organise, dispose, and deploy its forces as to create in the mind of a potential aggressor a clear conviction that any aggression will be contested and will fail in the end.

The U.S. Army has combat-ready forces stationed in Europe and in the Far E. These forces constitute military obstacles to aggression. In Europe the U.S. Seventh Army forms a significant part of the N.A.T.O. shield deployed against the Iron Curtain. A reinforced corps of 2 divs. stands alert on the armistice line to ensure peace in Korea. In all, some 40 per cent of the U.S. Army is overseas.

The U.S. Army seeks to create in its military organisation a strength derived from quality rather than from quantity. For this reason, the Army has modernised its fire-power and structure in the last 10 years. It has developed new weapons, tested new tactical organisations, and has tailored units towards the requirements of atomic war. The Army now has the ability to buttress military power with weapons of great flexibility, ranging from the pistol of the military policeman to the atomic warhead of the guided missile.

As in the wars of the past, success in land combat in the foreseeable future will continue to depend upon the proper

combination of 3 essential elements—fire-power, movement, and personnel. First, a word about fire-power as the U.S. Army regards it at the present time.

The rocket and guided missile will provide the heavy fire-power required by army forces in this period. Already some of these new weapons are operational and are in the hands of Amer. troops at home and abroad. Soon the U.S.A. will have sev. short-range missiles to deliver fire-power in support of front-line troops. The Honest John rocket—already available—plus the Little John and Lacrosse, the primary missiles which can be sited in areas well protected from enemy action and which can fire many miles into enemy ter., are already in the hands of Amer. troops in some cases and, in others, are in

*U.S. Information Service:
American Embassy*

THE EXPLORER III MISSILE

the latter stages of test and development. The Corporal (which is now operational) and the Redstone are such weapons. These missiles will allow the U.S. Army to deliver, from virtually impregnable positions, devastating atomic fire ranging many miles into enemy territory.

Missiles will provide improved ground-to-air as well as ground-to-ground fire-power. Conventional anti-air artillery will largely disappear from the active

army. For defence against enemy aircraft, the U.S. Army will place prim. dependence on missiles, particularly the Nyke family of weapons, in which Nyke-Hercules (formerly called Nyke B) will become the prim. member. Nyke-Hercules will be provided with an integrated system of control in local defence through the U.S. Army's electronic 'Missile Master' data-handling device. This system, in turn, will be co-ordinated with the nation-wide control organisation of the Continental Air Defense Command. The Talos missile system may soon be operational, and could be incorporated into the Army's anti-air system.

The U.S. Army is obtaining increasing mobility by improving its basic combat organisation, by reducing the weight and bulk of its weapons, and by providing better equipment to move its units and supplies on the battlefield. In the field of organisation, the U.S. Army is reducing the size of basic combat elements, recognising that dispersion will be the rule on future battlefields, where detection by the enemy may mean destruction.

On the ground, the U.S. Army is developing improved cross-country mobility, based upon the use of lightweight troop and weapons carriers. In the air, it looks to Army aviation to provide it with the internal mobility to survive and win on the battlefield of the future. To be of maximum utility, Army aviation must be forward, where it is immediately responsive to the requirements of the Army commander, and units must be able to operate from unprepared airfields. Because the Army is not interested in organic aircraft without this fundamental capability, there is no need for types of aircraft which would compete with the U.S. Air Force in the discharge of its approved functions.

Apart from mobility on the battlefield, the U.S. Army requires strategic mobility. Here, of necessity, it looks to the Air Force for the provision of strategic airlift. The Army has been continually applying technological development to aid in reducing the weight, bulk, and quantity of equipment in its units. Thus, it is steadily progressing towards making Amer. fighting units transportable by air.

The U.S. Army must maintain forces at proper levels of readiness to be able to contribute in the discharge of national commitments. Furthermore, it must maintain ready forces which are sufficiently versatile to use both conventional and nuclear weapons. They must be highly mobile and suitably deployed to respond quickly to local aggression. Such requirements necessarily influence the size and composition of the force structure, the type of people in the Army, and their training.

Finally, the number of people in the U.S. Army is affected by the location of troop units. Overseas deployments determine to a large degree the overall strength which must be maintained. With a 3-year overseas tour, which is about the practical limit, the U.S. Army has learned by experience that for every 100 men overseas, it must have 150 at home to

provide a training-base replacement system for the individuals and units abroad.

United States Lines, Amer. steamship company, estab. in 1921, and acquired in 1930 by the International Mercantile Marine Company (founded in 1903 and incorporating the old American Line, which first operated just after the close of the Amer. Civil war). Passenger liners of the U. S. L. are the world's fastest, *United States* (53,330 gross tons), holder of the Blue Riband of the N. Atlantic, and *America* (33,532 gross tons). In July 1952, on her maiden voyage from New York (departure 3 July at 2.36 p.m.) to Le Havre, the *United States* set up a new record for the fastest Atlantic crossing of

Courtesy United States Lines

U.S. SS 'UNITED STATES'

3 days, 17 hrs, 48 min., covering the 3191 (nautical) m. at an average speed of 35.53 knots. The passage from the *Ambrose* light vessel, New York, to Bishop Rock (2949 m.) took 3 days, 10 hrs, 40 min. (average speed, 35.59 knots). The *United States* and the *America* maintain a regular service between New York and Europe. The company also own 50 fast freight vessels. Most of these cargo vessels carry 6-12 passengers and operate between the U.K., Ireland, continental Europe, and the U.S.A.; also the U.S.A. to Hawaii, the Far E., Australia, and New Zealand. Associated companies include the American Pioneer Line, which serves the Far E., the S. Atlantic Line, which operates between S.E. coast U.S.A. ports and Europe, and the Atlantic Transport Company Ltd. (q.v.).

United States (American) Literature, see **AMERICAN LITERATURE**.

United States Marine Corps, integral part of the U.S. Navy under the control of the Navy Dept. Its members, like those of the Royal Marines (see **MARINES**), on which the U. S. M. C. was originally modelled, are trained to serve by land and air as well as on the sea, and the corps has distinguished itself in many land-actions. The U. S. M. C. was founded in 1775, and is a completely self-contained unit; during the Second World War the corps had its own artillery, tanks, and air force. It took part in the Sp.-Amer. war, the First World War, and in many inter-war operations in China, Mexico, Cuba, etc. In the Second World War a small force of Amer. marines heroically defended Wake

Is. against an overwhelming Jap. attack. In 1942-3 4 divs. of the U. S. M. C. were used in an attack on the Jap-occupied Solomon and Marshall Is. When S. Korea was invaded by N. Koreans in 1950, part of the U. S. M. C. was sent to help to defend S. Korea on behalf of the U.N. In Sept. 1950 Amer. marines took part in assault-landings on the Korean coast, and assisted in the capture of Seoul, cap. of S. Korea. Lt.-Gen. Randolph Pate succeeded Gen. Lemuel C. Shepherd, Jr., on 1 Jan. 1956, as Commandant of the Corps. The average strength of the U. S. M. C. in 1955 was approximately 207,000.

United States Military Academy, see WEST POINT MILITARY ACADEMY.

United States Navy. The term 'Department of the Navy' as used in the National Security Act of 1947 is construed to mean: the Dept of the Navy at the seat of gov.; the H.Q., U.S. Marine Corps; the entire operating forces of the U.S. Navy, including naval aviation, and of the U.S. Marine Corps, including the reserve components of such forces; all field activities, H.Q., forces, bases, installations, activities, and functions under the control and supervision of the Dept of the Navy; and the U.S. Coast Guard when operating as a part of the Navy pursuant to law.

The Dept of the Navy is organised, trained, and equipped primarily for prompt and sustained combat incident to operations at sea. The Navy is responsible for naval reconnaissance, anti-submarine warfare, and the protection of shipping. The operating forces are organised into 2 main fleets, the Pacific Fleet and the Atlantic Fleet, and also into various forces, such as the U.S. Naval Forces, E. Atlantic and Mediterranean, and U.S. Naval Forces, W. Pacific. The shore establishment is the portion of the Navy which may properly be described as supporting the operating forces. Organised into 14 districts, the shore establishment provides the Chief of Naval Operations with area commanders through whom he exercises his command responsibilities over activities ashore.

The supervision and direction of the entire Naval Establishment is vested by law in the Secretary of the Navy, who, in the performance of his legal duty in supervising the Naval Establishment, delegates portions of his authority to his naval and civilian executive assistants through authoritative channels. The Marine Corps is headed by its Commandant, who is appointed for a 4-year term by the President and maintains his H.Q. in Washington, D.C., as a separate component of the Navy Dept, directly under the Secretary of the Navy. Generally the corps is divided into 3 parts; the first, under control of H.Q., Marine Corps, are a number of estabs. which provide logistic support and training for the corps as a whole. The second fulfils the secondary Marine Corps mission to provide security forces afloat and ashore, and the third is the Fleet Marine Force, which includes about half of the strength of the corps.

To-day's Navy continues to move forward with its traditional strides in development and scientific progress. It is undergoing tremendous changes from steam to nuclear power, jet-propelled aircraft, and guided missiles. Two very important parts of its total striking power are the fast carrier attack force and the guided-missile submarine.

For the fiscal year 1957, the new Navy construction programme called for 23 new warships, 5000 tons of land and service craft, and 18 conversions. Also proposed was a new 85,000-ton nuclear-powered aircraft carrier. Included in the programme was the sixth attack carrier of the *Forrestal* class, a nuclear guided-missile cruiser of 11,000 tons; 4 guided-missile frigates of 4000 tons; 8 guided-missile destroyers of 3000 tons; 6 nuclear-powered submarines; 2 destroyer escorts of 1400 tons; and one 8000-ton ammunition ship. Among the Navy's operational missiles are the *Sidevinder*, an air-to-air defence weapon which protects men and ships at sea from attack by enemy aircraft. *Sidevinder* is also employed in the air defence of the continental U.S. The air-to-surface missile *Petrel* is launched by patrol aircraft outside the range of the target's air defence. The missile attacks at high speeds, sparing the pilot from anti-aircraft hazards. *Regulus*, a surface-to-surface missile, is capable of delivering a war-head over a range of hundreds of miles guided by a built-in electronic brain. The supersonic surface-to-air missile *Terrier* is designed to intercept aircraft at longer range and higher altitudes than conventional anti-aircraft guns and under all weather conditions.

Names are assigned to the following types of ships as indicated: *Battleships*, states of the Union; *Cruisers*, heavy and light, cities of the U.S.A.; *Cruisers*, large, names of territories and insular possessions of the U.S.A.; *Aircraft Carriers*, names of famous ships formerly on the Navy list and important U.S. battles. The escort class of carriers are given names of is., bays, and sounds of the U.S.A., also important U.S. operations, battles, and engagements; *Destroyers*, the names of deceased persons in (1) Naval, Marine Corps, and Coast Guard who rendered distinguished service to their country, (2) Secretaries and Assistant Secretaries of the Navy, (3) Members of Congress who were closely identified with naval affairs, (4) inventors. The *Destroyer Escort* type is named for personnel of the Navy, Marine Corps, and Coast Guard killed in enemy action in the Second World War; *Landing Ships*, places of historical interest; and *Submarines*, names of fish and denizens of the deep. The numerous additional types of vessels—mine-layers and sweepers, patrol vessels (frigates, gunboats, and yachts), and auxiliaries (tenders, repair ships, ammunition and transport and cargo ships, hospital ships, oilers, etc.) and miscellaneous craft are all given names in accordance with an agreed pattern. The names of these types and classes vary widely, including Indian chiefs and

tribes, mythological characters, volcanoes, mountains, countries, and deceased Naval and Marine Corps personnel.

The strength of the U.S. Navy for the period ending 30 June 1957, taken from the 1956-7 edition of *Jane's Fighting Ships*, was a total of 4500 ships. Of these 1000 were in active service and 1500 in the Reserve Fleet. This does not include service craft. Beyond the strength of ships and planes alone lies one of the Navy's greatest assets—highly trained personnel whose pioneering spirit in

research and devotion to country have made the U.S. Navy one of the greatest military forces in history. The U.S. Navy to-day, equipped with some of the most advanced weapons of the nuclear age, gives the U.S.A. a strong and mobile force to keep the sea lanes free and to deter aggression. See also NAVY, DEPARTMENT OF THE.

United States of America, federal rep. of 48* sovereign states. Its constitution is written. Each state has a similar fundamental law. The U.S.A. lies roughly

¹ The original 13 states. ² Gross area represents land and water. ³ Organised.

* Alaska took its place as the 49th state in 1958.

between 23° N. and 49° N. lat., and 69° W. and 125° W. long. The boundaries are the Atlantic Ocean on the E., the Gulf of Mexico and Mexico on the S., the Pacific Ocean on the W., and the dominion of Canada on the N.

AREA AND POPULATION. The estimated area of the continental U.S.A. is 3,022,387 sq. m., consisting of 2,974,726 sq. m. of land and 47,661 sq. m. of inland water. Non-contiguous ters. of the U.S.A. include the Ter. of Alaska (586,400

census the pop. of the continental U.S.A. is divided as follows: white, 134,942,028; Negro, 15,042,286; Amer. Indian, 343,410; Chinese, 117,629; Japanese, 141,768; other races, 110,240. Of the white pop., 124,780,860 were native born and 10,161,168 foreign born. Although the permitted quota is 154,657 immigrant aliens, a total of 208,177 immigrants entered the U.S.A. in 1954, some of these persons being in non-quota classes. (See also EMIGRATION; IMMIGRATION.)

¹ Purchased.

sq. m.), the Ter. of the Hawaiian or Sandwich Is. (6423 sq. m.), and the following dependencies: the Panama Canal Zone (553 sq. m.), Puerto Rico (3435 sq. m.), Guam (206 sq. m.), the Virgin Is. (133 sq. m.) and Navassa Is. (2 sq. m.) Tutuila and other Is. of F. Samoa, including Swain's Is. (area 76 sq. m. in all), the Wake and Midway Is. (5 sq. m.) and various other Pacific Is., Kure Is., Palmyra, Kingman Reef, Cornwallis or Johnston Is., Howland, Baker, and Jarvis Is. (about 6 sq. m. in all). The Caroline Is. (500 sq. m.) and the Mariana and Marshall Is. (830 sq. m.) are administered under U.N. trusteeship. In addition, 2 Is. of the Phoenix Group, Canton and Enderbury, are administered jointly by the U.S.A. and Great Britain for common use as air stations. Total area of the U.S.A., including ters. and dependencies, is 3,628,130 sq. m.

States and Dependencies. Continental U.S.A. comprises 48 states and the Dist. of Columbia. Alaska, Hawaii, the Panama Canal Zone, Puerto Rico, Guam, Samoa, and the Virgin Is. are also U.S. possessions, and in addition the U.S.A. has the lease of a number of defence bases. The states and dependencies of the U.S.A., together with their pop. and caps. are shown on pages 332 and 333.

Population. According to the census of 1950 the pop. of the U.S.A. and Territorial possessions was 151,132,000 (including military forces overseas), an increase of 19,312,000 or 8·7 per cent over the findings of the previous census taken in 1940. An estimated figure of 165,248,000 in July 1952 shows a still further increase. According to the 1950

Cities. In the 1950 census it was found that 106 cities in the U.S.A. had a pop. of over 100,000. A list of these follows (the figure given in brackets denotes the pop. in 1880).

GEOGRAPHY. Surface. The surface of the U.S.A. from E. to W. may be divided as follows: (1) the Atlantic Plain, which extends from the coast to the Appalachian system (formerly called the Alleghenies); (2) the Mississippi Valley and Great Central Plain, which extends from the Appalachian Mts W. to the Rocky Mts, an enormously fertile region about 1000 m. by 1000 m. in extent; (3) the W. Highlands; (4) the Pacific Slope, which extends from the Rocky Mts to the Pacific Ocean.

Mountains. The chief mt systems are the Appalachian ranges in the E. and the Rocky Mts (q.v.) in the W.

(1) The Appalachian system consists of very ancient rocks, which were elevated in former ages to a great height, and then reduced by erosive forces to a broad lowland. More recent elevation is responsible for some of the present ranges, while others are remainders of the earlier movements which have restricted erosive forces. The surface of this region to-day is a series of parallel ranges divided by fertile valleys. There is no peak of marked elevation in the Appalachian region, the highest point being Mt Mitchell in N. Carolina, which reaches a height of 6684 ft.

(2) The Rocky Mt system is composed of comparatively recent formations, and in some parts elevation still continues. Many of the ranges are anticlinal, and many peaks rise to great heights. Vol-

canoes or extinct volcanoes are numerous. The U.S.A. Rocky Mt system extends from 36° N. to 49° N. lat., a distance of about 1200 m. The system is continued in Canada. The highest peak is Mt Whitney, 14,496 ft. in California. In the W. part of the S. Rockies lies the Great Basin of Colorado, which is extremely arid, has suffered much volcanic action, and is intersected by deep canyons cut by the rivs.

The W. of the highland region of the W. U.S.A. is bounded by the Pacific Mts. These consist of 3 ranges, the Sierra Nevada, the Cascade Range, and the Coast Range.

Coast. The E. coast of the U.S.A. continues the Continental Shelf of Canada. This shelf was at one period in the geological hist. of the country completely uncovered, and at another period the whole of the present coastal plain, as well as the present Continental Shelf, was submerged. The Continental Shelf practically disappears off Florida.

The riv. valleys which cross the coastal plain and the Continental Shelf are now partially submerged, and so give safe and deep harbours. From the N. boundary of the U.S.A., as far S. as Cape Hatteras, the coast is low and, especially N. of New York State, rocky, the coast of Maine eminently so. The coast of New Jersey, on the other hand, is sandy, and, farther S., off the Atlantic coast and also along parts of the coast of the Gulf of Mexico, there are numerous sand-spits with shallow channels, lagoons, and swamps. There are few good natural harbours here.

There is only one considerable indentation on the E. coast of the U.S.A., viz. Chesapeake Bay, which runs inland in a northward direction for more than 180 m., with an average breadth of about 15 m.

The Pacific coast of the U.S.A. has a very narrow Continental Shelf, and few bays or capes. The only considerable indentations are San Francisco harbour, which is deep and safe, and Puget Sound, between the State of Washington and British Columbia.

Rivers. The rivs. of the Atlantic Plain rise in the Appalachian system, and are comparatively short. In some cases they are too rapid to be of much value for navigation, but are valuable as supplying water power. The others almost without exception have good harbours at their mouths. The chief are: the Hudson (315 m.), the Delaware (410 m.), the Susquehanna (450 m.), the Potomac (285 m.), the James (340 m.), and the Savannah (450 m.). The Hudson is the most valuable for commerce, as it is connected by the New York State Barge Canal with Buffalo and the Great Lakes, while the Richelieu Canal connects it with Montreal. The Delaware 410 m. includes the E. branch. If the Potomac S. branch is included in its length the total is 415. The James begins at the confluence of the Cowpasture and the Jackson rivs., each 75 m. long. The Savannah (314 m.) is formed by the junction of the Tugaloo (45 m.) and the Seneca (50 m.).

The Great Central Plain is drained by

the Mississippi-Missouri riv. system, the basin of which covers half the area of the U.S.A., and is equal in area to about one-third the area of Europe. The Mississippi rises in Lake Itasca in Minnesota, at about 1500 ft above sea-level. After flowing for about 100 m. in an easterly direction it turns S., and is joined by numerous tribs. The chief are: the Missouri, which enters the Mississippi just above St Louis; the Ohio, which joins the main riv. at Cairo; the Arkansas, the Wisconsin, the Illinois, and the Red R. The Mississippi (with the Missouri, its chief trib.) is 4814 m. long; the Missouri, 2464 m.; the Ohio, 1500 m.; the Arkansas, 981 m.

The Mississippi-Missouri has made a broad flood plain, varying in width from 30 to 60 m. This plain is subject to severe inundations, for it slopes very gently away from the riv. bed, which is in many parts of the riv. above the level of the surrounding plain contained by levees maintained by the gov. When these break great floods occur. The riv. carries a vast amount of silt, which it deposits at its mouth, forming a delta.

Other rivs. falling into the Gulf of Mexico are the Mobile and the Rio Grande. The latter (about 1885 m. long) forms the boundary between Texas and Mexico.

The rivs. flowing into the Pacific are comparatively short, owing to the nearness of the coast ranges to the sea. The Colorado R., 1400 m. long, flows into the Gulf of California, after crossing an arid plateau. It has cut for itself a deep canyon with almost perpendicular banks, in many places more than a m. high. The San Joaquin and the Sacramento R. unite and flow into the harbour of San Francisco; these and the Columbia, 1210 m. long, are the only important rivs. on the W. of the U.S.A.

Lakes. Of the Great Lakes of N. America Lake Michigan lies within the U.S.A., and the S. shores of Lake Ontario, Lake Erie, Lake Huron, and Lake Superior are U.S.A. ter. These lakes were formed by the action of the glacier which once covered the continent as far S. as the forty-second parallel, roughly speaking. They are remainders of much larger lakes and are of the utmost importance as waterways. They comprise the greatest inland body of fresh water in the world, and carry ships comparable to those of the ocean. New England has very many smaller lakes, which are also the result of glacial action. The largest lake of the U.S.A., apart from the Great Lakes, is the Great Salt Lake of Utah.

Climate. A country as large as the U.S.A. and one having such wide differences of elevation must necessarily have a climate of wide differences of temp. and of rainfall. The SE. States have almost a sub-tropical climate, without extreme variation between the winter and summer temps. The E. and central states are subject to much greater variations of temp., while the W. coast is less extreme in climate than are the other parts of the U.S.A. The rainfall is heaviest in Alabama, Mississippi, Gulf States, and on

the E. coast; it gradually decreases towards the W.; California and Colorado are dry, and the N. part of the W. coast has an abundant rainfall. The driest states are Arizona, Nevada, Montana, and New Mexico. The rainfall of the E. coast is steady and rather greater than that of England. The rainfall in the Gulf States is heavier and is chiefly monsoonal in character, falling mainly in the summer. The winds from the Pacific bring rain to the W. coast, but the Sierra Nevada Mts shut these winds off from the Great Basin in Nevada and Utah, which has an average yearly rainfall of less than 10 in. The climate of the Central Plain is rendered colder in winter owing to lack of shelter from the winds blowing from the N. The Central Plain and the New England States have heavy snowfalls in

still preserved in the Yellowstone dist. Other indigenous animals are the grizzly bear, which belongs to the Rockies, the Rocky Mt goat, the Rocky Mt sheep, the opossum, the prairie dog, the puma, the wild cat, coyote, and various kinds of deer. The fish include cod, halibut, mackerel, shad, and salmon. Many varieties of fresh-water fish are found in the lakes. The country is also noted for its great variety of bird life.

MINERALS. The U.S.A. is rich in almost every kind of mineral. There are 7 main coalfields supplying bituminous coal. These are: the Appalachian, the Central, the W., the Rocky Mt., the Michigan, the Richmond Basin, and the Pacific coast fields. The only important source of anthracite coal is Pennsylvania. The most productive iron mines are in the

winter, while perpetual snow lies on the summits of the Rockies and of the Coast Ranges.

Flora and Fauna. In their natural state the E. coastal plain and the E. highlands were covered with temperate forests. These have been largely cut down. The S. States (the Gulf States) have some sub-tropical forest trees which yield woods valuable in commerce. The W. coast forests are extensive, and are noted for the enormous size of some of their trees, which are mainly spruce, cedar, redwood, and Sequoia pine. The Central Plain was originally covered on the E. with mixed forest and grass-lands, which merged into grass lands without forests to the W. as the rainfall decreased. This dist. is now the great wheat and grass area. The Great Basin region has not much vegetation; what there is is mainly of a desert type, though where irrigation works have been successfully carried out this region has proved itself capable of supporting a luxuriant vegetation.

The Central Plains of the U.S.A. were once the haunt of the bison, but it is now almost exterminated, though herds are

neighbourhood of Lake Superior; the most valuable mines apart from these are in the S. Appalachian region. The Lake Superior dist. is rich also in copper, which is found almost in its pure state. Copper is also found in Arizona, Utah, Montana, and New Mexico. The E. States are rich also in petroleum and in natural gas. Pennsylvania is the largest producer of these commodities in the E., but there have been enormous finds in Texas, Oklahoma, and California. Zinc is found principally in Idaho, Oklahoma, New Jersey, and Kansas. The precious metals are mined principally in California, Colorado, Idaho, S. Dakota, Utah, Montana, Arizona, and Alaska. Large supplies of kaolin are found in the E. States; some sulphur is mined in Nevada and Utah. Salt is produced commercially in a number of States, especially Michigan, New York, Ohio, and Louisiana. Considerable quantities of marble are quarried in Vermont; sandstone is found in Ohio, Pennsylvania, Connecticut, and New York.

Gold production was as high as 6,000,000 troy oz. in 1940 (value \$210m.), and thereafter declined steadily to under

1,000,000 troy oz. in 1945; in 1952 it was 1,652,704 troy oz. (value \$57,845,000). Silver production had a peak year in 1941 with over 71,000,000 troy oz. (value \$25m.); in 1952 it was 39,419 troy oz. (value \$35,676,000). The platinum group of metals (platinum, palladium, ruthenium, iridium, rhodium, osmium) are produced mainly from placers but also as a by-product of copper refining. Their annual value in recent years is about \$1m. Production in a peak year (1938) was 45,000 troy oz., but in 1947 it had declined to 17,000 troy oz. Apart from the precious metals, the most recent figures for the production (in short tons, i.e. of 2000 lb.) and value of other non-ferrous metals are as follows: copper 855,000 (value \$210m.); zinc, 545,000 (value \$81m.); lead, 430,000 (value \$57m.).

In addition to this vast domestic production, imports of crude oil amounted to 242,000,000 barrels in 1954 at a value of \$2412m. The Philadelphia area is the chief refining centre, and the port of Philadelphia is the port of entry for crude oil imported from abroad. As a result of expansion in 1948, refineries are now able to cope with the domestic demand for petrol, kerosene, and light and heavy fuel oils. Coal production in 1954 (estimated), millions of short tons (value in millions of dollars), amounted to: anthracite, 27 (value 261); bituminous 392 (value 1889). Coke production was 78,836,857 net tons in 1953 (value \$1,156,562,004).

The value in millions of dollars of combined mineral products is as follows: in 1953 the total value was 14,381. Divided between metallic products, fuels

SCHOOLS, NEW YORK

A MERCHANT-SEAMAN
OF NEW YORK

American Embassy, London

In 1954 production of copper was 1,656,000,000 lb. (value \$488,520,000); zinc, 410,000 short tons (value \$89m.); lead, 322,700 short tons (value \$88,420,000). Other important non-ferrous metals (with 1952 production) are antimony (4434 short tons), molybdenum (42,717 short tons), magnesium (25,000,000 lb.), and mercury (951,500 lb.). Iron ore is abundant in a number of states, particularly Minnesota, Michigan, and Alabama. Total output of iron ore was 117,994,769 gross tons in 1953 and 77,864,000 gross tons in 1954. In 1953 production of pig iron was 74,901,429 net tons, and in 1954, 57,965,548 net tons. Steel production declined from 111,609,719 net tons in 1953 to 88,311,652 net tons in 1954. Of the non-metallic mineral products, petroleum is produced in 26 states, the chief being Texas (over 900,000,000 barrels annually), California (300,000,000), Louisiana (246,000,000), Oklahoma (186,000,000), and Kansas (119,000,000). In 1954, production of crude oil was 2,257,119,000 barrels, of natural gas (liquid), 302,698,000 barrels, of natural gas, 9,426,509,000,000 cub. ft.

(i.e. coal, petroleum, natural gas, and liquid natural gas and allied products), and non-metallic (excluding fuels), the values are as follows (1953): metallic 1796, fuels 10,249, other non-metallic 2336.

AGRICULTURE. The 1950 census showed that nearly 60 per cent of the total land area of the continental U.S.A. is farmed, i.e. 1,158,565,852 ac., comprising 5,382,162 farms. The number of farms has decreased since 1930, but the acreage farmed has grown from 968,771,000 ac. in 1930 to the present figure. Since 1930 output has increased by about a quarter as the result of improved farming methods, but the long-term fertility of the soil may have been impaired. The value of farm lands and buildings has fluctuated, being (in millions of dollars) 48 in 1930, 34 in 1940, and about 75 in 1950. In 1954 it was estimated that 21,890,000 people were engaged in farming in the U.S.A. (31,614,269 in 1900). Agriculture is still, however, the largest single industry in America, employing approximately 13.5 per cent of the working pop. Wheat, oats, barley, and corn are the chief cereals

grown. Wheat is grown chiefly in Washington, Minnesota, Indiana, N. and S. Dakota, Ohio, and Oregon. Oats and barley are grown also in California. Corn is largely grown for fattening cattle, chiefly in Kansas, Nebraska, Iowa, Illinois, Missouri, Indiana, and Ohio. Rice is grown in the swampy parts of

U.S. Information Service:
American Embassy

OIL REFINING: 'TOPPING HEATER'

Louisiana and Texas. Tobacco is grown principally in Kentucky, S. Carolina, N. Carolina, Virginia, Georgia, and Tennessee. Sugar is grown in Louisiana, but beet sugar also is manufactured from beets grown in Michigan, Nebraska, Colorado, Utah, and California. Cotton is very largely grown in the SE. part of the country. There are 2 kinds, the 'sea-island' cotton, which has a long thread and is grown on the is. and coasts of Georgia, S. Carolina, and Florida, and the 'upland' cotton, which has a short thread. This is grown inland in the SE. states. The production in 1954 was 13,569,000 bales of 500 lb. each. The leading cotton state is Texas; others are

Mississippi, Arkansas, Alabama, Georgia, S. Carolina, Louisiana, N. Carolina, Oklahoma, and Tennessee. Flax is grown mainly for its seed. The chief centre for it is Oregon. The production in 1954 of the prin. crops was as follows (in millions of bushels): corn (maize), 2964; oats, 1500; wheat, 970; potatoes, 355; barley, 370; soya beans, 343; sorghums, 204; rice, 59; rye, 24; flax seed, 41.5; buck-wheat, 31. Production of cotton was 13,569,000 bales, and of cotton-seed 5,568,000 short tons. Tobacco production was 2,200,134,000 lb. Over 104,380,000 tons of cultivated hay were cut. Fruit and nuts form a large part of the ann. produce; figures for 1954 for the chief fruits are (in millions): apples, 104 bushels; peaches, 61 bushels; pears, 30 bushels; grapes, 3 tons; oranges, 141 boxes; grapefruit, 46 boxes; lemons, 15 boxes; strawberries, 12 crates. During the same year production of sugar cane was 6,940,000 short tons. Sugar beet amounted to 14,027,000 short tons.

Stock Farming. The 1950 census showed there were in the U.S.A. 7,781,000 horses and mules, 77,963,000 cattle, of which 23,853,000 were milk cows, 26,182,000 sheep, and 58,852,000 hogs. Estimates for 1955 showed a decline in hogs and horses and mules, but an increase in cattle. Figures (with value in millions of dollars) were: 4,551,000 horses and mules (horses value 165, mules value 90), 95,433,000 cattle

(value 8478), 24,408,000 milk cows (value 3252), 26,979,000 sheep (value 402), 55,002,000 hogs (value 1684). Poultry on farms in 1955 numbered 447,310,000, and egg production for 1954 was 65,375,000,000.

Forestry. An estimate made in 1945 showed that forest land occupied about 624,000,000 ac., or about one-third of the area of the continental U.S.A. Of this forest area, 461,044,000 ac. represented commercial forest, comprising saw-timber

areas 205,176,000 ac. of second or older growth, pole-timber areas 95,013,000 ac., seedling and sapling areas 85,552,000 ac., and areas poorly stocked or denuded 75,303,000 ac. Of the commercial forests the Federal Gov. owned 38,957,000 ac., state, co., or city 27,114,000 ac., and private companies 344,973,000 ac. The national Forest Service, however, administers both commercial and non-commercial forest land, divided into 152 national forests in 40 states and in Alaska and Puerto Rico, the total extent (1948) being nearly 180,000,000 ac. The W. and S. states supply Douglas and White fir, redwood, ponderosa and sugar pine, hemlock, and spruce; the E. states, yellow and white pine, oak, red gum, yellow poplar, maple, hemlock, beech, and cypress. Timber production in 1953 was 36,742,000,000 board ft. By-products from forestry include turpentine, tar, resin, and molasses made from wood sugar for poultry food.

MANUFACTURES AND INDUSTRY. Industrial production in the years since the Second World War is nearly a hundred per cent higher than in 1938-9. The following figures, in millions of dollars, are for 1954. The chief durable manufs. are iron and steel (1442), machinery other than electrical (1796), electrical machinery (1374), transportation equipment other than automobile (814), automobiles and equipment (2319), non-ferrous metals and their products (787), timber and lumber products (286), stone, clay, and glass products (883). Non-durable manufs. include textiles (345), chemical products (2283), rubber products (393), petroleum and coal products (52), food and kindred products (1817), tobacco (329), paper and allied products (970), printing and publishing (357), and leather products (116). Industry is widespread, the chief manufacturing centres being New York, Newark, and New Jersey, Chicago, Detroit (centre of the motor-industry), Philadelphia and Camden, Pittsburgh, Boston, Cleveland, Buffalo, St. Louis, Los Angeles, San Francisco, and Oakland, Baltimore, Milwaukee, Cincinnati, Youngstown, Bridgeport, New Haven, and Waterbury. The chief iron manufs. are in Pennsylvania, Allegheny co. being the most important dist., and Pittsburgh the most important tn. This state manufs. mainly steel for bridges, frames of buildings, rolled steel, nails, etc. Tools and cutlery are manufactured in the New England States, agric. implements in Illinois and Connecticut. Machinery is largely made in Chicago, New York, Pittsburgh, Philadelphia, and Cleveland. Steel shipbuilding goes on at Philadelphia, San Francisco, and other ports. Cottons are manufactured, mainly on the E. Coastal Plain. The atmosphere is here sufficiently damp for the thread, and the line of falls by which the rivs. descend from the Appalachian hills to the plain supplies abundant water power for the working of the machinery. The S. states, particularly N. Carolina, have begun the manuf. of cotton textiles and are displacing New England in this regard.

Woollens are manufactured mainly in the New England states, and in Philadelphia and New York. The manufs. include men's suitings, women's dress goods, carpets, and felts. Silk is manufactured in New Jersey, New York, and Pennsylvania. Food manufs. and industries are important. They include the preparation of cattle, sheep, and pigs for export. Chicago, Omaha, and Kansas City are the largest centres for this industry; from

U.S. Information Service: American Embassy

THE STEEL INDUSTRY

Cutting the moving steel bar at the first continuous casting tower in Beaver Falls, Pennsylvania. The oval bar, emerging from the mould, is cut into 15-ft lengths by an automatic acetylene cutting torch.

it arises the leather-making industry, whose chief dists. are New York, Philadelphia, and Worcester in Massachusetts. Flour milling is carried on mainly at Minneapolis, St. Paul, and at Superior. Fruit and salmon are canned very largely on the Pacific coast. Other important manufs. are glassware, silverware, and hardware, asbestos products, druggist preparations and patent medicines, perfume and cosmetics, cigarettes, musical instruments, and fertilisers. The table shows general statistics for major industry groups in 1953.

To meet the high cost of living, wages and salaries, by European standards, are generally high. Amer. labour is organised into unions which, unlike most European bodies, accept in principle the capitalist basis of society. Since the 1880s, Amer. industries have been increasingly

United States

340

United States

dominated by large corporations. Amer. industry relies to a large extent on electricity. In 1953 industries produced a total of 514,169,000,000 kwh, of which industry used 404,552,000 (fuel) and 109,617,000 (hydro-electric), and electric utilities used 337,431,000 (fuel) and 105,233,000 (hydro-electric).

COMMERCE. The extent of internal trade is shown by the fact that retail

and eggs, 100, meats and edible fats, 149; semi-manufs. and finished manufs., 11,552, the chief commodities being electrical, industrial, and agric. machinery, 2276; automobiles, including parts and accessories, 1035 (including 173,000 passenger motor cars and 184,000 trucks and coaches); chemicals and related products, 974; iron and steel-mill products, including scrap, 510

sales amounted during 1954 to \$170,664m., and wholesale sales to \$109,294m. External trade has shown an excess of exports over imports since 1880. The prin. countries to which U.S. goods are exported are (in order of value of trade): Canada, the U.K., France, Argentina, Brazil, Mexico, Germany, Belgium, and Luxembourg. Those from which goods are imported are (in the order of value of trade): Canada, Cuba, Brazil, Brit. Malaya, India, Mexico, and the U.K. During 1954 the value (in millions of dollars) of exports, divided into economic classes with the value of the chief commodities in each class (and quantity shown in brackets) was as follows: crude materials, 1896, including coal, 304 (34,000,000 short tons); cotton, 788 (4,430,000 bales); tobacco, 303 (468,000,000 lb.); petroleum, 45 (13,599,000 barrels); crude and manufactured foodstuffs, 1500, including wheat and flour, 427 (232,000,000 bushels), fruit and vegetables, 272, dairy products

(4,376,000 tons); petroleum products, 386 (including 8,428,000 barrels of motor fuel and gasoline and 8,894,000 barrels of lubricating oil).

During 1954 the value (in millions of dollars) of imports, divided into economic classes with the value of the chief commodities in each class (and quantity shown in brackets) was as follows: crude materials, 2412, including rubber, 262 (1,337,000,000 lb.), wool, 223 (214,000,000 lb.), petroleum, 544 (242,000,000 barrels), undressed furs, 67, non-ferrous ores, 854, oilseeds, 62 (815,000,000 lb.), hides and skins, 53 (120,000,000 lb.), tobacco, 83 (106,000,000 lb.); foodstuffs, crude and manufactured, 3315, including coffee, 1486 (2,261,000,000 lb.), cane sugar, 409 (7,484,000,000 lb.), fruit, nuts, and vegetables, 225, cocoa or cacao beans, 252 (519,000,000 lb.), wines and spirits, 147; semi-manufs., 2310, including non-ferrous metals, 854, wood pulp, 252 (2,051,000 short tons), gas and fuel oil, 254 (137,000,000 barrels), vegetable oils, 59

(356,000,000 lb.); finished manufs., 2195, including paper, 637, newsprint, 698, burlaps, 71 (416,000,000 lb.), timepieces, 67, textiles, 374, passenger automobiles, 45 (28,000 motor cars).

COMMUNICATIONS. *Shipping.* The tonnage of vessels entered and cleared at U.S.A. ports each year is about 190,000,000 net tons, of which over 100,000,000 represents Amer. shipping. New York is the

1954	15,076	10,207

chief seaport, over 40,000,000 tons of shipping being entered and cleared annually and over 100,000,000 tons of cargo handled. Other important ports on the N. Atlantic coast are Philadelphia, Boston, Portland, Providence, and Bridgeport: total tonnage entered and cleared annually, 12,000,000 tons. On the S. Atlantic coast the chief ports are Norfolk, Baltimore, Charleston and Savannah: total tonnage, 41,000,000 tons. On the Mexican Gulf the chief ports are New Orleans, Galveston, Tampa, Mobile, and Port Arthur: total tonnage, 35,000,000 tons. On the Pacific coast the chief ports are Los Angeles, San Francisco, Seattle, Portland, and San Diego: total tonnage, 21,000,000 tons. Of the Great Lakes ports, Duluth (at which over 50,000,000 tons of cargo are handled annually), Toledo, Chicago, and Cleveland are the chief. Another important port is Houston, Texas, the Houston Ship Channel, 50 m. long and 30 ft deep having been completed in 1925. Houston ranks as the fourth seaport after New York, Philadelphia, and Baltimore, over 30,000,000 tons of cargo being handled annually at each of these ports. Excluding vessels on the Great Lakes and inland waterways, the U.S. merchant marine comprised

(1955) approximately 1162 sea-going ships of 1000 gross tons or over.

Road, Rail, and Air Transport. Road mileage outside urb. areas is estimated (1953) at 3,012,320 m., of which 89,990 m. are under Federal control, 600,518 under State control, and 2,322,012 under local control. Under the Federal Aid Highway Act of 1948, increased Federal aid was given to a system of primary roads extending over 232,000 m. This included the National Inter-State Highway system covering over 40,000 m., consisting of about 37,000 m. of main rural roads, the remainder being urb. and by-pass roads. The secondary road system receiving Federal aid extended over 378,000 m. (1949), new construction during 1948 amounting to some 27,000 m. A section of the Pan-Amer. Highway, to which the U.S., Mexican, and Central Amer. govs. contribute, runs through the U.S.A. from Nuevo Laredo on the Mexican border to Panama City, about 3260 m. The Highway Act of 1948 authorised an ann. expenditure of \$450m. on roads.

The first railway projected was to run from Baltimore linking the coast with the Ohio valley (1831). In succeeding years a number of railways came into existence over short distances between neighbouring towns. By Act of Congress, the Union Pacific Railroad (q.v.) was chartered in 1862. By the end of the cent. about 167,000 m. of railway were in operation. The mileage has since been increased to over 224,000 m. (1949), but by 1953 had declined to 221,758. During 1948 and 1949 considerable capital improvement was carried out, involving an ann. expenditure of over \$1000m.

1947 was a record year for the value of freight traffic with a tonnage of 1,813,000,000 carried over 657,873,000,000 ton-m. In that year also 706,000,000 passengers were carried over 46,000,000,000 passenger-m. In succeeding years there has been a decline both in passenger and freight traffic as a result of increased competition from other forms of transport.

Air transport over continental U.S.A. is conducted by 33 companies, of which 19 operate trunk lines and the remainder feeder lines. Of these 19 companies, 10 also operate overseas and international lines, while there are a further 4 companies operating overseas and international lines only. On the domestic airlines over 554,433,000 m. were flown in 1954 with over 31,784 passengers, and on the overseas and international lines some 124,897,000 m. with over 3,406,000 passengers. The commercial airlines have (1954) nearly 1600 aircraft in commission.

Telegraphs and Telephones. These are controlled by private companies, the former largely by Western Union Telegraph with nearly 30,000 offices, and the latter by American Telephone and Telegraph, which has organised the Bell Telephone System, operating over 50,369,000 telephones out of a total of 50,373,000 for all systems. Post offices number 32,076 (1955), of which 3613 are Class 1. Air mail is carried over 33 domestic and overseas airlines, 62,759,000

ton-m. being flown in 1955. The 2 chief cable companies are the W. Union and Commercial Cable, both of which also own cable lines to Europe.

RELIGION. The religious census taken in 1936 showed that there were in the U.S.A. 256 religious bodies, with 199,302 churches and a total membership of 55,807,366. In 1955 it was estimated that the continental U.S.A. contained 254 religious bodies, with 300,056 churches and a membership of 97,482,611. Of the various Protestant denominations, those with over 1,000,000 membership were: Baptists, 18,785,241; Methodists, 11,803,645; Lutherans, 7,117,906; Presbyterians, 3,837,101; Protestant Episcopalians, 2,757,744; Disciples of Christ, 1,822,377; Congregational Christian Church, 1,310,572; Latter-Day Saints, 1,438,428. Other Protestant bodies included the Evangelical Reformed Church, 761,325; and the Evangelical United Brethren, 746,206. The Roman Catholic Church was the largest single church, with 36,023,977 (1958) members; the Eastern Orthodox Church had 2,808,872 members. There were 5,500,000 Jews.

EDUCATION. Illiteracy among the pop. aged 14 or over decreased from 3.1 per cent in 1940 to 2.5 per cent in 1952. Illiteracy is higher among the non-white pop., being 11 per cent (1947), among non-white aged 14 or over and 32.4 per cent among non-white aged 65 or over. Each state has its own laws for compulsory school attendance up to age 14 or 16, and exercises control in conjunction with the local authorities. According to the 1954 estimates 50 per cent of the pop. between the ages of 5 and 30 was attending school, college, or other educational institution, numbering 36,083,000 persons. There are nearly 200,000 elementary and secondary schools, including nearly 24,000 public high schools. Many higher educational institutions receive State grants, and most are run on the basis of co-education. There were in 1951-2 some 1850 univs., senior colleges and professional, technological, and other higher educational institutions, embracing in all nearly 2,500,000 students of both sexes and over 100,000 teachers. Harvard and Yale bear most similarity to Oxford and Cambridge, on which they are consciously modelled to some extent. Among the most famous colleges for women are Vassar, Wellesley, and Smith. Most Amer. univs., however, are co-educational. See also RACIAL SEGREGATION IN U.S. SCHOOLS.

FEDERAL CONSTITUTION AND STATE GOVERNMENTS. The Federal Constitution dates from 17 Sept. 1787. Its framers used their experience or knowledge of the working of the Brit. constitution, and adopted both the spirit and machinery of that constitution. The Amer. constitution contains 7 original and 21 amending articles, and entrusts the gov. of the nation to 3 separate authorities: the Legislature, the Executive, and the Judiciary. Article 1 vests the legislative power in a Congress consisting of a Senate together with a House of Representatives, and prescribes the qualifications of

senators and representatives. The representatives are chosen every second year by the electors of the different states. The House of Representatives consists of 435 members, the number of each state's representatives being allotted in proportion to its pop., the present average being 1 member for approximately 300,000 persons. Two senators chosen by the electors represent each state for a term of 6 years, one-third of the Senators being elected every 2 years. As in the case of the Brit. Parliament, each House determines the rules of its proceedings, adjudges disputed elections, and punishes members for misconduct. A Bill becomes law on passing both houses, provided the president approves and signs it. If he returns the bill, which he may do, with his objections, the House of origination may proceed to reconsider it, and if on reconsideration, two-thirds of that House agree to pass the bill, they may send it to the other House, together with the president's objections; if approved by two-thirds of that House it becomes law. A bill not returned by the president within 10 days after presentation automatically becomes law, unless Congress, by adjourning, prevent its return. The president has the power, with the advice and consent of the Senate, to make treaties, provided two-thirds of the senators present concur. All revenue bills must originate in the House of Representatives, but the Senate may propose or concur with amendments. Congress must assemble at least once annually. The vice-president, who holds office for 4 years, is *ex officio* president of the Senate, but votes only on an equality of division. He becomes president, in case of the death or resignation of the latter, for the unexpired portion of the presidential term. Section 3 of Article I, which specifies the powers of Congress, is the vital part of the constitution. Beyond those powers Congress may not go, and the courts are made the ultimate arbiters on the constitutionality or otherwise of any law of Congress. (See CONGRESS OF THE UNITED STATES.) By the amending Articles XIV and XV, additional powers are given for the protection of citizens against unjust or discriminating legislation by any state. The prin. remaining clauses of Article I forbid the grant of titles of nobility, and prohibit any state from making treaties or exercising other powers vested in Congress, or from passing *ex post facto* (or retro-active) laws.

Executive power is vested by Article II in the president, who holds office for 4 years. He is elected by the Electoral College, the members of which are appointed by each state in numbers equal to the number of representatives and senators returned to Congress by the state. No person except a natural-born citizen is eligible as president nor is any one eligible unless he be at least 35 years of age, and have been 14 years resident in the U.S.A. He is commander-in-chief of the Army and Navy, and of the militia in the service of the Union. Thirty-four men have held the office.

Article III provides for the judicial power, and gives the courts power to adjudicate on all matters touching the constitution. Article IV provides for the admission to the Union of new states, and guarantees to every such state a republican form of gov. Article V provides the mode of amending the constitution as follows: whenever two-thirds of both Houses deem it necessary Congress must propose amendments, or, on the application of the legislatures of two-thirds of the sev. states, call a convention for proposing amendments; and such amendments are effectual as part of the constitution if ratified by the legislatures of three-fourths of the sev. states, or by conventions in three-fourths of the states, according as one or other mode of ratification be proposed by Congress. Article VI makes the constitution the supreme law of the land, while Article VII provides for the ratification of the constitution. The amendments to the federal constitution comprise 21 additional articles. The prin. of these amendments guarantee religious freedom and freedom of speech; prohibit slavery, excessive bail, excessive fines, and the infliction of cruel punishments; maintain the popular right to bear arms; prohibit quartering of soldiers in private houses in time of peace; give a person accused of crime the right to a speedy trial; preserve the right of trial by jury in all cases where the value in controversy exceeds \$20; regulate the mode of balloting for the presidential elections; and guarantee the privileges and immunities and prescribe the status of citizens of the U.S.A. The eighteenth amendment (1919) made prohibition (q.v.) of liquor a federal concern, and was repealed by the twenty-first Amendment (1933). The nineteenth Amendment (1920) admitted women to the franchise and gov., and the twentieth (1933) fixed, *inter alia*, the day and time on which the terms of president and vice-president and also senators and representatives shall end. (On the constitution see further Lord Bryce (q.v.) *American Commonwealth*, 1911.) It is to be noted that the constitution does not purport to be a complete scheme of gov., but presupposes the existence of states' govts., whose powers comprise the residuum of legislative functions over and above the common or national matters vested expressly in Congress. Yet, as Lord Bryce points out, there are strange omissions to be found among the restrictions on state powers. The significance of these omissions is that the authors of the constitution evidently had no desire for general uniformity of states' govts. or institutions, their main object being 'to secure the national Gov. against encroachments on the part of the States, and to prevent causes of quarrel both between the Federal or State authorities and between the several States.' Nevertheless, the different states have tended almost to an excess of uniformity, and their legislatures have evinced little desire for experimental changes in their institutions. Each of the 48 states has its own constitution,

deriving its authority solely from the people of each state. Admission into the Union is granted by special Act of Congress. Each state has an elected governor and other executive officers, a legislature of 2 houses, and a judiciary. The powers of both Houses are co-ordinate, though in some states money bills must originate in the House of Representatives. The states' senates have powers similar to those of the Federal Senate. Sessions are generally biennial; the governor has the right to summon an extraordinary session, but not to adjourn or dissolve. The governor is elected by the direct vote of the people for a term varying from 1 to 4 years. In all but 2 states he has a veto on legislation, which may, however, be rendered nugatory by an adverse vote of the 2 Houses. In some 3 or 4 states the Federal Gov. prescribes the form of the local legislature and the president himself appoints the territorial governor and other important officials. The Dist. of Columbia (q.v.) is the seat of the Federal Gov.

DEFENCE. In accordance with the National Security Act of 1947 the armed forces were unified under a secretary of national defence with cabinet rank, under whom the Army, Navy, and Air Force are organised in 3 separate Depts, each having a secretary at the head, a civilian but not holding cabinet rank, with 2 assistant secretaries. Defence is co-ordinated by the National Security Council, of which the members are the president as commander-in-chief, the secretary of state, the secretary of defence, the secretaries of the 3 service depts, and the chairman of the National Security Resources Board. The secretary of defence, the 3 departmental secretaries, and the chiefs of staff also form a War Council. Subject to the authority of the president and the secretary of defence, the armed forces are directed by the Joint Board of the Chiefs of Staff. See the separate articles UNITED STATES AIR FORCE; UNITED STATES ARMY; UNITED STATES NAVY.

LAW. Strictly there is no Amer. law in the sense of a common law of indigenous origin, and the laws of the constituent states rest at bottom on the Eng. common law as it existed in the early 17th cent. The only notable exceptions are to be found in Louisiana and New Mexico, i.e. in ter. formerly subject to France or Spain. These latter states derive much of their civil law from France and Spain, and thus, remotely, from the principles of Rom. law. Nor, except within a sphere constitutionally defined, is there a national supreme tribunal to unify legal doctrine. On the other hand, while there is no common law of the U.S.A. as a sovereign state, each state has its own common law unfettered except by the provisions of certain articles of the federal constitution; and even these provisions do not necessarily conduce to unity of law except the clause requiring that full credit shall be given in each state to the public Acts and judicial proceedings of every other state, which to some extent

operates to unify doctrines respecting the conflict of laws. Penalties vary from state to state; e.g. not all states award capital punishment. It is also conceivable that the decisions of the lower federal courts that exist in every state and those of the Supreme Court tend to regularise judicial doctrine, especially in the field of federal commercial law which the states generally follow voluntarily (see LAW MERCHANT). In the early decades of this cent., however, the unification of law in America was assisted by the Amer. Bar Association in editing uniform Acts for adoption by all the states, and these Acts, together with a great body of judicial tradition, and much legislation governing the standards to which the Amer. people, irrespective of state, commonly conform, tend to modify the general assumption that, technically, there is no *corpus juris* or body of unified Amer. law. The ultimate safeguard of private rights is to be found in the guarantees in the fourteenth amendment of the federal constitution (1868) which resulted from the Civil war. One of the provisions of this Amendment is that no state shall deny to any person within its jurisdiction the equal protection of the laws; another, equally fundamental, is that no state may deprive a person of life, liberty, or property otherwise than by due process of law. These guarantees, together with that safeguarding the sanctity of contracts, decisively altered the relation between the state and federal tribunals and inaugurated a new era in the legal development of the nation; for issues depending on these guarantees have made the federal courts the agents of the social legislation arising out of the economic and industrial conditions developed since the Civil war (see SHERMAN ANTI-TRUST ACT). Regarding public law, the Supreme Court is absolutely supreme in its power to decide in cases of conflict between the federal authority and the state authorities. The constitution estab. the federal courts, whose jurisdiction extends to all cases arising out of the constitution, including those of an international character, whether between the states or between the U.S.A. and any other state in the world; and it also estab. a Supreme Court, which is a final court of appeal in these cases. This makes that court the ultimate interpreter of the constitution and places the judicial dept above any legislation (within the limits of the constitution) whether federal or state.

The Federal Gov. maintains courts to try crimes against the U.S.A. and civil actions brought by the gov. or which arise out of the constitution, treaties, or laws of the U.S.A. relating to such subjects as admiralty, banking, patents, and taxation. The federal courts also have jurisdiction in cases between citizens of different states and between those of a state and a foreign state. The judges of all Amer. courts hold office during good behaviour, and may retire at 70 with full pay after 10 years' service. The Supreme Court at Washington consists of a chief justice and 8 associate justices, with

original jurisdiction in cases affecting ambassadors or where a state is a party to the suit, and with appellate jurisdiction from inferior federal courts of the states. The U.S. courts of appeal deal with appeals from district courts, and consist of the justice of the Supreme Court for the circuit and all the circuit and district judges within the circuit. There are 93 dist. courts, served by 200 dist. court judges. These are the lowest of the federal courts, and, besides civil cases, they may try all criminal cases arising under the federal laws, including capital crimes. The whole country is divided into 10 circuits, each with a circuit court of appeal under the chief justice or an associate justice. Cases from inferior courts are usually heard in these appeal courts and then in the Supreme Court on a writ of *certiorari* (q.v.), but in certain cases, as when a decision is adverse to the constitutionality of an Act of Congress (see under ACT), the appeal may go to the Supreme Court direct. There are also various special courts with jurisdiction in customs, patents, and taxation cases. These are the court of claims, the U.S. customs court, the tax court, and the courts of customs and patents appeals. The state courts try all civil and criminal cases arising under state laws, but decisions of the courts of last resort as to the validity of treaties or on constitutional issues are subject to review by the Supreme Court. The lowest courts are those of justices of the peace; there are also municipal and police courts in many towns and cities with power to commit for trial on criminal charges or to try civil cases involving small amounts of money. See also APPEALS in U.S.A.; BAR ASSOCIATION, AMERICAN; CRIMINAL LAW—United States; JUDGE—Judges in the U.S.A.; LEGAL EDUCATION; POLICE—Police Courts; STATE OR DISTRICT ATTORNEY (also ATTORNEY-GENERAL).

FINANCE. Federal. There has been a National Ann. Budget System and an independent Audit of Gov. Accounts since 1921. (For U.S. revenue 1947-54 see under PUBLIC REVENUE. See also under PUBLIC DEBT.) In 1954-55 nearly 50 per cent of the budget was assigned to national defence; over 10 per cent to interest on the national debt and refunds owing under the tax laws; over 16 per cent to war veterans' benefits, thus leaving slightly over 20 per cent for all remaining expenditure.

SOCIAL SECURITY. The Social Security Act of Aug. 1935, since amended, makes provision for a system of old age, survivors', and unemployment insurances, organised by the Federal Gov. In 1949 further legislation increased the social security coverage to include a total of some 46,000,000 persons. Federal grants are made to the states for welfare services and public assistance. In 1946 the Social Security Administration replaced the Social Security Board: in this body is vested the Federal responsibility for these programmes. In addition, there are state insurance schemes which differ in

their scope and operation from state to state. See also NEW DEAL.

HISTORY. Colonial America. It is probable that the E. coast of N. America was discovered in AD 1000 by Leif Ericsson and his band of Norsemen. They planted a colony in Greenland and in 'Vinland,' probably some place on the coast of what is now New England. But they left no traces, for the colonies perished and the memory of them died out. It was left to Christopher Columbus on 12 Oct. 1492 to make the first historic landing on Amer. soil. Columbus's first landing was in the Bahama Is. He believed he had landed in the Indies, and hence called the natives Indians. His return to Spain fired the imagination of the people. The greed for land at once arose. The Portuguese had already sailed along the shores of Africa, colonising it there. So there arose a dispute between Spain and Portugal over the ownership of this new world. They appealed to Pope Alexander VI, who, in his bull of 2 May 1493, drew an imaginary line of demarcation. Under this all the New World, except a part of Brazil, was given to Spain.

Soon the English took part in the exploration of the new lands. Henry VII granted a permit to John Cabot to go on a voyage of discovery. To Cabot, who, like Columbus, was an Italian, belongs the honour of having first discovered N. America (apart from Ericsson). Cabot landed in 1497, either on Cape Breton Is., Newfoundland, or Labrador. In 1498 he made a second expedition, of which the fate is unknown. Amerigo Vespucci (see VESPUCCI) made 3 voyages of discovery, landing on the coast of Brazil in 1501.

Now began an era of adventure and exploration. Some were attracted by adventure, others by the lure of the gold and jewels they expected to find. The great maritime nations of that time (Spain, England, France, and Portugal) led in this, followed by Holland and Sweden. The Spaniards discovered and explored all Central and S. America and then turned their attention to N. America. Ponce de Léon landed in Florida. Hernando de Soto, sent to Cuba as governor, went to Florida and wandered all over the S. states, discovering the Mississippi R., which he crossed into what is now Arkansas and Missouri. From France came Jacques Cartier in 1534, discovering the Gulf of St Lawrence. On a second expedition he sailed up the St Lawrence as far as the present site of Montreal.

Sir Walter Raleigh founded a first colony in 1585, in the ter. he named Virginia, after the 'virgin queen.' This first colony failed, and the colonists were brought back to England by Sir Francis Drake. They took back with them 2 indigenous plants, the potato and tobacco. In 1607 a second Virginian colony was estab. at Jamestown, by John Smith (q.v.). By 1649 Virginia, which had now a royal charter and considerable self-gov., began to be settled by cavaliers who founded the far-famed 'First Families of Virginia.' The foundation of Maryland marked a new

kind of colony, one practically owned and ruled by a lord-proprietor holding a royal charter. Religious persecution in England led to the foundation of the New England colonies. The first of these occurred in 1620 when the Puritans known as the Pilgrim Fathers landed at Plymouth Rock, in what is now Massachusetts, having sailed on the *Mayflower*. Georgia was founded by James Oglethorpe and was the last of the 13 original colonies which afterwards became the first

henceforth called Nova Scotia (q.v.). By the Peace of Utrecht, Acadia, New-foundland, and the Hudson Bay territory were ceded to England. The boundary, however, between the Eng. colonies and Canada was not settled, and there was the question of control of the Mississippi valley. The French claimed all N. America, except the Hudson Bay region and the strip of Eng. colonies on the Atlantic coast. In Europe, from 1744 to 1748, England and France were on opposite sides in the War of the Austrian Succession. The Amer. colonies were soon involved. Organised by Governor Shirley of Massachusetts, an expedition under Wm Pepperell of Maine laid siege to and captured the seemingly impregnable Louisburg, but the peace of Aix-la-Chapelle gave this back to France. There was a fresh dispute between France and England about the boundaries of Acadia. They were rival claimants for the Ohio valley.

The Conquest of Canada. In 1754 the war began which was to decide the language and civilisation of N. America. In command of a small body of Virginia militiamen, George Washington (q.v.) came into conflict with the French at Great Meadows and the Fr. commander and 9 of his men were killed. The war thus started in America 2 years before it broke out in Europe. The odds seemed to favour the French, but after initial setbacks, Lord Jeffrey Amherst captured Louisburg (1758); at about this time the French had to evacuate Fort Frontenac, and in Sept. 1759 was fought the decisive battle for the capture of Quebec, which fell into the hands of the English, and the sovereignty of France in N. America was practically ended. By the Peace of Paris, signed 1763, England gave back Cuba and the Philippines to Spain and received Florida instead. France ceded to Spain New Orleans and the vast ter. known as Louisiana (q.v.) (which she regained in 1800). To England France surrendered the Ohio Valley, Canada, everything except 2 ls. in the Gulf of St Lawrence.

The American War of Independence. The war helped to unite the colonists in the 13 settlements, and gave them a new conception of their strength and importance. They began to reconsider their position with regard to England. The Eng. Navigation (q.v.) Acts provided a closed market in England to certain colonial goods, but they hampered colonial trade, as all trade went via England, and the prices of goods were raised by duties in transit. Smuggling became universal. The colonies also began manufacturing for their own needs, and England forbade this, the general aim being to export manufs. to the colonies and import raw materials and food. The situation came to a head when George Grenville as Prime Minister decided that the Navigation Acts should be strictly enforced; that a standing army should be garrisoned in the colonies; and that the colonies should be taxed. England proposed to send the standing army to the colonies to protect them

U.S. Information Service: American Embassy

THE STATUE OF CAPTAIN JOHN SMITH ON JAMESTOWN ISLAND, VIRGINIA

The Jamestown colony, the first permanent English settlement in America, was established by John Smith on 13 May 1607, on a marshy peninsula, now an island, in the James River.

13 states of the U.S.A. Pennsylvania was founded by the Quakers, led by Wm Penn. Ten of these colonies were Eng. New York had been founded by the Dutch as New Amsterdam, and was afterwards to be taken by the English. New Jersey was started as a Dutch colony, but soon became Eng. Delaware was claimed by the Dutch, but was first settled by the Swedes, and finally came into possession of the English.

The wars of Europe had their repercussions in America. France and England engaged in the War of the Sp. Succession (1701-14). The Amer. struggles, extending from 1689 to 1763, are known as the Fr. and Indian wars. The Indians and the French massacred Eng. colonists. In 1710 the colonists, aided by a small force of English, captured Port Royal and took the ter. of Acadia, which was

from the dangers of Indian outbreaks, but the colonists believed the army was to be sent to overawe them. Grenville proposed to raise the money for part of the support of this army by a stamp-tax. James Otis, an eloquent Boston lawyer, called upon the colonials to resist. In Virginia Patrick Henry voiced similar sentiments.

Under the leadership of Massachusetts the colonies held a Stamp Act Congress in New York to petition the king and Parliament. Riots occurred and stamps were destroyed. The cry was taken up—'No taxation without representation.' The Eng. gov. failed to appreciate this fundamental cause of discontent, and its gestures of conciliation were therefore of no avail. The Amer. objection to 'internal' taxes imposed from outside was recognised, and the stamp tax was abolished. But the right to tax remained, and as the Americans appeared to be willing to accept external taxation, i.e. customs duties, Townshend, as chancellor of the Exchequer, secured in 1767 an import duty on tea, glass, and other articles. The revenue so obtained was used to pay the officials of the Crown appointed to the colonies. To the Eng. Gov. this seemed reasonable, but to their surprise Amer. protests continued. Mob opposition, which had been silenced by the repeal of the Stamp Act, was again roused, and the import duties were repealed except that on tea, which was retained simply as a token tax. The colonials refused to buy supplies of Eng. tea, and smuggled it from Holland. In 1773 tea-laden vessels reached Amer. ports. In Charleston the cargo rotted in storage. In Boston a band of men disguised as Indians boarded the tea ships and tossed tea chests into the sea, an episode known as 'the Boston tea-party.' George III called upon Parliament to pass drastic Acts, including the removal of the cap. of Massachusetts from Boston to Salem, and the annulment of the colony's charter. All the colonies prepared to stand by Massachusetts, and the first Continental Congress was held at Philadelphia, 5 Sept. 1774. It was resolved to draft an appeal to the king, to the people of England, and the people of Canada. The idea of independence was disavowed, and in fact it was not until later that the elements which did press for independence gained control. Events moved rapidly. Gen. Gage was sent to Massachusetts with a military force, and became both military and civil governor. Whilst attempting to arrest 2 of the popular leaders his troops opened fire on a small body of Americans at Lexington, but in the fight which followed at Concord they lost 273 men and the Americans 93. The War of Independence had started, the product of complex factors, but basically due to Britain's refusal to recognise that, economically and psychologically, the Amer. colonies had attained a status which demanded an alteration in the theory and practice of their relations with England.

The second Continental Congress met

VOL. XII.

in Philadelphia and appointed George Washington commander-in-chief of the Amer. forces. It was not yet prepared to throw off allegiance to the Crown. At Boston the British were reinforced by the arrival of Howe, Clinton, and Burgoyne with additional troops, which raised the total forces to 10,000. The Amer. army occupied the mainland and a force was sent to fortify Bunker Hill. Here on 17 June 1775 was fought a battle won by the British only with great loss. On 4 July 1776 the Continental Congress passed its Declaration of Independence, largely written by Thomas Jefferson. Prior to that, in Mar., Gen. Howe evacuated Boston, as Washington had fortified Dorchester Heights and by heavy bombardment obtained the mastery of the city. Despite Brit. successes at Long Is., White Plains, and Fort Lee, and the fall of Newark, New Brunswick, and Trenton, Washington defeated Lord Cornwallis at Princeton (1776). St Leger was defeated by Herkimer, and Gen. Burgoyne surrendered to Gates after the battle of Saratoga.

In Feb. 1778 the Amer. emissaries concluded a treaty with France whereby that country was to come to the aid of the Americans and thus strike a blow at its old enemy, England. Also that spring, Lord North reversed his policy and induced Parliament to pass laws enabling him to send peace commissioners to America. All the Americans had asked for and more was promised, but the terms were refused. Spain also intervened in the war in 1779 by using New Orleans as a base for privateers against Brit. shipping. In 1780 the Netherlands also joined in the war against England, while Catherine II of Russia formed a league of armed neutrality, which assisted the Amer. colonies by obstructing the use of England's sea power. Thus the Amer. War of Independence was part of a general war in which most of the great powers participated. Late in 1777, prior to these events, the Americans had been defeated at the Brandywine and at Germantown, and Howe had occupied Philadelphia, the cap. Clinton succeeded Howe as commander of the Brit. forces and was ordered to evacuate Philadelphia and return to New York. Washington hung on his flanks, and the drawn battle of Monmouth was fought 28 June 1778. It was the last general engagement fought on N. soil. Clinton occupied New York, Washington took up his position at White Plains near by, and here the enemies remained watching each other for 3 years, while the real fighting took place in the S. At first everything went well with the English, but in the late summer of 1781 Cornwallis found himself besieged in Yorktown by Washington and Lafayette, the Fr. commander. On 19 Oct. he surrendered.

For sea fighting, the Americans had built men-of-war, and at one time 70,000 men were engaged in naval warfare. The outstanding hero was John Paul Jones (q.v.). Many of the battles he and his fellow commanders fought were in Brit. waters.

M

The peace treaty was signed at Paris, 3 Sept. 1783, the Amer. commissioners being Benjamin Franklin, John Jay, and John Adams. The peace of Paris with the Americans and the other treaties which Great Britain signed on the same day with France and Spain, divided N. America among Spain, the Brit. Empire, and the U.S.A. Spain received the land W. of the Mississippi and S. of a line which gave her Florida. England kept what is now Canada, though the boundary was not clearly settled at the time. France took a few W. Indian colonies.

should be the present city of Washington. The national debt was founded and paid in interest-bearing bonds. In 1794 came the first real test of the new gov.'s power. Farmers in Pennsylvania resisted the excise tax on whisky. Washington sent to the governors of Pennsylvania, Maryland, New Jersey, and Virginia for troops, and the rebellion collapsed. Two terms of Washington's presidency saw the rise of political parties. Alexander Hamilton founded the Federalist party, Thomas Jefferson, the Republicans.

The young rep. soon became involved

THE DECLARATION OF INDEPENDENCE: THE PAINTING BY JOHN TRUMBULL

Here before the Congress which adopted the Declaration, Thomas Jefferson offers the document to John Hancock for his signature. On Jefferson's left stands Benjamin Franklin, and on his right John Adams, Roger Sherman, and Robert Livingston.

The Americans now had their independence, but their country was in a state of confusion. Finally, a convention was held at Philadelphia (1787) to draft a constitution and form the permanent gov. for the new country. The constitution was the result of a series of compromises, and there were vigorous contests before the states ratified it, the last being Rhode Island in 1790. The actual voting for the first president and vice-president took place in Jan. 1789. By common consent Washington was chosen as head of the state. John Adams was chosen vice-president. New York City became the first temporary cap., and Congress settled down to the work of gov. It passed a Tariff Act to raise revenue, it enacted a law forming the president's cabinet, and it created the Supreme Court of the country. It was decided that the cap.

in the troubles of Europe. England, engaged in a war with France, claimed the right to search Amer. neutral vessels, and impressed seamen of Amer. ships. Washington had determined to retire to private life at the end of his second term. The first real campaign for the presidency now began. John Adams, who was the Federalist candidate, was chosen by the electoral college in 1797 by 71 to 68 votes, and Jefferson became vice-president. Adams's administration became odious on account of the Alien and Sedition Laws. The former gave the president power to banish from the country, without giving any reason and without a trial, any alien he considered dangerous. Adams also sought to silence the Press. By the election of 1800, Jefferson became president. Jefferson's assumption of office marked the beginning of real democratic rule in

America. It was a rapidly growing country over which he presided. The 1800 census showed a pop. of over 5,300,000, though one-fifth were slaves. Virginia was still the most populous state, Pennsylvania second, New York third, Massachusetts fourth. Already the people had begun to look westward, and more than half a million had settled in the Mississippi valley. The greatest of Jefferson's achievements was the famous Louisiana Purchase, by which an empire was added to the U.S.A. for \$15m. The treaty, which was signed with France, 30 April 1803, added 1,171,931 sq. m. of ter. to the U.S.A., a greater domain than the 13 original states combined.

Jefferson had been triumphantly re-elected president in 1804. France and England were once more at war. Napoleon issued his Berlin Decrees; England retorted to this by closing all Fr. ports to neutrals. Between them England and France were paralysing Amer. sea-borne commerce, and Jefferson saw no way to make war upon the 2 greatest powers in Europe. On 22 Dec. 1807 he got Congress to pass the Embargo Act, by which, for a time, all foreign commerce was forbidden. Jefferson believed the warring powers would abandon their decrees because they needed Amer. commerce. He was mistaken, however, and Amer. farm products accumulated in warehouses, and ships lay rotting in harbours. Subsequent legislation replaced the Embargo Act, but failed to achieve Jefferson's purposes.

In 1808 Jefferson's secretary of state James Madison, one of the chief framers of the constitution, was elected fourth president of the U.S.A. There were skirmishes with the Shawnee Indians under Tecumseh. Then came the culmination of the troubles with England.

The War of 1812-14. It was evident that the Americans would be adamant unless the orders in council were repealed. Meanwhile, Congress was pressing Madison to declare war. The Brit. ministry was slowly yielding on all the points pressed by the Americans, and the orders in council were repealed on 23 June. But before the news of this repeal came to America Madison had signed a declaration of war. In the autumn he was re-elected president after a severe contest, the Federalists being opposed to the war.

The war opened badly for the Americans. The Brit. gen. Isaac Brock invaded the U.S.A. from Canada. On 16 Aug. 1812 Governor Hull surrendered Detroit and with it Michigan ter. without striking a blow. On the same day Fort Dearborn, on the site of the future city of Chicago, was taken by Indians. The Americans were more successful at sea, and though the superior might of the Brit. Navy soon became evident, Amer. privateers did considerable damage to vessels of the Brit. merchant marine. In the meantime, on land the Amer. troops met with disaster in a fight at the R. Raisin. Perry's victory on Lake Erie in Sept. 1813 made it possible for Amer.

troops under Gen. W. H. Harrison to invade Canada, and a battle was fought on the R. Thames, 5 Oct. 1813, which the Americans won. Tecumseh, the Indian chief, being slain. As a result of this victory, Michigan was once more held by the Americans, and the war in that quarter was ended. Prevost abandoned the campaign to invade New York State. But by now the Brit. Gov. was able to display its true military power. A flotilla of ships reached Chesapeake Bay in Aug. 1814 and an army was landed which met the Americans at Bladensburg, defeating them. Washington, the cap. of the nation, was captured. The Capitol, the White House, residence of the Amer. presidents, and the navy yard were burnt down. It was decided to march northward and take the important city of Baltimore. However, the troops were stopped by Amer. resistance and the fleet could not pass Fort McHenry. The British abandoned the campaign and sailed away with the troops. Meanwhile in Alabama, Andrew Jackson defeated the Indians at Talladega. He was then made commanding gen. of all the S. ter. In the autumn of 1814 it became known that the British had decided upon an attack on New Orleans with the object of capturing the entire Louisiana ter. Jackson hastened there and put the city into a state of defence. The enemies met in front of New Orleans on 23 and 24 Dec. 1814, and fierce battles were fought without victory for either side. Jackson's defeat of the British at New Orleans took place 8 Jan. 1815, although the treaty of peace had already been signed, on 24 Dec. 1814. It was the last time Amer. and Brit. soldiers met as enemies. The treaty merely ended hostilities; there was no cession of ter. by either side; there was no written agreement about impressment of seamen; and all the old disputes about boundaries, fishery rights, and navigation of the Mississippi were left open for settlement at a later time.

The U.S.A. before the Civil War. In 1816 James Monroe (1758-1831) was elected president, and again in 1820. Early in his first administration trouble broke out with the Seminole Indians, but was speedily ended by Amer. troops under Andrew Jackson. This brought the country into conflict with Spain, which still owned Florida (Britain having returned it in 1783). In 1822, however, Spain ceded that country to the U.S.A. for \$5m., and by the same treaty the U.S.A. gave up its claim to Texas, which thus became Sp. ter. The U.S.A. was rapidly growing in pop., and the W. was being settled. A number of new states had been admitted to the Union, including Louisiana and Indiana. Now came the question of admitting Missouri, and it was then that the slavery question became acute. The N. wanted to stop the admission of states in which slavery was allowed; the S. wanted exactly the opposite. Missouri was finally admitted in 1820 by the Missouri Compromise (q.v.), which in addition decreed that slavery should be prohibited in all the remainder

of the Louisiana ter. N. of 36° 30' N. lat. In Dec. 1823 Monroe signed the document which had made his name famous, the message embodying the Monroe Doctrine (q.v.).

The election of 1824 gave Andrew Jackson the most votes in the electoral college, but not a majority over all the other candidates. His nearest opponent was John Quincy Adams (1767-1848), who was the son of the second president. The election of a president was therefore thrown into the House of Representatives and Adams was chosen. He was never popular, both Houses of Congress were

the Democratic party. In 1837 van Buren urged the creation of an independent treasury system to take the place of the U.S. Bank, and this finally became law in 1840. In the same year van Buren was renominated for the presidency by the Democrats. The Whigs nominated Wm Henry Harrison (1773-1841), and John Tyler was nominated for vice-president. Harrison was easily elected, but he d. exactly 1 month after taking office, and Tyler (1790-1862) succeeded him. A feature of his administration was the Webster-Ashburton Treaty between the U.S.A. and England, whereby the

against him, and no administrative measure of any importance was passed. In 1828 he ran for re-election, but was heavily defeated by Andrew Jackson (1767-1845).

In the presidential election of 1833 Henry Clay unsuccessfully opposed Jackson. The issue between them was the U.S. Bank, under whose charter and powers the financial control of the nation rested. Jackson was its opponent, believing it was corrupting the politics of the nation. On his own authority he removed from the bank the U.S. deposits, and thus ruined it. He practically dictated the presidential nomination of Martin van Buren (1782-1862) by the Democratic party in 1836. Van Buren had been his secretary of state and later vice-president. Shortly after van Buren's induction came the great panic of 1837, for which his political opponents blamed

boundaries between Maine and New Brunswick, Canada, were settled. The Texas question soon came to the fore. In 1827 Mexico had freed her slaves, but her N. prov. of Texas refused to do so, and in 1836 declared her independence. This was recognised by the U.S.A. and by some of the European powers; and having defeated the Mexicans in the battle of San Jacinto, Texas applied for admission as a state of the U.S.A. In 1844 Tyler sent in a treaty annexing Texas, but the Senate rejected it. The question thus became a main issue in the 1844 presidential campaign. The Democrats pronounced for the annexation of Texas, and finally the Democrat James K. Polk (1795-1849) was chosen. The Texas matter had been settled before Polk took office, Congress passing a joint resolution to annex that vast ter. and admit it to the Union. Polk announced an ambitious programme

and carried it out. A Bill re-creating an independent national treasury became law in 1846, and in the same year he signed a Tariff Bill which lowered many of the duties in the old Whig Tariff Bill. He now turned his attention to the Oregon problem involving the great ter. in the NW. from the Rocky Mts to the Pacific, lying between 42° and 54° 40' N. lat., which had been occupied jointly by England and the U.S.A. In 1846 a compromise was arranged; instead of 54° 40', the boundary line was fixed at 49° N. lat., the U.S.A. thus securing 300,000 sq. m. of ter. and England securing for the future Canada a sea coast on the Pacific and the whole of Vancouver Island. The last item in Polk's programme was the acquisition of California. California belonged to Mexico, and that country refused to sell it. Occasion for war and conquest was found in the dispute between the U.S.A. and Mexico over their boundaries. Polk had sent Gen. Zachary Taylor with an army of occupation into the disputed Texas ter. On 8 and 9 May 1846 a Mexican army was defeated at Palao Alto and Resaca de la Palma. Polk made a declaration of war on Mexico, and a series of battles resulted in a total Mexican defeat. The treaty of peace, signed 2 Feb 1848, ceded to the U.S.A. the ter. which is now the states of California, Nevada, and Utah and parts of New Mexico, Arizona, and Colorado.

Only 9 days before the treaty was signed gold was discovered in California, and the famous gold rush began which in 2 years increased the pop. of that state to 100,000. Zachary Taylor (1784-1850), nominated by the Whigs, was elected president in 1848. The slavery question at once became prominent. California was claiming entrance into the Union, and in 1849 adopted a state constitution excluding slavery. Taylor was a southerner and slave-owner, but he recommended that California be admitted as a free state. Enraged southern statesmen freely spoke of dissolution of the Union. The year 1850 was a fateful one. Clay brought into the Senate his compromise measures, which provided, among other things, for the admission of California as a free state, prohibition of slavery in the Dist. of Columbia, where the cap. was situated, and a new fugitive slave law. While the debate was still pending, President Taylor d. He was succeeded by the vice-president Millard Fillmore (1800-74). California was admitted as a free state, but the fugitive slave law was also adopted. In many N. states there was covert rebellion against the law.

In the presidential election of 1852 the main issue was the fugitive slave law, and the Democrats nominated Franklin Pierce (1804-69). He carried all the states except 4, thus obtaining a sweeping victory. It was the death-blow to the Whig party. Pierce began well, but he soon lost popularity, being an opponent of the abolitionists. At this moment Stephen A. Douglas attacked the Missouri Compromise, whereby ter. N. of 36° 30' was to be free soil. He brought in a Bill

which maintained that it was the purpose of Congress that all future ters. and states be admitted on the same principle, viz. that the people themselves should decide for or against slavery. Secondly, he maintained that the Missouri Compromise Bill was unconstitutional. Douglas then introduced another Bill, known as the Kansas-Nebraska Bill, virtually repealing the Missouri Compromise, which had stood as a treaty between N. and S. for over 30 years. It passed both houses. Throughout the N. mass-meetings and legislatures denounced the Bill, and condemned Douglas. His action alienated N. states, which had hitherto been Democratic, and it paved the way for the formation of the new Republican party, which is said to have had its inception in Ripon, Wisconsin, on 30 Mar. 1854, where the citizens called for the formation of a free-soil party to be known as Republican.

In the presidential campaign of 1856 the Democratic convention nominated James Buchanan (1791-1868), and the platform endorsed the Kansas-Nebraska Law. The Republicans nominated John C. Fremont. Buchanan was elected, carrying 10 S. and 5 N. states, while Fremont carried all the rest of the N. After the Kansas-Nebraska Bill was passed, people from Missouri had poured into Kansas for the purpose of making it a slave state; and the N. sent bodies of immigrants into the ter., determined to make it free soil. The free-soilers framed a constitution making Kansas a free state, and it was ratified by the people, the pro-slavery party ignoring the election of a territorial legislature. There was a state approaching civil war in Kansas. John Brown (q.v.), the abolitionist, led a night raid of free-soilers on the vil. of Pottawatomie and killed some pro-slavery adherents. After that rival armed bands roamed the state and made war upon each other. Buchanan appointed R. J. Walker of Mississippi governor of Kansas. Walker was a Democrat and former slave-owner, but he would have no part in the pro-slavery machinations. A pro-slavery convention met at Leecompton and produced a constitution which in effect meant that Kansas would be a slave state. Walker had promised the people a vote on it. Buchanan had supported him, but he now broke his word and prepared to force the admission of Kansas with the Leecompton constitution. He sent the constitution to Congress and urged that Kansas be made a state under it. It was at this juncture that Douglas, who now saw that the Kansas-Nebraska Bill had been a mistake, defied the president and his party and opposed the Kansas constitution in a speech which made him once more the favourite of the N. Democrats and defeated the Bill not in the Senate, where he spoke, but in the House. At the opening of the Civil war, Kansas was finally admitted as a free state. (See also DRED SCOTT CASE, THE.)

On 17 Oct. 1859 a crowd of abolitionists and Negroes under the leadership of John Brown (q.v.) seized the U.S. arsenal at Harpers Ferry, Virginia. The gov. sent

forces under Colonel Robert E. Lee and J. E. B. Stuart. Brown was captured, tried for treason and murder, and hanged.

Then came the momentous presidential campaign of 1860. The Democrats were divided among themselves. The Republicans nominated Abraham Lincoln on a platform which pronounced slavery an evil and denied the right of Congress to give legality to slavery in any ter. Lincoln obtained 180 votes in the electoral college, 152 being enough to elect. Lincoln had swept the N., but the threats of secession made by S. orators for 40 years were about to be realised. Some months before Lincoln was inaugurated as president, the S. Carolinians held a convention arising out of which, on 20 Dec. 1860, they formally passed secessionist resolutions. They repealed the Act of 1788 by which their state had adopted the constitution and proclaimed the union between S. Carolina and the U.S.A. at an end. Mississippi, Florida, Alabama, Georgia, Louisiana, and Texas soon followed their example at similar conventions. The 7 states held a joint convention at Montgomery, Alabama, 4 Feb. 1861, adopted a temporary constitution and chose as provisional president and vice-president Jefferson Davis and A. H. Stephens of Georgia respectively. The whole move seemed fantastic to the people of the N., in view of the Republican pledge that they would not interfere with slavery where it already existed, and the further fact that both Houses of Congress were still Democratic. While these events were in progress, President Buchanan vacillated. As state after state seceded, their senators and congressmen withdrew from Congress. In many of the S. states, forts, arsenals, and munition supplies belonging to the national gov. were taken over by the Southerners. Before Buchanan left office this was the case everywhere with a few striking exceptions, the chief of which were the forts guarding the harbour of Charleston, S. Carolina, where secession began. Here Maj. Robert Anderson left Fort Moultrie and took its guns to the stronger Fort Sumter, where he prepared to hold out with the regular Amer. soldiers. Buchanan sent the *Star of the West* to carry further ammunition supplies, but it was fired upon by the shore batteries in charge of S. Carolinians and driven away. These constituted the first shots in the war.

The Civil War. In Mar. 1861 Lincoln was inaugurated as president. In his speech he affirmed that he did not propose to interfere with slavery where it already existed. He said he would uphold the fugitive slave law. He said he would support a proposal made in the House of Representatives to add an immutable amendment to the constitution which would make slavery perpetual in the states where it already existed. But he also said that the Union was intact and must remain so. He asserted that no state could withdraw from the Union, and that it would be his duty to preserve, protect, and defend the Union.

A little more than a month later, Lincoln, against the advice of a majority of his cabinet, decided that Fort Sumter must be relieved, and in accordance with a promise made to the governor of S. Carolina, notified him, on 8 April 1861, of this intention. The Confederate cabinet was also divided, but militant counsels finally prevailed, and Gen. P. G. T. Beauregard, who had resigned his post in the Amer. army and was now in charge of the Charleston forces, was ordered to take the fort. The bombardment began on 12 April and 34 hrs later the fort was surrendered. Two days later Lincoln issued a call for 75,000 troops. N. Democratic leaders rallied to the cause. In the S., Virginia, which had at first been against secession, now joined the Confederacy and soon all the 11 S. states were united. There were 4 border states which were also slave states—Delaware, Maryland, Kentucky, and Missouri. Special efforts were made by the S. to win Missouri and Kentucky. The governors of those commonwealths favoured secession, but their legislatures defeated them.

In the conflict which was now beginning the N. had certain great advantages which were bound ultimately to weigh decisively in the balance. It had 4 times as many white people as the S. It had greater wealth. It was immeasurably more advanced in manufs., the S. being mainly agric. and dependent for most other things on purchases from the N. and from Europe. The N. also had better railway lines. It was completely self-contained. It could meet all its own needs and those of its armies. If there was to be a lengthy war, the N. numbers would tell. The N., too, had the stronger navy and soon had command of the sea, enabling the gov. to blockade the ports of the S. Thus the decisive factors lay mainly with the Union.

If Lincoln called for 75,000 troops, Davis asked for 100,000 and at the same time moved the cap. to Richmond. The first real clash of arms came on 21 July 1861 between the N. army under Gen. Irvin McDowell and the Southerners under Beauregard and Johnston, at the battle of Bull Run. The Union forces were completely routed, retreating as far as Washington. While the fighting was going on in Virginia and Missouri, relations with England assumed great importance. There was dismay in the N. when on 14 May 1861 a proclamation of neutrality was issued by England which accorded to the Confederacy belligerent rights such as are granted to a sovereign nation. Most of the European nations soon followed. Nor was the situation improved when the so-called Trent affair occurred. But the N. was beginning to gather strength. Nearly half a million men had come to the colours when only about half that number had responded so far in the S.

By 1862 the first advance towards the S. was begun. After sev. battles and a brief investment U. S. Grant captured Fort Donelson on the Cumberland R.; the Confederate Gen. Buckner was forced to accept Grant's stipulation of uncon-

ditional surrender, and gave up an army of 14,000 men. The opposing forces next met in battle at Shiloh on 6 April 1862. The first day's fighting favoured the Confederates, but Albert S. Johnston, one of the most brilliant of the Confederate commanders, was killed. In the second day's fighting the Union forces won and the Confederates retreated to Corinth. One of the results of this battle was that Grant discovered in W. T. Sherman one of his ablest lieutenants, and from that time on assigned to him some of his most difficult tasks. Another great blow was struck at the Confederates when a fleet under David G. Farragut (q.v.) ran past the forts protecting New Orleans and captured it.

In Mar. 1862 Gen McClellan came up with the Confederates at Yorktown. His army had been weakened by the sudden withdrawal of 25,000 men to defend Washington, and he settled down for a siege, only to find that the enemy had retreated. He met them in battle at Williamsburg, where once more the enemy retreated towards Richmond. McClellan was again ready to move, when the officials at Washington conceived the idea of crushing Jackson, who was in the Shenandoah valley. President Davis sent reinforcements to Jackson. That great soldier defeated Banks at Winchester, evaded the other 2 Union armies which were seeking him, and triumphantly led his men back to join the forces in line near Richmond. In the meantime, on 31 May and 1 June, McClellan's army fought a great battle at Fair Oaks. At first it seemed as if the Union force had lost the day, but the sudden and timely arrival of a new corps changed things and the Confederates were put to flight. McClellan was now only 6 m. from Richmond, but the swamps of the Chickahominy lay between and saved the cap. for the time being. A new Confederate commander came upon the scene, Robert E. Lee. Davis appointed Lee as commander-in-chief of the S. armies. Lee was quick to take advantage of the pause in McClellan's movement. He rushed up reinforcements from all over the S. until he had an effective fighting force of 90,000 men against his enemy's 100,000. Then ensued the Seven Days' battles. Two severe engagements were fought in the last days of June at Mechanicsville and Gaines Mill, and on 1 July was fought the battle of Malvern Hill. The Union forces settled down at last on the bank of the James R., while Lee withdrew to the defences of Richmond. Once more McClellan was ready to attempt the capture of Richmond. But all his plans were rendered nugatory, because the gov. ordered him to return with his army to cover Washington. There was dissatisfaction in the N., but there was really not much cause for complaint; Kentucky and Missouri had not seceded; Arkansas and Tennessee had been taken by Union forces; New Orleans was in Union hands. The Union leaders were already in process of encircling the Confederacy. The administration made Gen. Halleck com-

mander-in-chief and gave Gen. Pope the best part of McClellan's army. On 25 Aug. 1862 was fought the second battle of Bull Run and the Union armies were beaten. Another defeat at Chantilly completely destroyed Pope's reputation as a gen. Lincoln called on McClellan to resume command of the army at the Potomac once more. Lee had moved into Maryland, thinking to win that state to the Confederacy, to capture Baltimore, and then advance into Pennsylvania, thus carrying the war into Union ter. The stage was now set for the great struggle at Antietam, 17 Sept. 1862. The battle was drawn, 23,000 dead being left on the field. Lee retreated across the Potomac and McClellan delayed in following his enemy. He was now relieved for good. Lincoln then took one of his most important steps. Hitherto he had merely struggled to preserve the Union intact. The slavery question had been held in abeyance for fear of alienating the Democrats in the N. and the people in the border states. But now, on 22 Sept. 1862, he issued his famous proclamation of emancipation, declaring that the slaves in all states in rebellion against the gov. should be free on and after 1 Jan. 1863. The reaction in Europe was immediate, most nations being in sympathy with the abolition of slavery. But there was a reaction in the N. itself. The Democrats made big gains in the Nov. elections, and it was only New England and the border states which kept the House of Representatives Republican.

In the autumn of 1862 Rosecrans won victories at Corinth and Murfreesboro, and most of Tennessee was in his possession. In the E., on 13 Dec. 1862, Lee severely defeated Burnside in the battle of Fredericksburg. In the first days of May 1863 the Confederates won a great battle at Chancellorsville, but it cost them the life of Stonewall Jackson. In the W. Grant had conceived the idea of taking Vicksburg, Mississippi. After various failures he at last invested Vicksburg with his army and a fleet of ironclads. The siege lasted 6 weeks and on 4 July 1863 the tn was surrendered. While the siege was still in progress the greatest battle of the war was fought at Gettysburg, Pennsylvania, Lee retreating to Virginia. This was the turning point of the war.

In Sept. 1863 Bragg beat the Union forces under Rosecrans at Chickamauga in Tennessee. Then followed the battle of Lookout Mt. The Confederates retreated to Georgia. These last battles had been fought with Grant as commander-in-chief. In Feb. 1864 Lincoln made him lieutenant-gen. in charge of all the armies. Grant now planned to end the war. He himself would face Lee in Virginia, seek to destroy his army, and take Richmond. At the same time he would send Sherman to face Gen. J. E. Johnston in Georgia. In May 1864 began the 2 indecisive battles of the Wilderness of Virginia and of Spotsylvania. On 3 June 1864 the enemies met at Cold Harbor, and here in less than

an hr over 12,000 Union soldiers were killed or wounded. Grant had lost 60,000 men in this campaign; and the Confederates 40,000; but he knew that the S. could not replace its losses in manpower, whereas the N. could. In the early autumn months Sherman won victories at Winchester and Cedar Creek and then laid waste the entire Shenandoah Valley. While Grant was fighting in the Wilderness Sherman began his march from Chattanooga. On 2 Sept. 1864 he entered Atlanta. In the meantime, in Aug. Adm. Farragut had won his famous victory of Mobile Bay, which had been the harbour for the Confederate blockade runners, a victory which destroyed the Confederate fleet. In Nov., after strong opposition in his own party, Lincoln was re-nominated for president by the Republicans, and Andrew Johnson, a war Democrat from Tennessee, was nominated for vice-president. Gen. McClellan was nominated by the Democrats. Lincoln was easily re-elected. Less than 2 weeks after the election Sherman set out on his famous march to the sea from Atlanta. The army of 62,000 men accomplished the 300-m. journey, leaving destruction in its wake. On 21 Dec. Sherman entered Savannah unopposed. Gen. Thomas won the battle of Nashville in Dec. 1864 and thus drove the last of the Confederates out of Tennessee. In Jan. 1865 Wilmington, N. Carolina, was taken by joint naval and military action, and the last remaining port of the Confederacy was closed. Sherman began his march back from the sea. Columbia was burned down, and Charleston was deserted by the Confederates. An abortive attempt at peace failed, but the end was in sight. Grant, with his superior numbers, was encircling Petersburg and Richmond. On 2 April the Union forces attacked Petersburg and captured it. At length, on 3 April 1865, the Union armies entered Richmond. Lee was completely surrounded. At Appomattox Court House on 9 April he surrendered. Johnston surrendered his army to Sherman on 26 April, and by the end of May all the rest of the organised forces in the far S. had also laid down their arms.

In this costly civil war half a million lives had been lost, while tens of thousands of soldiers returned with health permanently impaired. The public debt of the Union had risen to nearly \$3 billion. What it cost the Confederacy has never been definitely estimated. Despite all this, the N. was stronger than ever; the S. was ruined. It is perhaps true to say that, because of the vindictiveness in the post-war years, real union between the sections was not really attained until the Sp.-Amer. War when a Republican and N. president, Wm McKinley, had the courage and inspiration to call to high command some of the last notable surviving figures of the old Confederate army.

The general rejoicing in the N. came to a sudden end when on 14 April 1865 President Lincoln was assassinated. He had been ready to accord the rebel states generous treatment; but his views did

not meet with the approval of Radicals in Congress. Lincoln had been succeeded by Andrew Johnson, who maintained Lincoln's attitude towards the S. On 29 May 1865 he issued a pardon proclamation to the entire S. The only exceptions were the leaders, and most of these were promised pardon if they accepted certain conditions. Under him, too, the 13th Amendment to the Constitution, forbidding slavery in the U.S.A., was adopted. But Johnson had not reckoned with Congress, which met on 4 Dec. 1865 and at once passed a Bill for the appointment of a committee whose function was to inquire into the question of the S. States. In Mar. they passed, over Johnson's veto, a Bill giving the Negroes full rights as citizens, and this was afterwards embodied in the 14th Amendment to the Constitution. No S. State could come back into the Union unless it ratified this amendment. Tennessee alone did so. In the autumn of 1866 came the election of a new House of Representatives, and the opposition to Johnson prevailed decisively. Now the road was clear for the most malignant enemies of the S. Their plan was to keep troops in the S., enfranchise the ex-slaves, and keep the conquered section as a group of permanent Republican states. One of their Acts provided that citizens, white and coloured, taking the oath of allegiance should vote for delegates to a constitutional convention in each S. state. This 14th Amendment not only admitted the Negroes as voters, but practically disfranchised the S. white leaders. Three states, Virginia, Mississippi, and Texas, failed to come in. The other 7 did so only by reason of Negro and white 'carpet-bagger' votes. To make sure that this regime would endure the 15th Amendment was adopted, denying to any state the right to disfranchise a man on account of race, colour, or previous servitude. With the bulk of the whites disfranchised, the voting was by the Negroes and by those whites who had come mainly from the N. seeking what they could loot. Those former Confederates who joined in the plunder were known as 'scalawags.' The legislatures were largely made up of ignorant ex-slaves, and their white leaders easily procured them to pass all kinds of Appropriation Bills. The unfortunate S. states were plunged into huge debts. In the end the S. whites formed the notorious Ku-Klux Klan which struck terror both into the Negroes and the 'carpet-baggers.' Matters came to a climax with President Johnson, when he dismissed Stanton, his secretary for war. The House of Representatives adopted a resolution for the impeachment of the president. Johnson was saved by a single vote.

The Growth of U.S. Big Business—The Opening of the West. In the presidential campaign of 1868 the Republicans chose Gen. Grant, who defeated his Democratic opponent, Horatio Seymour of New York. Grant's first administration was marked by a series of measures aimed at gagging the S., and by the *Alabama* (q.v.) affair.

In 1872 Grant was renominated by the Republicans. His second term was filled with more scandals than the first. Corruption in administration was the political reflection of the licence which the industrialists were allowing themselves. The era of 'reconstruction' was the beginning of 'big business,' which in the years which followed produced J. D. Rockefeller, Andrew Carnegie, J. Pierpont Morgan, and others who controlled vast monopolistic enterprises. The industrialisation of the country was made possible by the rapid building of railways after the Civil war had ended. The Union Pacific Railroad was completed in 1869, and the network soon spread over the whole continent. The West was opened up, and the pioneers were followed by the farmers. The agrarian movement paralleled the industrial, and became a political force when the farmers formed a co-operative organisation, known as the Grange, to protect themselves from the effects of low prices and excessive freight charges. The disappearance of the 'Wild West' as an ever-expanding frontier, the cultivation of the land, the growth of the pop. through immigration, the development of manufactures, all contributed in the second half of the cent. to the phenomenal growth of cities. There was extreme wealth and extreme poverty. Labour in the factories was poorly paid, and slow to organise (*see under TRADE UNIONS*). The labour movement, the control of capitalistic enterprise, and the economics of agriculture formed the 3 major problems confronting successive presidents. In the succeeding years presidential elections turned principally upon tariffs, pensions, and the free silver issue. Grant's administration was followed by a run of 3 Republicans: Rutherford B. Hayes (1876); James A. Garfield (1881, assassinated 1881); and Chester A. Arthur (1881). In 1884 Grover Cleveland was elected, the first Democrat president since the Civil war. In 1888 Benjamin Harrison, Republican, defeated Cleveland when the latter ran for re-election, but in 1892 Cleveland was again elected president. Wm McKinley, a Republican, became president in 1896.

For years the people of Cuba had been in revolt against Sp. rule. President Cleveland had warned Spain that the U.S.A. could not look on calmly. In Jan. 1898 he sent the battleship *Maine* to Havana to guard Amer. interests. On the night of 15 Feb. the ship was blown up and 266 of her crew lost their lives. On 21 Mar. a naval committee of inquiry reported that the tragedy was caused by the explosion of a submarine mine. The call for war was now more insistent. On 25 April war was formally declared (*see SPANISH-AMERICAN WAR*).

In the presidential election of 1900 McKinley was easily re-elected, but on 6 Sept. 1901, he was shot by an anarchist and *d.* on 14 Sept. Theodore Roosevelt (1858-1919), who had been elected vice-president, succeeded to the presidency. It was realised that a new era had been inaugurated. Roosevelt had made ene-

mies of the political bosses, whom McKinley knew how to placate. In the summer of 1902 the anthracite coal region was paralysed through a strike which lasted until Roosevelt intervened and induced both sides to agree to arbitration. Roosevelt had actively taken up the matter of building the Panama Canal when negotiations with Colombia failed. Roosevelt recognised the Panama Rep. and concluded a bargain which made the construction of the canal possible (*see PANAMA CANAL*). In 1904 the Republicans nominated Roosevelt, who thus ran for the presidency in his own right, and he was elected. In the next presidential election the Democrats nominated Bryan for a third time, but W. H. Taft (1857-1930) was elected. Congress passed another high tariff Bill, the Payne-Aldrich Act, which Taft signed, although at heart he had been in favour of lower duties.

When the Republicans held their nominating convention in 1912 Taft was nominated after contesting delegations favouring Roosevelt were ruled out. Thereupon Roosevelt formed his Bull Moose (q.v.) party and ran as its candidate. Woodrow Wilson, who had been governor of New Jersey, was nominated by the Democrats. Largely due to the split in the Republican ranks, he won by an overwhelming majority. Under his impulsion in his first term Congress passed the Underwood Act, which greatly lowered the tariffs; a finance Bill, which took the control of the nation's finances out of the hands of Wall Street and placed it under the Federal Reserve Banks; and a Bill placing Amer. on an equality with foreign vessels in the matter of Panama Canal tolls. In 1916 Wilson was renominated and defeated Charles E. Hughes, the Republican nominee. When the First World War broke out Wilson called upon the people to be neutral, but on 6 April 1917 the U.S. entered the war against Germany. (*See WORLD WAR, FIRST.*)

The U.S.A. between the Two World Wars. When the Peace Conference opened on 18 Jan. 1919 Wilson broke all precedents by attending as head of the Amer. delegation. The draft Treaty did not meet with his approval, but he yielded because the Covenant of the League of Nations (q.v.) was interwoven with it, and he believed that these articles could mitigate the rest. He returned to advocate its adoption by the U.S. Senate, but met increasing opposition. The treaty was eventually rejected by the Senate.

In 1920 a group of Republican Senators and bosses secured the nomination of Senator Warren G. Harding for president. The Democrats nominated James M. Cox, governor of Ohio, but Harding was elected by a large majority. The most creditable achievement of Harding's administration was the calling of the arms conference at Washington in Nov. 1921. Congress passed a Bill limiting immigration into the country and starting the quota system (*see IMMIGRATION*). In Sept. 1922 the Fordney-McCumber Tariff

Bill was passed, its new feature being that the President had power to lower or raise duties on the advice of the Tariff Commission. The regime was darkened by some grave scandals, which brought the administration into disrepute.

After Harding's death Vice-President Calvin Coolidge was sworn in as President. He was nominated for the presidency in his own right, in 1924, and the Democrats nominated J. W. Davis, who had been ambas. to Britain. Coolidge was elected. His policy was to interfere with business as little as possible, economise the nation's money, and reduce taxes and national indebtedness. These things he accomplished. Coolidge secured substantial cuts in the income-tax rates. During Harding's brief term the U.S.A. had made arrangements for the refunding of Great Britain's war loans from the U.S.A. Under Coolidge similar contracts were made with France and Italy. In Jan. 1926, at the persuasion of Coolidge, the Senate voted to have the U.S.A. adhere to the World Court (see under INTERNATIONAL COURT OF JUSTICE), but made the action abortive, because it added reservations which the other signatory powers refused to accept. In 1927 Coolidge sent D. W. Morrow to Mexico, and he succeeded in effecting a settlement of all outstanding questions between the 2 countries. In the same year Aristide Briand, Fr. Foreign Minister, proposed to secretary of state T. B. Kellogg that the U.S.A. and France agree upon a treaty renouncing war between them and agreeing to settle all disputes by pacific method (see KELLOGG PACR). In 1928 Coolidge was succeeded by Herbert C. Hoover. As the result of conversations between MacDonald, the Brit. Prime Minister, and Hoover a Naval Disarmament Conference was arranged which eventuated in the treaty of 22 April 1930.

But everything else that happened in Hoover's term faded into insignificance in comparison with the acute economic crisis, which started with the great New York Stock Exchange slump in the autumn of 1929. Hoover at first attempted to meet the crisis by a policy of 'business as usual' and to prevent a fall in wages. Orthodox methods were, however, insufficient. In 1930 the congressional elections went heavily in favour of the Democrats, as did the governors' elections. The financial plight of the nation occupied public attention during the next 2 years almost to the exclusion of all other matters. Unemployment increased to over 5,000,000. Export trade declined largely as a result of worsening conditions in Europe, and it was in the hope of reviving trade with Europe that President Hoover proposed in June 1931 a moratorium for 1 year on the repayment of both principal and interest on all war debts. This was at first successful, but large withdrawals of gold by European banks which had deposits in the U.S.A. caused a serious drain on the Amer. gold reserve. Congress approved the moratorium, but recorded disapproval of any

proposal to reduce or cancel war debts. Early in 1932 Congress accepted Hoover's proposal to set up a Reconstruction Finance Corporation as a means of helping industry through the slump, but this measure, though it served a useful purpose, did not, however, prevent the decline in popularity of President Hoover's Administration. The result was a landslide in the Democratic favour at the Presidential elections in the autumn of 1932. Franklin D. Roosevelt, the Democratic candidate, gained a popular vote of 22,821,857, which carried 42 states possessing 472 votes in the electoral college. The Democrats also gained a majority in the Senate and increased their previous majority in the House of Representatives.

Roosevelt assumed office on 4 Mar. 1933. The first year of his administration was almost wholly taken up with measures to combat the depression and to bring into effect the 'New Deal' (q.v.) which he had promised the nation. The Economy Act of 1933 was one of the first measures, and was designed to separate emergency spending to meet the depression from the normal budget under which expenditure was reduced. Prices were given an upward trend by 'controlled inflation', and the export of gold abroad was forbidden except under licence, thus taking America off the gold standard. Spending power was increased when employers pledged themselves under the National Industrial Recovery Act (June 1933) to agree to codes of fair competition, price and wage fixing, and other gov. measures. Agriculture was similarly helped by the Agric. Adjustment Act (May 1933), by which commodity prices were raised and over-production, which was a cause of depression, reduced. This year (1933) is also to be remembered as bringing the Prohibition experiment to an end. The Congress elected in 1934 showed further Democratic gains. Its first consideration was the labour trouble which had arisen as a result of the National Recovery Administration. The latter was brought to an end the following year by a decision of the U.S. Supreme Court to the effect that it was unconstitutional. Shortly afterwards (1936) the Supreme Court ruled that the Agric. Adjustment Act was also unconstitutional. There remained the Farm Credit Administration, also set up in 1933 as part of the New Deal plan for agriculture. This continued the work of the Federal Farm Board, estab. by President Hoover. With the end of the Agric. Adjustment Act, however, production could no longer be controlled, and in 1936 Roosevelt dealt with the problem in another way by the Soil Conservation and Domestic Allotment Act. Grants to farmers were made conditional on their making the best use of their land and preventing soil erosion.

As a result of the set-backs which the New Deal had received at the hands of the Supreme Court, Roosevelt embarked on a 'Second New Deal,' strengthened by his re-election to a second term in 1936. Roosevelt at once set about the

reform of the Supreme Court, but the bill was rejected by Congress. The senior justice resigned, however, and was replaced by one more sympathetic to the New Deal. Roosevelt's second term began with a business 'recession,' of which excessive gov. expenditure was said to be the cause. A Monopoly Investigation was authorised by Congress, and the anti-trust laws were revived. A new Agric. Adjustment Act was passed in 1938. Opposition to the New Deal had grown, and the Republicans increased their representation in Congress after the mid-term elections (1938). The policy of the New Deal was conducted against a background of foreign affairs which became increasingly disturbed. The World Economic Conference held in London in 1933 had broken down largely through the Amer. preference for economic isolation. In spite of this, a Trade Agreements Act was passed in 1934, allowing the president to negotiate treaties for the mutual reduction of tariffs up to a maximum of 50 per cent. With this mandate, Cordell Hull (q.v.), the secretary of state for foreign affairs, successfully concluded a number of treaties, particularly with Great Britain, Canada, and the countries of S. America. The Latin-Amer. treaties were a facet of the good-neighbour policy to which the president gave expression at an Inter-Amer. Conference for Peace held in Buenos Aires in 1936.

The Amer. attitude to the possibility of war in Europe was shown by the passing of 3 Neutrality Acts in 1935, 1936, and 1937. (*See NEUTRALITY, American Neutrality Legislation.*)

In April 1939 Roosevelt tried to remove the threat of war in Europe by a fruitless appeal to Hitler. Congress, however, rejected the president's proposal to amend the Neutrality Act, which was not in fact revised until Nov. 1939. It then became permissible for the U.S. to sell arms to those nations able to pay for them in cash and to transport them in their own or other non-Amer. ships. There was still a strong isolationist feeling, but Canada was already at war, and there was the prospect of Great Britain continuing the war from there if the U.K. were overrun. The U.S.A. and Canada entered upon joint measures of defence. A Permanent Board of Defence was set up with F. H. La Guardia, mayor of New York, at the head of the U.S. delegation. Two years earlier Roosevelt had promised Amer. aid if Canada were invaded, for this was consistent with the Monroe Doctrine (q.v.). The common ground of both isolationists and interventionists was the need to rearm the U.S. and re-equip its forces. By the autumn of 1940 the U.S. was practically on a war footing. A National Defence Advisory Committee had been set up in May, which was later replaced by an Office of Production Management of which W. F. Knudsen was director-general. For the first time in Amer. hist. military conscription was introduced in peace-time. The president showed that preparedness transcended politics,

and in June 1940 appointed 2 Republicans, H. L. Stimson and Frank Knox, to the posts of secretary of war and the navy respectively. Amer. sympathy was on the side of the Allies, and the Battle of Britain encouraged the U.S.A. to send all aid to Great Britain 'short of war.' A valuable measure of aid (Sept. 1940) was the transfer of 50 destroyers from the U.S. to the Brit. navy in return for a 99-year lease of bases in Newfoundland, the Bahamas, Jamaica, and elsewhere in the W. Indies. With the fall of France and the Netherlands, the U.S.A. warned Germany that the transfer of colonies in the W. hemisphere from one non-Amer. power to another would not be tolerated. As a consequence a Pan-Amer. Conference began (21 July 1940) to consider moves to withstand any Ger. effort to gain control of Fr. and Dutch ters. in S. America.

The year 1940 was election year. Both Republicans and Democrats supported the president's foreign policy and were united in the wish to hasten Amer. preparedness. The election was therefore fought on domestic issues. Roosevelt, departing from tradition, was nominated for a third term. Roosevelt gained a larger majority than anticipated, polling 27,243,466 votes against Willkie's (q.v.) 22,304,755. Roosevelt's entry upon a third term was marked by the Lend-Lease (q.v.) Act, which was presented to Congress on 6 Jan. 1941 and became law on 11 Mar. In spite of anti-Russian feeling, Lend-Lease credits were granted to Russia after the Ger. invasion on 22 June. By that time Roosevelt had declared a 'state of unlimited national emergency' (27 May). Amer. expeditionary forces were sent as a protective measure to Greenland, Iceland, Dutch Guiana, and elsewhere. On 14 Aug. the terms of the Atlantic Charter (q.v.) were announced, following a secret meeting between President Roosevelt and Churchill on a battleship in mid-Atlantic. The Amer. defence policy was hindered by labour disturbances during the year (1941). There was considerable agitation for anti-strike legislation, but the president was against this.

The Entry of the U.S.A. into the Second World War. Meanwhile, Japan's adherence to the tripartite Pact with Germany and Italy was giving concern in Washington. The Trade Agreement with Japan had lapsed (26 Jan. 1940), and had not been renewed. During 1941 relations became critical after the Jap. occupation of Siam (Aug. 1941). Diplomatic conversations were conducted in Washington between the president and the Jap. ambas. Adm. Nomura, aided by the special envoy, Mr Kurosio, sent by the Jap. premier, Gen. Tojo. Behind this diplomatic screen Japan prepared for war, and on 7 Dec. 1941 struck from the air against the Amer. naval base at Pearl Harbor (q.v.), Hawaii, crippling the U.S. Pacific Fleet and giving Japan naval supremacy. On 11 Dec. Germany and Italy also declared war on the U.S.A. Shortly afterwards Churchill went to Washington to confer with the president.

Pearl Harbor was followed by an attack on the Philippines, Hong Kong, and the Malay Peninsula. The Philippines were occupied by the Japanese by the end of May, 1942. The effect was to release a tremendous production drive, and this was encouraged as the year progressed by naval successes in the Coral Sea and off Guadalcanal (*see* NAVAL OPERATIONS IN SECOND WORLD WAR).

Various boards were created to further the war effort, notably the War Production Board, with Donald Nelson as chief executive, and the Economic Stabilisation Board, with J. F. Byrnes at the head. The aim was to create an armed force of 10,000,000 men, but the drafting of recruits caused a shortage of labour in industry. In April 1943 the president announced an economic programme to stabilise the cost of living. The Emergency Price Control Act was followed by an order issued by Leon Henderson, head of the Office of Price Administration, fixing maximum retail and wholesale prices. In spite of war taxation, increased income tax, and the increase in the National Debt, inflation became a problem. This was met by the Anti-Inflation Act, designed to fix the level of wage-rates as in Sept. of that year. In Europe the U.S.A. maintained diplomatic relations with the Fr. Gov. at Vichy, but supported the occupation of Madagascar by the British in May 1942. The U.S. landings in N. Africa followed in Nov. under the command of Lt.-Gen. Eisenhower (*see* AFRICA, NORTH, SECOND WORLD WAR, CAMPAIGNS IN). The next stage in war diplomacy was the conference at Casablanca (q.v.) in Jan. 1943, the first time in the hist. of the U.S.A. that the Amer. president was away from the country in war-time.

The Congressional elections in 1942 had resulted in Republican gains, and this marked a growing opposition to the liberal tendencies of the Roosevelt administration. The Anti-Inflation Act of 1942 was swept away, and efforts to control spending and to tax war profits were rebuffed. The cost of living rose sharply, bringing protests from organised labour. The coal strike of May 1943 was the occasion of anti-strike legislation passed hurriedly over the president's veto. Domestic conflicts, sharpened by the approach of the presidential elections in 1944, did not, however, seriously hamper the war effort. In foreign affairs Roosevelt's prestige was high. After his return from the Teheran conference, Roosevelt in his ann. message to Congress (11 Jan. 1944) called for a National Service Law, backed by laws to tax war profits, control the cost of food, and stabilise prices. Congress was not responsive. It was not until July, however, that Roosevelt announced that he would stand for a fourth term. By that time domestic policy receded before the events in Europe, following the Allied invasion in France in June. It was against this background of war that the election was fought. Roosevelt was renominated, with Senator Truman as the vice-presidential

candidate in place of Henry Wallace (q.v.). The Republican candidate was T. E. Dewey (q.v.), Governor of New York. In the elections in Nov. Roosevelt's popular vote was 25,602,505 and Dewey's 22,006,278. Foreign policy had been kept outside party politics, and no political capital was made out of the not very successful outcome of the conference at Dumbarton Oaks (q.v.). When the new Congress met in Jan. 1945 Senator Vandenberg (q.v.), the Republican leader, gave the Dumbarton Oaks plan his support. Then followed the conferences at Yalta (q.v.) between Roosevelt, Churchill, and Stalin. Meanwhile, the U.S.A. and the Latin-Amer. countries had confirmed Amer. solidarity in a declaration of mutual assistance, known as the Act of Chapultepec (6 Mar. 1945). Soon after the Yalta Conference, invitations were issued by the U.S.A., Great Britain, and the U.S.S.R., to 51 nations to take part in a conference to be held at San Francisco to discuss the future of the world organisation sketched out at Dumbarton Oaks. The opening of the conference on 25 April was overshadowed by the death of Roosevelt. Harry S. Truman, vice-president, succeeded to the presidency. The U.S. delegation, as nominated by Roosevelt, consisted of representatives of both the Democratic and Republican parties and some independent representatives. (*See* SAN FRANCISCO CONFERENCE.)

While the conference was in session, there came the news of the surrender of Germany on 7 May. The collaboration of the U.S.A. with Great Britain, the U.S.S.R., and France in the control of Germany emphasised the need for amicable relations, particularly between the U.S.A. and Russia. Truman dispatched Harry Hopkins (q.v.) to Moscow. This paved the way for the meeting of Truman, Churchill, and Stalin at the Potsdam (q.v.) Conference. On 28 July the Senate ratified the U.N. Charter (q.v.) by 90 votes to 2. It seemed that isolationism as a political force was ended. The Senate also ratified the Bretton Woods Agreements (q.v.), and decided that the U.S.A. should take part in the U.N. Food and Agriculture Organisation (q.v.). By 24 Oct. Byrnes, who had succeeded Stettinius (q.v.) as secretary of state on 30 June, was able to announce that all the necessary ratifications had been received. The Charter of the U.N. was now law.

Meanwhile, in the Far E. the atomic bomb (q.v., *also* HIROSHIMA and NAGASAKI) was instrumental in causing the surrender of Japan. The war was at an end, but the atomic bomb figured largely in the problems of peace; controversy over the control of it broke out at once. A Congressional Committee was set up and resulted in the MacMahon Bill, which became law on 1 Aug. 1946, establishing control by means of a civilian Atomic Energy Commission. In Nov. President Truman held a conference in Washington with the Prime Ministers of Great Britain and Canada, and by agreement with them

the problem of control was put to the U.N.

The U.S.A. after the Second World War. The end of the War also posed the question of the continuation of the Lend-Lease Act. On 21 Aug. 1945 Truman had announced that all outstanding contracts for Lend-Lease were cancelled unless the govs. concerned were willing to pay either in cash or by credit arrangements. As a result Lord Keynes and

and 1946 in the coal, automobile, steel, and electrical industries. Wages were bound up with prices, and the country was divided on the question of price control. The Price Control Act lapsed in June 1946, and by the end of the year the president had reluctantly to give way to the public agitation for the removal of controls. All controls were swept away except for those on rent, rice, and sugar. Against this domestic background

Lord Halifax headed a Brit. mission to Washington to discuss financial relations between the 2 countries. On 6 Dec. a final settlement was reached, the U.S.A. cancelling \$25m. and granting a loan of \$650m. to cover goods under contract or on the way. In addition, the Brit. mission negotiated a loan of \$3750m. (about £937,500,000) at 2 per cent interest repayable in 50 ann. instalments beginning in 1951.

In domestic affairs the struggle between management and labour was renewed. Trade-union membership had increased during the War, and attempts to reduce war-time wages or at least to resist any increase although prices remained high were met by a series of strikes during 1945

of labour disputes, rapid demobilisation, and sometimes violent readjustment to peace-time conditions. U.S. foreign policy was conducted with the support of Republicans and Democrats alike. The secretary of state, Byrnes, represented the U.S.A. at a series of international conferences beginning with the General Assembly of the U.N. in Jan. 1946, and ending with the Peace Conference in Paris from July to Oct. Amer. foreign policy was largely united by doubt of Russia's intentions. Reacting from the unfavourable reception given by the U.S.S.R. to his plans for Four-Power control of Germany for 25 years, Byrnes in a speech at Stuttgart on 6 Sept. spoke in terms of Ger. unity and co-operation with the W.

Henry Wallace, U.S. secretary of commerce, denounced Byrnes's policy of resistance to Russia in the interests, as he averred, of Brit. imperialism, and resigned his office. This controversy aggravated the difficulties which the Democratic Party had to face in the Congressional elections in Nov. The Republicans gained a majority in both the House of Representatives and the Senate, the first Republican majority in Congress since 1930. In foreign affairs relations with Russia continued to occupy the State Dept. Early in the new year Byrnes was succeeded as secretary of state by Gen. George C. Marshall (q.v.). Events in Greece provided the occasion for an important speech by the president on 12 Mar., calling for Amer. aid to Greece and Turkey, and laying down the policy, later known as the Truman Doctrine, of helping any country in danger of submersion to a Communist regime. In May \$50m. authorised for relief work through U.N.R.R.A. (q.v.) was taken over to be administered direct by the U.S. Gov. itself in Europe and China. The way was thus prepared for the most significant event of the year, the speech by Gen. Marshall at Harvard Univ. on 5 June 1947 advocating U.S. aid to enable Europe to recover its normal economy. The speech was recognised as an invitation to the countries of Europe to examine their needs and concert a plan of development which Amer. magnanimity would make possible. The foreign ministers of the U.K., France, and the U.S.S.R. met in Paris in June to discuss Gen. Marshall's offer. Russian participation was later withdrawn. In spite of this a conference on European economic co-operation opened in Paris, and as a result of its recommendations the Economic Co-operation Bill was passed by Congress in April the following year. (See EUROPE, *European Recovery*; also ORGANISATION FOR EUROPEAN ECONOMIC CO-OPERATION.)

Meanwhile, the administration was at odds with Congress over its budget proposals earlier in the year (1947). Congress proposed a greater measure of tax reduction than the president considered safe in view of the possibility of inflation, but the congressional proposals were successfully vetoed. The president's veto was, however, unable to prevent anti-labour legislation, contained in the so-called Taft-Hartley Act, passed over the veto in June 1947. It imposed, *inter alia*, a period of notice before strike action or lock-out, banned the 'closed shop,' and restricted the unions' powers of compulsion over their members. Union funds were not allowed to be used for political purposes, and if unions wished to take advantage of the National Labour Relations Board they had first to certify that their officials were not Communists. Events in Europe, particularly the Communist *coup d'état* in Czechoslovakia in Feb. 1948, gave considerable impetus to the project for aid to Europe. In June the Senate adopted a resolution proposed by Senator Vandenberg, with the intention of giving aid to Europe in defence as

well as in economic affairs, and thus admitting the possibility of regional defence pacts within the framework of the U.N. Charter. Both the Republican and Democratic parties supported Truman's foreign policy, which was not therefore an issue in the presidential election due to take place later in the year (1948). At the Democratic convention in July Truman was nominated, but with no general conviction of success on that part of his supporters. Dewey was again nominated as Republican candidate, and the general expectation was that he would win the election. Truman, himself confident, confounded the prophets by polling 24,105,812 votes in the popular ballot against 21,970,005 for Dewey. Voting for Thurmond was 1,169,021 and for Wallace 1,157,172. These results gave Truman an overwhelming majority in the electoral college. The party position in both houses of Congress was reversed, the Democrats gaining a majority. The results put the President in a position to launch his 'Fair Deal' programme, which included the repeal of the Taft-Hartley Act (which repeal labour felt it had earned by its strenuous political support for the Democrats), and the introduction of civil rights legislation. He was, however, disappointed by the unwillingness of Congress to embark on either of these measures during 1949.

Meanwhile, in foreign affairs, the Vandenberg Resolution provided the initiative for consultations between the U.S.A. and the 5 Powers (the U.K., France, the Netherlands, Belgium, and Luxembourg), which on 17 Mar. 1948 had signed the Brussels Treaty (q.v.) of mutual assistance. Other countries (Italy, Portugal, Denmark, Norway, and Iceland), were invited to participate, and these 10 countries with the U.S.A. and Canada concluded the North Atlantic Treaty (see NORTH ATLANTIC TREATY), which was signed in Washington on 4 April 1949. This made the U.S.A. a party to the defence plan of W. Europe, and the next step was the Mutual Defence Assistance Act, which was signed by President Truman on 6 Oct. 1949. This authorised an expenditure of \$1100m. on military supplies to W. Europe in support of a co-ordinated defence plan which was to be worked out. The passage of the second year's appropriations for the Marshall plan, acceptance of the N. Atlantic Treaty and the Mutual Assistance Act for European defence, and the renewal of the Reciprocal Trade Agreements Act were features of a constructive foreign policy which afforded significant evidence of continued appreciation by both parties of the new position of the U.S.A. in world affairs.

There was a steady fall in industrial production between Oct. 1948 and the late summer of 1949, and unemployment reached a total of more than 3,700,000, and certain especially distressed areas were given preference in federal contracts to reduce unemployment. The economic position was further aggravated by a prolonged strike of the steel-workers, whose

aim, which was successful, was to secure a pension scheme comparable with that won earlier by the coal-miners. The steel-workers' victory encouraged other unions to press for pensions of \$100 a month at 65, and also prompted other companies, notably the Bell Telephone System, to follow the Ford Automobile Company in granting similar pensions.

On 27 Jan. (1950) the Mutual Defence Assistance Agreement between Britain and the U.S.A. under the N. Atlantic Treaty was signed in Washington and came into force immediately. Similar agreements were signed between the U.S.A. and France, Italy, Denmark, Norway, Belgium, the Netherlands, and Luxembourg. In the same month President Truman announced that he had decided to instruct the Atomic Energy Commission to continue its work on the hydrogen bomb.

The economic situation improved after Oct. (1949), and at the turn of the year there was a marked if short-lived boom, unemployment being appreciably reduced. Then came the Korean crisis, and on 19 July President Truman, in his message to Congress, asked for \$10,000m. for the Amer. armed forces and said he would request further sums for military aid to the Atlantic Pact Powers and other nations vital to Amer. security. He also reported to Congress that he had authorised the secretary of defence to call up as many men as might be needed, and he asked for the statutory limits of the strength of the armed forces to be removed.

The Korean War (1950). On 25 June Communist forces of N. Korea crossed the 38th parallel and launched an aggressive attack against the rep. of S. Korea (see KOREAN WAR). President Truman announced that Amer. forces would intervene, and immediately afterwards the Security Council of the U.N. decided to invoke military sanctions against the aggressors (see UNITED NATIONS, CHARTER OF THE). Brit. and Australian naval and air forces were placed at the disposal of Gen. MacArthur (q.v.), who assumed command of all U.N. forces. At the same time the Seventh U.S. Fleet was placed between Formosa (then in the hands of the Chinese Nationalists) and the mainland of China to prevent further acts of aggression against that is. by organised Communist troops. During June-July the U.N. troops were driven farther S., eventually centring their defence on Taegu, in positions extending over a perimeter of 125 m. from Pohang to Pusan. On 14 Sept. Amer. troops were landed behind the Communist lines at Inchon, in a major U.N. counter-offensive. Landings were made at sev. other points on the occupied coast, and other troops advanced N. from the Pusan perimeter. Troops in the N. had captured Seoul by the end of Sept., and the U.N. forces were on the Yalu R. itself by Nov., having crossed the 38th parallel a month before. In Jan. 1951, however, the Chinese intervened and launched a large-scale offensive against the U.N. army, sweeping deep into S.

Korea. But by April the U.N. forces had checked the advance and thrown the enemy back beyond the 38th parallel again. In April 1951 MacArthur was replaced by Gen. Ridgway (q.v.), who in turn was replaced, in 1952, by Gen. Clark (q.v.). Bitter fighting continued, while truce negotiations, begun in July 1951, took their slow course. One of the chief difficulties lay with the question of prisoners of war, the U.N. insisting on voluntary repatriation, the Communists refusing to agree to this. In 1953, when the way seemed to be clear for a truce, President Rhee (q.v.) made demands for guarantees from the U.N. which presented fresh difficulties. Finally, on 12 July, Rhee agreed to 'collaborate,' and an armistice was signed on 27 July.

Meanwhile, Truman's term of office had ended, and in 1952 his successor, Dwight D. Eisenhower (q.v.), had been elected, the first Republican president since Hoover. Eisenhower's nomination had been the subject of bitter controversy within the Republican party itself, the influential Right-wing preferring Taft (q.v.); once nominated, however, Eisenhower swept into office on a wave of popularity, easily defeating his Democratic rival, Adlai Stevenson (q.v.), himself of the highest calibre. The Republicans also gained control of Congress by a very narrow margin. Truman's second term had ended somewhat stormily. In Nov. 1950 an unsuccessful attempt on his life had been made by Puerto Rican nationalists. Through 1951 and 1952 inflationary pressures upset the domestic life of the nation, and there were sev. major strikes; there were disturbing cases of criminal corruption on a large scale, and the growing fear of Communist infiltration into the U.S.A. showed itself in retrograde and restrictive legislation such as the McCarran-Walter Immigration Act, enacted over Truman's veto. The Korean truce talks dragged on inconclusively.

Eisenhower's first term proved generally successful at home. The administration weathered a threatened economic recession 1953-4; a Korean cease-fire was signed in July 1953 (Eisenhower had visited Korea in Dec. 1952 in fulfilment of his election promises); and to the Negro pop. the decision of the Supreme Court in May 1954 that racial segregation in the public schools was unconstitutional was very naturally associated with the prevailing Republican administration. A more sinister feature of the period 1952-4 was the campaign against alleged Communist infiltration into Amer. public life and public service, conducted in particular by Senator McCarthy (q.v.). This reached a violence which disturbed many serious thinking Americans.

In 1954 the Democrats regained control of Congress, and after this date McCarthy's influence declined rapidly. Democratic critics of Eisenhower have suggested, with some justification, that the president found it easier to work with a Democratic Congress than with one controlled by his own party. By the end of

the president's first term the administration's most obvious domestic problem was the relatively weak position of the farming community in an otherwise flourishing economy (apart from isolated pockets of chronic unemployment, notably in the motor industry). In foreign affairs tension in the Far E. had apparently eased after the Geneva Conference of 1954 had ended the war in Indo-China, even though the U.S.A. continued to refuse recognition to the Communist gov. in Peking. In European matters, the death of Stalin was interpreted as the beginning of an easing of the 'cold war,' an idea strengthened in the popular mind by the meeting of heads of gov. (including Eisenhower and Bulganin) at Geneva in 1955.

In 1956, in spite of a recent hist. of serious illness, Eisenhower ran for the presidency again, once more with Nixon (q.v.) as vice-presidential candidate, and with Stevenson again his Democratic opponent. The last days of the election campaign were overshadowed by the anti-Communist rising in Hungary and by the renewal of the Egyptian-Israeli war—the latter incident resulting in an Anglo-Fr. military landing in Egypt.

Eisenhower's reputation as a peacemaker might now seem jeopardised; but the ominous foreign news possibly made many Americans cling more than ever to a president who seemed to have transcended party ties and to have become a national idol. Eisenhower was elected by a land-slide vote: but it was essentially a personal victory. His party failed to gain control of Congress; and his second term opened with the traditional Anglo-Amer. alliance threatened by fundamental differences on Middle E. policy. During 1957-8 the traditional Anglo-Amer. alliance was largely rebuilt, and the U.S.A. showed increasing willingness to take the initiative in Middle E. affairs. At the end of 1957 Eisenhower and Dulles attended the N.A.T.O. conference in Paris at which agreement was reached on the principle of the Amer. offer to supply an atomic stockpile and nuclear weapons to certain European member countries, but many European observers believed that the U.S.A. had in fact achieved far less than she had hoped for at this conference. During the year Amer. confidence was severely shaken by the launching of the 2 Russian 'sputniks'; the subsequent launching of a small Amer. earth satellite, 'Explorer' (1 Feb. 1958), considerably restored this. The 1958 budget allowed for increased defence expenditure.

By the beginning of 1958 it was clear that the U.S.A. was experiencing a fairly considerable business recession; unemployment was mounting and consumption in certain categories of goods was falling.

ART. Amer. art, unlike that of the Amer. Indians (see AMERICAN INDIANS, *Arts and Crafts*), dates only from the third quarter of the 17th cent. The sparsity of the settlements and the lack of communication between them at this period meant that a general tradition was impossible; such work as existed, which was

mainly confined to New England, consisted of sev. individual enterprises. As the early artists generally came from the Eng. provs., their style was often slightly behind that existing in the cap. The different nationalities of the immigrants meant, however, that other artistic traditions—Dutch, Ger., Fr.—combined with the Eng. one; this mixture of styles has been a general characteristic of Amer. art.

The increased prosperity of the cities on the E. seaboard, from Boston to Charleston, encouraged artistic activity during the 18th cent., and an indication of the high standards of living can be seen in colonial silver, which though mainly following the Eng. example, had its own characteristics of simplicity and craftsmanship. The process of adapting European examples to colonial needs was evident in architecture (see AMERICAN ARCHITECTURE). The painters, though sometimes dabbling in religious works and landscapes, were mainly portraitists. The somewhat naïve imitation of the aristocratic court portrait found in the early part of the cent. surrendered at the hands of John Smibert (1688-1751) and Robert Feke (c. 1705-c. 1750) to a more direct manner of assessing character, which reached its climax in the sharp realism of John Singleton Copley (1738-1815) (q.v.). Copley is distinguished not only for his uncompromising portraits (e.g. 'Mrs. Boylston Harvard') but for his realistic treatment of historic events as in his 'Death of Major Pierson' (Tate Gallery).

Although colonial art was mainly a reflection of that existing in Europe and was completely inspired by it, Benjamin West (1738-1820) (q.v.), who became president of the Royal Academy, exerted some influence in England, especially in departing from the habit of representing modern heroes in ant. dress. A wish to celebrate the growing pains of the Rep. was reflected in John Turnbull's (1756-1834) records of such notable events as the battle of Bunker Hill and the Declaration of Independence. Such heroes as Washington found physical immortality in the elegant yet shrewd work of Gilbert Stuart (1755-1828), who was the leader of a competent generation of portraitists. The romantic stirrings of the early 19th cent. affected America as well as England, though the struggles of Washington Allston (1779-1843) (q.v.) to finish his 'Belshazzar's Feast' indicated the general failure of the romantic approach in subject paintings, and a more genuine, if naïve, spirit marked the Sunday Painters—the so-called Primitives—who now began to come into their own. America itself was increasingly described by the landscape artists, notably by Thomas Cole (1801-48) (q.v.), who founded the landscape school which took its name from the Hudson R. formed 1811-76. A search for subject matter at home was not, however, sufficient; the second half of the cent. witnessed a determined desire to enrich the country's cultural heritage by the importation of old masters from abroad and by a frank study

of the masters of modern art. The sensitive approach to nature of the Barbizon School influenced George Inness (1825-94) (q.v.), the author of a series of gentle atmospheric landscapes. His work announced the appearance of a style, which like that of Copley or West in the past, was genuine and fresh, and which found its prin. exponents in Thomas Eakins (1844-1916) (q.v.) and Winslow Homer (1836-1910) (q.v.). This evolution was paralleled in architecture, and a specifically Amer. style of building—the skyscraper—sprang up in the Chicago of the 1880s (see AMERICAN ARCHITECTURE). The attempt to come to grips with Amer. life was not the only current in 19th-cent. art; it was accompanied by the attempt to escape from the realism and monotony of a materialistic society, which suggested the Gothic revival, the Amer. counterparts of the Pre-Raphaelites, the symbolist work of Albert Pinkham Ryder (1847-1905) (q.v.), and the eclectic culture of Boston. It was a period in which expatriation was the order of the day, and Whistler's 'Japonaiserie', silhouette portraits, and nocturnes, played an important part in European painting. Whistler (q.v.) remains a great but isolated figure in art. John Singer Sargent (1855-1925) (q.v.) devoted the methods of big business to his portraiture of cosmopolitan society. The response to Fr. 19th-cent. art was considerable, as can be seen in Mary Cassatt (1855-1925) (q.v.), who added something of her own to Degas' style. The Impressionism of Monet inspired such charming members of the group, known as 'The Ten', as Childe Hassam (1859-1935) and Theodore Robinson (1850-96). Their sensitive application of paint did not satisfy the robust realists of the 1900s, led by Robert Henri (1865-1929), and their sobriquet of 'The Ashcan School' indicated the nature of their art.

Since the 1900s many factors have encouraged the artist—the activity of such dealers as Alfred Stieglitz, the patronage of the New Deal, the foundation of the Whitney Museum and the Museum of Modern Art. The sculpture of Alexander Calder (b. 1898) and architecture of Frank Lloyd Wright (b. 1869) indicate that Amer. art now enjoys an international importance. Two main tendencies seem to emerge: one is a hearty interest among some painters in Amer. life, which may be illustrated by the vigorous work of George Bellows (1882-1925), Thomas Benton (b. 1889), John Steuart Curry (b. 1897), Reginald Marsh (b. 1898), and Grant Wood (1892-1942); and includes the 'symbolic realism' that appeared between 1940 and 1950. The other is a concern with modern expression and its means, seen, e.g. in the water colours of John Marin (b. 1872) or the severe 'still-life' of Georgia O'Keeffe (b. 1887), and in a number of abstract painters, much influenced by Europe.

MUSIC. See AMERICAN MUSIC.

FILM. In 1895 the brothers Lumière (q.v.) gave the first public performances of motion pictures, and from that moment commercial cinematography was possible. Round about the turn of the cent. many experimenters were making and showing short films; but the commercial film as a money-maker may be said to have been born in the U.S.A. in 1903, when *The Great Train Robbery* appeared, having what was then the considerable length of 800 ft. This film was shown all over the U.S.A. for many years. Wherever new nickelodeon (as the film houses were called) was opened, *The Great Train Robbery* was the first film to be shown there. From 1903 onwards the men whose names now indicate the big film-manufacturing companies—Warner, Fox, Laemmle, Goldwyn, Zukor, and Lasky began to enter the film industry. The films made by these early pioneers were slapstick and comedies and 'westerns'. The form of the 'western' has proved durable; the modern versions have a slickness and sophistication, but the shape remains. After the early 'westerns', serial thrillers were in fashion. In 1914 David Wark Griffith, with some financial help but entirely on his own responsibility and in the teeth of the opposition of all the existing film corporations, supervised and directed a film which, appearing in the following year, was to change all over the world ideas about film-making. This was *The Birth of a Nation*. In 1916 Griffith made a second and equally important film, *Intolerance*. He thereby estab. the film as something more than vaudeville entertainment. What had commenced as one of the attractions of itinerant showmen became, through Griffith, a new art form existing in its own right and competing with the stage for the attention of the public; of equal importance was Charlie Chaplin, whose custard-pie films were true cinema.

With the introduction of sound, films became infantile again. From a chaos of vulgar noise the sound film was rescued by a series of great directors who worked to restore to the Amer. film its essentially cinematic qualities; outstanding are Robert Flaherty (*Man of Aran*, *Louisiana Story*), Frank Capra (*It Happened One Night*, *Mr Deeds Goes to Town*), William Dieterle (*The Story of Louis Pasteur*, *All That Money Can Buy*), John Ford (q.v.) (*The Informer*, *Stage Coach*, *Grapes of Wrath*), Ernst Lubitsch (*The Merry Widow*, *Ninotchka*), Preston Sturges (*Palm Beach Story*, *Sullivan's Travels*, *Hail the Conquering Hero*), and Walt Disney (q.v.), whose enormous versatility has developed the film cartoon into such varied and popular entertainments as *Snow White* and *The Seven Dwarfs*, *Fantasia*, *Bambi*, *Peter Pan*, etc.

A milestone in the later development of the Amer. cinema is Orson Welles's *Citizen Kane*, 1941, whose innovations, such as the novel camera angles and gigantic close-ups, have had a far-reaching influence on subsequent technique. Other outstanding directors since the Second World War include Elia Kazan (q.v.) (*A*

Streetcar Named Desire, *East of Eden*) and John Huston (*Treasure of Sierra Madre*, *The African Queen*): while directors such as George Stevens (*Shane*, *Giant*), William Wyler (*The Best Years of Our Lives*, *Friendly Persuasion*), and Billy Wilder (*Sunset Boulevard*) maintain a consistently high level.

Cecil B. de Mille's *Samson and Delilah*, 1950, began a series of spectacular religious films which included *David and Bathsheba*, *Quo Vadis?*, and *The Robe*, the first film in Cinemascope, and later *The Ten Commandments*. Hollywood musicals should also be mentioned. Many of these are adapted from the stage (*Oklahoma!*, *The King and I*, *Guys and Dolls*), but some of those specially created for the screen have reached a high standard of freshness and originality (e.g. *An American in Paris*, *Seven Brides for Seven Brothers*). Broadway plays form the basis of many good films (*Born Yesterday*, *Come Back, Little Sheba*, *The Country Girl*, *Picnic*, *The Rainmaker*, *The Teahouse of the August Moon*), as also do novels (including *Gone with the Wind*, the longest film ever made, running for 3 hrs 40 min.). A new and promising trend is the adaptation of television plays for the screen (e.g. *Marty*, *12 Angry Men*, *The Bachelor Party*).

The Amer. film to-day is marked by an astonishing technical competence, the result of a div. of labour in which each separate technical process is in the hands of an expert dept. The industry continues to produce a substantial number of fine films of serious purpose, as well as those which are designed solely to entertain.

See also CINEMATOGRAPH, particularly under THE SCREEN for the latest technical developments.

United States of Brazil, see BRAZIL.

United States Steel Corporation was incorporated in the state of New Jersey in 1901. Its purpose was to combine a number of companies in order to achieve the benefits of a fully integrated steel operation from raw materials through a wide variety of finished products. U.S. Steel's facilities have been augmented from time to time in order to round out its operations and better to serve the changing demands for steel as America's economy continues to expand.

U.S. Steel's proportion of the total Amer. steel production declined more or

less steadily from 87 per cent in 1901 to about 30 per cent in 1955.

Units, standards, arbitrarily chosen, in terms of which quantities may be expressed. Scientifically, U.s are of 2 kinds, viz. fundamental and derived. The fundamental U.s are those in terms of which all others can be expressed. See METROLOGY; PHYSICAL UNITS.

Units, Electrical. In the electrostatic C.G.S. (centimetre, gramme, and second) system, unit charge is defined as that which repels an equal charge at a distance of 1 cm. in vacuo with a force of 1 dyne; Coulomb gives dimension (q.v.) from the equation $[force] = M L T^{-2} = [q]^2 / \epsilon L^2$,

$[q] = \sqrt{\epsilon M^{1/2} L^{3/2} T^{-1}}$ where ϵ is the permittivity of the medium separating the charges. The dimensions of all other electric quantities follow, e.g. current

$[I] = \sqrt{\epsilon M^{1/2} L^{3/2} T^{-1}}$, charge per sec. In the magnetic system the inverse square law gives the dimension of unit magnetic quantity $[m] = \sqrt{\mu M^{1/2} L^{3/2} T^{-1}}$ and magnetic force = force per unit quantity = $[H] = M L T^{-2} / \sqrt{\mu M^{1/2} L^{3/2} T^{-1}} =$

$\frac{1}{\sqrt{\mu}} M^{1/2} L^{1/2} T^{-1}$. Maxwell's law $H = 0.4\pi n I$ for the magnetic force in a solenoid with n turns per cm. carrying a current I (amps.), establishes a relation between the 2 systems, and if a current is measured in both systems the dimensions are

$\sqrt{\epsilon} M^{1/2} L^{3/2} T^{-1} = \frac{1}{\sqrt{\mu}} M^{1/2} L^{3/2} T^{-1}$, from

which $\frac{1}{\sqrt{\epsilon \mu}} = L T^{-1}$, the dimension of a velocity. The numerical value is the velocity of light in vacuo. A practical system that can be standardised for universal use must be based on quantities that can be accurately measured, or physical objects that can be reproduced. Such a system is based, by international agreement, on the ampere, defined as the current which deposits 0.001118000 gm. of silver per sec. in a silver nitrate voltmeter; the ohm, defined as the resistance at 0°C. of a column of mercury 106.300 cm. long, of uniform cross-section and of mass 14.521 gm. From these, all other units are derived, but as a check the volt is compared with the e.m.f. of a Weston cell, which is taken as 1.018300V. The coulomb is $\frac{1}{96485}$ amp. sec., $1 V = 1 \text{ ohm } A$, $1 F = 1 \text{ coulomb/V.}$, $1 W = 1 \text{ VA.}$, $1 \text{ joule} = 1 \text{ W sec.}$, $1 \text{ henry} = 1 \text{ V per A per sec.}$ Multiples and submultiples are k (kilo) = 1000, M (mega) = 10^6 , m (milli) = 10^{-3} , μ (micro) = 10^{-6} , p (pica) = 10^{-12} . An 'absolute' practical system based on the metre, kg., sec., ohm (MKSA) was proposed by Giorgi at the convention of 1946, and has recently penetrated to the current text-books. The Giorgi system accepts the definition of the ampere and the ohm of the practical system but with some slight correction, due to recent accurate measurements. Field intensity is measured in volts per metre, and in other such units involving length or mass, the cm. and gm. are replaced by m. and kg. See also METROLOGY; PHYSICAL UNITS.

Unity of the Brethren, The, see MORAVIANS.

Universal, abstract conception formed by stripping a concrete percept of all accidentals, thus creating a concept which embodies the features common to all. Thus *man* in the abstract is a universal term, while an individual man is the particular. For the great medieval controversy as to the real existence of U.s, see NOMINALISM; REALISM.

Universal Declaration of Human Rights, see HUMAN RIGHTS.

Universal Language, see ESPERANTO; IDO.

Universal Postal Union, see POST OFFICE. Universalists, primarily those who hold the opinion first definitely upheld by Origen, that all men and even the devils themselves will finally be saved. This opinion, or a modified form of it which said that all men would be saved, was common in the early cents. and is not uncommon to-day. The name U. is also given to a sect founded in 1774 in America by John Murray (b. England 1741, d. Boston, Massachusetts, 1815). The Amer. Universalist Church had over 50,000 members in 1950.

Universe, The, see COSMOGONY; COSMOLOGY; NEBULAR HYPOTHESIS; SPACE; TIME.

'Universe, The,' weekly journal founded by Dennis Lane in 1860 for the reporting of Catholic news. It covers Church topics in every part of the world, Papal pronouncements, the Catholic attitude to social and political problems, personal paragraphs, literary and dramatic criticism, and includes a 3-page family feature.

Universities, originally from *universitas*, a term meaning any community or corporation; when devoted to learning the full title was *universitas magistrorum et scholarium*. At the end of the 14th cent. the word began to be used with the exclusive meaning of a lawfully recognised community of teachers and scholars and gradually replaced the older term *studium generale* (a centre of instruction for all). Their charters allowed schools other than cathedral schools to be opened, licensed their teachers, and were first granted by religious authorities. After the Reformation charters were increasingly granted by secular authorities, and to-day in the U.K. U. receive a Royal Charter which enables them to confer degrees and other privileges and promote education in the higher branches of learning. Originally the U. restricted themselves to the study of law, theology, and medicine. As early as the 9th cent. medicine was being taught in Salerno Univ. During the 12th and 13th cents. other great It. schools maintained this tradition. There was also a revival of legal studies at Pavia, and Bologna became recognised as the centre of civil and canon law. Paris Univ., whose organisation influenced all the central European U., including Oxford and Cambridge, grew out of the school opened by Wm of Champeaux during the first decade of the 12th cent. About this time many eminent scholars gathered in

Paris, and the reputation and inspiration of one of them, Abélard (d. 1142), did much to make Paris Univ. famous. Organised in 4 faculties, theology, canon law, medicine, and arts, the Univ. passed into the control of an oligarchy of teachers and officials, whilst its teaching functions passed to the associated colleges. By the 14th cent. there were some 40 colleges under secular or sectarian control, thus forming a federation rather like that existing in the U. of Oxford, Cambridge, and London. Each college had, however, less independence than is usual in England.

The origins of Oxford Univ. were similar: it grew out of schools centred on a nunnery and an abbey, and after 1168 allusions to Oxford as a *studium generale* become more frequent. No doubt educational activities were being carried out at this time in the neighbourhood of Cambridge: they were strengthened by a migration of students from Oxford in 1209. In both cases a unique and permanent feature of Eng. U. was estab. through the halls of residence, later known as colleges, which have retained a considerable measure of autonomy. The number of U. in Europe grew rapidly during the 14th cent. Charters were granted to Prague, Cracow, Vienna, Heidelberg, and Cologne, among others. The Reformation marks a great boundary line in the development of European U. Cambridge for a time became the centre of Puritanism in Elizabethan England, and although this tendency was suppressed both there and at Oxford, many U., Lutheran in outlook, were estab. in Europe. This was particularly the case in Germany through the 16th cent.; it was followed by a counter Reformation, in the course of which sev. Catholic institutions were opened.

The secularisation of Paris Univ. occurred as a consequence of the Fr. Revolution. In 1793 a decree of the Revolutionary Convention abolished the U. and colleges of the *ancien régime*; the new system of univ. organisation was promulgated by Napoleon I in 1808. The whole system of education under the univ. of France was to be controlled and directed by the State. Each of 17 regions was to have certain faculties; these became regional U. In 1896, the year after religious authorities were allowed some freedom to re-establish faculties under their control.

Development of U. in England had to wait until the 19th cent. A proposal to open a univ. in Durham by Cromwell came to nothing. Entry to Oxford and Cambridge was restricted by denominational tests, which were abolished only in 1871, although the range of studies at both was gradually extended through the 18th cent. and written examinations were introduced. In 1828 a group of dissenters representing all denominations opened the univ. of London. This was soon followed in 1831 by King's College, whose express purpose it was to promote the doctrines and duties of the Church of England and Ireland. In 1836 the 2 colleges became constitution members of the Univ. of London, whose functions were restricted

to conducting examinations and conferring degrees. The other stimulus to univ. development came from the need for men capable of running the nation's growing commercial and industrial activities. The civic U. of Manchester, Newcastle, Sheffield, Leeds, and Birmingham were created to meet local needs and supported by local benefactions. From being colleges primarily concerned with technical and professional studies they grew into modern U. with a full range of faculties. Fourteen of them are able to confer first and further degrees; 3 Univ. Colleges prepare students for London external degrees and await their own charters. The Univ. College of North Staffordshire estab. in 1949 does not organise its studies in the traditional manner and is able to confer B.A. degrees. Three of the Scottish U. were founded in the 15th cent., the fourth, Edinburgh, in the 16th cent.

The inclusion of technological studies (to be contrasted with the pure sciences) within the full univ. framework is, as far as Europe is concerned, peculiar to the U.K. Elsewhere separate institutions providing courses at the highest level in technology have grown up—the Ger. *Technische Hochschulen* quickly reached the status of U. in the late 19th cent. Everywhere the most significant change was the rapid advance made in the study of natural science. Technical U. have grown up in sev. parts of the Commonwealth. Meanwhile developments in the U.S.A. have been startlingly different from those in Europe. The original settlers were quick to establish colleges for the preparation of the clergy. Harvard, Yale, William and Mary, Princeton, King's (later Columbia), Brown, Rutgers, and Dartmouth were all estab. before 1750. A more liberal programme of studies was introduced by Benjamin Franklin in the univ. of Pennsylvania. The older U. retain even to-day some of the conservatism of the European U., but their curricular offerings have been modified by the pressure exerted by the large State U. These institutions were originally estab. with the aid of Federal funds to meet the agric. and industrial needs of the country's expanding economy. Grants were made for technological studies, this investment encouraged further local investment, and to-day the State U. offer a wide range of professional courses taken to the highest level. They are extremely wealthy and with other institutions of higher learning (about 1800 in all) cater for about a quarter of the age group. This compares with about 4 per cent in England and Wales. There is no doubt that professional and vocational studies are becoming increasingly popular in the U.S.A.: nearly 20 per cent of the first degrees awarded are in education, some 14 per cent in business and commerce, nearly 10 per cent in engineering, and 5 per cent in applied biology. The percentage of first degrees in the arts has dropped to less than 10. This emphasis on professional, technical education is apparent in the U.S.S.R.

By contrast in Great Britain 44 per cent of univ. students continue to graduate in arts subjects, 21 per cent in pure science, whilst engineering claims some 12 per cent.

The dangers of professionalism and proliferation of subjects (including, for example, courses in 'practical poultry raising,' 'book reviewing,' etc.) have been stressed in Europe and by a number of people in the U.S.A. Similarly, the lowering of 'standards'—the result of allowing so many students to attend college—is deplored. These critics of modern tendencies argue that the broad liberal education traditionally provided in U. will be lost, leaving the professionally trained graduates narrow specialists unable to play the same role in national affairs. The argument against U.S.A. developments based on 'lowering standards' should be treated with caution. It is true that there are wide variations in the quality of the institutions of higher learning, and a distinction should be made between degree-granting colleges and U. proper. The latter have well-developed post-graduate schools, whose students reach a very high standard of scholarship. Many of the former have grown from the early teacher-training or 'normal' colleges, and are themselves now evolving into fully developed U. Despite the diversity, perhaps some 200 institutions rank with the U. of England and the rest of Europe.

Commonwealth Universities have followed the pattern of the Eng. civic U. In 1957 there were 121 of them. In the Dominions all the U. were estab. by Acts of the State Legislatures, but by statute and royal charter they are self-governing academic corporations. The Australian National Univ. at Canberra was founded by an Act of the Commonwealth of Australia in 1946, in the first instance for the development of research institutes. The Asquith Commission on Higher Education in the Colonies (Cmd. 6647, 1945), its committee for the W. Indies (Cmd. 6654, 1945), and the Elliott Commission on Higher Education in W. Africa (Cmd. 6655, 1945) gave impetus to univ. development in the non-self-governing territories. The 5 univ. colleges, Ghana (1948), Ibadan, Nigeria (1948), E. Africa (1949) (formerly Makerere College), Rhodesia and Nyasaland (1952), and W. Indies (1946, charter 1949) prepare their students for univ. of London degrees. The well-estab. U. of Hong Kong and Malta have been strengthened, and the univ. of Malaya (granting its own degrees) was founded in 1949 by the fusion of 2 existing colleges in Singapore by ordinances of the govts. of Malaya and Singapore.

British University Expansion 1945-56. Sev. committees at the end of the War urged that the number of univ. graduates should be increased. The Barlow Committee Report on Scientific Manpower (Cmd. 6824, 1946) recommended that the output of science graduates should be doubled by 1950. This target was achieved, but the country remained very

short of scientists, and in particular of technologists (see Technical Education, Cmd. 9703, 1956). The Percy Committee Report on Higher Technological Education (H.M.S.O., 1945) emphasised the great need for technologists. The expansion has not been able to keep pace with the demand. The total number of univ. students has grown from some 50,000 in 1945 to about 80,000 in 1955. Each year the Univ. Grants Committee publishes *Returns from Universities and University Colleges for the Academic Year*. By this committee the quinquennial univ. requirements are assessed and recommendations made on them to the Treasury. The Treasury grant has now risen to some 67 per cent of univ. income. It has been accompanied by remarkably little interference by the gov. with the traditional freedom enjoyed by Brit. U. See also articles on individual U. and colleges.

University City, city of St Louis co., E. Missouri, near Mississippi R., suburb W. of St Louis. It was incorporated in 1906. Pop. 38,893.

University College, Oxford, dates from the year 1249, when Wm of Durham, Rector of Wearmouth, bequeathed a sum of money to maintain certain graduates of the univ., the institution obtaining the name 'The Great Hall of the University,' which is still part of its designation. Whether Wm of Durham intended by his bequest to initiate a major change in the character of Oxford life is unknown; but it seems certain that in the generation following his death (1249) the collegiate system was instrumental in shaping it. In the beginning his foundation was probably confined to clerks from Durham. **University College**, school of London Univ. (q.v.), founded 1826, and opened in 1828 as the 'univ. of London,' incorporated as U. C., London, in 1838. U. C. was the first constituent college of London Univ. in which it was incorporated in 1907, and comprises the faculties of arts (including economics), laws, science, engineering, and medical sciences. Included in it are the Slade School of Fine Art, the School of Librarianship and Archives, the Bartlett School of Architecture, and the dept. of Town Planning; the Francis Galton Laboratory for Natural Eugenics is now incorporated in the dept. of eugenics. U. C. has administered the univ. observatory (Mill Hill Park) since 1951, the Nuffield Research Garden (Regent's Park) for the dept. of botany since 1953, while the Blakeney Field Station is maintained by the dept. of botany. The college possesses one of the best teaching collections of Egyptian antiquities in the world, amassed by Sir W. M. Flinders Petrie (q.v.), who also inaugurated the chair of Egyptology there. In 1953 a centre was founded for research in the field of communications. The present buildings have developed on the original site in Gower Street, and there are now 3400 students. **University College Hospital**, founded in 1833 by University College, London. By the Transfer Act of 1905 a separate

corporation was estab. for the administration of the hospital and medical school. Considerable extensions were made in 1926 and 1937. In 1948 the hospital was designated a teaching hospital incorporating St Pancras Hospital (ex L.C.C.) and the Hospital for Tropical Diseases; the medical school became an independent teaching school of the univ. with its own council.

University College of North Staffordshire, see NORTH STAFFORDSHIRE.

University College School, public school for boys at Hampstead, London. Founded in 1830 as 'The London University School,' the name was modified some years later. The school was transferred to Hampstead in 1907. A preparatory dept is maintained.

University Settlements, see SOCIAL SETTLEMENTS.

U.N.O. (United Nations Organisation), see under UNITED NATIONS, CHARTER OF THE.

Unreason, Abbot of, see ABBOT OF UNREASON; FOOLS, FEAST OF.

Unruh, Fritz von (1885-). Ger. author, b. Koblenz, of a family of anct Ger. nobility, with a high military tradition. He became a Guards officer. In 1910 he wrote a drama *Offiziere* (pub. 1911), opposed to the sentiments and traditions of Ger. militarists and nationalists. He resigned his commission in 1912. He entered politics, but left Germany with the advent of Hitler, and finally settled in America in 1941. His later works include *Miss Rolschuh* (a comedy), and the novels, *Der nie verlor*, 1949, and *The End is not yet*, 1947. See studies by F. Engel, 1922, and A. Kronacher, 1946.

Unsaturated Compounds, in chem., compounds that will form derivative substances by direct addition. Thus ethylene, C_2H_4 , combines directly with chlorine to form ethylene dichloride: $C_2H_4 + Cl_2 = C_2H_4Cl_2$; and acetylene, C_2H_2 , will combine directly with bromine to form acetylene tetrabromide, $C_2H_2Br_4$: $C_2H_2 + 2Br_2 = C_2H_2Br_4$. Ethylene and acetylene are therefore said to be unsaturated, as contrasted, for instance, with methane, CH_4 , which can form derivatives only by substitution. Thus, when methane reacts with chlorine, a hydrogen atom is removed for every chlorine atom that enters: $CH_4 + Cl_2 = CH_3Cl + HCl$; $CH_3Cl + Cl_2 = CH_2Cl_2 + HCl$; and so on. In methane the pairs of electrons forming each bond redistribute themselves in space to form 4 similar valency bonds of equal strength. In ethylene the double bond is not composed of 2 similar bonds due to the different types of pairs of electrons forming those bonds. One bond is hence weaker than the other.

Unsaturated.

Saturated.

An illustration of U. C. in action is the

use of linseed oil as a drying oil. Linseed oil is an U. C. and, though the reactions involved in the drying of oil films are not completely understood, oxygen is absorbed by addition to the double bonds, until solidity is reached.

Unst, is. of the Shetland (q.v.) Is., most northerly of the Brit. Is., 40 m. N.E. of Lerwick and separated from Yell (q.v.) by Blue Mull Sound. There are 2 anchorages, and fishing and knitting are carried on. Area 465 sq. m. (including the is. of Uyea and Muckle Flugga, the latter with a lighthouse); pop. 1250.

Untermeyer, Louis (1885-). Amer. poet and critic, b. New York. Educ. at the De Witt Clinton High School, he went into his father's jewellery business. Vols. of his verse include *First Love*, 1911, *Challenge*, 1914, *The New Adam*, 1920, *Rosset Lorianth*, 1923, and *Burning Bush*, 1928. *Collected Parodies*, 1926, contains witty imitations of contemporary poets. His critical works include *American Poetry Since 1900*, 1923, and *Forms of Poetry*, 1926, and he compiled some 10 poetry anthologies, the most important being *Modern American Poetry*, 1919, and *Modern British Poetry*, 1920, both of which were later revised. From 1934 to 1937 he was poetry editor of the *American Mercury*. He married successively Jean Starr and Virginia Moore, both poetesses, Esther Antin, a lawyer, and Bryna Ivens.

Unterwalden, one of the forest cantons of Switzerland, lying to the S. of the Lake Luzern. It is divided into Obwalden (area 189 sq. m.) and Nidwalden (area 106 sq. m.). Pasturage and dairy work are the chief industries. It was one of the founders of the Confederation; Sarnen and Stans are the caps. Total pop. (1955) 42,500, Rom. Catholics.

Untouchables, a term usually applied in India to Hindus of the lowest social status who do not belong to any caste. They are untouchable to the caste Hindus, who consider themselves polluted by their touch and must purify themselves if they do come in contact. They are now more frequently called scheduled castes. The Gov. of India are doing as much as can be done by legislation to break down the prejudice. See B. R. Ambedkar, *The Untouchables* (New Delhi), 1949.

Unwin, Sir Raymond (1863-1940), architect and town-planner, b. Rotherham, was trained as an engineer; but turned to architecture and began practice in 1896 with Barry Parker. In 1901-3 they planned the Rowntree Estate near York, and in 1903 won the competition for planning the first Garden City at Letchworth, Herts. In 1906 Unwin planned the Hampstead Garden Suburb. From 1914 to 1928 he was employed as adviser on town planning by various gov. depts. In 1909 he pub. a standard book on *Town Planning in Practice*; and came to be known as 'The Father of Eng. Town Planning.' He was President R.I.B.A. 1931-3, and was awarded the R.I.B.A. Royal Gold Medal in 1937.

Unwin, Sir Stanley (1884-), publisher, Chairman of George Allen & Unwin, Ltd.,

publishers. He was educ. at Abbots-holme and in Germany, and after early experience in German bookselling and in printing, joined the publishing firm of T. Fisher Unwin in 1903, of which he later became manager. Leaving the firm in 1912, he travelled round the world, visiting booksellers, librarians, and editors, and on 4 Aug 1914 founded the firm of George Allen & Unwin to take over the assets of George Allen and of Swan Sonnenschein. Having progressive leanings from the first, the firm attracted many authors whose names became famous in the world of ideas, among them Bertrand Russell, J. A. Hobson, Ramsay Macdonald, Lowes Dickinson, Gilbert Murray, Harold Laski, R. H. Tawney, L. T. Hobhouse, Graham Wallas, etc. U. is past President of the International Publishers Congress and of the Publishers Association of Great Britain and Ireland; is on the governing body of the British Council, and is a director of The Equitable Life Assurance Society. He received the Hon. LL.D. of Aberdeen Univ. in 1945 and was knighted in 1946. His book, *The Truth about Publishing*, 1926 (6th ed. 1950), is the standard work on the subject.

Up Holland, urb. dist. of Lancs, England, 4 m. from Wigan. Brick-making and agric. are the chief industries. Here is St Joseph's College, seminary for the Rom. Catholic archdiocese of Liverpool. Pop. 6450.

Upanishad, see VEDANTA.

Upas-tree, see ANTARIUS.

Upchurch Ware, a variety of coarse Rom. pottery, usually grey in colour and ornamented with burnishing and applied dots, which has been widely found at Upchurch on the Medway in Kent and at places in Essex. There does not seem to be enough evidence that its manuf. formed a really important local industry.

Uphall, par. and vil. of W. Lothian, Scotland, on Brox Burn. There are paraffin works, and oil-shale is mined. Pop. (with Broxburn) 9530.

Upminster, see HORNCHURCH.

Upolu, see SAMOA.

Upper Austria, see AUSTRIA, UPPER.

Upper Canada, see ONTARIO.

Upper Darby, township of Delaware co., SE. Pennsylvania, U.S.A. It is chiefly residential (SW. of Philadelphia), with some manufacturing of aircraft parts, plastic, wood, and rubber products, furniture, and communications equipment. It was incorporated in 1907. Pop. 84,951.

Uppingham, rural dist. and mrkt tn of Rutland, England, 6½ m. S. of Oakham. Here is U. School (q.v.); one of the original school buildings is in the churchyard. The church is partly 14th cent.; Jeremy Taylor held the living from 1638 to 1643. Pop. (dist.) 6700.

Uppingham School, public school for boys, founded in 1584 by Archdeacon Johnson at Uppingham, Rutland. Under the Rev. Edward Thring, headmaster from 1853 to 1887 and founder of the Headmasters' Conference, the school was expanded and developed to reach its present position.

Uppsala, or Upsala. 1. Län of Sweden, in the E. central part. Iron ore and granite are produced, and there is much forest. Area 2056 sq. m.; pop. 149,800.

2. Cap. of the above, on both sides of the R. Fyris. The old tn is on the W. bank and the new on the E., the 2 being joined by 5 bridges. It is a tn of great

Swedish Tourist Traffic Assoc.

UPPSALA: THE OLD CHURCH
(12th Century).

historical interest. Its univ., with which Linnæus (q.v.) was connected, was founded in 1477, and the new buildings were erected in 1879-86. It has a famous library, containing some 700,000 books, and 17,000 MSS. In the Gothic cathedral (1230-1435) are buried Gustavus I, Linnæus, and Swedenborg. The cathedral is the greatest surviving achievement of Swedish Gothic architecture: its S. door is especially notable. U. is the metropolitan see of the Swedish State Church. Near U. there is an academy of agriculture. Some 2 m. N. at Old U., once a centre of pagan worship, are burial mounds of early kings. Pop. 70,142.

Ur, anc. city, the Biblical 'Ur of the Chaldees', bp. of Abraham, formerly on the R. Euphrates near the Persian Gulf, mod. Tell el-Mugayyar ('Mound of Bitumen') 6 m. W. of Nasiriyah (Iraq). Ur was an influential capital of a Sumerian city-state. First excavated by J. E. Taylor in 1854 and then by Campbell Thompson and Hall (1918-19), the main excavations were made 1922-34 by a joint expedition of the Brit. Museum and the Museum of the univ. of Pennsylvania under C. L. (later Sir Leonard) Woolley (q.v.). Remains of several prehistoric phases, one named after Al 'Ubaid (4 m. N.), Uruk, and Jemdet Nasr were found in a number of pits dug down to virgin soil. Pottery and objects of the Ubaid periods were found interrupted by an 8-ft. deposit of clean water-laid clay which Woolley considers to be evidence of the Flood recorded in Biblical and Babylonian texts.

A remarkable series of 16 brick and stone built tombs of the First Dynasty of Ur (c. 2500 BC) included those of a warrior Mes-kalam-shar and of a queen Shub-ad (q.v.). As many as 80 attend-

Sin, Ur was most prosperous under its Sumerian Third Dynasty (2070-1980 BC), founded by Ur-Nammu builder of the first temple tower or *ziggurat* (q.v.) and many temples and buildings dedicated

Scale of 0 10 20 30 40 50 60 70 meters

British Museum

THE ZIGGURAT OF UR-NAMMU RESTORED: ISOMETRIC PROJECTION

ants were buried with 1 occupant, together with many fine objects of gold, silver, and copper. These are now in the Iraq, Brit., and Philadelphia Museums.

British Museum

Some interpret these 'Royal Tombs' as part of ritual burials of priests and priestesses. After a period under the Semites, Sargon of Agade, and Naram

principally to Nannar (or Sin, q.v.), the moon god. Many thousands of inscribed clay tablets illustrate the prosperous life of the city, both at this time and in the later Babylonian, Kassite, and Chaldaean periods. Nebuchadnezzar II extensively rebuilt the temple area and the *ziggurat*, the lower 2 stages of which dominate the present ruins. Nabonidus (556-539 BC), the last Chaldaean king, dedicated his daughter, Bel-shalti-nannar, to be the high-priestess of the moon-god Sin. Details of her estab., museum, etc., have been found. A few Persian houses seem to have been occupied until as late as the 4th cent. BC, when the site was abandoned following a change of course by the R. Euphrates. For a record of his 12 years' work see Sir Leonard Woolley, *Excavations at Ur*, 1954. For full details see the Brit. Museum publications series *Ur Excavations* and *Ur Excavations Texts* (1936-56). See also BABYLONIA; CHALDAEA.

Uraemia (Gk *ouros*, urine; *haima*, blood), toxic condition caused by renal failure. As the derivation from the Gk words suggests, in U. the waste products normally excreted by the kidneys into the urine are retained in the blood. Urea, which is an end product of protein metabolism, is one of these products, and a way of measuring the degree of U. is to estimate the urea in the blood. Conversely, the amount of urea in the blood is a measure of the efficiency of kidney function. Normally the blood urea is

about 20 mg. of urea in every 100 ml. of blood. In cases of severe U. it may rise to 200-300 mg. The blood 'electrolytes' (sodium and potassium salts) are also increased in uraemia. The most usual cause of uraemia is kidney failure due to kidney disease (see NEPHRITIS). It also occurs in nephrosis (q.v.). It may also occur in conditions in which there is a sudden circulatory failure or reduction in blood volume, such as in haemorrhage, profuse diarrhoea and vomiting, and severe surgical shock. These are referred to as extrarenal causes of U., and since in them the uraemia is not essentially due to kidney disease, recovery occurs if the causative condition improves. In renal failure due to kidney disease, however, U. tends to be progressive. The symptoms of U. vary from malaise, headache, dyspepsia, and nausea in the mild case to vomiting, vertigo, bad headache, and disturbance of vision, and later convulsions and coma in the severe case. The patient is literally poisoned by his own waste products.

Ural (until 1775 Yaik), navigable riv. in Russia forming the boundary between Europe and Asia. It rises in the U. Mts and flows S., then W. and again S. into the Caspian Sea. Length 1580 m. The chief ports are Ural'sk and Gur'yev. From the 17th cent. the banks of the U. were colonised by Cossacks (q.v.).

Ural-Altaic Linguistic Family. Languages belonging to this family are spoken over vast stretches of Asia and Europe by c. 60,000,000 speakers. They fall into various sub-families or branches: (1) *Finno-Ugric* comprising Finnish (c. 4,000,000), Estonian (c. 1,000,000), Lapp (c. 30,000), Zyryan or Syryan or Komi (c. 250,000), Voliak (c. 275,000), Mordva (c. 1,000,000), Cheremiss, etc., as well as Hungarian or Magyar (c. 13,000,000), Szekler (c. 450,000), Samoyedic, Vogul, and Ostyak. Many scholars reject the unity of the U.-A. family, and prefer to consider the Finno-Ugric languages as an independent group. (2) *Turco-Tatar* comprising modern Turkish (c. 18,000,000), some extinct anc. languages of Central Asia, such as the Early Turki of the Kōk Turki inscriptions (see under ALPHABET), Uighur, a great number of Turki and Tatar languages and dialects nowadays spoken in various Soviet reps. and in Central Asia (Kazan Tatar, Azerbaijani, Jagatali, Kashgar, Crimean Tatar, Uzbek, Kumuk, Kirghiz, Bashkir, Turcoman, Karait, Chuvash, Yakut, etc.), extinct Tatar languages, and dialects of Central and N. China, etc. (3) *Mongolian branch* including Mongolian proper or Khalkha (c. 2,000,000), Kalmuck (c. 200,000), and Buryat (c. 300,000). (4) *The Tungus or Tungus branch*, including Manchu (c. 500,000). According to some scholars, Japanese (c. 80,000,000), and Korean (c. 30,000,000), and according to others, also the Dravidian languages (see LINGUISTIC FAMILIES), would belong to the U.-A. family. The main characteristics of the U.-A. L. F. are agglutination (see LANGUAGES, CLASSIFICATION OF), and a certain 'vowel harmony'.

Ural-Kuznetak Combine, large industrial project carried out in Russia in the 1930s, aimed at combining the iron ore of the Urals and the coking coal of the Kuznetak Basin (q.v.) (distance over 1200 m.) for the production of iron and steel. The idea was mooted before the First World War, and the first practical steps made during it, but the final decision on the U.-K. C. was taken at the 16th Congress of the Communist party in 1930. It was the main industrial basis of the country during the Second World War.

Ural Mountains (anc. Hyperborean Mountains or Rhipaei Montes) form part of the boundary between Europe and Asia and separate the Russian plain from the W. Siberian lowland. The chain extends for 1500 m. from the Arctic Ocean to the deserts of Central Asia. The mountains are old and much eroded, particularly the central U. The highest peak is Mt Narodnaya in the N., 6210 ft. The U. M. are extremely rich in mineral resources: iron ores, copper, aluminium, asbestos, gold, platinum, nickel, chrome, etc. Large salt, coal, and oil deposits are found in the adjacent lowland. See also URALS.

Uralite: 1. Pyroxene (augite) (q.v.) which has been altered to an amphibole (hornblende) (q.v.).

2. A fireproof building material composed of chalk, silicate, bicarbonate of soda, and asbestos fibre.

Urals, The (Russian Ural), one of the main industrial areas of Russia, comprising the Central and S. parts of the Ural Mts (q.v.) and the adjacent lowland to the W. and E. It has extensive forests. There are rich deposits of iron ore, non-ferrous, precious, and rare metals, salts, precious stones, coal, oil, and building materials; these form the basis of large-scale mining, metallurgical, engineering, and chemical industries. The chief cities (with over 200,000 inhab.) are Sverdlovsk, Chelyabinsk, Molotov, Ufa, Nizhny Tagil, Magnitogorsk, Izhevsk, and Ozenburg. The Russian advance into the U. started in the 11th cent. from Novgorod (q.v.), rapid colonisation took place after 1479, and industrial development (iron mining and working) dates from the early 18th cent. Around 1800 the U. was the biggest producer of pig-iron in the world, and it held the first place in Russia till 1895 when it was outstripped by the S. Industrial Region (q.v.) of European Russia. New impetus was given to industrial development by the Five Year Plans (q.v.) and the Second World War, when the U. was the main industrial base of the country's war effort. Further industrial development in the U. is hindered by limited power resources, and it is therefore scheduled for priority building of atomic power stations. Total area 290,000 sq. m.; pop. (1955) 15,400,000, mostly Russians (over 80 per cent), also Bashkirs, Tatars, Udmurts. See also BASHKIR AUTONOMOUS REPUBLIC; CHELYABINSK; CHKALOV; MOLOTOV; SVERDLOVSK; UDMURT AUTONOMOUS REPUBLIC.

Uralsk, tn in the W.-Kazakhstan oblast of the Kazakh S.S.R. It is situated on the Ural R. and is a meat-packing and wool-processing centre. Pop. 80,000.

Urania, Gk goddess of astronomy, *see* MUSES.

Uraninite, *see* PITCHBLENDE.

Uranium, a metallic chemical element, symbol U, atomic weight 238.1, atomic number 92. It is a dense white metal, sp. gr. 18.7, which is used as a source of atomic energy. U. is radioactive, spontaneously disintegrating into radium, etc., and finally into lead, the complete disintegration taking an extremely long time. Its compounds are widely distributed in nature and are easily detected because of their radioactivity. It was in 1789 that Klaproth, from his investigation of the mineral pitchblende, concluded that the mineral must contain a new element which he called U. in honour of the new planet Uranus, which had been discovered in 1781. Klaproth did not succeed in isolating the metal, only its oxide. Peligot in 1840 was the first to prepare metallic U. successfully by the reduction of U. tetrachloride with potassium in a closed platinum crucible.

Two rich deposits of U. in the ore pitchblende are those at Great Bear Lake in Canada and at Katanga in the Belgian Congo. Deposits of the ore carnotite are found in Czechoslovakia and in Colorado, Utah, and Arizona in the U.S.A. The goldfields of S. Africa also produce U. Pitchblende and carnotite are the only 2 U. ores that have been processed extensively. Generally, (1) the ores are treated with a mineral acid to bring the U. into solution; (2) the U. is converted to a soluble complex carbonate, thereby removing iron, aluminium, and manganese; (3) lead and copper are precipitated as sulphides; (4) U. is recovered as sodium uranate or ammonium uranate, which is heated to give the oxide. The metal may be prepared from the oxide by the following methods: (1) reduction of U. oxides by carbon; (2) reduction of the oxides with aluminium, calcium, or magnesium; (3) reduction of U. halides with alkali metals or alkaline-earth metals; (4) fused-salt electrolysis of U. halides; (5) thermal decomposition of U. halides.

Uranium as a Source of Atomic Energy. The energy changes involved in a modification of the central nucleus of an atom of a fissile material like U. are about a million times greater than those involved in chemical reactions such as the burning of coal. Nuclear fission is the name given to the reaction in which a free neutron, the uncharged constituent of the nucleus, strikes the nucleus of a fissile element and causes it to split into fragments of dissimilar mass. Natural U. consists of a mixture of 3 isotopes, i.e. atoms of slightly different weights, in the following proportions: U^{238} 99.28 per cent, U^{235} 0.71 per cent, and U^{234} 0.005 per cent; of these atoms only U^{235} undergoes fission on the capture of a 'thermal' or slow neutron. Natural U. is used in the 'thermal' type of nuclear reactor, where

fission of the U^{235} converts the non-fissile U^{238} by the absorption of neutrons to U^{239} , which rapidly decays to plutonium 239 . The fast or 'breeder' type of nuclear reactor requires a fuel containing an appreciably higher concentration of a fissile element than occurs in natural U. The fast neutrons liberated, however, are much more efficient in converting U^{238} to plutonium than are the slow neutrons in a thermal reactor. The plutonium produced in both types of reactor can be used as a fuel in the fast reactor.

Uranus, husband of Gaea (Earth) and the father of Cronus (Saturn) and other Titans, Cyclopes, and Hecatoncheires (hundred-handed). He represents heaven and the sky with its generative sun and rain. He was dethroned and mutilated by Cronus, and from his blood were formed the Gigantes on earth and Aphrodite in the sea.

Uranus, the first planet to be discovered since the invention of the telescope, was found by Sir Wm Herschel on 13 Mar. 1781, and named by him *Georgium Sidus* in honour of King George III. Its distance from the sun is over 10 times that of the earth. Its diameter is 3.9 times that of the earth, and its mass 14.6 times the earth's mass or only one-eighteenth that of Jupiter. In density it is about the same as the latter planet, i.e. one-third more dense than water. Up till 1949 only 4 satellites (Ariel, Umbriel, Titania, and Oberon) were known, but a fifth—Miranda—was discovered during that year by Kuiper, at the McDonald Observatory, U.S.A. All the satellites revolve around Uranus in a plane which is nearly at right angles to the plane of the planet's orbit.
